FERC VRF G3 Discussion	**Guideline 3: Consistency among Reliability Standards** PRC-010-1 Requirement R5 is similar to PRC-022-1 Requirement R1.5, which has an approved VRF of Medium.
FERC VRF G4 Discussion	**Guideline 4: Consistency with NERC Definitions of VRFs** PRC-010-1 Requirement R5 meets NERC's criterion for a Medium VRF. Failure to develop and subsequently provide a CAP to address the deficiencies identified as a result of a UVLS Program assessment in a timely manner could lead to failure to address a necessary program modification, which could, under anticipated Emergency, abnormal, or restorative conditions, directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, since the development of a CAP in Requirement R5 is dependent on the outcomes of Requirement R3 or R4, the likelihood of implications on the BES is commensurate with those of Requirements R3 and R4, which are assigned Medium VRFs. Therefore, a violation of Requirement R5 is unlikely to lead to BES instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.

VRF and VSL Justifications – PRC-010-1 Requirement R5	
FERC VRF G5 Discussion	**Guideline 5: Treatment of Requirements that Co-mingle More than One Obligation** PRC-010-1 Requirement R5 does not co-mingle reliability objectives of differing risk; the assigned VRF of Medium is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by less than or equal to 15 calendar days.
Proposed Moderate VSL	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by more than 15 calendar days but less than or equal to 30 calendar days.
Proposed High VSL	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by more than 30 calendar days but less than or equal to 45 calendar days.
Proposed Severe VSL	The applicable entity developed a Corrective Action Plan and provided it to UVLS entities in accordance with Requirement R5 but was late by more than 45 calendar days. OR The responsible entity failed to develop a Corrective Action Plan or provide it to UVLS entities in accordance with Requirement R5.
NERC VSL Guidelines Discussion	PRC-010-1 Requirement R5 meets NERC's VSL Guidelines in that there is an incremental aspect to the VSLs for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance** PRC-010-1 Requirement R5 is different in construct from the requirement it is replacing (PRC-022-1 Requirement R1) and, therefore, the VSLs cannot be compared. However, both sets of VSLs have incremental aspects and a binary aspect for failure.
FERC VSL G2 Discussion	**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSLs for PRC-010-1 Requirement R5 do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-010-1 Requirement R5	
FERC VSL G3	**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement** The proposed VSLs for PRC-010-1 Requirement R5 use similar terminology to that used in the requirement and are therefore consistent with the requirement.
FERC VSL G4	**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations** The proposed VSLs for PRC-010-1 Requirement R5 are based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1 Requirement R6	
Proposed VRF	Lower
NERC VRF Discussion	PRC-010-1 Requirement R6 meets NERC's criterion for a Lower VRF. Though having a current UVLS Program database is necessary to properly inform accurate undervoltage studies and event analyses, this is a planning requirement that is administrative in nature; failure to annually update a UVLS Program database would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1: Consistency w/ Blackout Report** N/A
FERC VRF G2 Discussion	**Guideline 2: Consistency within a Reliability Standard** The requirement has no parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3: Consistency among Reliability Standards** PRC-010-1 Requirement R6 similar to PRC-006-1 Requirement R6, which has an approved VRF of Lower.
FERC VRF G4 Discussion	**Guideline 4: Consistency with NERC Definitions of VRFs** PRC-010-1 Requirement R6 meets NERC's criterion for a Lower VRF. Though having a current UVLS Program database is necessary to properly inform accurate undervoltage studies and event analyses, this is a planning requirement that is administrative in nature; failure to annually update a UVLS Program database would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5: Treatment of Requirements that Co-mingle More than One Obligation** PRC-010-1 Requirement R6 does not co-mingle reliability objectives of differing risk; the assigned VRF of Lower is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity updated the database in accordance with Requirement R6 but was late by less than or equal to 30 calendar days.
Proposed Moderate VSL	The applicable entity updated the database in accordance with Requirement R6 but was late by less than or equal to 30 calendar days.
Proposed High VSL	The applicable entity updated the database in accordance with Requirement R6 but was late by more than 60 calendar days but less than or equal to 90

VRF and VSL Justifications – PRC-010-1 Requirement R6	
	calendar days.
Proposed Severe VSL	The applicable entity updated the database in accordance with Requirement R6 but was late by more than 90 calendar days. OR The applicable entity failed to update the database in accordance with Requirement R6.
NERC VSL Guidelines Discussion	PRC-010-1 Requirement R6 meets NERC's VSL Guidelines in that there is an incremental aspect to the VSLs for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance** PRC-010-1 Requirement R6 is replacing PRC-020-1 Requirement R1, which is applicable to the Regional Reliability Organization and has no associated VSLs. Therefore, there is no prior level of compliance.
FERC VSL G2 Discussion	**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSLs for PRC-010-1 Requirement R6 do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement** The proposed VSLs for PRC-010-1 Requirement R6 use similar terminology to that used in the requirement and are therefore consistent with the requirement.
FERC VSL G4	**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations** The proposed VSLs for PRC-010-1 Requirement R6 are based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1 Requirement R7	
Proposed VRF	Lower
NERC VRF Discussion	PRC-010-1 Requirement R7 meets NERC's criterion for a Lower VRF. Though providing current and formatted data is necessary to properly support a UVLS Program database, which subsequently informs accurate undervoltage studies and event analyses, this is a planning requirement that is administrative in nature; failure to provide the data according to the format and schedule specified would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1: Consistency w/ Blackout Report** N/A
FERC VRF G2 Discussion	**Guideline 2: Consistency within a Reliability Standard** PRC-010-1 Requirement R7 has no parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3 Consistency among Reliability Standards:** PRC-010-1 Requirement R7 is similar to PRC-006-1 Requirement R8, which has an approved VRF of Lower.
FERC VRF G4 Discussion	**Guideline 4: Consistency with NERC Definitions of VRFs** PRC-010-1 Requirement R7 meets NERC's criterion for a Lower VRF. Though providing current and formatted data is necessary to properly support a UVLS Program database, which subsequently informs accurate undervoltage studies and event analyses, this is a planning requirement that is administrative in nature; failure to provide the data according to the format and schedule specified would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5: Treatment of Requirements that Co-mingle More than One Obligation** PRC-010-1 Requirement R7 does not co-mingle reliability objectives of differing risk; the assigned VRF of Lower is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity provided data in accordance with Requirement R7 but was late by less than or equal to 30 calendar days per the specified schedule. OR

VRF and VSL Justifications – PRC-010-1 Requirement R7	
	The applicable entity provided data in accordance with Requirement R7 but the data was not provided according to the specified format.
Proposed Moderate VSL	The applicable entity provided data in accordance with Requirement R7 but was late by more than 30 calendar days but less than or equal to 60 calendar days per the specified schedule.
Proposed High VSL	The applicable entity provided data in accordance with Requirement R7 but was late by more than 60 calendar days but less than or equal to 90 calendar days per the specified schedule.
Proposed Severe VSL	The applicable entity provided data in accordance with Requirement R7 but was late by more than 90 calendar days per the specified schedule. OR The applicable entity failed to provide data in accordance with Requirement R7.
NERC VSL Guidelines Discussion	PRC-010-1 Requirement R7 meets NERC's VSL Guidelines in that the VSLs cover aspects of the requirement that are not equal in importance; there is an incremental aspect to the VSLs for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance** PRC-010-1 Requirement R7 is different in construct from the requirement it is replacing (PRC-021-1 Requirement R1) and, therefore, the VSLs cannot be compared. However, both sets of VSLs have incremental aspects and a binary aspect for failure.
FERC VSL G2 Discussion	**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSLs for PRC-010-1 Requirement R7 do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement** The proposed VSLs for PRC-010-1 Requirement R7 use similar terminology to that used in the requirement and are therefore consistent with the requirement.

VRF and VSL Justifications – PRC-010-1 Requirement R7	
FERC VSL G4	**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations** The proposed VSLs for PRC-010-1 Requirement R7 are based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-010-1 Requirement R8	
Proposed VRF	Lower
NERC VRF Discussion	PRC-010-1 Requirement R8 meets NERC's criterion for a Lower VRF. Though sharing a UVLS Program database with applicable entities in a timely manner supports an integrated and coordinated approach to UVLS programs, this is a planning requirement that is administrative in nature; failure to share the database within 30 calendar days of a request would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.
FERC VRF G1 Discussion	**Guideline 1: Consistency w/ Blackout Report** N/A
FERC VRF G2 Discussion	**Guideline 2: Consistency within a Reliability Standard** The requirement has no parts so only one VRF was assigned.
FERC VRF G3 Discussion	**Guideline 3: Consistency among Reliability Standards** PRC-010-1 Requirement R8 is similar to PRC-006-1 Requirement R7, which has an approved VRF of Lower.
FERC VRF G4 Discussion	**Guideline 4: Consistency with NERC Definitions of VRFs** PRC-010-1 Requirement R8 meets NERC's criterion for a Lower VRF. Though sharing a UVLS Program database with applicable entities in a timely manner supports an integrated and coordinated approach to UVLS programs, this is a planning requirement that is administrative in nature; failure to share the database within 30 calendar days of a request would not, under the anticipated Emergency, abnormal, or restorative conditions, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. The applicable entities are always responsible for maintaining the reliability of the BES regardless of the situation.
FERC VRF G5 Discussion	**Guideline 5: Treatment of Requirements that Co-mingle More than One Obligation** PRC-010-1 Requirement R8 does not co-mingle reliability objectives of differing risk; the assigned VRF of Lower is consistent throughout the requirement.
Proposed Lower VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by less than or equal to 15 calendar days.
Proposed Moderate VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by more than 15 calendar days but less than or equal to 30 calendar days.

VRF and VSL Justifications – PRC-010-1 Requirement R8	
Proposed High VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by more than 30 calendar days but less than or equal to 45 calendar days.
Proposed Severe VSL	The applicable entity provided its UVLS Program database in accordance with Requirement R8 but was late by more than 45 calendar days. OR The applicable entity failed to provide its UVLS Program database in accordance with Requirement R8.
NERC VSL Guidelines Discussion	PRC-010-1 Requirement R8 meets NERC's VSL Guidelines in that there is an incremental aspect to the VSLs for tardiness and a binary aspect for failure.
FERC VSL G1 Discussion	**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance** PRC-010-1 Requirement R8 is replacing PRC-020-1 Requirement R2, which is applicable to the Regional Reliability Organization and has no associated VSLs. Therefore, there is no prior level of compliance.
FERC VSL G2 Discussion	**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties** **Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent** N/A **Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language** The proposed VSLs for PRC-010-1 Requirement R8 do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement** The proposed VSLs for PRC-010-1 Requirement R8 use similar terminology to that used in the requirement and are therefore consistent with the requirement.
FERC VSL G4	**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations** The proposed VSLs for PRC-010-1 Requirement R8 are based on a single violation and not cumulative violations.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2008-02.2 Phase 2 of Undervoltage Load Shedding (UVLS): Misoperations
PRC-004-5 and PRC-010-2

Final Ballot Open through April 27, 2015

Now Available

A final ballot for **PRC-004-5 – Protection System Misoperation Identification and Correction and PRC-010-2 – Under Voltage Load Shedding** is open through **8 p.m. Eastern, Monday, April 27, 2015**.

Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a vote. All ballot pool members may change their previously cast votes. A ballot pool member who failed to vote during the previous ballot period may vote in the final ballot period. If a ballot pool member does not participate in the final ballot, the member's vote from the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard here. If you experience any difficulties in using the Standards Commenting & Balloting System, contact Arielle Cunningham.

Next Steps

The voting results for the standard will be posted and announced after the ballot closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Scott Barfield-McGinnis (via email) or at (404) 446-9689.

Standards Announcement

Project 2008-02.2 Phase 2 of Undervoltage Load Shedding (UVLS): Misoperations
PRC-004-5 and PRC-010-2

Final Ballot Results

Now Available

A final ballot for **PRC-004-5 – Protection System Misoperation Identification and Correction** and **PRC-010-2 – Under Voltage Load Shedding** concluded at **8 p.m. Eastern, Monday, April 27, 2015.**

The standard achieved a quorum and received sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Quorum /Approval
84.86% / 89.63%

Next Steps
The standard will be submitted to the NERC Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the **Standards Development Process**, refer to the Standard Processes Manual.

888 First Street, NE
Washington, D.C. 20426

RE: Errata to Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standards PRC-004-2.1(i)a, PRC-004-4, PRC-005-2(i), PRC-005-3(i), and VAR-002-4
Docket No. RD15-3-000

Dear Ms. Bose:

On February 6, 2015, the North American Electric Reliability Corporation ("NERC") filed a petition for approval of proposed Reliability Standards PRC-004-2.1(i)a, PRC-004-4, PRC-005-2(i), PRC-005-3(i), and VAR-002-4 ("Petition"), with the Federal Energy Regulatory Commission ("Commission").

It has come to NERC's attention that the Implementation Plans for PRC-005-2(i) and PRC-005-3(i), as submitted to the Commission in the Petition, need to be modified to properly sequence the version numbering and effective dates for PRC-005-2(i) and PRC-005-3(i) to ensure that the implementation of these Reliability Standards carries forth the intention of the standard drafting team responsible for development. The errata clarifies that PRC-005-2(i) should become effective concurrently with or after the effective date of PRC-005-2, and that PRC-005-3(i) should become effective concurrently with or after the effective date of PRC-005-3.

The proposed modifications are identified in the redline versions of the revised Implementation Plans, submitted herein as **Exhibit A**. The proposed clean versions of the revised Implementation Plans, which shall replace the Implementation Plans for PRC-005-2(i) and PRC-005-3(i) in the Petition, are submitted as **Exhibit B**.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

For the reasons set forth above, NERC respectfully requests that the Commission approve the proposed errata to the Implementation Plans for PRC-005-2(i) and PRC-005-3(i)**,** effective as proposed herein.

Respectfully submitted,

/s/ Milena Yordanova

Milena Yordanova
Counsel for the North American Electric Reliability Corporation

cc: Official service list in Docket No. RD15-3-000.

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Washington, D.C. this 8th day of May, 2015.

/s/ Milena Yordanova

Implementation Plans for PRC-005-2(i) and PRC-005-3(i) _Redline Version

PRC-005-2(i)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2014-01 Standards Applicability for Dispersed Power Producing Resources
PRC-005-2(i)

~~The standard numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.~~

Standards Involved

Approval:

- PRC-005-2(i) – Protection System Maintenance

Retirement:

- PRC-005-2 – Protection System Maintenance

Prerequisite Approvals:

N/A

Background:

In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees, changes to the applicability sections of certain Reliability Standards, including PRC-005, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed power producing resources in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk Power System.

Reliability Standard PRC-005-2, with its associated Implementation Plan, was adopted by the NERC Board of Trustees on November 7, 2012. The SDT has revised the applicability section of PRC-005-2 to align with the revised definition of "Bulk Electric System" in the event that this version of PRC-005 is mandatory and enforceable on the effective date of the revised definition of "Bulk Electric System."

General Considerations:

PRC-005-2(i) is proposed for approval to align the applicability section of PRC-005-2 with the revised definition of "Bulk Electric System." PRC-005-2 may already be retired pursuant to an implementation plan of a successor version of PRC-005 ~~by the time the revised definition of "Bulk Electric System"~~before PRC-005-2(i) becomes effective. If this occurs, PRC-005-2(i) will not go into effect.

Effective Date

PRC-005-2(i) shall become effective on the later of the first day following the Effective Date of PRC-005-2 or immediately after the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of the first day following the Effective Date of PRC-005-2 or the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~on the later of the effective date of the revised definition of Bulk Electric System or the first day following the effective date of PRC-005-2.~~

Retirement of Existing Standards:

PRC-005-2 shall be retired at midnight of the day immediately prior to the effective date of PRC-005-2(i) in the particular jurisdiction in which the revised standard is becoming effective.

Implementation Plan

All aspects of the Implementation Plan for PRC-005-2 will remain applicable to PRC-005-2(i) and are incorporated here by reference.

Cross References

The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2014-01 Standards Applicability for Dispersed Power Producing Resources
PRC-005-3(i)

~~The standard numbers currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.~~

Standards Involved

Approval:

- PRC-005-3(i) – Protection System and Automatic Reclosing Maintenance

Retirement:

- PRC-005-2(i) – Protection System Maintenance
- PRC-005-3 – Protection System and Automatic Reclosing Maintenance

Prerequisite Approvals

N/A

Background

In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees, changes to the applicability sections of certain Reliability Standards, including PRC-005, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed power producing resources in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk Power System.

Reliability Standard PRC-005-3, with its associated Implementation Plan, was adopted by the NERC Board of Trustees on November 7, 2013. The SDT has revised the applicability section of PRC-005-3 to align with the revised definition of "Bulk Electric System" in the event that this version of PRC-005 is mandatory and enforceable on the effective date of the revised definition of "Bulk Electric System."

General Considerations

PRC-005-3(i) is proposed for approval to align the applicability section of PRC-005-3 with the revised definition of "Bulk Electric System." PRC-005-3 may already be retired pursuant to an Implementation Plan of a successor version of PRC-005 ~~by the time the revised definition of "Bulk Electric System"~~ before PRC-005-3(i) becomes effective. If this occurs, PRC-005-3(i) will not go into effect.

Effective Date

PRC-005-3(i) shall become effective on the later of the first day following the Effective Date of PRC-005-3 or immediately after the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of the first day following the Effective Date of PRC-005-3 or the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~on the later of the effective date of the revised definition of Bulk Electric System or the first day following the effective date of PRC-005-3.~~

Retirement of Existing Standards

PRC-005-3 shall be retired at midnight of the day immediately prior to the effective date of PRC-005-3(i) in the particular jurisdiction in which the revised standard is becoming effective.

Implementation Plan

PRC-005-3(i~~X~~) only modifies the applicability for PRC-005-3. All aspects of the Implementation Plan for PRC-005-3 will remain applicable to PRC-005-3(i) and are incorporated here by reference.

Cross References

The Implementation Plan for the revised definition of "Bulk Electric System" is available here.

Approval:

- PRC-005-3(i) – Protection System and Automatic Reclosing Maintenance

Retirement:

- PRC-005-2(i) – Protection System Maintenance
- PRC-005-3 – Protection System and Automatic Reclosing Maintenance

Prerequisite Approvals

N/A

Background

In light of the adoption of a revised "Bulk Electric System" definition by the Board of Trustees, changes to the applicability sections of certain Reliability Standards, including PRC-005, are necessary to align with the implementation of the revised "Bulk Electric System" definition. The Standard Drafting Team (SDT) for Project 2014-01 – Standards Applicability for Dispersed Power Producing Resources has modified the applicability section of certain Generator Owner/Generator Operator requirements to recognize the unique technical and reliability aspects of dispersed power producing resources in order to ensure the applicability of the standards is consistent with the reliable operation of the Bulk Power System.

Reliability Standard PRC-005-3, with its associated Implementation Plan, was adopted by the NERC Board of Trustees on November 7, 2013. The SDT has revised the applicability section of PRC-005-3 to align with the revised definition of "Bulk Electric System" in the event that this version of PRC-005 is mandatory and enforceable on the effective date of the revised definition of "Bulk Electric System."

General Considerations

PRC-005-3(i) is proposed for approval to align the applicability section of PRC-005-3 with the revised definition of "Bulk Electric System." PRC-005-3 may already be retired pursuant to an Implementation Plan of a successor version of PRC-005 before PRC-005-3(i) becomes effective. If this occurs, PRC-005-3(i) will not go into effect.

Effective Date

PRC-005-3(i) shall become effective on the later of the first day following the Effective Date of PRC-005-3 or immediately after the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of the first day following the Effective Date of PRC-005-3 or the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards

PRC-005-3 shall be retired at midnight of the day immediately prior to the effective date of PRC-005-3(i) in the particular jurisdiction in which the revised standard is becoming effective.

Implementation Plan

PRC-005-3(i) only modifies the applicability for PRC-005-3. All aspects of the Implementation Plan for PRC-005-3 will remain applicable to PRC-005-3(i) and are incorporated here by reference.

North American Electric Reliability Corporation	**)**	**Docket No. RM15-16-___**
	)	

SUPPLEMENTAL INFORMATION TO PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF PROPOSED TRANSMISSION OPERATIONS AND INTERCONNECTION RELIABILITY OPERATIONS AND COORDINATION RELIABILITY STANDARDS

Pursuant to Section 215(d)(1) of the Federal Power Act[1] and Section 39.5[2] of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), the North American Electric Reliability Corporation ("NERC")[3] hereby submits supplemental information to its March 18, 2015 petition for approval of nine proposed Transmission Operations ("TOP") and Interconnection Reliability Operations and Coordination ("IRO") Reliability Standards (the "TOP/IRO Petition").[4] NERC is providing this supplemental information to address the removal of Load Serving Entities ("LSEs") from the applicability of proposed Reliability Standard TOP-001-3 in light of the Commission's order on NERC's Risk-Based Registration ("RBR") initiative.[5]

---

1 16 U.S.C. § 824o (2012).

2 18 C.F.R. § 39.5 (2014).

3 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the Federal Power Act ("FPA") on July 20, 2006. *North American Electric Reliability Corporation*, 116 FERC ¶ 61,062 (2006).

4 The nine proposed Reliability Standards are: TOP-001-3 (Transmission Operations); TOP-002-4 (Operations Planning); TOP-003-3 (Operational Reliability Data); IRO-001-4 (Reliability Coordination – Responsibilities); IRO-002-4 (Reliability Coordination –Monitoring and Analysis); IRO-008-2 (Reliability Coordinator Operational Analyses and Real-time Assessments); IRO-010-2 (Reliability Coordinator Data Specification and Collection); IRO-014-3 (Coordination Among Reliability Coordinators); and IRO-017-1 (Outage Coordination) (collectively, the "Proposed TOP/IRO Standards").

5 *North American Electric Reliability Corporation*, 150 FERC ¶ 61,213 (2015) ("RBR Order").

I. BACKGROUND

a. Applicability of Proposed Reliability Standard TOP-001-3

As discussed in greater detail in the TOP/IRO Petition, proposed Reliability Standard TOP-001-3 contains 20 requirements relating to transmission operations and applies primarily to the responsibilities of Transmission Operators and Balancing Authorities for maintaining reliable operations.[6] The only other functional entities subject to requirements under proposed Reliability Standard TOP-001-3 are Distribution Providers and Generator Operators, whose sole responsibilities under the proposed standard are to:

- comply with Operating Instructions[7] issued by a Transmission Operator or Balancing Authority (Requirements R3 and R5); or
- notify the Transmission Operator or Balancing Authority if they are unable to comply with the Transmission Operator's or Balancing Authority's Operating Instructions (Requirements R4 and R6).

As explained in the TOP/IRO Petition, proposed Reliability Standard TOP-001-3 replaces currently-effective Reliability Standards TOP-001-1a and certain requirements from other currently-effective TOP and IRO Reliability Standards.[8] The requirement for Distribution Providers and Generator Operators to comply with Operating Instructions issued by a Transmission Operator is a carry-over from Reliability Standard TOP-001-1a, Requirements R3 and R4, which require Generator Operators (Requirement R3) and Distribution Providers (Requirement R4) to comply with "reliability directives" issued by a Transmission Operator unless

---

6 *See* TOP/IRO Petition at 21-26.

7 As defined in the Glossary of Terms Used in NERC Reliability Standards, an "Operating Instruction" is "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)."

8 *See* Exhibit D to the TOP/IRO Petition.

such actions would violate safety, equipment, regulatory or statutory requirements.[9] Requirement R4 also required LSEs to comply with the reliability directives issued by a Transmission Operator. LSEs were not subject to any other requirements in TOP-001-1a nor were LSEs subject to the other currently-effective TOP/IRO requirements that proposed Reliability Standard TOP-001-3 is designed to replace. While LSEs were initially included in Requirements R3-R6 of proposed Reliability Standard TOP-001-3 along with Distribution Providers and Generator Operators, the standard drafting team decided to remove LSEs from the proposed standard following the NERC Board of Trustee's approval of proposed revisions to the NERC Rules of Procedure to eliminate the LSE functional registration category.

The proposal to eliminate the LSE functional registration category was part of a broader initiative at NERC, referred to as the RBR initiative, to revise the NERC registration criteria to ensure that the right entities are subject to the right set of Reliability Standards using a consistent approach to risk assessment and registration. The goal of the RBR initiative was to develop enhanced registry criteria, including the use of thresholds and specific Reliability Standards applicability, where appropriate, to better align compliance obligations with material risk to Bulk Electric System reliability. Eliminating the LSE functional registration category was one of a number of reforms proposed as part of the RBR initiative. On December 11, 2014, in Docket No. RR15-4-000, NERC filed a petition with the Commission for approval of proposed revisions to the NERC Rules of Procure to implement the reforms proposed as part of the RBR initiative (the "RBR Petition").

[9] As explained in the TOP/IRO Petition (at 20-21), the term "Operating Instruction" replaces the term "reliability directive" used in currently effective Reliability Standards TOP-001-1a. TOP-001-1a did not require Generator Operators, Distribution Providers, or LSEs to comply with reliability directives issued by a Balancing Authority.

b. RBR Order

On March 19, 2015, the Commission issued the RBR Order, ruling on the RBR Petition. Among other things, the Commission denied, without prejudice, NERC's proposal to remove the LSE function and directed NERC to submit a compliance filing providing additional information on the effect of deregistering LSEs.[10] The Commission found NERC's analysis incomplete, stating that it is concerned that NERC has not adequately explained how certain LSE reliability tasks will be performed going forward.[11] In particular, the Commission focused on the LSEs' role as a provider of information required for reliable operation of the Bulk Electric System.[12] The Commission stated:

> Upon elimination of the load-serving entity as a registered function, it is unclear whether and how some entities will continue to provide information or who will assume their obligations. It appears that some of the load-serving entities will be required to continue to provide the information through their responsibilities as other registered functions. However, NERC has not adequately explained which entities will continue to provide this information. Because of the gaps in NERC's analysis, discussed below, we are unable to satisfactorily conclude on the current record in this proceeding that the elimination of the load-serving entity function will have no material impact on the reliability of the Bulk-Power System.[13]

More specifically, the Commission expressed concern with the information provided by LSEs that serve as inputs into power system models and assessments under the Modeling, Data, and Analysis ("MOD") group of Reliability Standards:

> NERC does not adequately address whether, going forward, all balancing authorities and planners will have the ability to reasonably estimate demand and energy forecast data for areas where the load-serving entity is deregistered. In areas

---

[10] RBR Order at PP 37-43.

[11] *Id*.

[12] RBR Order at PP 37-41. As provided in the NERC Functional Model (at 55), LSEs, among other things, provide (1) load profiles and characteristics, plans, and forecasts as needed to the Balancing Authorities, Purchasing-Selling Entities, Planning Coordinators, Resource Planners, and Transmission Planners, (2) information as to self-provided reliability-related services to the Balancing Authority, and (3) generation commitments and dispatch schedules to the Balancing Authority.

[13] RBR Order at P 37.

> of significant load-growth, the cumulative effect of deregistered entities not having to provide accurate load data projections as required by certain MOD Reliability Standards could have an increasing effect on reliability over time as load increases, e.g., as a result of demand and energy forecast data omitted or not accurately depicted in power system models and assessments.[14]

To obtain additional information about the effects of deregistering LSEs, the Commission directed NERC to submit a compliance filing that provides, among other things: (1) an adjusted estimate on the number of LSEs that would be deregistered; (2) additional information regarding the peak load of such entities on an individual and balancing authority basis; and (3) for the LSEs for which NERC anticipates deregistration, specific information regarding the alternative sources of authority which will ensure the continuation of LSE reliability activities by either the deregistered entity or another registered entity.[15]

Additionally, in response to NERC's statement that NERC is in the process of removing the LSE function from a number of Reliability Standards, the Commission stated:

> When and if NERC submits one or more petitions for revised Reliability Standards that propose to remove the load-serving entity as an applicable entity, NERC must provide an adequate explanation of how the previous load-serving entities obligations will continue. In particular, an explanation that the removal of the load-serving entity function is consistent with the RBR initiative would be inadequate, if not circular, in light of NERC's rationale in the immediate docket that the impact from eliminating the load-serving entity function is lessened by the removal of the function from Reliability Standards. NERC is responsible to explain in the context of a particular modified Reliability Standard whether removal of the load-serving entity would result in a reliability gap and, if so, how the gap is addressed.[16]

In light of this directive, NERC is providing supplemental information to the TOP/IRO Petition to provide further explanation for removing LSEs as an applicable entity under proposed Reliability Standard TOP-001-3. As explained below, removing LSEs from proposed Reliability

---

[14] RBR Order at P 40 (internal citations omitted).

[15] RBR Order at P 41.

[16] RBR Order at P 43 (internal citations omitted).

Standard TOP-001-3 will not create a reliability gap, and the Commission should approve proposed Reliability Standard TOP-001-3 as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

II. SUPPLEMENTAL INFORMATION

The stated purpose of proposed Reliability Standard TOP-001-3 is to "prevent instability, uncontrolled separation, or Cascading outages that adversely affect the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences."[17] As noted above, the proposed standard achieves this reliability goal, in part, by providing Transmission Operators and Balancing Authorities the authority to direct the actions of certain other functional entities (via the issuance of Operating Instructions) to maintain reliability during Real-time operations. In contrast to prior versions of proposed Reliability Standard TOP-001-3, LSEs are not included in the list of entities that must comply with a Transmission Operator's or Balancing Authority's Operating Instructions.[18] As explained below, that is because none of the functions performed by LSEs, as described in the NERC Functional Model, necessitate that LSEs be subject to a requirement to comply with such Operating Instructions to ensure that a Transmission Operator or Balancing Authority can maintain the reliability of its Transmission Operator Area or Balancing Authority Area, respectively.

As explained in the NERC Functional Model,[19] an LSE is "the functional entity that secures energy and transmission service (and reliability-related services) to serve the electrical demand

---

[17] *See* TOP/IRO Petition at 21.

[18] As noted above, the only requirement in previous versions of proposed Reliability Standard TOP-001-3 applicable to LSEs was for LSEs to comply with "reliability directives" issued by a Transmission Operator. There was previously no requirement for LSEs to comply with the directives of a Balancing Authority.

[19] The NERC Functional Model is available at: http://www.nerc.com/pa/Stand/Functional%20Model%20Archive%201/Functional_Model_V5_Final_2009Dec1.pdf The NERC Functional Model was approved by the NERC Board of Trustees and provides the framework for the development and applicability of NERC's Reliability Standards. See *Mandatory Reliability Standards for the Bulk-*

and energy requirements of its end-use customers."[20] An LSE does not own or operate Bulk Electric System facilities or equipment or the facilities or equipment used to serve end-use customers.[21] As provided in the NERC Functional Model, an LSE's tasks are limited to the following:

1. *Ahead of Time Ta*sks:
    - Submits load profiles and characteristics, plans, and forecasts to Balancing Authorities, Purchasing-Selling Entities, Planning Coordinators, Resource Planners, and Transmission Planners.
    - Identifies new facility connection needs for end-use customers.
    - Provides generation commitments and dispatch schedules to the Balancing Authority.
    - Provides information as to self-provided reliability-related services to the Balancing Authority.
    - Provides planned purchases to the Resource Planner and Transmission Planner for system modeling and reliability evaluation.
    - Arranges for transmission service from Transmission Service Providers and makes arrangements for reliability-related services with Generator Owners or Load-Serving Entities.
    - Submits Requests For Interchange to Interchange Coordinators.
    - Notifies Generator Operators if Arranged Interchange requests are approved or denied.
    - Receives final approval or denial of Arranged Interchange from Interchange Coordinator.
    - Coordinates with Distribution Provider on identifying new facility interconnection needs.
    - Receives notification from Purchasing-Selling Entity if Arranged Interchange requests approved or denied.

Power System, Order No. 693, 72 FR 16416 at PP 117-129 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[20] NERC Functional Model at 55. As defined in the NERC Glossary, an LSE "[s]ecures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers."

[21] The Distribution Provider is the functional entity that provides facilities that interconnect an end-use customer load and the electric system for the transfer of electrical energy to the end-use customer. If a company registered as an LSE also owned facilities, the company would be registered for other functions as well.

2. *Real-Time Tasks*:

- Receives requests from the Balancing Authority and Distribution Provider for voluntary load curtailment.
- Communicates requests for voluntary load curtailment to end-use customers as directed by the Balancing Authority and Distribution Provider.
- Notifies Interchange Coordinators of Confirmed Interchange cancellations or terminations.
- Receives notice of Confirmed Interchange curtailments from Interchange Coordinator.[22]

In evaluating these functional obligations, the standard drafting team for proposed Reliability Standard TOP-001-3 did not identify any circumstances under which a Transmission Operator or Balancing Authority would need to issue an Operating Instruction to an LSE to meet the goal of the standard (i.e., to prevent instability, uncontrolled separation, or Cascading outages that adversely affect the reliability of the Interconnection in Real-time).[23] First, with respect to the LSE's role as a provider of information to other functional entities, which was the Commission's focus in the RBR Order, that role is primarily carried out ahead of Real-time and would not be the subject of an Operating Instruction. For instance, the LSE's submission of (1) load profiles and characteristics, plans, and forecasts, (2) generation commitments and dispatch schedules, and (3) information as to self-provided reliability related services to the Balancing Authority occurs in advance of Real-time operations. As explained above, the purpose of issuing Operating Instructions is to provide Transmission Operators and Balancing Authorities the authority to direct the actions of others so as to maintain reliable transmission operation in Real-time. Proposed

[22] NERC Functional Model at 55.

[23] In its compliance filing on the RBR Order, NERC will provide further analysis on removing the LSE function from currently-effective Reliability Standards and proposed Reliability Standards pending Commission approval. This supplement solely focusses on the removal of the LSE from proposed Reliability Standard TOP-001-3.

Reliability Standard TOP-001-3 is not the standard by which Transmission Operators or Balancing Authorities obtain operational or planning data from other functional entities.

Additionally, the LSE's Real-time role with respect to voluntary load curtailment does not necessitate requiring LSEs to comply with Operating Instructions issued by a Transmission Operator or Balancing Authority. In order to maintain reliability in their areas and prevent instability, uncontrolled separation, or Cascading outages, there may be circumstances under which Transmission Operators and Balancing Authorities need to shed load (i.e. direct non-voluntary load curtailment). Such action is implemented in Real time to address imminent or existing reliability issues such as an exceedance of an Interconnection Reliability Operating Limit or System Operating Limit, or a voltage problem. Due to the urgent nature of these circumstances, the Reliability Coordinator, Balancing Authority, or Transmission Operator may issue Operating Instructions directly to the Distribution Provider for physical implementation of load shedding (except when this can be accomplished directly by the Transmission Operator). As indicated by the NERC Functional Model, as the LSE does not own or operate equipment, the LSE does not play a role in shedding load in Real-time.[24] It is the Distribution Provider that provides the switches and reclosers used to shed load for emergency action at the direction of the Transmission Operator or Balancing Authority.[25]

In contrast to a Distribution Provider's role in load shedding, the LSE's role in load curtailment is voluntary and typically arranged ahead of Real-time. In many cases, the LSE obtains interruptible load contracts with end-use customers for the purpose of providing market price relief

[24] Because the LSE does not own or operate equipment, LSEs cannot shed load or perform other corrective actions. LSEs thus have no control that they could exercise for purposes of load shedding even if they were directed to take action by a Transmission Operator or Balancing Authority.

[25] NERC Functional Model at 47.

or assistance to the Balancing Authority in tight capacity/energy situations. The LSE often notifies the Balancing Authorities and Distribution Providers of the agreements so that voluntary load curtailment may be requested under specified conditions.[26] In Real-time, the LSE's role is simply to "[c]ommunicate requests for *voluntary* load curtailment to end-use customers as directed by the Balancing Authority and Distribution Provider."[27] An LSE's compliance with such requests, however, is not necessary for the Transmission Operator or Balancing Authority to maintain reliability in its area. Transmission Operators and Balancing Authorities have the ability to shed load absent agreement by the LSE or the end-use customer, as noted above. Requiring an LSE to comply with an Operating Instruction to exercise its rights to curtail load is thus unnecessary to maintain reliability and prevent instability, uncontrolled separation, or Cascading outages. If an LSE receives a request from a Transmission Operator or Balancing Authority to curtail load, the LSE may exercise its contractual rights to curtail or risk having its load shed by the Reliability Coordinator, Balancing Authority, Transmission Operator, and Distribution Provider according to established load shedding procedures.[28]

---

[26] Voluntary load curtailment is a tool used to address capacity deficiencies, not to control transmission constraints. Under Reliability Standard EOP-001-2.1b, Requirement R4, each Transmission Operator and Balancing Authority must have an emergency plan that includes, among other things, public appeals for voluntary load reductions and energy conservation. Similarly, under proposed Reliability Standard EOP-011-1, Requirement R2, Balancing Authorities must have an Operating Plan to mitigate Capacity Emergencies and Energy Emergencies that includes, among other things, public appeals for voluntary load reductions. Removing LSEs from proposed Reliability Standard TOP-001-3 does not change the requirement for Transmission Operators and Balancing Authorities to appeal for voluntary load reduction from an LSE or directly from end-use customers. Note that LSEs are not an applicable entity under EOP-001-2.1b or EOP-011-1.

[27] NERC Functional Model at 55 (emphasis added).

[28] NERC's Reliability Standards should not dictate when an LSE must exercise its contractual rights to curtail load, particularly where there are other mechanisms to maintain reliable operations.

III. Conclusion

NERC respectfully requests that the Commission consider the supplemental information provided herein and approve the proposed TOP and IRO Reliability Standards as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

Respectfully submitted,

/s/ Shamai Elstein

North American Electric
Reliability Corporation
Docket No. RD15-3-000

Holly A. Hawkins
Associate General Counsel
1325 G Street, NW
Suite 600
Washington, DC 20005

Reference: Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standards PRC-004-2.1(i)a, PRC-004-4, PRC-005-2(i), PRC-005-3(i), and VAR-002-4.

Dear Ms. Hawkins:

1. On February 6, 2015, the North American Electric Reliability Corporation (NERC) submitted a petition seeking approval of Reliability Standards PRC-004-2.1(i)a (Analysis and Mitigation of Transmission and Generation Protection System Misoperations), PRC-004-4 (Protection System Misoperation Identification and Correction), PRC-005-2(i) (Protection System Maintenance), PRC-005-3(i) (Protection System and Automatic Reclosing Maintenance), and VAR-002-4 (Generator Operation for Maintaining Network Voltage Schedules), pursuant to section 215(d) of the Federal Power Act (FPA).[1] On March 13, 2015, NERC submitted a supplemental petition seeking approval of three additional Reliability Standards: PRC-001-1.1(ii) (System Protection Coordination), PRC-019-2 (Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection), and PRC-024-2 (Generator Frequency and Voltage Protective Relay Settings). NERC states that it has modified the Reliability Standards to adjust the applicability to owners of dispersed generation

[1] 16 U.S.C. § 824o(d) (2012).

20150529-3024 FERC PDF (Unofficial) 05/29/2015

resources.[2] On May 8, 2015, NERC submitted errata to the February 6 petition, modifying the implementation plans for PRC-005-2(i) and PRC-005-3(i) to properly sequence the version numbering and effective dates for PRC-005-2(i) and PRC-005-3(i) to ensure that the implementation of these Reliability Standards carries forth the intention of the standard drafting team responsible for development. The errata clarifies that PRC-005-2(i) should become effective concurrently with or after the effective date of PRC-005-2, and that PRC-005-3(i) should become effective concurrently with or after the effective date of PRC-005-3.

2. The Commission-approved definition of "bulk electric system," inclusion I4, provides:

> Dispersed power producing resources that aggregate to a total capacity greater than 75 MVA (gross nameplate rating), and that are connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage of 100 kV or above.

Thus, under inclusion I4, the elements designated as bulk electric system are: (i) the individual resources; and (ii) the system designed primarily for delivering capacity from the point where those resources aggregate to greater than 75 MVA to a common point of connection at a voltage of 100 kV or above.

3. In its Petition, NERC states it revised certain provisions of the identified Reliability Standards to ensure that only those dispersed generation resources that could affect the reliability of the Bulk-Power System are subject to the standards. NERC provides a detailed description of the standard drafting team considerations for each reviewed Reliability Standard, which is further discussed in a "draft white paper."[3]

4. NERC explains that the design and operational characteristics of dispersed power producing resources are different than traditional generation. In particular, dispersed power producing resources are typically comprised of many individual generating units and, in most instances the units are similar in design and produced by the same

---

[2] *See* February 6 Petition at 1, fn.4. "Dispersed generation resources as used in this Petition refer to variable generation that depends on a primary fuel source which varies over time and cannot be stored." *See also* March 13 Supp. Petition at 2, fn.4.

[3] *Id.* at 10. *See also* February 6 Petition, Ex. C (Draft Technical White Paper) *Proposed Revisions to the Applicability of NERC Reliability Standards to Dispersed Generation Resources*.

20150529-3024 FERC PDF (Unofficial) 05/29/2015

manufacturer. The aggregated capability of the facility may contribute significantly to the reliability of the Bulk-Power System, and therefore, the equipment utilized to aggregate the individual units to a common point of interconnection with the transmission system should be operated and maintained as required by the NERC Reliability Standards subject to these petitions. Thus, NERC proposes to modify each of the identified Reliability Standards to include applicability language in provisions pertaining to generator owners and generator operators of resources identified through inclusion I4 of the bulk electric system definition.

5. The specific Reliability Standard provisions revised by NERC to affect this limitation of applicability consistent with the bulk electric system definition pursuant to inclusion I4 are as follows:

PRC-001-1.1(ii), Requirement R3;

PRC-004-2.1(i)a Requirements R2 and R3, and PRC-004-4, all requirements;[4]

PRC-005-2(i) and PRC-005-3(i), all requirements;

PRC-019-2, all requirements;

PRC-024-2, Requirements R1 and R2; and

VAR-002-4, Requirements R4 and R5.

[4] NERC explains that it submitted multiple versions of Reliability Standards PRC-004 and PRC-005 in order to include dispersed generation provisions in both: (1) the currently effective version of each standard; and (2) the previously modified version of each standard that was pending before the Commission at the time NERC submitted its petition in the immediate docket. Since the submission of NERC's petition in this docket, the Commission approved the pending Reliability Standards, PRC-004-3 and PRC-005-3. *See Protection System Maintenance Reliability Standard*, Order No. 803, 150 FERC ¶ 61,039 (2015) (approving PRC-005-3); *North American Electric Reliability Corp.*, 151 FERC ¶ 61,129 (2015) (approving PRC-004-3). In the immediate proceeding, we approve the requested modifications to both the currently effective standard, and the approved but not yet effective version of the standard, to ensure continuity in the application of the provisions pertaining to dispersed generation.

20150529-3024 FERC PDF (Unofficial) 05/29/2015

6. NERC states Reliability Standard PRC-001-1.1 is designed to ensure that system protection is coordinated among operating entities.[5] Proposed PRC-001-1.1(ii) reflects changes made to the currently-effective PRC-001-1.1.

7. NERC states currently-effective Reliability Standard PRC-004-2.1a is designed to ensure that all transmission and generation protection system misoperations affecting the reliability of the bulk electric system are analyzed and mitigated.[6] NERC states the proposed PRC-004-2.1(i)a reflects changes made to the currently-effective Reliability Standard PRC-004-2.1a. Proposed PRC-004-4 reflects changes made to Reliability Standard version PRC-004-3.[7]

8. NERC states that the purpose of PRC-005-3 is to document and implement programs for the maintenance of all protection systems and automatic reclosing affecting the reliability of the bulk electric system so that they are kept in working order and the proposed PRC-005-3(i) reflects changes to PRC-005-3. NERC explains the revisions included in PRC-005-2(i) and PRC-005-3(i) are necessary to ensure the proposed changes will continue to be carried forward while the versions of this Reliability Standard are being enhanced to ensure the reliability of the Bulk-Power System.[8] NERC Reliability Standard PRC-005-2 became enforceable on April 1, 2015.[9] NERC states the proposed PRC-005-2(i) reflects changes to PRC-005-2. Reliability Standard PRC-005-3 becomes effective April 1, 2016.[10]

---

[10] *Protection System Maintenance Reliability Standard*, Order No. 803, 150 FERC ¶ 61,039 (2015) (approving PRC-005-3).

20150529-3024 FERC PDF (Unofficial) 05/29/2015

9. NERC states that currently-effective Reliability Standard PRC-019-1 is designed to verify coordination of generating unit facility or synchronous condenser voltage regulating controls, limit functions, equipment capabilities and protection system settings.[11]

10. NERC states currently-effective Reliability Standard PRC-024-1 is designed to ensure generator owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.[12]

11. NERC states currently-effective Reliability Standard VAR-002-3 ensures that generators provide reactive support and voltage control within the generating facility capabilities in order to protect equipment and maintain reliable operation of the Interconnection.[13]

12. NERC proposes an implementation plan for each of the revised currently-effective Reliability Standards with each plan having an effective date "immediately after the standard is approved" by the Commission (or similar language). For revisions to Commission-approved Reliability Standards pending implementation, NERC proposes the effective dates of these revised standards should not alter the timing of concurrent standards development of PRC projects.

13. Notice of NERC's initial petition was issued on February 6, 2015 and published on February 12, with comments, protests and motions to intervene due on or before March 9, 2015. Notice of NERC's supplemental petition was issued on March 25, 2015 with comments, protests, and motions to intervene due on or before April 9, 2015. Dominion Resources Services, Inc. filed a timely motion to intervene and comments in support of NERC's Petition.

14. Pursuant to section 215(d)(2) of the FPA, we approve Reliability Standards PRC-001-1.1(ii), PRC-004-2.1(i)a, PRC-004-4, PRC-005-2(i), PRC-005-3(i), PRC-019-2, PRC-024-2, and VAR-002-4 and find that the standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. We also approve the

associated implementation plans and effective dates submitted by NERC for each Reliability Standard.

15. The information collection requirements contained in this order are subject to review by the Office of Management and Budget (OMB) under section 3507(d) of the Paperwork Reduction Act of 1995.[14] OMB's regulations require approval of certain information collection requirements imposed by agency rules.[15]

16. The revisions to eight Reliability Standards, approved in this order, are designed to clarify the applicability to owners of dispersed power producing resources. These entities comprise a subset of the generator owners in the NERC Compliance Registry. The eight Reliability Standards in this proceeding were previously approved by the Commission. The clarifications align existing responsibilities with current operating practices, and the Commission does not expect it to affect entities' current reporting burden.[16] Accordingly, we will submit this order to OMB for informational purposes only.

By direction of the Commission.

Nathaniel J. Davis, Sr.,
Deputy Secretary.

OFFICE OF ENERGY MARKET REGULATION

North American Electric Reliability Corporation
Docket No. RR15-7-000

May 5, 2015

North American Electric Reliability Corporation
1325 G Street NW, Suite 600
Washington, DC 20005

Attention: Andrew C. Wills
Associate Counsel

Reference: Amendments to Delegation Agreement with Texas Reliability Entity, Inc.

Dear Mr. Wills:

On February 27, 2015, North American Electric Reliability Corporation (NERC) submitted amendments to the Delegation Agreement between NERC and Texas Reliability Entity, Inc. (TRE), specifically to revise the TRE Bylaws.

Notice of this filing was issued on March 2, 2015, with protests and interventions due on or before March 20, 2015. Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and Procedure. 18 C.F.R. § 385.214. No protests were filed.

NERC's uncontested filing is accepted pursuant to the relevant authority delegated to the Director, Office of Energy Market Regulation, under 18 C.F.R. § 375.307 as of the date as this order.

This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.307(a)(2)(vi). This action does not constitute approval of any service, rate, charge, classification, or any rule, regulation, contract, or practice affecting such rate or service provided for in the filed documents. Such action shall not be deemed as recognition of any claimed right or obligation associated therewith and such action is without prejudice to any findings or orders that have been or may

hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order pursuant to 18 C.F.R. § 385.713.

Sincerely,

Penny S. Murrell, Director
Division of Electric Power Regulation-Central

OFFICE OF ENERGY MARKET REGULATION

North American Electric Reliability Corporation
Docket No. RR14-6-002

June 4, 2015

Schiff Hardin LLP
233 South Wacker Drive, Suite 6600
Chicago, IL 60606

Attention: Owen E. MacBride
Attorney for North American Electric Reliability Corporation

Reference: Expenditure Greater than $500,000 from Operating Reserves

Dear Mr. MacBride:

On May 14, 2015, North American Electric Reliability Corporation (NERC) submitted a request for approval to spend up to $600,000 from its operating reserves during 2015 to expedite development and implementation of a centralized corporate document management program, which NERC states will support various important business requirements that are central to its operations.[1]

Notice of this filing was issued on May 14, 2015, with protests and interventions due on or before May 21, 2015. Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and Procedure 18 C.F.R. § 385.214. No protests were filed.

NERC's uncontested filing is accepted pursuant to the relevant authority delegated to the Director, Office of Energy Market Regulation, under 18 C.F.R. § 375.307.

This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or

[1] NERC's request is made pursuant to Paragraph 7(b)(ii) of the Settlement Agreement that was approved in *North American Electric Reliability Corp.*, 142 FERC ¶ 61,042 (2013).

procedures pursuant to 18 C.F.R. § 375.307(a)(2)(vi). This action does not constitute approval of any service, rate, charge, classification, or any rule, regulation, contract, or practice affecting such rate or service provided for in the filed documents. Such action shall not be deemed as recognition of any claimed right or obligation associated therewith and such action is without prejudice to any findings or orders that have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order pursuant to 18 C.F.R. § 385.713.

Sincerely,

Penny S. Murrell, Director
Division of Electric Power Regulation-Central

[Docket No. RM15-11-000]

Reliability Standard for Transmission System Planned Performance for Geomagnetic Disturbance Events

(May 14, 2015)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Federal Energy Regulatory Commission (Commission) proposes to approve Reliability Standard TPL-007-1 (Transmission System Planned Performance for Geomagnetic Disturbance Events). Proposed Reliability Standard TPL-007-1 establishes requirements for certain entities to assess the vulnerability of their transmission systems to geomagnetic disturbance events (GMDs), which occur when the sun ejects charged particles that interact and cause changes in the earth's magnetic fields. Entities that do not meet certain performance requirements, based on the results of their vulnerability assessments, must develop a plan to achieve the requirements. The North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization, submitted the proposed Reliability Standard for Commission approval in response to a Commission directive in Order No. 779. In addition, the Commission proposes to direct that NERC develop modifications to the benchmark GMD event definition set forth in Attachment 1 of the proposed Reliability Standard so that the

20150514-3102 FERC PDF (Unofficial) 05/14/2015

definition is not based solely on spatially-averaged data. The Commission also proposes to direct NERC to submit a work plan, and subsequently one or more informational filings, that address specific GMD-related research areas.

DATES: Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**.

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document

FEDERAL ENERGY REGULATORY COMMISSION

Reliability Standard for Transmission System Planned Performance for Geomagnetic Disturbance Events — Docket No. RM15-11-000

NOTICE OF PROPOSED RULEMAKING

(May 14, 2015)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve Reliability Standard TPL-007-1 (Transmission System Planned Performance for Geomagnetic Disturbance Events). Proposed Reliability Standard TPL-007-1 establishes requirements for certain entities to assess the vulnerability of their transmission systems to geomagnetic disturbance events (GMDs), which occur when the sun ejects charged particles that interact and cause changes in the earth's magnetic fields. Entities that do not meet certain performance requirements, based on the results of their vulnerability assessments, must develop a plan to achieve the requirements. The North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO), submitted the proposed Reliability Standard for Commission approval in response to a Commission directive in Order No. 779.[2] The

[2] *Reliability Standards for Geomagnetic Disturbances*, Order No. 779, 78 FR 30,747 (May 23, 2013), 143 FERC ¶ 61,147, *reh'g denied*, 144 FERC ¶ 61,113 (2013).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Commission also proposes to approve one definition for inclusion in the NERC Glossary of Terms submitted by NERC as well as the proposed Reliability Standard's associated violation risk factors and violation severity levels, implementation plan, and effective dates.[3]

2. In addition, as discussed below, the Commission proposes to direct NERC to develop modifications to Reliability Standard TPL-007-1 and submit informational filings to address certain issues described herein.

3. Geomagnetic disturbances are considered to be "high impact, low frequency" events.[4] In other words, while the probability of occurrence of a severe geomagnetic disturbance may be low, a geomagnetic disturbance of sufficient magnitude could have potentially severe consequences to the reliable operation of the Bulk-Power System.[5] Such events could cause widespread blackouts and cause damage to equipment that could result in sustained system outages.[6] On that basis, it is important that NERC, planning

[3] NERC, Glossary of Terms Used in NERC Reliability Standards (April 2015) (NERC Glossary), *available at* http://www.nerc.com/files/glossary_of_terms.pdf.

[4] *See* NERC Petition at 3; *see also* NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

[5] Order No. 779, 143 FERC ¶ 61,147 at P 15 (quoting NERC comment that "as a high-impact, low frequency event, GMDs pose a unique threat to Bulk-Power System reliability, and NERC is committed to working with stakeholders and the Commission to address these challenges consistent with its responsibilities as the ERO").

[6] *Id.* PP 3, 16 (citing NERC, 2012 Special Reliability Assessment Interim Report: Effects of Geomagnetic Disturbances on the Bulk Power System at 69 (February 2012) (GMD Interim Report); Oak Ridge National Laboratory, Electromagnetic Pulse: Effects

(continued ...)

20150514-3102 FERC PDF (Unofficial) 05/14/2015

coordinators, transmission planners, transmission owners and generator owners take appropriate actions to prepare to withstand potentially harmful geomagnetic disturbances. For that reason, Order No. 779 required NERC to identify what severity GMD events (i.e., benchmark GMD events) responsible entities will have to assess, and that NERC should technically support its choice. In the proposed reliability standard, NERC set the benchmark GMD event as a "1-in-100 year" event.

4. We believe, based on information available at this time, that the provisions of proposed Reliability Standard TPL-007-1 are just and reasonable and address the specific parameters for the Second Stage GMD Reliability Standards on geomagnetic disturbance events, as set forth in Order No. 779. For example, the proposed Reliability Standard requires responsible entities to maintain system models needed to complete "GMD Vulnerability Assessments" (Requirements R1 and R2),[7] have criteria for acceptable system steady state voltage performance during a benchmark GMD event (Requirement R3), and complete a GMD Vulnerability Assessment once every 60 calendar months, based on the benchmark GMD event definition described in Attachment 1 of the proposed Reliability Standard (Requirement R4). Further, if an applicable entity

---

on the U.S. Power Grid: Meta-R-319 at page 1-14, Tables 4-1, 4-2, 4-3 (discussing at-risk transformers) (January 2010)).

[7] NERC proposes to define the term GMD Vulnerability Assessment to mean a "documented evaluation of potential susceptibility to voltage collapse, Cascading, or localized damage of equipment due to geomagnetic disturbances." *See* NERC Petition, Ex. B (Implementation Plan for TPL-007-1) at 1.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

concludes, based on the GMD Vulnerability Assessment, that its system does not meet specified performance requirements, it must develop a corrective action plan that addresses how the performance requirements will be met (Requirement R7). We propose to determine that the framework of the proposed Reliability Standard, as outlined above, is just and reasonable and provides a basis for approval. We believe that, when tested against an appropriate benchmark GMD event, compliance with the proposed Reliability Standard should provide adequate protection for an applicable entity's system to withstand a geomagnetic disturbance based on a 1-in-100 year GMD event design.

5. Our primary concerns with the proposed Reliability Standard pertain to the benchmark GMD event described in Attachment 1 of the proposed Reliability Standard. While there is limited historical geomagnetic data and the scientific understanding of geomagnetic disturbance events is still evolving, we have concerns regarding the proposed Reliability Standard's heavy reliance on spatial averaging. Thus, while proposing to approve proposed Reliability Standard TPL-007-1, we also propose to direct NERC to make several modifications to better ensure that, going forward, the study and benchmarking of geomagnetic disturbance events are based on a more complete set of data and a reasonable scientific and engineering approach. Further, we propose specific revisions to Requirement R7 of the proposed Reliability Standard to ensure that, when an applicable entity identifies the need for a corrective action plan, the entity acts in a timely manner.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

I. Background

A. Section 215 and Mandatory Reliability Standards

6. Section 215 of the FPA requires the Commission to certify an ERO to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval. Once approved, the Reliability Standards may be enforced in the United States by the ERO, subject to Commission oversight, or by the Commission independently.[8]

B. GMD Primer

7. GMD events occur when the sun ejects charged particles that interact and cause changes in the earth's magnetic fields.[9] Once a solar particle is ejected, it can take between 17 to 96 hours (depending on its energy level) to reach earth.[10] A geoelectric field is the electric potential (measured in volts per kilometer (V/km)) on the earth's surface and is directly related to the rate of change of the magnetic fields.[11] The geoelectric field has an amplitude and direction and acts as a voltage source that can cause geomagnetically-induced currents (GICs) to flow on long conductors, such as

---

[8] 16 U.S.C. 824o(e).

[9] GMD Interim Report at i-ii. On April 30, 2015, the Space Weather Operations, Research, and Mitigation Task Force, under the auspices of the National Science and Technology Council, sought comment on a draft 2015 National Space Weather Strategy, which is designed to "articulate high-level strategic goals for enhancing National preparedness to space weather events." *National Science and Technology Council; National Space Weather Strategy*, 80 FR 24,296 (Apr. 30, 2015).

[10] GMD Interim Report at ii.

[11] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

transmission lines.[12] The magnitude of the geoelectric field amplitude is impacted by local factors such as geomagnetic latitude and local earth conductivity.[13] Geomagnetic latitude is the proximity to earth's magnetic north and south poles, as opposed to earth's geographic poles. Local earth conductivity is the ability of the earth's crust to conduct electricity at a certain location to depths of hundreds of kilometers down to the earth's mantle. Local earth conductivity impacts the magnitude (i.e., severity) of the geoelectric fields that are formed during a GMD event by, all else being equal, a lower earth conductivity resulting in higher geoelectric fields.[14]

C. Order No. 779

8. In Order No. 779, the Commission directed NERC, pursuant to FPA section 215(d)(5), to develop and submit for approval proposed Reliability Standards that address the impact of geomagnetic disturbances on the reliable operation of the Bulk-Power System. The Commission based its directive on the potentially severe, wide-spread impact on the reliable operation of the Bulk-Power System that can be caused by GMD events and the absence of existing Reliability Standards to address GMD events.[15]

---

[12] *Id.*

[13] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 4.

[14] *Id.*

[15] Order No. 779, 143 FERC ¶ 61,147 at P 3.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

9. Order No. 779 directed NERC to implement the directive in two stages. In the first stage, the Commission directed NERC to submit, within six months of the effective date of Order No. 779, one or more Reliability Standards (First Stage GMD Reliability Standards) that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System.[16]

10. In the second stage, the Commission directed NERC to submit, within 18 months of the effective date of Order No. 779, one or more Reliability Standards (Second Stage GMD Reliability Standards) that require owners and operators of the Bulk-Power System to conduct initial and on-going assessments of the potential impact of benchmark GMD events on Bulk-Power System equipment and the Bulk-Power System as a whole. The Commission directed that the Second Stage GMD Reliability Standards must identify benchmark GMD events that specify what severity GMD events a responsible entity must assess for potential impacts on the Bulk-Power System.[17] Order No. 779 explained that, if the assessments identify potential impacts from benchmark GMD events, the Reliability Standards should require owners and operators to develop and implement a plan to protect against instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System

[16] *Id.* P 2.

[17] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

equipment, or otherwise, as a result of a benchmark GMD event. The Commission directed that the development of this plan could not be limited to considering operational procedures or enhanced training alone, but should, subject to the potential impacts of the benchmark GMD events identified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, system configuration, or location of specific equipment.[18] Order No. 779 observed that these strategies could, for example, include automatically blocking GICs from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, isolating certain equipment that is not cost effective to retrofit, or a combination thereof.

D. Order No. 797

11. In Order No. 797, the Commission approved Reliability Standard EOP-010-1 (Geomagnetic Disturbance Operations).[19] NERC submitted Reliability Standard EOP-010-1 for Commission approval in compliance with the Commission's directive in Order No. 779 corresponding to the First Stage GMD Reliability Standards. In Order No. 797-A, the Commission denied the Foundation for Resilient Societies' (Resilient Societies) request for rehearing of Order No. 797. The Commission stated that the rehearing

[18] *Id.*

[19] *Reliability Standard for Geomagnetic Disturbance Operations*, Order No. 797, 79 FR 35,911 (June 25, 2014), 147 FERC ¶ 61,209, *reh'g denied*, Order No. 797-A, 149 FERC ¶ 61,027 (2014).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

request "addressed a later stage of efforts on geomagnetic disturbances (i.e., NERC's future filing of Second Stage GMD Reliability Standards) and [that Resilient Societies] may seek to present those arguments at an appropriate time in response to that filing."[20] In particular, the Commission stated that GIC monitoring requirements should be addressed in the Second Stage GMD Reliability Standards.[21]

E. NERC Petition and Proposed Reliability Standard TPL-007-1

12. On January 21, 2015, NERC petitioned the Commission to approve proposed Reliability Standard TPL-007-1 and its associated violation risk factors and violation severity levels, implementation plan, and effective dates.[22] NERC also submitted a proposed definition for the term "Geomagnetic Disturbance Vulnerability Assessment or GMD Vulnerability Assessment" for inclusion in the NERC Glossary. NERC maintains that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. NERC further contends that the proposed

[20] Order No. 797-A, 149 FERC ¶ 61,027 at P 2.

[21] *Id.* P 27 (stating that the Commission continues "to encourage NERC to address the collection, dissemination, and use of geomagnetic induced current data, by NERC, industry or others, in the Second Stage GMD Reliability Standards because such efforts could be useful in the development of GMD mitigation methods or to validate GMD models").

[22] Proposed Reliability Standard TPL-007-1 is not attached to this notice of proposed rulemaking (NOPR). The proposed Reliability Standard is available on the Commission's eLibrary document retrieval system in Docket No. RM15-11-000 and on the NERC website, www.nerc.com. NERC submitted an errata on February 2, 2015 containing a corrected version of Exhibit A (Proposed Reliability Standard TPL-007-1).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Reliability Standard satisfies the directive in Order No. 779 corresponding to the Second Stage GMD Reliability Standards.[23]

13. NERC states that proposed Reliability Standard TPL-007-1 applies to planning coordinators, transmission planners, transmission owners and generation owners who own or whose planning coordinator area or transmission planning area includes a power transformer with a high side, wye-grounded winding connected at 200 kV or higher. NERC explains that the applicability criteria for qualifying transformers in the proposed Reliability Standard is the same as that for the First Stage GMD Reliability Standard in EOP-010-1, which the Commission approved in Order No. 797.

14. The proposed Reliability Standard contains seven requirements.

15. Requirement R1 requires planning coordinators and transmission planners to determine the individual and joint responsibilities in the planning coordinator's planning

[23] We note that Resilient Societies has submitted to NERC, pursuant to Section 8.0 of the NERC Standards Process Manual, an appeal alleging certain procedural errors in the development of proposed Reliability Standard TPL-007-1. *See* NERC Rules of Procedure, Attachment 3A (Standards Process Manual), Section 8.0 (Process for Appealing an Action or Inaction). The appeal is currently pending NERC action. On May 12, 2015, Resilient Societies submitted a request for stay of the proceedings in Docket No. RM15-11-000, asking that the Commission refrain from issuing a notice of proposed rulemaking until NERC acts on Resilient Societies' appeal. We deny Resilient Societies' request. We see no irreparable harm in issuing a proposal for public comment as we do today. Rather, we will consider any necessary issues pertaining to the appeal before or in a final rule issued in this proceeding.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

area for maintaining models and performing studies needed to complete the GMD Vulnerability Assessment required in Requirement R4.[24]

16. Requirement R2 requires planning coordinators and transmission planners to maintain system models and GIC system models needed to complete the GMD Vulnerability Assessment required in Requirement R4.

17. Requirement R3 requires planning coordinators and transmission planners to have criteria for acceptable system steady state voltage limits for their systems during the benchmark GMD event described in Attachment 1 (Calculating Geoelectric Fields for the Benchmark GMD Event).

18. Requirement R4 requires planning coordinators and transmission planners to conduct a GMD Vulnerability Assessment every 60 months using the benchmark GMD event described in Attachment 1 to the proposed Reliability Standard. The benchmark GMD event is based on a 1-in-100 year frequency of occurrence and is composed of four elements: (1) a reference peak geoelectric field amplitude of 8 V/km derived from statistical analysis of historical magnetometer data; (2) a scaling factor to account for local geomagnetic latitude; (3) a scaling factor to account for local earth conductivity; and (4) a reference geomagnetic field time series or wave shape to facilitate time-domain

[24] Proposed Reliability Standard TPL-007-1, Requirements R2, R3, R4, R5, and R7 refer to planning coordinators and transmission planners as "responsible entities."

20150514-3102 FERC PDF (Unofficial) 05/14/2015

analysis of GMD impact on equipment.[25] The product of the first three elements is referred to as the regional geoelectric field peak amplitude.[26]

19. Requirement R5 requires planning coordinators and transmission planners to provide GIC flow information, to be used in the transformer thermal impact assessment required in Requirement R6, to each transmission owner and generator owner that owns an applicable transformer within the applicable planning area.

20. Requirement R6 requires transmission owners and generator owners to conduct thermal impact assessments on solely and jointly owned applicable transformers where the maximum effective GIC value provided in Requirement R5 is 75 amperes per phase (A/phase) or greater.

21. Requirement R7 requires planning coordinators and transmission planners to develop corrective action plans if the GMD Vulnerability Assessment concludes that the system does not meet the performance requirements in Table 1 (Steady State Planning Events).

II. Discussion

22. Pursuant to section 215(d) of the FPA, the Commission proposes to approve Reliability Standard TPL-007-1 as just, reasonable, not unduly discriminatory or

[25] *See* Proposed Reliability Standard TPL-007-1, Att. 1; s*ee also* NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

[26] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

preferential, and in the public interest. The proposed Reliability Standard addresses the directives in Order No. 779 corresponding to the development of the Second Stage GMD Reliability Standards. Proposed Reliability Standard TPL-007-1 does this by requiring applicable Bulk-Power System owners and operators to conduct initial and on-going vulnerability assessments regarding the potential impact of a benchmark GMD event on the Bulk-Power System as a whole and on Bulk-Power System components.[27] In addition, the proposed Reliability Standard requires applicable entities to develop and implement corrective action plans to mitigate any identified vulnerabilities.[28] Potential mitigation strategies identified in the proposed Reliability Standard include, but are not limited to, among other things, the installation, modification, or removal of transmission and generation facilities and associated equipment.[29] Accordingly, proposed Reliability Standard TPL-007-1 constitutes an important step in addressing the risks posed by GMD events to the Bulk-Power System.

23. While proposed Reliability Standard TPL-007-1 addresses the Order No. 779 directives, pursuant to FPA section 215(d)(5), the Commission proposes to direct NERC to develop modifications to the Reliability Standard concerning: (1) the calculation of the reference peak geoelectric field amplitude component of the benchmark GMD event

[27] *See* Order No. 779, 143 FERC ¶ 61,147 at PP 67, 71.

[28] *Id.* P 79.

[29] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

definition; (2) the collection of GIC monitoring and magnetometer data; and (3) deadlines for completing corrective action plans and the mitigation measures called for in corrective action plans. In addition, to improve the understanding of GMD events generally and address the specific research areas discussed below, the Commission proposes to direct that NERC submit informational filings. These proposals are discussed in greater detail below.

24. The Commission seeks comments from NERC and interested entities on these proposals.

A. Benchmark GMD Event Definition

NERC Petition

25. NERC states that the purpose of the benchmark GMD event is to "provide a defined event for assessing system performance during a low probability, high magnitude GMD event."[30] NERC explains that the benchmark GMD event represents "the most severe GMD event expected in a 100-year period as determined by a statistical analysis of recorded geomagnetic data."[31] The benchmark GMD event definition is used in the GMD Vulnerability Assessments and thermal impact assessment requirements of the proposed Reliability Standard.

[30] NERC Petition at 15.

[31] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

26. As noted above, NERC states that the benchmark GMD event definition has four elements: (1) a reference peak geoelectric field amplitude of 8 V/km derived from statistical analysis of historical magnetometer data; (2) a scaling factor to account for local geomagnetic latitude; (3) a scaling factor to account for local Earth conductivity; and (4) a reference geomagnetic field time series or wave shape to facilitate time-domain analysis of GMD impact on equipment.[32]

27. The standard drafting team determined that a 1-in-100 year GMD event would cause an 8 V/km reference peak geoelectric field amplitude at 60 degree geomagnetic latitude using Québec's earth conductivity.[33] The standard drafting team stated that:

> the reference geoelectric field amplitude was determined through statistical analysis using … field measurements from geomagnetic observatories in northern Europe and the reference (Quebec) earth model …. The Quebec earth model is generally resistive and the geological structure is relatively well understood. The statistical analysis resulted in a conservative peak geoelectric field amplitude of approximately 8 V/km …. The frequency of occurrence of this benchmark GMD event is estimated to be approximately 1 in 100 years.[34]

28. The standard drafting team explained that it used field measurements taken from the IMAGE magnetometer chain, which covers Northern Europe, for the period 1993-2013 to calculate the reference peak geoelectric field amplitude used in the benchmark

---

[32] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

[33] *Id.*

[34] *Id.* (footnotes omitted).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

GMD event definition.[35] As described in NERC's petition, the standard drafting team "spatially averaged" four different station groups of IMAGE data, each spanning a square area of approximately 500 km (roughly 310 miles) in width.[36] The standard drafting team justified the use of spatial averaging by stating that the proposed Reliability Standard is designed to "address wide-area effects caused by a severe GMD event, such as increased var absorption and voltage depressions. Without characterizing GMD on regional scales, statistical estimates could be weighted by local effects and suggest unduly pessimistic conditions when considering cascading failure and voltage collapse."[37]

29. NERC states that the benchmark GMD event includes scaling factors to enable applicable entities to tailor the reference peak geoelectric field to their specific location for conducting GMD Vulnerability Assessments. NERC states that the scaling factors in the benchmark GMD event definition are applied to the reference peak geoelectric field

[35] *Id.* at 8. The International Monitor for Auroral Geomagnetic Effects (IMAGE) consists of 31 magnetometer stations in northern Europe maintained by 10 institutes from Estonia, Finland, Germany, Norway, Poland, Russia, and Sweden. *See* IMAGE website, *available at* http://space.fmi.fi/image/beta/?page=home#.

[36] As applied by the standard drafting team, spatial averaging refers to the averaging of geoelectric field amplitude readings within a given area. NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 9.

[37] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 9.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

amplitude to adjust the 8 V/km value for different geomagnetic latitudes and earth conductivities.[38]

30. The standard drafting team also identified a reference geomagnetic field time series from an Ottawa magnetic observatory during a 1989 GMD event that affected Québec.[39] The standard drafting team used this time series to estimate a geoelectric field, represented as a time series (i.e., 10-second values over a period of days), that is expected to occur at 60 degree geomagnetic latitude during a 1-in-100 year GMD event. NERC explains that this time series is used to facilitate time-domain analysis of GMD impacts on equipment.[40]

Discussion

31. The Commission proposes to approve proposed Reliability Standard TPL-007-1, including the proposed benchmark GMD event definition submitted by NERC. However, pursuant to FPA section 215(d)(5) , the Commission proposes to direct that NERC develop modifications to the benchmark GMD event definition set forth in Attachment 1 of the proposed Reliability Standard so that the definition is not based solely on spatially-averaged data. The Commission also seeks comment from NERC and other interested entities regarding the scaling factor used to account for geomagnetic

[38] NERC Petition at 18-19.

[39] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 15-16.

[40] *Id.* at 5-6.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

latitude in the benchmark GMD event definition. The Commission also proposes to direct NERC to submit a work plan, and subsequently one or more informational filings, that address the specific issues discussed below.

32. The benchmark GMD event definition proposed by NERC complies with the directive in Order No. 779 requiring that the Second Stage GMD Reliability Standards identify benchmark GMD events that specify what severity GMD events a responsible entity must assess for potential impacts on the Bulk-Power System. Order No. 779 did not specify the severity of the storm or define the characteristics of the benchmark GMD event. Instead, the Commission directed NERC, through the standards development process, to define the benchmark GMD events. Consistent with the guidance provided in Order No. 779, the benchmark GMD event definition proposed by NERC addresses the potential widespread impact of a severe GMD event, while taking into consideration the variables of geomagnetic latitude and local earth conductivity.[41] Accordingly, we propose to approve the definition submitted by NERC. Nonetheless, while acceptable as consistent with FPA section 215 and the Order No. 779 directives, we believe that the

[41] *See* Order No. 779, 143 FERC ¶ 61,147 at P 71 ("the benchmark GMD events should be based on factors that may include, but are not limited to, varying severity of the GMD … duration, geographic footprint of the GMD, how the GMD's intensity varies with latitude, system configuration, and the orientation of the magnetic fields produced by the GMD); *see also id*. P 70 ("[GMD] vulnerability assessments would be based on uniform criteria (e.g., geographic location and geology) but the values for such criteria would be entity-specific").

20150514-3102 FERC PDF (Unofficial) 05/14/2015

benchmark GMD event definition should be improved through the proposed revision and research discussed below.

33. First, the proposed Reliability Standard's exclusive use of spatial averaging to calculate the reference peak geoelectric field amplitude could underestimate the impact of a 1-in-100 year GMD event, which was the design basis arrived upon by the standard drafting team. NERC states that the benchmark GMD event "expands upon work conducted by the NERC GMD Task Force in which 1-in 100 year geoelectric field amplitudes were calculated from a well-known source of dense high-resolution geomagnetic data commonly used in space weather research [i.e., IMAGE data]."[42] However, the application of spatial averaging significantly reduces the reference peak geoelectric field amplitude using the IMAGE data compared with a prior analysis of nearly the same data set. As noted in the NERC petition, the GMD Interim Report described a study that used the same IMAGE magnetometers and data as the standard drafting team for the period 1993-2006.[43] That study calculated a 1-in-100 year peak geoelectric amplitude of 20 V/km for Québec.[44] The study calculated a significantly higher figure (20 V/km versus 8 V/km) using similar data as the standard drafting team because, instead of averaging geoelectric field values occurring simultaneously over a

[42] NERC Petition at 17.

[43] GMD Interim Report at 22.

[44] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

large geographic area, the study cited by the GMD Interim Report used the magnitude of the geoelectric amplitude in individual geomagnetic observatories.

34. Based on our review of NERC's petition, it does not appear that spatial averaging of geomagnetic fields is discussed in the studies cited by the standard drafting team except in the standard drafting team's GMD Benchmark Event White Paper. In addition, it is unclear how the standard drafting team determined that spatial averaging should be performed using a square area 500 km in width. The GMD Benchmark Event White Paper explains that the IMAGE magnetometers were organized into four groups comprised of squares 500 km wide, and the readings within a group were averaged. The GMD Benchmark Event White Paper also states, citing to the statistical analysis in its Appendix I, that "geomagnetic disturbance impacts within areas of influence of approximately 100-200 km do not have a widespread impact on the interconnected transmission system."[45] While Appendix I of the GMD Benchmark Event White Paper discusses why local geomagnetic disturbances do not have a significant impact on all transformers operating within a square 500 km in width, it does not explain why the standard drafting team chose a square area 500 km in width as opposed to a square with a smaller or larger total area. These questions largely inform our concerns regarding the proposed Reliability Standard's heavy reliance on spatial averaging.

[45] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 4.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

35. The geoelectric field values used to conduct GMD Vulnerability Assessments and thermal impact assessments should reflect the real-world impact of a GMD event on the Bulk-Power System and its components. A GMD event will have a peak value in one or more location(s), and the amplitude will decline over distance from the peak. Only applying a spatially-averaged geoelectric field value across an entire planning area would distort this complexity and could underestimate the contributions caused by damage to or misoperation of Bulk-Power System components to the system-wide impact of a GMD event within a planning area. However, imputing the highest peak geoelectric field value in a planning area to the entire planning area may incorrectly overestimate GMD impacts. Neither approach, in our view, produces an optimal solution that captures physical reality.

36. To address this issue, the Commission proposes to direct NERC to develop modifications to the Reliability Standard so that the reference peak geoelectric field amplitude element of the benchmark GMD event definition is not based solely on spatially-averaged data. For example, NERC could satisfy this proposal by revising the Reliability Standard to require applicable entities to conduct GMD Vulnerability Assessments and thermal impact assessments using two different benchmark GMD events: the first benchmark GMD event using the spatially-averaged reference peak geoelectric field value (8 V/km) and the second using the non-spatially averaged peak

20150514-3102 FERC PDF (Unofficial) 05/14/2015

geoelectric field value found in the GMD Interim Report (20 V/km).[46] The revised Reliability Standard could then require applicable entities to take corrective actions, using engineering judgment, based on the results of both assessments. That is, the applicable entity would not always be required to mitigate to the level of risk identified by the non-spatially averaged analysis; instead, the selection of mitigation would reflect the range of risks bounded by the two analyses, and be based on engineering judgment within this range, considering all relevant information. This proposed revision is consistent with the directive in Order No. 779 that owners and operators develop and implement a plan to protect against instability, uncontrolled separation, or cascading failures of the Bulk-Power System.[47] Alternatively, NERC could propose an equally efficient and effective modification that does not rely exclusively on the spatially-averaged reference peak geoelectric field value.[48]

[46] Conducting a GMD Vulnerability Assessment using essentially two measures of the same benchmark GMD events is consistent with Order No. 779 because, in that order, the Commission contemplated that an applicable entity could be required to assess GMD vulnerabilities using multiple benchmark GMD events. Order No. 779, 143 FERC ¶ 61,147 at P 2 ("The Second Stage GMD Reliability Standards must identify 'benchmark GMD events' that specify what severity GMD events a responsible entity must assess for potential impacts on the Bulk-Power System.").

[47] Order No. 779, 143 FERC ¶ 61,147 at P 2.

[48] For example, responsible entities could calculate GIC flows and resulting Bulk-Power System impacts using models that utilize both spatially averaged and non-spatially averaged peak geoelectric field values to simulate GMD conditions.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

37. The Commission also seeks comment from NERC and other interested entities regarding the scaling factor used in the benchmark GMD event definition to account for differences in geomagnetic latitude. Specifically, the Commission seeks comment on whether, in light of studies indicating that GMD events could have pronounced effect on lower geomagnetic latitudes, a modification is warranted to reduce the impact of the scaling factors.[49]

38. Next, the record submitted by NERC and other available information manifests a need for more data and certainty in the knowledge and understanding of GMD events and their potential effect on the Bulk-Power System. For example, NERC's proposal is based on data from magnetometers in northern Europe, from a relatively narrow timeframe with relatively low solar activity, and with little or no data on concurrent GIC flows. Similarly, the adjustments for latitude and ground conductivity are based on the limited information currently available, but additional data-gathering is needed. To address this

[49] *See*, *e.g.*, Ngwira, C. M., Pulkkinen, A., Kuznetsova, M. M., Glocer, A., "Modeling extreme 'Carrington-type' space weather events using three-dimensional global MHD simulations," 119 Journal of Geophysical Research: Space Physics 4472 (2014) (finding that in Carrington-type events "the region of large induced ground electric fields is displaced further equatorward … [and] thereby may affect power grids … such as [those in] southern states of [the] continental U.S."); Gaunt, C. T., Coetzee, G., "Transformer Failures in Regions Incorrectly Considered to have Low GIC-Risk," 2007 IEEE Lausanne 807 (July 2007) (stating that twelve transformers were damaged and taken out of service in South Africa (at -40 degrees latitude) during a 2003 GMD event).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

limitation on relevant information, we propose to direct that NERC conduct or oversee additional analysis on these issues.[50]

39. In particular, we propose to direct that NERC submit informational filings that address the issues discussed below. In the first informational filing, NERC should submit a work plan indicating how NERC plans to: (1) further analyze the area over which spatial averaging should be calculated for stability studies, including performing sensitivity analyses on squares less than 500 km per side (e.g., 100 km, 200 km); (2) further analyze earth conductivity models by, for example, using metered GIC and magnetometer readings to calculate earth conductivity and using 3-D readings; (3) determine whether new analyses and observations support modifying the use of single station readings around the earth to adjust the spatially averaged benchmark for latitude; and (4) assess how to make GMD data (e.g., GIC monitoring and magnetometer data) available to researchers for study.[51] We propose that NERC submit the work plan within six months of the effective date of a final rule in this proceeding. The work plan submitted by NERC should include a schedule to submit one or more informational

[50] *See, e.g., Revisions to Reliability Standard for Transmission Vegetation Management*, Order No. 777, 142 FERC ¶ 61,208 (2013) (approving Reliability Standard but directing that NERC perform a study to develop empirical evidence on one input to the "Gallet equation" used to calculate minimum clearances for vegetation).

[51] The Commission seeks comment on the barriers, if any, to public dissemination of GIC and magnetometer readings, including if the dissemination of such data poses a security risk and if any such data should be treated as Critical Energy Infrastructure Information or otherwise restricted to authorized users.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

filings that apprise the Commission of the results of the four additional study areas as well as any other relevant developments in GMD research. Further, in the submissions, NERC should assess whether the proposed Reliability Standard remains valid in light of new information or whether revisions are appropriate.

B. Thermal Impact Assessments

NERC Petition

40. Proposed Reliability Standard TPL-007-1, Requirement R6 requires owners of transformers that are subject to the proposed Reliability Standard to conduct thermal analyses to determine if the transformers would be able to withstand the thermal effects associated with a benchmark GMD event. NERC states that transformers are exempt from the thermal impact assessment requirement if the maximum effective GIC in the transformer is less than 75 A/phase during the benchmark GMD event as determined by an analysis of the system. NERC explains that "based on available power transformer measurement data, transformers with an effective GIC of less than 75 A per phase during the Benchmark GMD Event are unlikely to exceed known temperature limits established by technical organizations."[52]

41. As provided in Requirements R5 and R6, "the maximum GIC value for the worst case geoelectric field orientation for the benchmark GMD event described in Attachment 1" determines whether a transformer satisfies the 75 A/phase threshold. If the 75

[52] NERC Petition at 30.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

A/phase threshold is satisfied, Requirement R6 states, in relevant part, that a thermal impact assessment should be conducted on the qualifying transformer based on the effective GIC flow information provided in Requirement R5.

Discussion

42. The Commission proposes to approve proposed Reliability Standard TPL-007-1, Requirement R6. However, the Commission has two concerns regarding the proposed thermal impact assessment in Requirement R6. These concerns reflect in part the difficulty of replacing large transformers quickly, as reflected in studies, such as an April 2014 report by the Department of Energy that highlighted the reliance in the United States on foreign suppliers for large transformers.[53]

43. First, as discussed in the previous section, the Commission proposes to direct NERC to develop modifications to the Reliability Standard such that the benchmark GMD event definition's reference peak geoelectric field amplitude element does not rely on spatially-averaged data alone. The proposed modification is relevant to thermal impact assessments, as it is relevant to GMD Vulnerability Assessments, because both are ultimately predicated on the benchmark GMD event definition. Indeed, the concern is even greater in this context because a thermal impact assessment assesses the localized

[53] U.S. Department of Energy, Large Power Transformers and the U.S. Electric Grid (April 2014), *available at* http://energy.gov/sites/prod/files/2014/04/f15/LPTStudyUpdate-040914.pdf

20150514-3102 FERC PDF (Unofficial) 05/14/2015

impact of a GMD event on an individual transformer. Thus, we propose to direct NERC to modify the Reliability Standard to require responsible entities to apply spatially averaged and non-spatially averaged peak geoelectric field values, or some equally efficient and effective alternative, when conducting thermal impact assessments.

44. Second, Requirements R5.1 and R6 provide that the geoelectric field orientation causing the maximum effective GIC value in each transformer should be used to determine if the assessed transformer satisfies the 75 A/phase qualifying threshold in Requirement R6. However, Requirement R6 does not use the maximum GIC-producing orientation to conduct the thermal assessment for qualifying transformers (i.e., transformers with an maximum effective GIC value greater than 75A/phase). Instead, Requirement R6 uses the effective GIC time series described in Requirement R5.2 to conduct the thermal assessment on qualifying transformers.[54] The Commission seeks comment from NERC as to why qualifying transformers are not assessed for thermal impacts using the maximum GIC-producing orientation. NERC should address whether, by not using the maximum GIC-producing orientation, the required thermal impact assessments could underestimate the impact of a benchmark GMD event on a qualifying transformer.

[54] *See also* NERC Petition, Ex. E (White Paper on Transformer Thermal Impact Assessment) at 8-9.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

C. Monitoring Devices

NERC Petition

45. Proposed Reliability Standard TPL-007-1, Requirement R2 requires responsible entities to "maintain System models and GIC System models of the responsible entity's planning area for performing the study or studies needed to complete GMD Vulnerability Assessment(s)." NERC states that proposed Reliability Standard TPL-007-1 contains "requirements to develop the models, studies, and assessments necessary to build a picture of overall GMD vulnerability and identify where mitigation measures may be necessary."[55] NERC explains that mitigating strategies "may include installation of hardware (e.g., GIC blocking or monitoring devices), equipment upgrades, training, or enhanced Operating Procedures."[56]

Discussion

46. The Commission proposes to direct NERC to develop revisions to Reliability Standard TPL-007-1 requiring installation of monitoring equipment (i.e., GIC monitors and magnetometers) to the extent there are any gaps in existing GIC monitoring and magnetometer networks, which will ensure a more complete set of data for planning and operational needs. Alternatively, we seek comment on whether NERC itself should be responsible for installation of any additional, necessary magnetometers while affected

[55] NERC Petition at 13.

[56] *Id.* at 32.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

entities would be responsible for installation of additional, necessary GIC monitors. As part of NERC's work plan, we propose to direct that NERC identify the number and location of current GIC monitors and magnetometers in the United States to assess whether there are any gaps.

47. NERC maintains that the installation of monitoring devices could be part of a mitigation strategy. We agree with NERC regarding the importance of GIC and magnetometer data. As the Commission stated in Order No. 779, the tools for assessing GMD vulnerabilities are not fully mature.[57] Data from monitors are needed to validate the analyses underlying NERC's proposed Reliability Standard and the analyses to be performed by affected entities.[58] GIC monitors also can facilitate real-time adjustments to grid operations during GMD events, to maintain reliability and prevent significant equipment damage, by enhancing situational awareness for grid operators. For example, PJM's operating procedures for GMDs are triggered when GICs are above 10 A for 10 minutes at either of two specified locations, and confirmed by other sources of information.[59]

---

[57] Order No. 779, 143 FERC ¶ 61,147 at P 68.

[58] *See*, *e.g.*, *Disturbance Monitoring and Reporting Requirements Reliability Standard*, 80 FR 22,441 (Apr. 16, 2015), 151 FERC ¶ 61,042 (2015) (notice of proposed rulemaking proposing to approve Reliability Standard PRC-002-2 requiring the collection of disturbance monitoring data).

[59] *See* PJM Manual 13 (Emergency Operations), Revision 57, at 55 (2015).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

48. Accordingly, rather than wait to install necessary monitoring devices as part of a corrective action plan, GIC and magnetometer data should be collected by applicable entities at the outset to validate and improve system models and GIC system models, as well as improve situational awareness. To be clear, we are not proposing that every transformer would need its own GIC monitor or that every entity would need its own magnetometer. Instead, we are proposing the installation and collection of data from GIC monitors and magnetometers in enough locations to provide adequate analytical validation and situational awareness. We propose that NERC's work plan use this criterion in assessing the need and locations for GIC monitors and magnetometers.

49. Cost recovery is potentially available for costs associated with or incurred to comply with proposed Reliability Standard TPL-007-1, including for the purchase and installation of monitoring devices.[60] The Commission seeks comment on whether it should adopt a policy specifically allowing recovery of these costs.

[60] Order No. 779, 143 FERC ¶ 61,147 at P 14 n.20 (stating that "nothing precludes entities from seeking cost recovery if needed"); *see Extraordinary Expenditures Necessary to Safeguard National Energy Supplies*, 96 FERC ¶ 61,299, at 61,129 (2001) (stating that the Commission "will approve applications to recover prudently incurred costs necessary to further safeguard the reliability and security of our energy supply infrastructure in response to the heightened state of alert. Companies may propose a separate rate recovery mechanism, such as a surcharge to currently existing rates or some other cost recovery method"); *see also Policy Statement on Matters Related to Bulk Power System Reliability*, 107 FERC ¶ 61,052, at P 28 (2004) (affirming and clarifying that "the policy extends to the recovery of prudent reliability expenditures, including those for vegetation management, improved grid management and monitoring equipment, operator training and compliance with NERC standards").

20150514-3102 FERC PDF (Unofficial) 05/14/2015

D. Corrective Action Plan Deadlines

NERC Petition

50. Proposed Reliability Standard TPL-007-1, Requirement R7 provides that:

> Each responsible entity, as determined in Requirement R1, that concludes, through the GMD Vulnerability Assessment conducted in Requirement R4, that their System does not meet the performance requirements of Table 1 shall develop a Corrective Action Plan addressing how the performance requirements will be met ….

NERC explains that the NERC Glossary defines corrective action plan to mean, "A list of actions and an associated timetable for implementation to remedy a specific problem."[61] Requirement R7.3 states that the corrective action plan shall be provided within "90 calendar days of completion to the responsible entity's Reliability Coordinator, adjacent Planning Coordinator(s), adjacent Transmission Planner(s), functional entities referenced in the Corrective Action Plan, and any functional entity that submits a written request and has a reliability-related need."

Discussion

51. The Commission proposes to direct that NERC revise Reliability Standard TPL-007-1 to include deadlines concerning the development and implementation of corrective action plans under Requirement R7.

52. In accordance with Order No. 779 directives, Requirement R7 requires applicable entities to develop and implement measures when vulnerabilities from a benchmark

[61] NERC Petition at 31.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

GMD event are identified.[62] However, Requirement R7 does not establish deadlines for developing or implementing corrective action plans. Requirement R7 only requires responsible entities to distribute corrective action plans within 90 days of completion to certain registered entities. By contrast, other NERC Reliability Standards include deadlines for developing corrective action plans, such as Reliability Standard PRC-006-2 (Automatic Underfrequency Load Shedding) and Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements). In addition, by definition, a corrective action plan includes "an associated timetable for implementation" of a remedy.[63] Consistent with the definition of corrective action plan and the other NERC Reliability Standards, the Commission proposes to direct that NERC modify Reliability Standard TPL-007-1 to require corrective action plans to be developed within one year of the completion of the GMD Vulnerability Assessment.

53. A corrective action plan is defined in the NERC Glossary as "[a] list of actions and an associated timetable for implementation to remedy a specific problem." Because of the complexities surrounding GMDs and the uncertainties about mitigation techniques, the time needed to implement a corrective action plan may be difficult to determine. At

[62] Order No. 779, 143 FERC ¶ 61,147 at P 2 ("If the assessments identify potential impacts from benchmark GMD events, the Reliability Standards *should* require owners and operators to develop and implement a plan to protect against instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, as a result of a benchmark GMD event.").

[63] NERC Glossary at 26.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

the same time, the absence of reasonable deadlines for completion of corrective actions may risk significant delay before identified corrective actions are started or finished. The Commission, therefore, proposes to direct NERC to modify the Reliability Standard to require a deadline for non-equipment mitigation measures that is two years following development of the corrective action plan and a deadline for mitigation measures involving equipment installation that is four years following development of the corrective action plan. The Commission recognizes that there is little experience with installing equipment for GMD mitigation and thus we are open to proposals that may differ from our proposal, particularly from any entities with experience in this area.

54. We seek comments from NERC and interested entities on these proposals. Further, we seek comment on appropriate alternative deadlines and whether there should be a mechanism that would allow NERC to consider, on a case-by-case basis, requests for extensions of required deadlines.

E. Minimization of Load Loss and Curtailment

NERC Petition

55. Proposed Reliability Standard TPL-007-1, Requirement R4 states that each responsible entity "shall complete a GMD Vulnerability Assessment of the Near-Term Transmission Planning Horizon once every 60 calendar months." Requirement R4.2 further states that the "study or studies shall be conducted based on the benchmark GMD event described in Attachment 1 to determine whether the System meets the performance requirements in Table 1."

20150514-3102 FERC PDF (Unofficial) 05/14/2015

56. NERC maintains that Table 1 sets forth requirements for system steady state performance. NERC explains that Requirement R4 and Table 1 "address assessments of the effects of GICs on other Bulk-Power System equipment, system operations, and system stability, including the loss of devices due to GIC impacts."[64] Table 1 provides, in relevant part, that load loss and/or curtailment are permissible elements of the steady state:

> Load loss as a result of manual or automatic Load shedding (e.g. UVLS) and/or curtailment of Firm Transmission Service may be used to meet BES performance requirements during studied GMD conditions. The likelihood and magnitude of Load loss or curtailment of Firm Transmission Service should be minimized.

Discussion

57. The Commission seeks comment from NERC regarding the provision in Table 1 that "Load loss or curtailment of Firm Transmission Service should be minimized." Because the term "minimized" does not represent an objective value, the provision is potentially subject to interpretation and assertions that the term is vague and may not be enforceable. Similarly, use of the modifier "should" might indicate that minimization of load loss or curtailment is only an expectation or a guideline rather than a requirement.

58. The Commission seeks comment from NERC that explains how the provision in Table 1 regarding load loss and curtailment will be enforced, including: (1) whether, by

[64] NERC Petition at 39.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

using the term "should," Table 1 requires minimization of load loss or curtailment, or both; and (2) what constitutes "minimization" and how it will be assessed.

F. Violation Risk Factors and Violation Severity Levels

59. Each requirement of proposed Reliability Standard TPL-007-1 includes one violation risk factor and has an associated set of at least one violation severity level. NERC states that the ranges of penalties for violations will be based on the sanctions table and supporting penalty determination process described in the Commission-approved NERC Sanction Guidelines.

60. The Commission proposes to approve the violation risk factors and violation severity levels submitted by NERC, for the requirements in Reliability Standard TPL-007-1, consistent with the Commission's established guidelines.[65]

G. Implementation Plan and Effective Dates

61. NERC proposes a phased, five-year implementation period.[66] NERC maintains that the proposed implementation period is necessary: (1) to allow time for entities to develop the required models; (2) for proper sequencing of assessments because thermal impact assessments are dependent on GIC flow calculations that are determined by the responsible planning entity; and (3) to give time for development of viable corrective action plans, which may require applicable entities to "develop, perform, and/or validate

[65] *North American Electric Reliability Corp.*, 135 FERC ¶ 61,166 (2011).

[66] NERC Petition, Ex. B (Implementation Plan for TPL-007-1).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

new or modified studies, assessments, procedures … [and because] [s]ome mitigation measures may have significant budget, siting, or construction planning requirements."[67]

62. The proposed implementation plan states that Requirement R1 shall become effective on the first day of the first calendar quarter that is six months after Commission approval. For Requirement R2, NERC proposes that the requirement shall become effective on the first day of the first calendar quarter that is 18 months after Commission approval. NERC proposes that Requirement R5 shall become effective on the first day of the first calendar quarter that is 24 months after Commission approval. NERC proposes that Requirement R6 shall become effective on the first day of the first calendar quarter that is 48 months after Commission approval. And for Requirement R3, Requirement R4, and Requirement R7, NERC proposes that the requirements shall become effective on the first day of the first calendar quarter that is 60 months after Commission approval.

63. The Commission proposes to approve the implementation plan and effective dates submitted by NERC. However, given the serial nature of the requirements in the proposed Reliability Standard, we are concerned about the duration of the timeline associated with any mitigation stemming from a corrective action plan. As a result, the Commission seeks comment from NERC and other interested entities as to whether the length of the implementation plan, particularly with respect to Requirements R4, R5, R6, and R7, could be reasonably shortened.

---

III. Information Collection Statement

64. The collection of information contained in this notice of proposed rulemaking is subject to review by the Office of Management and Budget (OMB) regulations under section 3507(d) of the Paperwork Reduction Act of 1995 (PRA).[68] OMB's regulations require approval of certain informational collection requirements imposed by agency rules.[69]

65. Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

66. We solicit comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. Specifically, the Commission asks that any revised burden or cost estimates submitted by commenters be supported by sufficient detail to understand how the estimates are generated.

---

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Public Reporting Burden: The Commission proposes to approve Reliability Standard TPL-007-1 and the associated implementation plan, violation severity levels, and violation risk factors, as discussed above. Proposed Reliability Standard TPL-007-1 will impose new requirements for transmission planners, planning coordinators, transmission owners, and generator owners. Proposed Reliability Standard TPL-007-1, Requirement R1 requires planning coordinators, in conjunction with transmission planner, to identify the responsibilities of the planning coordinator and transmission planner in the planning coordinator's planning area for maintaining models and performing the study or studies needed to complete GMD Vulnerability Assessments. Proposed Requirements R2, R3, R4, R5, and R7 refer to the "responsible entity, as determined by Requirement R1," when identifying which applicable planning coordinators or transmission planners are responsible for maintaining models and performing the necessary study or studies. Proposed Requirement R2 requires that the responsible entities maintain models for performing the studies needed to complete GMD Vulnerability Assessments, as required in proposed Requirement R4. Proposed Requirement R3 requires responsible entities to have criteria for acceptable system steady state voltage performance during a benchmark GMD event. Proposed Requirement R4 requires responsible entities to complete a GMD Vulnerability Assessment of the near-term transmission planning horizon once every 60 calendar months. Proposed Requirement R5 requires responsible entities to provide GIC flow information to transmission owners and generator owners that own an applicable bulk electric system power transformer in the planning area. This information is necessary for applicable transmission owners and generator owners to conduct the

20150514-3102 FERC PDF (Unofficial) 05/14/2015

thermal impact assessments required by proposed Requirement R6. Proposed Requirement R6 requires applicable transmission owners and generator owners to conduct thermal impact assessments where the maximum effective GIC value provided in proposed Requirement R5, Part 5.1 is 75 A/phase or greater. Proposed Requirement R7 requires responsible entities to develop a corrective action plan when its GMD Vulnerability Assessment indicates that its system does not meet the performance requirements of Table 1 – Steady State Planning Events. The corrective action plan must address how the performance requirements will be met, must list the specific deficiencies and associated actions that are necessary to achieve performance, and must set forth a timetable for completion. The Commission estimates the annual reporting burden and cost as follows:

FERC-725N, as modified by the NOPR in Docket No. RM15-11-000 (TPL-007-1 Reliability Standard for Transmission System Planned Performance for Geomagnetic Disturbance Events)[70]

[70] Eng.=engineer; RK =recordkeeping (record clerk); PC=planning coordinator; TP=transmission planner; TO=transmission owner; and GO=generator owner.

Title: FERC-725N, Mandatory Reliability Standards: TPL Reliability Standards

Action: Proposed Additional Requirements.

OMB Control No: 1902-0264.

Respondents: Business or other for-profit and not-for-profit institutions.

Frequency of Responses: One time and on-going.

Necessity of the Information: The Commission has reviewed the requirements pertaining to proposed Reliability Standard TPL-007-1 and has made a determination that the

[72] Of the 57,640 total burden hours, 42,137 hours are one time burden hours, and 15,503 hours are on-going annual burden hours.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

proposed requirements of this Reliability Standard are necessary to implement section 215 of the FPA. Specifically, these requirements address the threat posed by GMD events to the Bulk-Power System and conform to the Commission's directives regarding development of the Second Stage GMD Reliability Standards, as set forth in Order No. 779.

Internal review: The Commission has assured itself, by means of its internal review, that there is specific, objective support for the burden estimates associated with the information requirements.

67. Interested persons may obtain information on the reporting requirements by contacting the Federal Energy Regulatory Commission, Office of the Executive Director, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

68. Comments concerning the information collections proposed in this notice of proposed rulemaking and the associated burden estimates, should be sent to the Commission in this docket and may also be sent to the Office of Management and Budget, Office of Information and Regulatory Affairs [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at the following e-mail address: oira_submission@omb.eop.gov. Please reference FERC-725N and OMB Control No. 1902-0264 in your submission.

IV. Environmental Analysis

69. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect

20150514-3102 FERC PDF (Unofficial) 05/14/2015

on the human environment.[73] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[74] The actions proposed here fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act

70. The Regulatory Flexibility Act of 1980 (RFA)[75] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.[76] The SBA revised its size standard for electric utilities (effective January 22, 2014) to a standard based on the number of employees, including affiliates (from a standard based on megawatt hours).[77] Under SBA's new size standards, planning coordinators, transmission planners,

[73] *Regulations Implementing the National Environmental Policy Act*, Order No. 486, FERC Stats. & Regs. Preambles 1986-1990 ¶ 30,783 (1987).

[74] 18 CFR 380.4(a)(2)(ii).

[75] 5 U.S.C. 601-12.

[76] 13 CFR 121.101.

[77] SBA Final Rule on "Small Business Size Standards: Utilities," 78 FR 77,343 (Dec. 23, 2013).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

transmission owners, and generator owners are likely included in one of the following categories (with the associated size thresholds noted for each):[78]

- Hydroelectric power generation, at 500 employees
- Fossil fuel electric power generation, at 750 employees
- Nuclear electric power generation, at 750 employees
- Other electric power generation (e.g., solar, wind, geothermal, biomass, and other), at 250 employees
- Electric bulk power transmission and control,[79] at 500 employees

71. Based on these categories, the Commission will use a conservative threshold of 750 employees for all entities.[80] Applying this threshold, the Commission estimates that there are 440 small entities that function as planning coordinators, transmission planners, transmission owners, and/or generator owners. However, the Commission estimates that only a subset of such small entities will be subject to the proposed Reliability Standard given the additional applicability criteria in the proposed Reliability Standard (i.e., to be subject to the requirements of the proposed Reliability Standard, the applicable entity must own or must have a planning area that contains a large power transformer with a high side, wye grounded winding with terminal voltage greater than 200 kV).

---

[78] 13 CFR 121.201, Sector 22, Utilities.

[79] This category covers transmission planners and planning coordinators.

[80] By using the highest number threshold for all types of entities, our estimate conservatively treats more entities as "small entities."

20150514-3102 FERC PDF (Unofficial) 05/14/2015

72. Proposed Reliability Standard TPL-007- 1 enhances reliability by establishing requirements that require applicable entities to perform GMD Vulnerability Assessments and to mitigate any identified vulnerabilities. The Commission estimates that each of the small entities to whom the proposed Reliability Standard TPL-007-1 applies will incur one-time compliance costs of $5,193.34 and annual ongoing costs of $5,233.50.

73. The Commission does not consider the estimated cost per small entity to impose a significant economic impact on a substantial number of small entities. Accordingly, the Commission certifies that the proposed Reliability Standard will not have a significant economic impact on a substantial number of small entities.

VI. Comment Procedures

74. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**. Comments must refer to Docket No. RM15-11-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

75. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

76. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC, 20426.

77. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VII. Document Availability

78. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington DC 20426.

79. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

80. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Room at (202) 502-8371, TTY (202)502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

By direction of the Commission.

Kimberly D. Bose,
Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Philip D. Moeller, Cheryl A. LaFleur,
Tony Clark, and Colette D. Honorable.

Western Electricity Coordinating Council Docket No. IN14-11-000

ORDER APPROVING STIPULATION AND CONSENT AGREEMENT

(Issued May 26, 2015)

1. The Commission approves the attached Stipulation and Consent Agreement (Agreement) among the Office of Enforcement (Enforcement), the North American Electric Reliability Corporation (NERC), Western Electricity Coordinating Council (WECC), and Peak Reliability (Peak). This order is in the public interest because it resolves on fair and reasonable terms an investigation of WECC (as the Reliability Coordinator (RC) for the Western Interconnection (WECC RC)), conducted by Enforcement in coordination with NERC and the Commission's Office of Electric Reliability (OER), into possible violations of Reliability Standards associated with WECC RC's oversight of a portion of the Bulk-Power System (BPS) and a blackout that occurred on September 8, 2011 (the September 8 event or the event). WECC agrees to pay a civil penalty of $16,000,000, of which $3,000,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $13,000,000 will be invested in reliability enhancement measures identified below that go above and beyond the Agreement's mitigation and reliability activities or what the Reliability Standards require (Reliability Enhancements). Peak did not exist as a separate entity at the time of the September 8 event, but is a party to the Agreement as the successor to WECC as the RC for the Western Interconnection. WECC and Peak also commit to certain mitigation and reliability activities, subject to compliance monitoring, as detailed in the Agreement.

I. Background

2. WECC is a non-profit, public service corporation and is not a load-serving entity. At the time of the event, WECC acted as both the Regional Entity (WECC RE) and the RC for the Western Interconnection. The WECC region at the time of the event extended from Canada to Mexico, was nearly 1.8 million square miles in size and served a population of 78 million. It included the Canadian provinces of Alberta and British Columbia, the northern part of Baja California, Mexico, the states of Washington,

20150526-3001 FERC PDF (Unofficial) 05/26/2015

Oregon, California, Idaho, Nevada, Utah, Arizona, Colorado, Wyoming, and portions of Montana, South Dakota, New Mexico, and Texas.

3. WECC's RE and RC functions were organized separately, but reported to the same WECC executive management. WECC RC was a NERC Registered Entity, and was the highest level of authority responsible for the reliable operation of the Bulk Electric System (BES) in the Western Interconnection.

4. The RC of the Western Interconnection (formerly WECC RC, now Peak) is responsible for overseeing operation of the Western Interconnection in real time, receiving data from entities throughout the entire Interconnection, and providing high-level situational awareness for the entire system. The RC has the authority to prevent or mitigate emergency operating conditions in the next-day and real-time timeframes. The RC may issue directives to other functional entities to ensure reliable operations. The RC performs reliability analyses including next-day planning and real-time contingency analysis (RTCA) for the Western Interconnection. The RC may also assist transmission operators (TOPs) in mitigating equipment overloads and coordinating restoration plans, contingency plans, and reliability-related services.

5. As the RE, WECC or its delegate, among other things, monitors compliance of Registered Entities (including, formerly, WECC RC and currently, Peak) with the Reliability Standards, under delegated authority from NERC.

6. On March 16, 2007, in Order No. 693,[1] the Commission approved the initial Reliability Standards, which became mandatory and enforceable within the contiguous United States on June 18, 2007.

7. After the event, WECC sought approval from the Commission to establish a new entity to perform the RC and interchange authority (IA) functions in the Western Interconnection. The bifurcation of WECC into two separate entities, WECC and Peak, received final approval from the Commission on February 12, 2014.[2] With the Commission's approval, WECC sub-delegated the RC and IA functions in the Western Interconnection to Peak. WECC has retained its RE responsibilities.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

8. WECC and Peak are subject to the Commission's regulation under section 215 of the Federal Power Act (FPA).[3]

9. The investigation of WECC arose out of a system disturbance that occurred on the afternoon of September 8, 2011 in the Pacific Southwest, which resulted in cascading outages and left approximately 2.7 million customers (equivalent to five million or more individuals) without power, some for multiple hours extending into the next day. The total load loss for the event was in excess of 30,000 MWh. The event started with a three-phase fault which led to the loss of Arizona Public Service Company's (APS) Hassayampa-N. Gila 500 kV transmission line (H-NG). This transmission line is a segment of the Southwest Power Link (SWPL), a major transmission corridor transporting power in an east-west direction, from generators in Arizona, through Imperial Irrigation District's (IID) service territory, into Southern California.

10. With the SWPL's major east-west corridor broken by the loss of H-NG, power flows instantaneously redistributed throughout the electric system in the Pacific Southwest and Southern California, increasing flows through lower voltage systems parallel to the SWPL as power continued to flow on a hot day during hours of peak demand.

11. These redistributed flows traveled through IID's and Western Area Power Administration-Desert Southwest Region's (Western-DSW) facilities, onto WECC Path 44, an aggregation of five 230 kV transmission lines that deliver power in a north-south direction from Southern California Edison Company's (SCE) territory in Los Angeles to San Diego Gas & Electric (SDG&E). The increased power flows parallel to the SWPL, together with lower than peak generation levels in California and Mexico, led to significant voltage deviations and transmission equipment overloads. The flow redistributions, voltage deviations, and resulting overloads had a cascading effect, as transmission and generation equipment tripped offline in a relatively short time period. Just seconds before the blackout, Path 44 carried all flows into San Diego as well as parts of Arizona and Mexico. This excessive loading on Path 44 initiated an intertie separation scheme owned and operated by SCE at the San Onofre switchyard. The California Independent System Operator (CAISO) is responsible for many of the TOP functions for SCE under a Coordinated Functional Registration. Initiation of the intertie separation scheme at the San Onofre switchyard separated SDG&E from Path 44, contributed to tripping the San Onofre Nuclear Generating Station nuclear units offline, and eventually resulted in the complete blackout of San Diego and Comisión Federal de Electricidad's Baja California Control Area in Mexico.

12. WECC RC was the highest reliability authority at the time of the event and maintained a wide-area view of the entire Interconnection. WECC RC was staffed with

[3] 16 U.S.C. § 824o (2012).

20150526-3001 FERC PDF (Unofficial) 05/26/2015

two operators (one real-time operator and one study desk operator) in each of its two regional offices at the time of the event.

13. Promptly after WECC RC's alarms reflected the loss of H-NG, WECC RC operators contacted APS, the operator of H-NG, to discuss the status of H-NG. APS operators informed WECC RC operators that APS could restore H-NG within minutes. WECC RC operators relied on the statement by APS operators that APS could restore H-NG within minutes, and issued no reliability directives in connection with the event, which lasted only 11 minutes (not including restoration). WECC RC and APS operators did not discuss the existing large phase angle difference between Hassayampa and N. Gila that needed to be addressed before H-NG could be returned to service.

14. Prior to the event, WECC RC conducted a next-day study for the entire Western Interconnection, using a model that included, among other equipment, IID's 230 /92 kV transformers. However, the study did not include the effects of the S-Line remedial action scheme (RAS) and separation scheme at the San Onofre switchyard. At the time of the event, WECC excluded from its interpretation of the definition of special protection systems/remedial action schemes (SPSs/RASs) certain types of protection systems, including the S-Line RAS and the separation scheme at the San Onofre switchyard. As a result, WECC RC and the TOPs did not study those systems and schemes. Additionally, WECC RC only reviewed the TOPs' next-day studies when it identified an issue in its own next-day study. WECC RC did not review IID's next-day study for September 8.

15. WECC RC was responsible for monitoring all critical facilities in the Western Interconnection, which may include facilities below 100 kV, as necessary to ensure that at any time, regardless of unplanned events, it was able to determine system operating limits (SOLs) and interconnection reliability operating limits (IROLs), and to know the status of all critical facilities whose failure could result in an SOL or IROL exceedance. On September 8, a WECC RC operator was alerted by an alarm in real time to the fact that IID's 230/92 kV Coachella Valley transformers had tripped (WECC RC had real-time visibility of the transformers even though they were not classified as BES facilities at the time), but was unaware that those transformers tripping could result in a previously unidentified IROL. The September 8 event also exposed SOLs that were previously unrecognized by WECC RC, by revealing that operating WECC Path 44 to an SOL of 2,200 MW, and H-NG (a portion of WECC Path 49), to a limit of 1800 MW, would expose the WECC RC area to cascading outages.

16. Prior to the event, the Operating Practices Subcommittee of WECC's Operating Committee stated an operating philosophy that no IROLs existed under normal operating conditions. As a result, WECC RC did not recognize any IROLs in the Western Interconnection. Following the exposure of the Coachella Valley 230/92 transformers IROL by the September 8 event, WECC RC has since recognized the existence of several IROLs in the Western Interconnection, and Peak continues to analyze the Interconnection

20150526-3001 FERC PDF (Unofficial) 05/26/2015

for additional IROLs. At the time of the event WECC RC also delegated to TOPs the responsibility for identifying criteria that determine when violating an SOL qualifies as an IROL.

17. WECC RC was aware of post-contingency overloads within Western-DSW and IID, but did not alert Western-DSW and IID to these potential transmission problems.

II. Investigation

18. On September 9, 2011, the Commission and NERC announced a joint inquiry to determine how the blackout occurred and to make recommendations to avoid similar situations in the future. The inquiry team, comprised of Commission and NERC staff, used on-site visits and interviews, detailed computer modeling, event simulations, and system analyses to make its findings and recommendations for preventing similar events in the future. The inquiry determined that entities responsible for planning and operating the BPS were not prepared to ensure reliable operation or prevent cascading outages in the event of a single contingency. On May 1, 2012, the inquiry team published a report entitled *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (the Report), which is hereby incorporated by reference.[4] The Report discusses a detailed sequence of events, simulations, and findings related to the causes of the cascading outages. The Report also makes twenty-seven recommendations related to next-day planning, seasonal planning, near- and long-term planning, situational awareness, consideration of BES equipment, SOLs and IROLs, and protection systems.

19. Following publication of the Report, Enforcement, OER, and NERC staff reviewed the data gathered during the inquiry for compliance implications. At the direction of the Commission, Enforcement initiated non-public investigations of several entities, including WECC, under Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014), which were conducted jointly with NERC.

20. Enforcement and NERC determined that WECC violated the Facilities Design, Connection and Maintenance (FAC) and Interconnection Reliability Operations and Coordination (IRO) groups of Reliability Standards. The IRO Reliability Standards "detail the responsibilities and authorities of [an RC]," and "establish requirements for data, tools and wide-area view, all of which are intended to facilitate [an RC's] ability to perform its responsibilities and ensure the reliable operation of the interconnected grid."[5] The FAC standards at issue aim to ensure that SOLs are determined based on an established methodology.

---

[4] *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (April 2012), *available at* http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf.

[5] Order No. 693 at P 888.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

21. Enforcement and NERC determined that WECC RC violated nine Requirements of five Reliability Standards: FAC-011-2 R3; FAC-014-2 R1; IRO-003-2 R1 and R2; IRO-004-1 R1; and IRO-005-2 R5, R9, R12, and R15—stemming from its role in the September 8 event.

22. Enforcement and NERC staff determined that WECC RC violated IRO-003-2 R1 and R2 because WECC RC was unaware that IROLs such as the Coachella Valley 230-92 kV transformers existed in its control area, and thus did not determine or prevent IROL violations on September 8, 2011.

23. Enforcement and NERC staff determined that WECC RC violated IRO-004-1 R1 and IRO-005-2 R5, R9, and R15 because it did not identify the cause of potential and actual SOL and IROL violations on Paths 44 and 49, mitigate the violations, and alert impacted TOPs and BAs in its area.

24. Enforcement and NERC staff determined that WECC RC violated IRO-005-2 R12 because it was not aware of the impact of the S-line RAS and separation scheme at the San Onofre switchyard.

25. Enforcement and NERC staff determined that WECC RC violated FAC-011-2 R3 and FAC-014-2 R1 as a result of inadequacies in its SOL methodology that resulted in the establishment of unreliable SOLs for Paths 44 and 49 and the failure to identify IROLs.

III. Stipulation and Consent Agreement

26. Enforcement, NERC, WECC and Peak resolved this matter by means of the attached Agreement. WECC stipulates to the facts recited in the Agreement and agrees to pay a civil penalty of $16,000,000, of which $3,000,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $13,000,000 will be invested by WECC and Peak in Reliability Enhancements that go above and beyond the requirements of the Reliability Standards, as described in the Agreement. WECC and Peak also agree to mitigation and reliability activities, and to submit to compliance monitoring, as specified in the Agreement. WECC neither admits nor denies that its actions constituted violations of the Reliability Standards.

27. In determining the appropriate sanction, Enforcement considered that WECC has made significant efforts to date to address reliability concerns identified in the inquiry and investigation and also by WECC on its own initiative. WECC also cooperated with Enforcement and NERC during the investigation.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

IV. Determination of the Appropriate Sanctions

28. The civil penalty amount is consistent with the Penalty Guidelines.[6] Enforcement considered that the event caused a loss of 10,000 or more MWh of firm load, and WECC was allocated a share of the base penalty due to its role as the RC. WECC RC also had a prior history of violations of the Reliability Standards, including two violations based on conduct substantially similar to that at issue in this event.[7] The civil penalty amount reflects credit for WECC's cooperation during the course of the investigation, as well as credits for avoiding a trial-type hearing and having an effective compliance program.

29. The Commission concludes that the penalties and other sanctions set forth in the Agreement are a fair and equitable resolution of this matter and are in the public interest. The Commission also concludes that the reliability enhancement, mitigation and reliability activities set forth in the Agreement will enhance the reliability of the BPS and are therefore also fair and in the public interest.

The Commission orders:

The attached Stipulation and Consent Agreement is hereby approved without modification.

By the Commission. Chairman Bay is not participating.

(S E A L)

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Western Electricity Coordinating Council) Docket No. IN14-11-000

STIPULATION AND CONSENT AGREEMENT

I. INTRODUCTION

1. Staff of the Office of Enforcement (Enforcement) of the Federal Energy Regulatory Commission (Commission), the North American Electric Reliability Corporation (NERC), Western Electricity Coordinating Council (WECC), and Peak Reliability (Peak) enter into this Stipulation and Consent Agreement (Agreement) to resolve a non-public investigation conducted by Enforcement and NERC pursuant to Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014). The investigation examined possible violations of NERC Reliability Standards by WECC as the Reliability Coordinator (RC) for the Western Interconnection (WECC RC)) related to a system event in the Pacific Southwest on September 8, 2011 (September 8 event or event). WECC neither admits nor denies that WECC RC violated the Reliability Standards described in the Agreement, but agrees to pay a total civil penalty of $16,000,000, of which $3,000,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $13,000,000 will be invested in reliability enhancement measures identified below that go above and beyond the Agreement's mitigation and reliability activities or what the Reliability Standards require (Reliability Enhancements). Peak did not exist as a separate entity at the time of the September 8 event, but is a party to the Agreement as the successor to WECC as the RC for the Western Interconnection. WECC and Peak also commit to certain measures, subject to compliance monitoring, as detailed in the Agreement.

II. STIPULATED FACTS

2. Enforcement, NERC, and WECC and Peak hereby stipulate and agree to the following facts.

A. WECC

3. WECC is a non-profit, public service corporation and is not a load-serving entity. WECC is funded by assessments to load-serving entities, among others. At the time of the event, WECC acted as both the Regional Entity (WECC RE) and the RC for the Western Interconnection. These functions were organized separately, but reported to the same WECC executive management. WECC RC was a NERC Registered Entity, and was the highest level of authority responsible for the reliable operation of the Bulk Electric System (BES) in the Western Interconnection.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

4. The RC of the Western Interconnection (formerly WECC RC, now Peak) is responsible for overseeing operation of the Western Interconnection in real time, receiving data from entities throughout the entire Interconnection, and providing high-level situational awareness for the entire system. The RC has the authority to prevent or mitigate emergency operating conditions in the next-day and real-time timeframes. The RC may issue directives to other functional entities to ensure reliable operations. The RC performs reliability analyses including next-day planning and real-time contingency analysis (RTCA) for the Western Interconnection. The RC may also assist transmission operators (TOPs) in mitigating equipment overloads and coordinating restoration plans, contingency plans, and reliability-related services.

5. As the RE, WECC or its delegate, among other things, monitors compliance of Registered Entities (including, formerly, WECC RC and currently, Peak) with the Reliability Standards, under delegated authority from NERC.

6. After the event, WECC sought approval from the Commission to establish a new entity to perform the RC and interchange authority (IA) functions in the Western Interconnection. The bifurcation of WECC into two separate entities, WECC and Peak, received final approval from the Commission on February 12, 2014.[1] With the Commission's approval, WECC sub-delegated the RC and IA functions in the Western Interconnection to Peak. WECC has retained its RE responsibilities.

B. Event Description

7. During an 11-minute period on the afternoon of September 8, 2011, a system disturbance occurred in the Pacific Southwest, resulting in cascading outages and leaving approximately 2.7 million customers without power, some for multiple hours extending into the next day. The total load loss for the event was in excess of 30,000 MWh. The event started with a three-phase fault which led to the loss of Arizona Public Service's (APS) Hassayampa-N. Gila 500 kV transmission line (H-NG). This transmission line is a segment of the Southwest Power Link (SWPL), a major transmission corridor transporting power in an east-west direction, from generators in Arizona, through the service territory of Imperial Irrigation District (IID), into Southern California.

8. With the SWPL's major east-west corridor broken by the loss of H-NG, power flows instantaneously redistributed throughout the electric system in the Pacific Southwest and Southern California, increasing flows through lower voltage systems parallel to the SWPL as power continued to flow on a hot day during hours of peak demand.

---

[1] *See North American Electric Reliability Corp.*, 146 FERC ¶ 61,092 (2014*), reh'g denied*, 147 FERC ¶ 61,064 (2014) (accepting compliance filings submitted by NERC and WECC and eliminating all final obstacles to bifurcation), appeal docketed *sub nom Edison Electric Institute v. FERC*, No. 14-1071 (D.C. Cir. May 9, 2014).

20150526-3001 FERC PDF (Unofficial) 05/26/2015

9. These redistributed flows traveled through IID's and Western Area Power Administration – Desert Southwest Region's facilities (Western-DSW), onto WECC Path 44, an aggregation of five 230 kV transmission lines that deliver power in a north-south direction from Southern California Edison Company's (SCE) territory in Los Angeles to San Diego Gas and Electric (SDG&E). The increased power flows parallel to the SWPL, together with lower than peak generation levels in California and Mexico, led to significant voltage deviations and transmission equipment overloads. The flow redistributions, voltage deviations, and resulting overloads had a cascading effect, as transmission and generation equipment tripped offline in a relatively short time period. Just seconds before the blackout, Path 44 carried all flows into San Diego as well as parts of Arizona and Mexico. This excessive loading initiated an intertie separation scheme owned and operated by SCE at the San Onofre switchyard. The California ISO (CAISO) is responsible for many of the TOP functions for SCE under a Coordinated Functional Registration. Initiation of the intertie separation scheme at the San Onofre switchyard separated SDG&E from Path 44, contributed to tripping the San Onofre Nuclear Generation Station nuclear units offline, and eventually resulted in the complete blackout of San Diego and Comisión Federal de Electricidad's Baja California Control area.

10. WECC RC was the highest reliability authority at the time of the event and maintained a wide-area view of the entire Interconnection. WECC RC was staffed with two operators (one real-time operator and one study desk operator) in each of its two regional offices at the time of the event.

11. Promptly after WECC RC's alarms reflected the loss of H-NG, WECC RC operators contacted APS, the operator of H-NG, to discuss the status of H-NG. APS operators informed WECC RC operators that APS could restore H-NG within minutes. WECC RC operators relied on the statement by APS operators that APS could restore H-NG within minutes, and issued no reliability directives in connection with the event, which lasted only 11 minutes (not including restoration). WECC RC and APS operators did not discuss the existing large phase angle difference between Hassayampa and N. Gila that needed to be addressed before H-NG could be returned to service.

12. Prior to the event, WECC RC conducted a next-day study for the entire Western Interconnection, using a model that included, among other equipment, IID's 230 /92 kV transformers. However, the study did not include the effects of the S-Line remedial action scheme (RAS) and separation scheme at the San Onofre switchyard. At the time of the event, WECC excluded from its interpretation of the definition of special protection systems/remedial action schemes (SPSs/RASs) certain types of protection systems, including the S-Line RAS and the separation scheme at the San Onofre switchyard, among others. As a result, WECC RC and the TOPs did not study those systems and schemes. Additionally, WECC RC only reviewed the TOPs' next-day studies when it identified an issue in its own next-day study. WECC RC did not review IID's next-day study for September 8.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

13. WECC RC was responsible for monitoring all critical facilities in the Western Interconnection, which may include facilities below 100 kV, as necessary to ensure that at any time, regardless of unplanned events, it was able to determine system operating limits (SOLs) and interconnection reliability operating limits (IROLs), and to know the status of all critical facilities whose failure could result in an SOL or IROL exceedance. On September 8, a WECC RC operator was alerted by an alarm in real time to the fact that IID's 230/92 kV Coachella Valley transformers had tripped (WECC RC had real-time visibility of the transformers even though they were not classified as BES facilities at the time), but was unaware that those transformers tripping could result in a previously unidentified IROL. The September 8 event also exposed SOLs that were previously unrecognized by WECC RC, by revealing that operating WECC Path 44 to an SOL of 2,200 MW, and H-NG (a portion of WECC Path 49) to a limit of 1800 MW, would expose the WECC RC area to cascading outages.

14. Prior to the event, the Operating Practices Subcommittee of WECC's Operating Committee stated an operating philosophy that no IROLs existed under normal operating conditions. As a result, WECC RC did not recognize any IROLs in the Western Interconnection. Following the exposure of the Coachella Valley 230-92 transformers IROL by the September 8 event, WECC RC has since recognized the existence of several IROLs in the Western Interconnection, and Peak continues to analyze the Interconnection for additional IROLs. At the time of the event WECC RC also delegated to TOPs the responsibility for identifying criteria that determine when violating an SOL qualifies as an IROL.

15. WECC RC was aware of post-contingency overloads within Western-DSW and IID, but did not alert Western-DSW and IID to these potential transmission problems.

III. INQUIRY AND INVESTIGATION

16. On September 9, 2011, the Commission and NERC announced a joint inquiry to determine how the blackout occurred and to make recommendations to avoid similar situations in the future. The inquiry team, comprised of Commission and NERC staff, used on-site visits and interviews, detailed computer modeling, event simulations, and system analyses to make its findings and recommendations for preventing similar events in the future. The inquiry determined that entities responsible for planning and operating the bulk-power system (BPS) were not prepared to ensure reliable operation or prevent cascading outages in the event of a single contingency. On May 1, 2012, the inquiry team published a report entitled *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (the Report), which is hereby incorporated by reference.[2] The Report discusses a detailed sequence of events, simulations, and findings

[2] *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (April 2012), *available at* http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

related to the causes of the cascading outages. The Report also makes twenty-seven recommendations related to next-day planning, seasonal planning, near- and long-term planning, situational awareness, consideration of BES equipment, SOLs and IROLs, and protection systems.

17. Following publication of the Report, Enforcement and NERC reviewed the data gathered during the inquiry for compliance implications. As a result of that review, Enforcement and NERC initiated non-public investigations of several entities, including WECC, under Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014).

18. Enforcement and NERC determined that WECC violated nine Requirements of five Reliability Standards, and found these violations undermined the reliability of the BPS and contributed to the September 8 event. Enforcement and NERC recognized, however, that after the event, and during the inquiry and investigation, WECC voluntarily began making improvements in its planning and operations, and implementing recommendations from the Report, that addressed many of the findings arising from the Report. WECC established an online Dashboard to track its progress. In addition, WECC cooperated with Enforcement and NERC during the investigation.

19. As part of the investigation, Enforcement and NERC reviewed WECC's compliance program (as it existed at the time of the event) and found that WECC satisfied the criteria for an effective compliance program under the Commission's Penalty Guidelines.[3] Enforcement and NERC considered the elements of WECC's compliance program set forth in this paragraph. At the time of the September 8 event, WECC RC had a formal compliance program. WECC RC had a designated Compliance Manager, who had direct access to WECC senior executives and, as necessary, the WECC board. All WECC team members were expected to collaborate in the implementation of practices and policies meant to ensure compliance with all rules and regulations. All WECC team members underwent mandatory training on the Reliability Standards relevant to their positions, as well as training on the benefits of compliance and the risks of non-compliance. Peak has built upon WECC's compliance program. Under Peak's current program, the Compliance Director reports directly to the President and Chief Executive Officer, with access to the Chair of the Board of Directors as needed. The Compliance Director is directly supported by an Operations Compliance Specialist and CIP Compliance Specialist, with all Peak team members required to collaborate to develop and implement policies, procedures, work practices and technologies to ensure compliance with the Reliability Standards. Peak has a "Compliance Open Door Policy" that encourages all team members to bring compliance issues to the attention of management, whether through direct report to the Compliance Director, or anonymous

[3] *Enforcement of Statutes, Orders, Rules and Regulations,* 132 FERC ¶ 61,216, § 1B2.1 (2010).

20150526-3001 FERC PDF (Unofficial) 05/26/2015

reporting to a third-party compliance reporting service provider. All Peak team members undergo mandatory compliance training relevant to their positions, and new hires are trained on the Reliability Standards, benefits of compliance, risks of non-compliance, the Compliance Open Door Policy, and Peak's rewards for compliance and disciplinary measures for non-compliance.

IV. ENFORCEMENT AND NERC FINDINGS OF VIOLATIONS

20. Enforcement and NERC staff determined that WECC RC violated the following Requirements of the Reliability Standards: FAC-011-2 R3; FAC-014-2 R1; IRO-003-2 R1 and R2; IRO-004-1 R1; and IRO-005-2 R5, R9, R12, and R15.[4] Enforcement and NERC staff determined that WECC RC violated IRO-003-2 R1 and R2 because WECC RC was unaware that IROLs existed in its control area and were violated on September 8, 2011. Enforcement and NERC staff determined that WECC RC violated IRO-004-1 R1 and IRO-005-2 R5, R9, and R15 because it did not identify the cause of potential and actual SOL and IROL violations, mitigate the violations, and alert impacted TOPs and Balancing Authorities (BAs) in its area. Enforcement and NERC staff determined that WECC RC violated IRO-005-2 R12 because it was not aware of the impact of the S-line RAS and separation scheme at the San Onofre switchyard. Lastly, Enforcement and NERC staff determined that WECC RC violated FAC-11-2 R3 and FAC-014-2 R1 for inadequacies in its SOL methodology that resulted in the establishment of unreliable SOLs and the failure to identify IROLs.

V. REMEDIES AND SANCTIONS

21. WECC stipulates to the facts as described in Section II of this Agreement, but neither admits nor denies Enforcement's and NERC's findings that WECC RC violated the Reliability Standards specified in Section IV. For purposes of settling any and all disputes within the jurisdiction of the Commission arising from any and all reliability matters related to the September 8 event, or Enforcement's and NERC's investigation, WECC agrees to the remedies and sanctions set forth in the following paragraphs assigned to WECC, including the entire cash payment to Treasury and NERC, and Peak agrees to the remedies assigned to Peak. Pursuant to the Revised Reliability Coordinator and Interchange Authority Agreement between the Western Electricity Coordinating Council and Peak Reliability (RC Agreement), Peak is responsible for reporting obligations and enforcement conditions relating to its role as the RC, and WECC is responsible for reporting obligations and enforcement conditions relating to its role as the RE.

[4] As noted in paragraphs 1 and 21, WECC neither admits nor denies the findings by Enforcement and NERC regarding violations of the Reliability Standards, and use of the term mitigation is not meant to imply otherwise.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

A. Civil Penalty

22. WECC shall pay a total civil penalty of $16,000,000, of which $3,000,000 shall be paid, divided in equal amounts, to the United States Treasury and NERC. $1,000,000, divided equally between the United States Treasury and NERC, shall be due within ten days of the Effective Date of the Agreement. $1,000,000, divided equally between the United States Treasury and NERC, shall be due within one year from the Effective Date and $1,000,000, divided equally between the United States Treasury and NERC, shall be due within two years of the Effective Date. Enforcement and NERC agree to give WECC a partial civil penalty offset for the remaining $13,000,000 in exchange for WECC and Peak implementing the Reliability Enhancements as set forth in section V.B. The value of the Reliability Enhancements is expected to substantially exceed the amount of the offset.

B. Reliability Enhancements

23. In exchange for the $13,000,000 offset, WECC and Peak have completed or shall complete the following Reliability Enhancements:

a. WECC RC partially increased, and Peak has continued to and shall increase, staffing of the RC function from the staffing in effect on September 8, 2011, by 61 full-time equivalent positions, including 18 RC operators. Peak shall maintain the additional 18 RC operator positions at least through December 31, 2016; and

b. WECC completed bifurcation of the RE function of WECC from the RC function, with the RC function sub-delegated to Peak on February 14, 2014.

24. WECC and Peak will provide Enforcement and NERC with satisfactory evidence that investments to date in the Reliability Enhancements have substantially exceeded $13,000,000.

C. Completed and Required Mitigation and Reliability Activities

25. WECC and Peak, respectively, commit to the designated actions in this Section V.C. As indicated below, WECC and Peak affirm that they have already completed most of the mitigation and reliability activities, and shall complete all remaining mitigation and reliability activities no later than one year after the Effective Date of the Agreement, unless otherwise stated in Section V.C. WECC and Peak shall continue operating consistent with the completed and required mitigation and reliability activities, until they implement improved practices and procedures in accordance with the Reliability Standards in existence now or in the future. Until WECC and Peak have completed all mitigation and reliability activities and Reliability Enhancements, any material alterations in the mitigation and reliability activities set forth in Section V.C. shall be approved by

20150526-3001 FERC PDF (Unofficial) 05/26/2015

Enforcement and NERC staff, such approval not to be unreasonably withheld. WECC and Peak will individually or jointly report on the status of all mitigation and reliability activities described in this Section V.C. and submit evidence of progress and/or completion in their compliance monitoring reports to be submitted to Enforcement and NERC pursuant to Section V.D of this Agreement. WECC and Peak agree to work cooperatively to provide Enforcement and NERC staff with information necessary to confirm that all mitigation and reliability activities have been completed.

i. Seasonal, Next-Day and Current-Day Planning

26. Peak now shares its next-day study, as well as study inputs such as outages and interchange, electronically on a daily basis with all WECC entities that have executed the Universal Data Sharing Agreement (UDSA). WECC RC and Peak created additional formats for TOPs to review the RC studies, including Power System Simulator for Engineering (PSS/E) and Positive Sequence Load Flow (PSLF). After the September 8 event, WECC and Peak obtained executed UDSAs from all Western Interconnection BAs, TOPs and Transmission Owners (TOs). Peak and the TOPs are engaged in negotiations to renew the UDSA. The Peak Board of Directors has established a bridge policy to ensure that access to data sharing is maintained during the negotiations.

27. Peak has improved the forecasting of interchange between TOPs by working with BAs to identify the reasons for forecasting errors, and to improve the unit commitment data provided to the RC. Peak worked with the BAs to address unit commitment data issues that were identified by a task force that reviewed input data issues related to the RC's next-day studies. All data issues related to unit commitment and interchange forecasting identified by the task force have been remedied.

28. By June 30, 2015, WECC will issue a guideline outlining best practices for next-day studies, which will be posted on the WECC website. WECC will monitor the effectiveness of this guideline through a next-day study working group and the annual Operational Practices Survey, or other appropriate means.

29. In February 2014, WECC issued its "Pre/Post-Contingency Guideline," which guides TOPs to take pre-contingency mitigation measures when potential post-contingency conditions could exceed the TOPs' highest emergency rating for a facility. The Guideline also reminds TOPs to consider the time necessary to take mitigation actions, and to consider the effect of relays that automatically isolate facilities without providing time for mitigating measures. WECC has posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

30. Peak shall coordinate the seasonal planning process for its RC area. Seasonal planning by TOPs in the Western Interconnection begins with the operational base cases prepared by WECC. WECC shall continue to prepare operational base cases. WECC

20150526-3001 FERC PDF (Unofficial) 05/26/2015

and Peak shall cooperate, to the extent applicable, to gather information from TOPs to update the operational base cases. WECC RC and Peak have worked with the sub regional study groups to facilitate a consistent method for seasonal planning, including consistency in system conditions to be evaluated and consistency in process. WECC RC also worked with the sub regional study groups to improve coordination between seasonal study planners and operators. Peak shall require, per its SOL methodology and seasonal coordination process, that the seasonal planning for the Western Interconnection includes all critical internal and external conditions and contingencies, including generation and transmission outages, transfers, and demand patterns, including non-peak demand patterns. Critical internal and external facilities may be sub-100 kV, if they impact the BES. To the extent required by changes to the Reliability Standards related to planning, Peak will consult with FERC and NERC on how to satisfy the measures contained in this paragraph.

31. WECC has developed a procedure to perform N-1 contingency analysis on operational base cases for the Western Interconnection. WECC will implement this procedure by June 30, 2015, and will provide the results of its analysis to the area coordinators within 30 days after WECC completes its analysis.

j. Near- And Long-Term Planning

32. WECC established the Planning Coordinator Function Task Force to identify the current Planning Coordinator (PC) issues in the Western Interconnection, evaluate gaps in PC coverage in the Western Interconnection and to develop a methodology, procedures and implementation plan for addressing the PC issues in the Western Interconnection. In addition, using the results of a survey issued to registered PCs, WECC has identified those facilities within each current PC area, as well as facilities in areas for which no PC has been identified. WECC shall provide the Planning Coordinator Function Task Force's report (and any other deliverables) to Enforcement and NERC within 7 days of completion by the Task Force. After receipt of the report and deliverables, WECC, Peak, and FERC and NERC staff shall confer and cooperate in order to reach an agreement on a solution for the PC issues in the Western Interconnection, especially the gaps in PC coverage and seams issues.[5]

33. In July, 2014, WECC issued a BES Inclusion Guideline, which recognized that non-BES, or sub-100 kV, facilities may be important to the reliability of the Interconnection. The Guideline helps registered entities identify such facilities, and encourages, but does not require, registered entities to consider facilities for inclusion in

[5] Seams issues refers to the fact that transmission lines, interchange and loop flow patterns, among other characteristics of the BES, cross the boundaries between entities or sub regional groups, and thus may not be consistently analyzed by any individual entity or sub regional group.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

the BES through the NERC exception procedures. Among other situations that might qualify a non-BES facility for inclusion through the NERC exception procedures are facilities identified as a significant contributing factor in an event analysis report, or where the facility's single-contingency outage changes the flow on any BES element by more than 10 percent. WECC will monitor the effectiveness of the guideline through its annual Operational Practices Survey, or other appropriate means.

k. Protection Systems

34. Peak has included 239 additional RASs, and greater specificity about the existing RASs, in the models used for Peak's RTCA. Peak has also added 212 additional RASs to its Supervisory Control and Data Acquisition (SCADA) displays, and 4701 additional RAS Inter-Control Center Communication Protocol points, since the event.

35. By March 31, 2016, WECC will have developed the capability for entities to model RASs so that they can be added to its powerflow base cases. By June 30, 2016, WECC will update the Data Preparation Manual to include the requirement for data submitters to include RAS models in their submittal to WECC. WECC will produce the first powerflow base case to include RAS models by July 2016. By June 30, 2017, all WECC base cases shall include all (1) RASs, and (2) overcurrent protection relays with inter-TOP impact, known to WECC to exist in the Western Interconnection as of the Effective Date. In the interim, WECC collected and posted some data on RASs and relays with inter-TOP impact so that entities can model those impacts until those RASs and relays are modeled in the WECC base cases. Any RASs installed in the Western Interconnection after June 30, 2016 and known to WECC to exist shall be modeled in the base cases as soon as practicable in coordination with WECC's established base case production schedule.

36. WECC developed and adopted the Regional Criterion entitled "Remedial Action Scheme Review and Assessment Plan, PRC-(012 through 14)-WECC-CRT-2," which became effective January 1, 2014 (an earlier version became effective in October 2011). This criterion requires TOs, Generator Owners and Distribution Providers to submit data on RASs initially and before putting any changes or new RASs in service, to review the information in WECC's Remedial Action Scheme Database annually for accuracy, and to assess their RASs for operation, coordination, and effectiveness at least once every five years, among other requirements. This criterion also requires WECC's Remedial Action Scheme Reliability Subcommittee (RASRS) to review each RAS submitted to the RASRS for compliance with designated Reliability Standards, including Standards within the Transmission Planning and Protection Systems groups. As a result of this criterion, WECC has gathered data on multiple existing and new schemes. In addition, the RASRS chair issued a data request to all Western Interconnection TOPs requesting them to provide information on any tie line schemes or safety nets within their systems. That effort identified 25 additional RASs from seven entities that were incorporated into the Remedial Action Scheme Database. The information collected through the criterion will

20150526-3001 FERC PDF (Unofficial) 05/26/2015

facilitate the WECC modeling process and assist in the identification of interaction among RASs.

37. WECC prepared a white paper on "The Recognition of Power Plant Control, Protection and Operation in Transmission Simulation Studies," which was posted on the WECC website.

38. In November, 2012, WECC issued its Guideline for Protection System Loadability. The guideline encourages TOPs to set load-responsive relays that are operated in parallel with the BES, but not subject to Reliability Standard PRC-023, to use one of the setting criteria from PRC-023. The Guideline also addresses phase angle differences used when reclosing a breaker, encouraging the TOPs to provide visibility of the phase angle difference by means that could include planning studies, State Estimator, Real-time Contingency Analysis (RTCA), Phasor Measurement Units, or synch check relays. WECC posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

l. Angular Separation

39. Since September 2011, WECC RC and Peak have improved the ability of the RC to estimate phase angle differences. Peak can monitor estimated or expected (post-contingency) phase angles using Real-time State Estimation and RTCA. A procedure exists, called *Monitoring Heavy E-W Flows on SWPL*, which describes action to be taken by the RC operator when exceeding phase angle line reclosure limits (synch check relay thresholds) on the SWPL. In addition to its focused monitoring of the phase angles on the SWPL, Peak also monitors fifteen other node-pairs in the Western Interconnection for, among other things, excessive phase angles. If a relevant line is open and results in the exceedance of a node-pair phase angle limit, Peak RC System Operators will see that exceedance in Peak's Energy Management System (EMS) applications. An actual exceedance of a node-pair phase angle limit is detected and reported in Peak's Real-time State Estimation. A post-contingency exceedance of a node-pair phase angle limit is detected and reported in Peak's RTCA and study contingency analysis applications. The node-pair phase angle limits currently implemented in Peak's EMS inform the RC System Operators that the relevant line cannot be reclosed because of the excessively high phase angle.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

m. System Operating Limits and Interconnection Reliability Operating Limits

40. After September 8, 2011, WECC began using a new SOL methodology, and further refined that methodology with its "Phase II SOL Methodology," Revision 7.0 of the SOL Methodology for the Operations Horizon, which became effective in March 2014. Among other things, the SOL Methodology currently in use by TOPs in the Western Interconnection and Peak instructs entities to assess projected system conditions as real time approaches to establish SOLs, and includes criteria for identifying the subset of SOLs that qualify as IROLs in real time, as well as a clearer definition of what is included in an SOL. The SOL methodology requires TOPs and the RC to operate in real time to the most restrictive of Facility Ratings, voltage limits, voltage stability limits, transient stability limits or WECC Path Ratings. Prior to the event, some TOPs operated only to Path Ratings or seasonally-determined SOLs. The SOL methodology also requires TOPs to use models for establishing SOLs and IROLs that include the entire WECC RC area, to include critical modeling details from other RC areas that would impact the facilities being studied, to model parallel sub-100 kV facilities (e.g., the Coachella Valley transformers), to include RASs/SPSs in their models where feasible, and to consider the impact of SPS/RAS actions when establishing SOLs and IROLs. Current IROLs recognized by Peak are posted online in the secure area of peakrc.org.

41. Peak shall make the following modifications to the SOL Methodology for the Operations Horizon:

a. Peak shall not exclude all load loss due to RAS/SPS actions for the purpose of determining whether an IROL exists, because to do so would have allowed the Coachella Valley transformers to elude recognition as an IROL; and

b. Peak shall justify the reason for the 1,000 MW cut-off for SOLs to be IROLs or establish a cut-off with technical justification.

n. Situational Awareness

42. Peak runs its RTCA every five minutes and Peak's RTCA results and certain State Estimator Savecases are immediately available to all TOPs and BAs in real time in the secure area of peakrc.org.

43. WECC RC began flagging and alarming the two Coachella Valley transformers in its RTCA shortly after the September 8, 2011 event. Peak shall continue to flag and alarm the Coachella Valley transformers.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

44. WECC RC and Peak have allowed TOPs to view the Coordinated Outage System once the TOPs executed the UDSA. All current TOPs have now executed the UDSA.[6]

45. WECC and Peak have increased real-time data sharing among TOPs by developing the WECC Operations Network guideline. WECC has posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

46. Peak has modified its data request to require each TOP to provide telephone notification to Peak when the TOP loses real-time data or RTCA. Peak will modify the Data Request to require notification either by telephone or by WECCNET, if possible.

47. WECC has issued a Real-Time Tools Guideline. Among other recommendations for best practices, it guides TOPs on the scope of their network model (to allow identification of external contingencies, for example), on how often to update their state estimator (every 10 minutes) and RTCA (at least every 30 minutes). WECC has posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

o. Emergency Operations

48. WECC has issued an Emergency Operations Procedure, which, among other things, defines the RC operator's role during emergency operations and in evaluating emergency conditions, including major system disturbances. The Procedure also provides specific guidance to RC operators on issuing "clear, concise and definitive" Reliability Coordinator Directives.

p. Modeling

49. WECC is developing the Base Case Coordination System (BCCS), to validate data automatically, build power flow base cases, and store dynamic data in a centralized, Web-accessible database. WECC is in the process of implementing the BCCS, and expects to fully implement the BCCS by June 30, 2016. WECC has offered training in the use of the BCCS to all TOPs in the Western Interconnection. If, despite its good faith and diligent efforts, WECC is unable to fully implement the BCCS due to irreconcilable technical issues or vendor performance, WECC, FERC and NERC staff shall confer and cooperate in order to reasonably address through other means any identified issues regarding validation of base case data or revision of power flow base cases.

[6] See paragraph 26 regarding the renegotiation of the UDSA, and interim measures to preserve data sharing.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

50. WECC and its Transmission Planners (TPs) have benchmarked their dynamic models against actual data from the September 8, 2011 event, as recommended by the Report. WECC worked with the TPs to identify modeling deficiencies and track improvements, and all modeling deficiencies identified as a result of the model validation process have been corrected.

51. WECC continues to reconcile its planning base cases to the Peak West-wide System Model used for operations, as recommended by the Report, and WECC and Peak continue to make any necessary changes in the two models.

52. WECC has added a generator tripping model to its base cases to provide an indication of when generators may trip during events.

53. WECC and Peak have conducted a two-phase study to identify facilities with at least one terminal below 100 kV that have an impact on the BES. In the first phase, WECC and Peak worked with TOPs to obtain a list of sub-100 kV facilities that the TOPs believed should be monitored due to potential loop flow, and performed a study using the Peak West-wide System Model. In the second phase, a study was conducted using WECC's planning model. WECC and Peak identified additional sub-100 kV facilities to be added to the Peak West-wide System Model and Peak's EMS model, and Peak is monitoring additional facilities identified by TOPs. Peak has alarmed all facilities identified through these studies in its EMS.

54. WECC will benchmark a base case, including dynamic models, on an annual basis, against actual system performance during the single most severe reportable disturbance that occurred on the Western Interconnection during the previous year. On a prospective basis, WECC will work with PCs and TPs to modify any discrepancies found between the base case (including dynamic models) and actual system performance.

q. **Voltage and Reactive Reserves**

55. WECC RC, and later Peak, implemented a voltage stability tool, the Region of Stability Excellence, or ROSE, which combines State Estimator and Phasor Measurement Unit (PMU) data for on-line calculation and visualization of the current operating point and its proximity to the voltage stability boundary, thus giving RC operators an improved awareness of system stability and potentially alerting them to impending system emergencies. Peak will fully implement ROSE by September 15, 2015. Peak will train all RC operators on ROSE.

D. Compliance Monitoring

56. WECC and Peak shall make semi-annual reports to Enforcement and NERC, which may be independent or joint reports, for one year after the Effective Date of this Agreement. Enforcement and NERC may require one additional year of semi-annual

20150526-3001 FERC PDF (Unofficial) 05/26/2015

reporting if circumstances indicate the need for further monitoring. The first semi-annual report for each entity shall cover the first six-month period after the Effective Date of this Agreement and shall be submitted to Enforcement and NERC staff within thirty days thereafter. The subsequent report(s) shall be due in six month increments thereafter. Each report shall detail the following: (1) actions taken as of the date of the report to satisfy the terms of the Agreement, including all Reliability Enhancements and (2) actions taken to improve reliability and/or reliability compliance, including investments in new measures and training activities during the reporting period. Peak shall also detail any additional possible violations, compliance exceptions, or self-logged issues of Reliability Standards by Peak identified by Peak or WECC or reported to WECC, and whether and how Peak has addressed those matters. The reports must include affidavits executed by officers of WECC and Peak, respectively, that the compliance reports are true and accurate and must also include corroborative documentation or other satisfactory evidence demonstrating or otherwise supporting the content of these reports. Corroborative documentation shall include, at a minimum, the Operational Practices Survey results and a description of any actions planned in response to the Operational Practices Survey results, or, in the alternative, the results of other applicable monitoring and a description of any actions planned in response to those results. If, after WECC and/or Peak have fulfilled the semi-annual reporting requirement, either entity has not yet completed or implemented its mitigation or reliability activities, it shall continue to update Enforcement and NERC semi-annually on the progress and completion of the mitigation or reliability activities not yet completed or implemented. Updates shall include corroborative documentation or other satisfactory evidence of progress, completion or implementation.

VI. TERMS

57. The “Effective Date” of the Agreement shall be the date on which the Commission issues an order approving the Agreement without material modification. When effective, the Agreement shall resolve any and all reliability claims relating to the September 8 event within the jurisdiction of the Commission, and that occurred on or before the Effective Date, as to WECC, Peak or any affiliated entity.

58. Commission approval of the Agreement without material modification shall release WECC and Peak and forever bar the Commission and NERC from holding WECC or Peak, any affiliated entity, and any successor in interest to WECC or Peak liable for any and all claims within the jurisdiction of the Commission, arising out of any and all reliability matters related to the September 8 event or conduct addressed and stipulated to in this Agreement, that occurred on or before the Agreement’s Effective Date.

59. Failure to make timely civil penalty payments or to comply with the Reliability Enhancements, mitigation and reliability activities, and monitoring agreed to herein, or

20150526-3001 FERC PDF (Unofficial) 05/26/2015

any other provision of the Agreement, shall be deemed a violation of a final order of the Commission issued pursuant to the Federal Power Act (FPA), 16 U.S.C. §792, *et seq.*, and may subject WECC to additional action under the enforcement provisions of the FPA.

60. Failure to comply with the Reliability Enhancements, mitigation and reliability activities, and monitoring agreed to herein, or any other provision of the Agreement, shall be deemed a violation of a final order of the Commission issued pursuant to the Federal Power Act (FPA), 16 U.S.C. §792, *et seq.*, and may subject Peak to additional action under the enforcement provisions of the FPA.

61. If WECC does not make any portion of the civil penalty payment described above at the time(s) agreed by the parties, interest payable to the United States Treasury and NERC shall begin to accrue pursuant to the Commission's regulations at 18 C.F.R. § 35.19(a) (2) (iii) (2014) from the date that payment is due.

62. The Agreement binds WECC, Peak, and their agents, successors, and assignees. The Agreement does not create any additional or independent obligations on WECC or Peak, or any affiliated entity, its agents, officers, directors, or employees, other than the obligations identified in the Agreement.

63. The findings of violations detailed in the Agreement shall constitute prior violations for consideration in any future Commission or NERC enforcement proceeding against Peak or any successor.

64. The signatories to the Agreement agree that they enter into the Agreement voluntarily and that, other than the recitations set forth herein, no tender, offer or promise of any kind by any member, employee, officer, director, agent or representative of Enforcement, NERC, WECC or Peak has been made to induce the signatories or any other party to enter into the Agreement.

65. Unless the Commission issues an order approving the Agreement in its entirety and without material modification, the Agreement shall be null and void and of no effect whatsoever, and Enforcement, NERC, WECC, and Peak shall not be bound by any provision or term of the Agreement, unless otherwise agreed to in writing by Enforcement, NERC, WECC and Peak.

66. WECC and Peak agree that the Commission's order approving the Agreement without material modification shall be a final and unappealable order assessing a civil penalty under the Federal Power Act. WECC and Peak waive findings of fact and conclusions of law, rehearing of any Commission order approving the Agreement without material modification, and judicial review by any court of any Commission order approving the Agreement without material modification.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

67. The Agreement can be modified only if in writing and signed by Enforcement, NERC, WECC and Peak, and any modifications will not be effective unless approved by the Commission.

68. Each of the undersigned warrants that he or she is an authorized representative of the entity designated, is authorized to bind such entity and accepts the Agreement on the entity's behalf.

69. The undersigned representatives of WECC and Peak affirm that he or she has read the Agreement, that all of the matters set forth in the Agreement are true and correct to the best of his or her knowledge, information and belief, and that he or she understands that the Agreement is entered into by Enforcement and NERC in express reliance on those representations.

70. The Agreement may be signed in counterparts.

71. The Agreement is executed in quadruplicate, each of which so executed shall be deemed to be an original.

151 FERC ¶ 61,175
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Philip D. Moeller, Cheryl A. LaFleur,
Tony Clark, and Colette D. Honorable.

Western Electricity Coordinating Council Docket No. IN14-11-000

ORDER APPROVING STIPULATION AND CONSENT AGREEMENT

(Issued May 26, 2015)

1. The Commission approves the attached Stipulation and Consent Agreement (Agreement) among the Office of Enforcement (Enforcement), the North American Electric Reliability Corporation (NERC), Western Electricity Coordinating Council (WECC), and Peak Reliability (Peak). This order is in the public interest because it resolves on fair and reasonable terms an investigation of WECC (as the Reliability Coordinator (RC) for the Western Interconnection (WECC RC)), conducted by Enforcement in coordination with NERC and the Commission's Office of Electric Reliability (OER), into possible violations of Reliability Standards associated with WECC RC's oversight of a portion of the Bulk-Power System (BPS) and a blackout that occurred on September 8, 2011 (the September 8 event or the event). WECC agrees to pay a civil penalty of $16,000,000, of which $3,000,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $13,000,000 will be invested in reliability enhancement measures identified below that go above and beyond the Agreement's mitigation and reliability activities or what the Reliability Standards require (Reliability Enhancements). Peak did not exist as a separate entity at the time of the September 8 event, but is a party to the Agreement as the successor to WECC as the RC for the Western Interconnection. WECC and Peak also commit to certain mitigation and reliability activities, subject to compliance monitoring, as detailed in the Agreement.

I. Background

2. WECC is a non-profit, public service corporation and is not a load-serving entity. At the time of the event, WECC acted as both the Regional Entity (WECC RE) and the RC for the Western Interconnection. The WECC region at the time of the event extended from Canada to Mexico, was nearly 1.8 million square miles in size and served a population of 78 million. It included the Canadian provinces of Alberta and British Columbia, the northern part of Baja California, Mexico, the states of Washington,

20150526-3001 FERC PDF (Unofficial) 05/26/2015

Oregon, California, Idaho, Nevada, Utah, Arizona, Colorado, Wyoming, and portions of Montana, South Dakota, New Mexico, and Texas.

3. WECC's RE and RC functions were organized separately, but reported to the same WECC executive management. WECC RC was a NERC Registered Entity, and was the highest level of authority responsible for the reliable operation of the Bulk Electric System (BES) in the Western Interconnection.

4. The RC of the Western Interconnection (formerly WECC RC, now Peak) is responsible for overseeing operation of the Western Interconnection in real time, receiving data from entities throughout the entire Interconnection, and providing high-level situational awareness for the entire system. The RC has the authority to prevent or mitigate emergency operating conditions in the next-day and real-time timeframes. The RC may issue directives to other functional entities to ensure reliable operations. The RC performs reliability analyses including next-day planning and real-time contingency analysis (RTCA) for the Western Interconnection. The RC may also assist transmission operators (TOPs) in mitigating equipment overloads and coordinating restoration plans, contingency plans, and reliability-related services.

5. As the RE, WECC or its delegate, among other things, monitors compliance of Registered Entities (including, formerly, WECC RC and currently, Peak) with the Reliability Standards, under delegated authority from NERC.

6. On March 16, 2007, in Order No. 693,[1] the Commission approved the initial Reliability Standards, which became mandatory and enforceable within the contiguous United States on June 18, 2007.

7. After the event, WECC sought approval from the Commission to establish a new entity to perform the RC and interchange authority (IA) functions in the Western Interconnection. The bifurcation of WECC into two separate entities, WECC and Peak, received final approval from the Commission on February 12, 2014.[2] With the Commission's approval, WECC sub-delegated the RC and IA functions in the Western Interconnection to Peak. WECC has retained its RE responsibilities.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

8. WECC and Peak are subject to the Commission's regulation under section 215 of the Federal Power Act (FPA).[3]

9. The investigation of WECC arose out of a system disturbance that occurred on the afternoon of September 8, 2011 in the Pacific Southwest, which resulted in cascading outages and left approximately 2.7 million customers (equivalent to five million or more individuals) without power, some for multiple hours extending into the next day. The total load loss for the event was in excess of 30,000 MWh. The event started with a three-phase fault which led to the loss of Arizona Public Service Company's (APS) Hassayampa-N. Gila 500 kV transmission line (H-NG). This transmission line is a segment of the Southwest Power Link (SWPL), a major transmission corridor transporting power in an east-west direction, from generators in Arizona, through Imperial Irrigation District's (IID) service territory, into Southern California.

10. With the SWPL's major east-west corridor broken by the loss of H-NG, power flows instantaneously redistributed throughout the electric system in the Pacific Southwest and Southern California, increasing flows through lower voltage systems parallel to the SWPL as power continued to flow on a hot day during hours of peak demand.

11. These redistributed flows traveled through IID's and Western Area Power Administration-Desert Southwest Region's (Western-DSW) facilities, onto WECC Path 44, an aggregation of five 230 kV transmission lines that deliver power in a north-south direction from Southern California Edison Company's (SCE) territory in Los Angeles to San Diego Gas & Electric (SDG&E). The increased power flows parallel to the SWPL, together with lower than peak generation levels in California and Mexico, led to significant voltage deviations and transmission equipment overloads. The flow redistributions, voltage deviations, and resulting overloads had a cascading effect, as transmission and generation equipment tripped offline in a relatively short time period. Just seconds before the blackout, Path 44 carried all flows into San Diego as well as parts of Arizona and Mexico. This excessive loading on Path 44 initiated an intertie separation scheme owned and operated by SCE at the San Onofre switchyard. The California Independent System Operator (CAISO) is responsible for many of the TOP functions for SCE under a Coordinated Functional Registration. Initiation of the intertie separation scheme at the San Onofre switchyard separated SDG&E from Path 44, contributed to tripping the San Onofre Nuclear Generating Station nuclear units offline, and eventually resulted in the complete blackout of San Diego and Comisión Federal de Electricidad's Baja California Control Area in Mexico.

12. WECC RC was the highest reliability authority at the time of the event and maintained a wide-area view of the entire Interconnection. WECC RC was staffed with

[3] 16 U.S.C. § 824o (2012).

20150526-3001 FERC PDF (Unofficial) 05/26/2015

two operators (one real-time operator and one study desk operator) in each of its two regional offices at the time of the event.

13. Promptly after WECC RC's alarms reflected the loss of H-NG, WECC RC operators contacted APS, the operator of H-NG, to discuss the status of H-NG. APS operators informed WECC RC operators that APS could restore H-NG within minutes. WECC RC operators relied on the statement by APS operators that APS could restore H-NG within minutes, and issued no reliability directives in connection with the event, which lasted only 11 minutes (not including restoration). WECC RC and APS operators did not discuss the existing large phase angle difference between Hassayampa and N. Gila that needed to be addressed before H-NG could be returned to service.

14. Prior to the event, WECC RC conducted a next-day study for the entire Western Interconnection, using a model that included, among other equipment, IID's 230 /92 kV transformers. However, the study did not include the effects of the S-Line remedial action scheme (RAS) and separation scheme at the San Onofre switchyard. At the time of the event, WECC excluded from its interpretation of the definition of special protection systems/remedial action schemes (SPSs/RASs) certain types of protection systems, including the S-Line RAS and the separation scheme at the San Onofre switchyard. As a result, WECC RC and the TOPs did not study those systems and schemes. Additionally, WECC RC only reviewed the TOPs' next-day studies when it identified an issue in its own next-day study. WECC RC did not review IID's next-day study for September 8.

15. WECC RC was responsible for monitoring all critical facilities in the Western Interconnection, which may include facilities below 100 kV, as necessary to ensure that at any time, regardless of unplanned events, it was able to determine system operating limits (SOLs) and interconnection reliability operating limits (IROLs), and to know the status of all critical facilities whose failure could result in an SOL or IROL exceedance. On September 8, a WECC RC operator was alerted by an alarm in real time to the fact that IID's 230/92 kV Coachella Valley transformers had tripped (WECC RC had real-time visibility of the transformers even though they were not classified as BES facilities at the time), but was unaware that those transformers tripping could result in a previously unidentified IROL. The September 8 event also exposed SOLs that were previously unrecognized by WECC RC, by revealing that operating WECC Path 44 to an SOL of 2,200 MW, and H-NG (a portion of WECC Path 49), to a limit of 1800 MW, would expose the WECC RC area to cascading outages.

16. Prior to the event, the Operating Practices Subcommittee of WECC's Operating Committee stated an operating philosophy that no IROLs existed under normal operating conditions. As a result, WECC RC did not recognize any IROLs in the Western Interconnection. Following the exposure of the Coachella Valley 230/92 transformers IROL by the September 8 event, WECC RC has since recognized the existence of several IROLs in the Western Interconnection, and Peak continues to analyze the Interconnection

20150526-3001 FERC PDF (Unofficial) 05/26/2015

for additional IROLs. At the time of the event WECC RC also delegated to TOPs the responsibility for identifying criteria that determine when violating an SOL qualifies as an IROL.

17. WECC RC was aware of post-contingency overloads within Western-DSW and IID, but did not alert Western-DSW and IID to these potential transmission problems.

II. Investigation

18. On September 9, 2011, the Commission and NERC announced a joint inquiry to determine how the blackout occurred and to make recommendations to avoid similar situations in the future. The inquiry team, comprised of Commission and NERC staff, used on-site visits and interviews, detailed computer modeling, event simulations, and system analyses to make its findings and recommendations for preventing similar events in the future. The inquiry determined that entities responsible for planning and operating the BPS were not prepared to ensure reliable operation or prevent cascading outages in the event of a single contingency. On May 1, 2012, the inquiry team published a report entitled *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (the Report), which is hereby incorporated by reference.[4] The Report discusses a detailed sequence of events, simulations, and findings related to the causes of the cascading outages. The Report also makes twenty-seven recommendations related to next-day planning, seasonal planning, near- and long-term planning, situational awareness, consideration of BES equipment, SOLs and IROLs, and protection systems.

19. Following publication of the Report, Enforcement, OER, and NERC staff reviewed the data gathered during the inquiry for compliance implications. At the direction of the Commission, Enforcement initiated non-public investigations of several entities, including WECC, under Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014), which were conducted jointly with NERC.

20. Enforcement and NERC determined that WECC violated the Facilities Design, Connection and Maintenance (FAC) and Interconnection Reliability Operations and Coordination (IRO) groups of Reliability Standards. The IRO Reliability Standards "detail the responsibilities and authorities of [an RC]," and "establish requirements for data, tools and wide-area view, all of which are intended to facilitate [an RC's] ability to perform its responsibilities and ensure the reliable operation of the interconnected grid."[5] The FAC standards at issue aim to ensure that SOLs are determined based on an established methodology.

---

[4] *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (April 2012), *available at* http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf.

[5] Order No. 693 at P 888.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

21. Enforcement and NERC determined that WECC RC violated nine Requirements of five Reliability Standards: FAC-011-2 R3; FAC-014-2 R1; IRO-003-2 R1 and R2; IRO-004-1 R1; and IRO-005-2 R5, R9, R12, and R15—stemming from its role in the September 8 event.

22. Enforcement and NERC staff determined that WECC RC violated IRO-003-2 R1 and R2 because WECC RC was unaware that IROLs such as the Coachella Valley 230-92 kV transformers existed in its control area, and thus did not determine or prevent IROL violations on September 8, 2011.

23. Enforcement and NERC staff determined that WECC RC violated IRO-004-1 R1 and IRO-005-2 R5, R9, and R15 because it did not identify the cause of potential and actual SOL and IROL violations on Paths 44 and 49, mitigate the violations, and alert impacted TOPs and BAs in its area.

24. Enforcement and NERC staff determined that WECC RC violated IRO-005-2 R12 because it was not aware of the impact of the S-line RAS and separation scheme at the San Onofre switchyard.

25. Enforcement and NERC staff determined that WECC RC violated FAC-011-2 R3 and FAC-014-2 R1 as a result of inadequacies in its SOL methodology that resulted in the establishment of unreliable SOLs for Paths 44 and 49 and the failure to identify IROLs.

III. Stipulation and Consent Agreement

26. Enforcement, NERC, WECC and Peak resolved this matter by means of the attached Agreement. WECC stipulates to the facts recited in the Agreement and agrees to pay a civil penalty of $16,000,000, of which $3,000,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $13,000,000 will be invested by WECC and Peak in Reliability Enhancements that go above and beyond the requirements of the Reliability Standards, as described in the Agreement. WECC and Peak also agree to mitigation and reliability activities, and to submit to compliance monitoring, as specified in the Agreement. WECC neither admits nor denies that its actions constituted violations of the Reliability Standards.

27. In determining the appropriate sanction, Enforcement considered that WECC has made significant efforts to date to address reliability concerns identified in the inquiry and investigation and also by WECC on its own initiative. WECC also cooperated with Enforcement and NERC during the investigation.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

IV. Determination of the Appropriate Sanctions

28. The civil penalty amount is consistent with the Penalty Guidelines.[6] Enforcement considered that the event caused a loss of 10,000 or more MWh of firm load, and WECC was allocated a share of the base penalty due to its role as the RC. WECC RC also had a prior history of violations of the Reliability Standards, including two violations based on conduct substantially similar to that at issue in this event.[7] The civil penalty amount reflects credit for WECC's cooperation during the course of the investigation, as well as credits for avoiding a trial-type hearing and having an effective compliance program.

29. The Commission concludes that the penalties and other sanctions set forth in the Agreement are a fair and equitable resolution of this matter and are in the public interest. The Commission also concludes that the reliability enhancement, mitigation and reliability activities set forth in the Agreement will enhance the reliability of the BPS and are therefore also fair and in the public interest.

The Commission orders:

The attached Stipulation and Consent Agreement is hereby approved without modification.

By the Commission. Chairman Bay is not participating.

(S E A L)

Kimberly D. Bose,
Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Western Electricity Coordinating Council) Docket No. IN14-11-000

STIPULATION AND CONSENT AGREEMENT

I. INTRODUCTION

1. Staff of the Office of Enforcement (Enforcement) of the Federal Energy Regulatory Commission (Commission), the North American Electric Reliability Corporation (NERC), Western Electricity Coordinating Council (WECC), and Peak Reliability (Peak) enter into this Stipulation and Consent Agreement (Agreement) to resolve a non-public investigation conducted by Enforcement and NERC pursuant to Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014). The investigation examined possible violations of NERC Reliability Standards by WECC as the Reliability Coordinator (RC) for the Western Interconnection (WECC RC)) related to a system event in the Pacific Southwest on September 8, 2011 (September 8 event or event). WECC neither admits nor denies that WECC RC violated the Reliability Standards described in the Agreement, but agrees to pay a total civil penalty of $16,000,000, of which $3,000,000 will be paid to the United States Treasury and NERC, divided in equal amounts, and $13,000,000 will be invested in reliability enhancement measures identified below that go above and beyond the Agreement's mitigation and reliability activities or what the Reliability Standards require (Reliability Enhancements). Peak did not exist as a separate entity at the time of the September 8 event, but is a party to the Agreement as the successor to WECC as the RC for the Western Interconnection. WECC and Peak also commit to certain measures, subject to compliance monitoring, as detailed in the Agreement.

II. STIPULATED FACTS

2. Enforcement, NERC, and WECC and Peak hereby stipulate and agree to the following facts.

A. WECC

3. WECC is a non-profit, public service corporation and is not a load-serving entity. WECC is funded by assessments to load-serving entities, among others. At the time of the event, WECC acted as both the Regional Entity (WECC RE) and the RC for the Western Interconnection. These functions were organized separately, but reported to the same WECC executive management. WECC RC was a NERC Registered Entity, and was the highest level of authority responsible for the reliable operation of the Bulk Electric System (BES) in the Western Interconnection.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

4. The RC of the Western Interconnection (formerly WECC RC, now Peak) is responsible for overseeing operation of the Western Interconnection in real time, receiving data from entities throughout the entire Interconnection, and providing high-level situational awareness for the entire system. The RC has the authority to prevent or mitigate emergency operating conditions in the next-day and real-time timeframes. The RC may issue directives to other functional entities to ensure reliable operations. The RC performs reliability analyses including next-day planning and real-time contingency analysis (RTCA) for the Western Interconnection. The RC may also assist transmission operators (TOPs) in mitigating equipment overloads and coordinating restoration plans, contingency plans, and reliability-related services.

5. As the RE, WECC or its delegate, among other things, monitors compliance of Registered Entities (including, formerly, WECC RC and currently, Peak) with the Reliability Standards, under delegated authority from NERC.

6. After the event, WECC sought approval from the Commission to establish a new entity to perform the RC and interchange authority (IA) functions in the Western Interconnection. The bifurcation of WECC into two separate entities, WECC and Peak, received final approval from the Commission on February 12, 2014.[1] With the Commission's approval, WECC sub-delegated the RC and IA functions in the Western Interconnection to Peak. WECC has retained its RE responsibilities.

B. Event Description

7. During an 11-minute period on the afternoon of September 8, 2011, a system disturbance occurred in the Pacific Southwest, resulting in cascading outages and leaving approximately 2.7 million customers without power, some for multiple hours extending into the next day. The total load loss for the event was in excess of 30,000 MWh. The event started with a three-phase fault which led to the loss of Arizona Public Service's (APS) Hassayampa-N. Gila 500 kV transmission line (H-NG). This transmission line is a segment of the Southwest Power Link (SWPL), a major transmission corridor transporting power in an east-west direction, from generators in Arizona, through the service territory of Imperial Irrigation District (IID), into Southern California.

8. With the SWPL's major east-west corridor broken by the loss of H-NG, power flows instantaneously redistributed throughout the electric system in the Pacific Southwest and Southern California, increasing flows through lower voltage systems parallel to the SWPL as power continued to flow on a hot day during hours of peak demand.

---

[1] *See North American Electric Reliability Corp.*, 146 FERC ¶ 61,092 (2014*), reh'g denied*, 147 FERC ¶ 61,064 (2014) (accepting compliance filings submitted by NERC and WECC and eliminating all final obstacles to bifurcation), appeal docketed *sub nom Edison Electric Institute v. FERC*, No. 14-1071 (D.C. Cir. May 9, 2014).

20150526-3001 FERC PDF (Unofficial) 05/26/2015

9. These redistributed flows traveled through IID's and Western Area Power Administration – Desert Southwest Region's facilities (Western-DSW), onto WECC Path 44, an aggregation of five 230 kV transmission lines that deliver power in a north-south direction from Southern California Edison Company's (SCE) territory in Los Angeles to San Diego Gas and Electric (SDG&E). The increased power flows parallel to the SWPL, together with lower than peak generation levels in California and Mexico, led to significant voltage deviations and transmission equipment overloads. The flow redistributions, voltage deviations, and resulting overloads had a cascading effect, as transmission and generation equipment tripped offline in a relatively short time period. Just seconds before the blackout, Path 44 carried all flows into San Diego as well as parts of Arizona and Mexico. This excessive loading initiated an intertie separation scheme owned and operated by SCE at the San Onofre switchyard. The California ISO (CAISO) is responsible for many of the TOP functions for SCE under a Coordinated Functional Registration. Initiation of the intertie separation scheme at the San Onofre switchyard separated SDG&E from Path 44, contributed to tripping the San Onofre Nuclear Generation Station nuclear units offline, and eventually resulted in the complete blackout of San Diego and Comisión Federal de Electricidad's Baja California Control area.

10. WECC RC was the highest reliability authority at the time of the event and maintained a wide-area view of the entire Interconnection. WECC RC was staffed with two operators (one real-time operator and one study desk operator) in each of its two regional offices at the time of the event.

11. Promptly after WECC RC's alarms reflected the loss of H-NG, WECC RC operators contacted APS, the operator of H-NG, to discuss the status of H-NG. APS operators informed WECC RC operators that APS could restore H-NG within minutes. WECC RC operators relied on the statement by APS operators that APS could restore H-NG within minutes, and issued no reliability directives in connection with the event, which lasted only 11 minutes (not including restoration). WECC RC and APS operators did not discuss the existing large phase angle difference between Hassayampa and N. Gila that needed to be addressed before H-NG could be returned to service.

12. Prior to the event, WECC RC conducted a next-day study for the entire Western Interconnection, using a model that included, among other equipment, IID's 230 /92 kV transformers. However, the study did not include the effects of the S-Line remedial action scheme (RAS) and separation scheme at the San Onofre switchyard. At the time of the event, WECC excluded from its interpretation of the definition of special protection systems/remedial action schemes (SPSs/RASs) certain types of protection systems, including the S-Line RAS and the separation scheme at the San Onofre switchyard, among others. As a result, WECC RC and the TOPs did not study those systems and schemes. Additionally, WECC RC only reviewed the TOPs' next-day studies when it identified an issue in its own next-day study. WECC RC did not review IID's next-day study for September 8.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

13. WECC RC was responsible for monitoring all critical facilities in the Western Interconnection, which may include facilities below 100 kV, as necessary to ensure that at any time, regardless of unplanned events, it was able to determine system operating limits (SOLs) and interconnection reliability operating limits (IROLs), and to know the status of all critical facilities whose failure could result in an SOL or IROL exceedance. On September 8, a WECC RC operator was alerted by an alarm in real time to the fact that IID's 230/92 kV Coachella Valley transformers had tripped (WECC RC had real-time visibility of the transformers even though they were not classified as BES facilities at the time), but was unaware that those transformers tripping could result in a previously unidentified IROL. The September 8 event also exposed SOLs that were previously unrecognized by WECC RC, by revealing that operating WECC Path 44 to an SOL of 2,200 MW, and H-NG (a portion of WECC Path 49) to a limit of 1800 MW, would expose the WECC RC area to cascading outages.

14. Prior to the event, the Operating Practices Subcommittee of WECC's Operating Committee stated an operating philosophy that no IROLs existed under normal operating conditions. As a result, WECC RC did not recognize any IROLs in the Western Interconnection. Following the exposure of the Coachella Valley 230-92 transformers IROL by the September 8 event, WECC RC has since recognized the existence of several IROLs in the Western Interconnection, and Peak continues to analyze the Interconnection for additional IROLs. At the time of the event WECC RC also delegated to TOPs the responsibility for identifying criteria that determine when violating an SOL qualifies as an IROL.

15. WECC RC was aware of post-contingency overloads within Western-DSW and IID, but did not alert Western-DSW and IID to these potential transmission problems.

III. INQUIRY AND INVESTIGATION

16. On September 9, 2011, the Commission and NERC announced a joint inquiry to determine how the blackout occurred and to make recommendations to avoid similar situations in the future. The inquiry team, comprised of Commission and NERC staff, used on-site visits and interviews, detailed computer modeling, event simulations, and system analyses to make its findings and recommendations for preventing similar events in the future. The inquiry determined that entities responsible for planning and operating the bulk-power system (BPS) were not prepared to ensure reliable operation or prevent cascading outages in the event of a single contingency. On May 1, 2012, the inquiry team published a report entitled *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (the Report), which is hereby incorporated by reference.[2] The Report discusses a detailed sequence of events, simulations, and findings

[2] *Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations* (April 2012), *available at* http://www.ferc.gov/legal/staff-reports/04-27-2012-ferc-nerc-report.pdf.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

related to the causes of the cascading outages. The Report also makes twenty-seven recommendations related to next-day planning, seasonal planning, near- and long-term planning, situational awareness, consideration of BES equipment, SOLs and IROLs, and protection systems.

17. Following publication of the Report, Enforcement and NERC reviewed the data gathered during the inquiry for compliance implications. As a result of that review, Enforcement and NERC initiated non-public investigations of several entities, including WECC, under Part 1b of the Commission's regulations, 18 C.F.R. Part 1b (2014).

18. Enforcement and NERC determined that WECC violated nine Requirements of five Reliability Standards, and found these violations undermined the reliability of the BPS and contributed to the September 8 event. Enforcement and NERC recognized, however, that after the event, and during the inquiry and investigation, WECC voluntarily began making improvements in its planning and operations, and implementing recommendations from the Report, that addressed many of the findings arising from the Report. WECC established an online Dashboard to track its progress. In addition, WECC cooperated with Enforcement and NERC during the investigation.

19. As part of the investigation, Enforcement and NERC reviewed WECC's compliance program (as it existed at the time of the event) and found that WECC satisfied the criteria for an effective compliance program under the Commission's Penalty Guidelines.[3] Enforcement and NERC considered the elements of WECC's compliance program set forth in this paragraph. At the time of the September 8 event, WECC RC had a formal compliance program. WECC RC had a designated Compliance Manager, who had direct access to WECC senior executives and, as necessary, the WECC board. All WECC team members were expected to collaborate in the implementation of practices and policies meant to ensure compliance with all rules and regulations. All WECC team members underwent mandatory training on the Reliability Standards relevant to their positions, as well as training on the benefits of compliance and the risks of non-compliance. Peak has built upon WECC's compliance program. Under Peak's current program, the Compliance Director reports directly to the President and Chief Executive Officer, with access to the Chair of the Board of Directors as needed. The Compliance Director is directly supported by an Operations Compliance Specialist and CIP Compliance Specialist, with all Peak team members required to collaborate to develop and implement policies, procedures, work practices and technologies to ensure compliance with the Reliability Standards. Peak has a "Compliance Open Door Policy" that encourages all team members to bring compliance issues to the attention of management, whether through direct report to the Compliance Director, or anonymous

[3] *Enforcement of Statutes, Orders, Rules and Regulations,* 132 FERC ¶ 61,216, § 1B2.1 (2010).

20150526-3001 FERC PDF (Unofficial) 05/26/2015

reporting to a third-party compliance reporting service provider. All Peak team members undergo mandatory compliance training relevant to their positions, and new hires are trained on the Reliability Standards, benefits of compliance, risks of non-compliance, the Compliance Open Door Policy, and Peak's rewards for compliance and disciplinary measures for non-compliance.

IV. ENFORCEMENT AND NERC FINDINGS OF VIOLATIONS

20. Enforcement and NERC staff determined that WECC RC violated the following Requirements of the Reliability Standards: FAC-011-2 R3; FAC-014-2 R1; IRO-003-2 R1 and R2; IRO-004-1 R1; and IRO-005-2 R5, R9, R12, and R15.[4] Enforcement and NERC staff determined that WECC RC violated IRO-003-2 R1 and R2 because WECC RC was unaware that IROLs existed in its control area and were violated on September 8, 2011. Enforcement and NERC staff determined that WECC RC violated IRO-004-1 R1 and IRO-005-2 R5, R9, and R15 because it did not identify the cause of potential and actual SOL and IROL violations, mitigate the violations, and alert impacted TOPs and Balancing Authorities (BAs) in its area. Enforcement and NERC staff determined that WECC RC violated IRO-005-2 R12 because it was not aware of the impact of the S-line RAS and separation scheme at the San Onofre switchyard. Lastly, Enforcement and NERC staff determined that WECC RC violated FAC-11-2 R3 and FAC-014-2 R1 for inadequacies in its SOL methodology that resulted in the establishment of unreliable SOLs and the failure to identify IROLs.

V. REMEDIES AND SANCTIONS

21. WECC stipulates to the facts as described in Section II of this Agreement, but neither admits nor denies Enforcement's and NERC's findings that WECC RC violated the Reliability Standards specified in Section IV. For purposes of settling any and all disputes within the jurisdiction of the Commission arising from any and all reliability matters related to the September 8 event, or Enforcement's and NERC's investigation, WECC agrees to the remedies and sanctions set forth in the following paragraphs assigned to WECC, including the entire cash payment to Treasury and NERC, and Peak agrees to the remedies assigned to Peak. Pursuant to the Revised Reliability Coordinator and Interchange Authority Agreement between the Western Electricity Coordinating Council and Peak Reliability (RC Agreement), Peak is responsible for reporting obligations and enforcement conditions relating to its role as the RC, and WECC is responsible for reporting obligations and enforcement conditions relating to its role as the RE.

[4] As noted in paragraphs 1 and 21, WECC neither admits nor denies the findings by Enforcement and NERC regarding violations of the Reliability Standards, and use of the term mitigation is not meant to imply otherwise.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

A. Civil Penalty

22. WECC shall pay a total civil penalty of $16,000,000, of which $3,000,000 shall be paid, divided in equal amounts, to the United States Treasury and NERC. $1,000,000, divided equally between the United States Treasury and NERC, shall be due within ten days of the Effective Date of the Agreement. $1,000,000, divided equally between the United States Treasury and NERC, shall be due within one year from the Effective Date and $1,000,000, divided equally between the United States Treasury and NERC, shall be due within two years of the Effective Date. Enforcement and NERC agree to give WECC a partial civil penalty offset for the remaining $13,000,000 in exchange for WECC and Peak implementing the Reliability Enhancements as set forth in section V.B. The value of the Reliability Enhancements is expected to substantially exceed the amount of the offset.

B. Reliability Enhancements

23. In exchange for the $13,000,000 offset, WECC and Peak have completed or shall complete the following Reliability Enhancements:

a. WECC RC partially increased, and Peak has continued to and shall increase, staffing of the RC function from the staffing in effect on September 8, 2011, by 61 full-time equivalent positions, including 18 RC operators. Peak shall maintain the additional 18 RC operator positions at least through December 31, 2016; and

b. WECC completed bifurcation of the RE function of WECC from the RC function, with the RC function sub-delegated to Peak on February 14, 2014.

24. WECC and Peak will provide Enforcement and NERC with satisfactory evidence that investments to date in the Reliability Enhancements have substantially exceeded $13,000,000.

C. Completed and Required Mitigation and Reliability Activities

25. WECC and Peak, respectively, commit to the designated actions in this Section V.C. As indicated below, WECC and Peak affirm that they have already completed most of the mitigation and reliability activities, and shall complete all remaining mitigation and reliability activities no later than one year after the Effective Date of the Agreement, unless otherwise stated in Section V.C. WECC and Peak shall continue operating consistent with the completed and required mitigation and reliability activities, until they implement improved practices and procedures in accordance with the Reliability Standards in existence now or in the future. Until WECC and Peak have completed all mitigation and reliability activities and Reliability Enhancements, any material alterations in the mitigation and reliability activities set forth in Section V.C. shall be approved by

20150526-3001 FERC PDF (Unofficial) 05/26/2015

Enforcement and NERC staff, such approval not to be unreasonably withheld. WECC and Peak will individually or jointly report on the status of all mitigation and reliability activities described in this Section V.C. and submit evidence of progress and/or completion in their compliance monitoring reports to be submitted to Enforcement and NERC pursuant to Section V.D of this Agreement. WECC and Peak agree to work cooperatively to provide Enforcement and NERC staff with information necessary to confirm that all mitigation and reliability activities have been completed.

i. Seasonal, Next-Day and Current-Day Planning

26. Peak now shares its next-day study, as well as study inputs such as outages and interchange, electronically on a daily basis with all WECC entities that have executed the Universal Data Sharing Agreement (UDSA). WECC RC and Peak created additional formats for TOPs to review the RC studies, including Power System Simulator for Engineering (PSS/E) and Positive Sequence Load Flow (PSLF). After the September 8 event, WECC and Peak obtained executed UDSAs from all Western Interconnection BAs, TOPs and Transmission Owners (TOs). Peak and the TOPs are engaged in negotiations to renew the UDSA. The Peak Board of Directors has established a bridge policy to ensure that access to data sharing is maintained during the negotiations.

27. Peak has improved the forecasting of interchange between TOPs by working with BAs to identify the reasons for forecasting errors, and to improve the unit commitment data provided to the RC. Peak worked with the BAs to address unit commitment data issues that were identified by a task force that reviewed input data issues related to the RC's next-day studies. All data issues related to unit commitment and interchange forecasting identified by the task force have been remedied.

28. By June 30, 2015, WECC will issue a guideline outlining best practices for next-day studies, which will be posted on the WECC website. WECC will monitor the effectiveness of this guideline through a next-day study working group and the annual Operational Practices Survey, or other appropriate means.

29. In February 2014, WECC issued its "Pre/Post-Contingency Guideline," which guides TOPs to take pre-contingency mitigation measures when potential post-contingency conditions could exceed the TOPs' highest emergency rating for a facility. The Guideline also reminds TOPs to consider the time necessary to take mitigation actions, and to consider the effect of relays that automatically isolate facilities without providing time for mitigating measures. WECC has posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

30. Peak shall coordinate the seasonal planning process for its RC area. Seasonal planning by TOPs in the Western Interconnection begins with the operational base cases prepared by WECC. WECC shall continue to prepare operational base cases. WECC

20150526-3001 FERC PDF (Unofficial) 05/26/2015

and Peak shall cooperate, to the extent applicable, to gather information from TOPs to update the operational base cases. WECC RC and Peak have worked with the sub regional study groups to facilitate a consistent method for seasonal planning, including consistency in system conditions to be evaluated and consistency in process. WECC RC also worked with the sub regional study groups to improve coordination between seasonal study planners and operators. Peak shall require, per its SOL methodology and seasonal coordination process, that the seasonal planning for the Western Interconnection includes all critical internal and external conditions and contingencies, including generation and transmission outages, transfers, and demand patterns, including non-peak demand patterns. Critical internal and external facilities may be sub-100 kV, if they impact the BES. To the extent required by changes to the Reliability Standards related to planning, Peak will consult with FERC and NERC on how to satisfy the measures contained in this paragraph.

31. WECC has developed a procedure to perform N-1 contingency analysis on operational base cases for the Western Interconnection. WECC will implement this procedure by June 30, 2015, and will provide the results of its analysis to the area coordinators within 30 days after WECC completes its analysis.

j. Near- And Long-Term Planning

32. WECC established the Planning Coordinator Function Task Force to identify the current Planning Coordinator (PC) issues in the Western Interconnection, evaluate gaps in PC coverage in the Western Interconnection and to develop a methodology, procedures and implementation plan for addressing the PC issues in the Western Interconnection. In addition, using the results of a survey issued to registered PCs, WECC has identified those facilities within each current PC area, as well as facilities in areas for which no PC has been identified. WECC shall provide the Planning Coordinator Function Task Force's report (and any other deliverables) to Enforcement and NERC within 7 days of completion by the Task Force. After receipt of the report and deliverables, WECC, Peak, and FERC and NERC staff shall confer and cooperate in order to reach an agreement on a solution for the PC issues in the Western Interconnection, especially the gaps in PC coverage and seams issues.[5]

33. In July, 2014, WECC issued a BES Inclusion Guideline, which recognized that non-BES, or sub-100 kV, facilities may be important to the reliability of the Interconnection. The Guideline helps registered entities identify such facilities, and encourages, but does not require, registered entities to consider facilities for inclusion in

[5] Seams issues refers to the fact that transmission lines, interchange and loop flow patterns, among other characteristics of the BES, cross the boundaries between entities or sub regional groups, and thus may not be consistently analyzed by any individual entity or sub regional group.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

the BES through the NERC exception procedures. Among other situations that might qualify a non-BES facility for inclusion through the NERC exception procedures are facilities identified as a significant contributing factor in an event analysis report, or where the facility's single-contingency outage changes the flow on any BES element by more than 10 percent. WECC will monitor the effectiveness of the guideline through its annual Operational Practices Survey, or other appropriate means.

k. Protection Systems

34. Peak has included 239 additional RASs, and greater specificity about the existing RASs, in the models used for Peak's RTCA. Peak has also added 212 additional RASs to its Supervisory Control and Data Acquisition (SCADA) displays, and 4701 additional RAS Inter-Control Center Communication Protocol points, since the event.

35. By March 31, 2016, WECC will have developed the capability for entities to model RASs so that they can be added to its powerflow base cases. By June 30, 2016, WECC will update the Data Preparation Manual to include the requirement for data submitters to include RAS models in their submittal to WECC. WECC will produce the first powerflow base case to include RAS models by July 2016. By June 30, 2017, all WECC base cases shall include all (1) RASs, and (2) overcurrent protection relays with inter-TOP impact, known to WECC to exist in the Western Interconnection as of the Effective Date. In the interim, WECC collected and posted some data on RASs and relays with inter-TOP impact so that entities can model those impacts until those RASs and relays are modeled in the WECC base cases. Any RASs installed in the Western Interconnection after June 30, 2016 and known to WECC to exist shall be modeled in the base cases as soon as practicable in coordination with WECC's established base case production schedule.

36. WECC developed and adopted the Regional Criterion entitled "Remedial Action Scheme Review and Assessment Plan, PRC-(012 through 14)-WECC-CRT-2," which became effective January 1, 2014 (an earlier version became effective in October 2011). This criterion requires TOs, Generator Owners and Distribution Providers to submit data on RASs initially and before putting any changes or new RASs in service, to review the information in WECC's Remedial Action Scheme Database annually for accuracy, and to assess their RASs for operation, coordination, and effectiveness at least once every five years, among other requirements. This criterion also requires WECC's Remedial Action Scheme Reliability Subcommittee (RASRS) to review each RAS submitted to the RASRS for compliance with designated Reliability Standards, including Standards within the Transmission Planning and Protection Systems groups. As a result of this criterion, WECC has gathered data on multiple existing and new schemes. In addition, the RASRS chair issued a data request to all Western Interconnection TOPs requesting them to provide information on any tie line schemes or safety nets within their systems. That effort identified 25 additional RASs from seven entities that were incorporated into the Remedial Action Scheme Database. The information collected through the criterion will

20150526-3001 FERC PDF (Unofficial) 05/26/2015

facilitate the WECC modeling process and assist in the identification of interaction among RASs.

37. WECC prepared a white paper on "The Recognition of Power Plant Control, Protection and Operation in Transmission Simulation Studies," which was posted on the WECC website.

38. In November, 2012, WECC issued its Guideline for Protection System Loadability. The guideline encourages TOPs to set load-responsive relays that are operated in parallel with the BES, but not subject to Reliability Standard PRC-023, to use one of the setting criteria from PRC-023. The Guideline also addresses phase angle differences used when reclosing a breaker, encouraging the TOPs to provide visibility of the phase angle difference by means that could include planning studies, State Estimator, Real-time Contingency Analysis (RTCA), Phasor Measurement Units, or synch check relays. WECC posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

l. Angular Separation

39. Since September 2011, WECC RC and Peak have improved the ability of the RC to estimate phase angle differences. Peak can monitor estimated or expected (post-contingency) phase angles using Real-time State Estimation and RTCA. A procedure exists, called *Monitoring Heavy E-W Flows on SWPL*, which describes action to be taken by the RC operator when exceeding phase angle line reclosure limits (synch check relay thresholds) on the SWPL. In addition to its focused monitoring of the phase angles on the SWPL, Peak also monitors fifteen other node-pairs in the Western Interconnection for, among other things, excessive phase angles. If a relevant line is open and results in the exceedance of a node-pair phase angle limit, Peak RC System Operators will see that exceedance in Peak's Energy Management System (EMS) applications. An actual exceedance of a node-pair phase angle limit is detected and reported in Peak's Real-time State Estimation. A post-contingency exceedance of a node-pair phase angle limit is detected and reported in Peak's RTCA and study contingency analysis applications. The node-pair phase angle limits currently implemented in Peak's EMS inform the RC System Operators that the relevant line cannot be reclosed because of the excessively high phase angle.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

m. System Operating Limits and Interconnection Reliability Operating Limits

40. After September 8, 2011, WECC began using a new SOL methodology, and further refined that methodology with its "Phase II SOL Methodology," Revision 7.0 of the SOL Methodology for the Operations Horizon, which became effective in March 2014. Among other things, the SOL Methodology currently in use by TOPs in the Western Interconnection and Peak instructs entities to assess projected system conditions as real time approaches to establish SOLs, and includes criteria for identifying the subset of SOLs that qualify as IROLs in real time, as well as a clearer definition of what is included in an SOL. The SOL methodology requires TOPs and the RC to operate in real time to the most restrictive of Facility Ratings, voltage limits, voltage stability limits, transient stability limits or WECC Path Ratings. Prior to the event, some TOPs operated only to Path Ratings or seasonally-determined SOLs. The SOL methodology also requires TOPs to use models for establishing SOLs and IROLs that include the entire WECC RC area, to include critical modeling details from other RC areas that would impact the facilities being studied, to model parallel sub-100 kV facilities (e.g., the Coachella Valley transformers), to include RASs/SPSs in their models where feasible, and to consider the impact of SPS/RAS actions when establishing SOLs and IROLs. Current IROLs recognized by Peak are posted online in the secure area of peakrc.org.

41. Peak shall make the following modifications to the SOL Methodology for the Operations Horizon:

a. Peak shall not exclude all load loss due to RAS/SPS actions for the purpose of determining whether an IROL exists, because to do so would have allowed the Coachella Valley transformers to elude recognition as an IROL; and

b. Peak shall justify the reason for the 1,000 MW cut-off for SOLs to be IROLs or establish a cut-off with technical justification.

n. Situational Awareness

42. Peak runs its RTCA every five minutes and Peak's RTCA results and certain State Estimator Savecases are immediately available to all TOPs and BAs in real time in the secure area of peakrc.org.

43. WECC RC began flagging and alarming the two Coachella Valley transformers in its RTCA shortly after the September 8, 2011 event. Peak shall continue to flag and alarm the Coachella Valley transformers.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

44. WECC RC and Peak have allowed TOPs to view the Coordinated Outage System once the TOPs executed the UDSA. All current TOPs have now executed the UDSA.[6]

45. WECC and Peak have increased real-time data sharing among TOPs by developing the WECC Operations Network guideline. WECC has posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

46. Peak has modified its data request to require each TOP to provide telephone notification to Peak when the TOP loses real-time data or RTCA. Peak will modify the Data Request to require notification either by telephone or by WECCNET, if possible.

47. WECC has issued a Real-Time Tools Guideline. Among other recommendations for best practices, it guides TOPs on the scope of their network model (to allow identification of external contingencies, for example), on how often to update their state estimator (every 10 minutes) and RTCA (at least every 30 minutes). WECC has posted this guideline on the WECC website, and will monitor its effectiveness through the annual Operational Practices Survey, or other appropriate means.

o. Emergency Operations

48. WECC has issued an Emergency Operations Procedure, which, among other things, defines the RC operator's role during emergency operations and in evaluating emergency conditions, including major system disturbances. The Procedure also provides specific guidance to RC operators on issuing "clear, concise and definitive" Reliability Coordinator Directives.

p. Modeling

49. WECC is developing the Base Case Coordination System (BCCS), to validate data automatically, build power flow base cases, and store dynamic data in a centralized, Web-accessible database. WECC is in the process of implementing the BCCS, and expects to fully implement the BCCS by June 30, 2016. WECC has offered training in the use of the BCCS to all TOPs in the Western Interconnection. If, despite its good faith and diligent efforts, WECC is unable to fully implement the BCCS due to irreconcilable technical issues or vendor performance, WECC, FERC and NERC staff shall confer and cooperate in order to reasonably address through other means any identified issues regarding validation of base case data or revision of power flow base cases.

[6] See paragraph 26 regarding the renegotiation of the UDSA, and interim measures to preserve data sharing.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

50. WECC and its Transmission Planners (TPs) have benchmarked their dynamic models against actual data from the September 8, 2011 event, as recommended by the Report. WECC worked with the TPs to identify modeling deficiencies and track improvements, and all modeling deficiencies identified as a result of the model validation process have been corrected.

51. WECC continues to reconcile its planning base cases to the Peak West-wide System Model used for operations, as recommended by the Report, and WECC and Peak continue to make any necessary changes in the two models.

52. WECC has added a generator tripping model to its base cases to provide an indication of when generators may trip during events.

53. WECC and Peak have conducted a two-phase study to identify facilities with at least one terminal below 100 kV that have an impact on the BES. In the first phase, WECC and Peak worked with TOPs to obtain a list of sub-100 kV facilities that the TOPs believed should be monitored due to potential loop flow, and performed a study using the Peak West-wide System Model. In the second phase, a study was conducted using WECC's planning model. WECC and Peak identified additional sub-100 kV facilities to be added to the Peak West-wide System Model and Peak's EMS model, and Peak is monitoring additional facilities identified by TOPs. Peak has alarmed all facilities identified through these studies in its EMS.

54. WECC will benchmark a base case, including dynamic models, on an annual basis, against actual system performance during the single most severe reportable disturbance that occurred on the Western Interconnection during the previous year. On a prospective basis, WECC will work with PCs and TPs to modify any discrepancies found between the base case (including dynamic models) and actual system performance.

q. **Voltage and Reactive Reserves**

55. WECC RC, and later Peak, implemented a voltage stability tool, the Region of Stability Excellence, or ROSE, which combines State Estimator and Phasor Measurement Unit (PMU) data for on-line calculation and visualization of the current operating point and its proximity to the voltage stability boundary, thus giving RC operators an improved awareness of system stability and potentially alerting them to impending system emergencies. Peak will fully implement ROSE by September 15, 2015. Peak will train all RC operators on ROSE.

D. Compliance Monitoring

56. WECC and Peak shall make semi-annual reports to Enforcement and NERC, which may be independent or joint reports, for one year after the Effective Date of this Agreement. Enforcement and NERC may require one additional year of semi-annual

20150526-3001 FERC PDF (Unofficial) 05/26/2015

reporting if circumstances indicate the need for further monitoring. The first semi-annual report for each entity shall cover the first six-month period after the Effective Date of this Agreement and shall be submitted to Enforcement and NERC staff within thirty days thereafter. The subsequent report(s) shall be due in six month increments thereafter. Each report shall detail the following: (1) actions taken as of the date of the report to satisfy the terms of the Agreement, including all Reliability Enhancements and (2) actions taken to improve reliability and/or reliability compliance, including investments in new measures and training activities during the reporting period. Peak shall also detail any additional possible violations, compliance exceptions, or self-logged issues of Reliability Standards by Peak identified by Peak or WECC or reported to WECC, and whether and how Peak has addressed those matters. The reports must include affidavits executed by officers of WECC and Peak, respectively, that the compliance reports are true and accurate and must also include corroborative documentation or other satisfactory evidence demonstrating or otherwise supporting the content of these reports. Corroborative documentation shall include, at a minimum, the Operational Practices Survey results and a description of any actions planned in response to the Operational Practices Survey results, or, in the alternative, the results of other applicable monitoring and a description of any actions planned in response to those results. If, after WECC and/or Peak have fulfilled the semi-annual reporting requirement, either entity has not yet completed or implemented its mitigation or reliability activities, it shall continue to update Enforcement and NERC semi-annually on the progress and completion of the mitigation or reliability activities not yet completed or implemented. Updates shall include corroborative documentation or other satisfactory evidence of progress, completion or implementation.

VI. TERMS

57. The “Effective Date” of the Agreement shall be the date on which the Commission issues an order approving the Agreement without material modification. When effective, the Agreement shall resolve any and all reliability claims relating to the September 8 event within the jurisdiction of the Commission, and that occurred on or before the Effective Date, as to WECC, Peak or any affiliated entity.

58. Commission approval of the Agreement without material modification shall release WECC and Peak and forever bar the Commission and NERC from holding WECC or Peak, any affiliated entity, and any successor in interest to WECC or Peak liable for any and all claims within the jurisdiction of the Commission, arising out of any and all reliability matters related to the September 8 event or conduct addressed and stipulated to in this Agreement, that occurred on or before the Agreement’s Effective Date.

59. Failure to make timely civil penalty payments or to comply with the Reliability Enhancements, mitigation and reliability activities, and monitoring agreed to herein, or

20150526-3001 FERC PDF (Unofficial) 05/26/2015

any other provision of the Agreement, shall be deemed a violation of a final order of the Commission issued pursuant to the Federal Power Act (FPA), 16 U.S.C. §792, *et seq.*, and may subject WECC to additional action under the enforcement provisions of the FPA.

60. Failure to comply with the Reliability Enhancements, mitigation and reliability activities, and monitoring agreed to herein, or any other provision of the Agreement, shall be deemed a violation of a final order of the Commission issued pursuant to the Federal Power Act (FPA), 16 U.S.C. §792, *et seq.*, and may subject Peak to additional action under the enforcement provisions of the FPA.

61. If WECC does not make any portion of the civil penalty payment described above at the time(s) agreed by the parties, interest payable to the United States Treasury and NERC shall begin to accrue pursuant to the Commission's regulations at 18 C.F.R. § 35.19(a) (2) (iii) (2014) from the date that payment is due.

62. The Agreement binds WECC, Peak, and their agents, successors, and assignees. The Agreement does not create any additional or independent obligations on WECC or Peak, or any affiliated entity, its agents, officers, directors, or employees, other than the obligations identified in the Agreement.

63. The findings of violations detailed in the Agreement shall constitute prior violations for consideration in any future Commission or NERC enforcement proceeding against Peak or any successor.

64. The signatories to the Agreement agree that they enter into the Agreement voluntarily and that, other than the recitations set forth herein, no tender, offer or promise of any kind by any member, employee, officer, director, agent or representative of Enforcement, NERC, WECC or Peak has been made to induce the signatories or any other party to enter into the Agreement.

65. Unless the Commission issues an order approving the Agreement in its entirety and without material modification, the Agreement shall be null and void and of no effect whatsoever, and Enforcement, NERC, WECC, and Peak shall not be bound by any provision or term of the Agreement, unless otherwise agreed to in writing by Enforcement, NERC, WECC and Peak.

66. WECC and Peak agree that the Commission's order approving the Agreement without material modification shall be a final and unappealable order assessing a civil penalty under the Federal Power Act. WECC and Peak waive findings of fact and conclusions of law, rehearing of any Commission order approving the Agreement without material modification, and judicial review by any court of any Commission order approving the Agreement without material modification.

20150526-3001 FERC PDF (Unofficial) 05/26/2015

67. The Agreement can be modified only if in writing and signed by Enforcement, NERC, WECC and Peak, and any modifications will not be effective unless approved by the Commission.

68. Each of the undersigned warrants that he or she is an authorized representative of the entity designated, is authorized to bind such entity and accepts the Agreement on the entity's behalf.

69. The undersigned representatives of WECC and Peak affirm that he or she has read the Agreement, that all of the matters set forth in the Agreement are true and correct to the best of his or her knowledge, information and belief, and that he or she understands that the Agreement is entered into by Enforcement and NERC in express reliance on those representations.

70. The Agreement may be signed in counterparts.

71. The Agreement is executed in quadruplicate, each of which so executed shall be deemed to be an original.

151 FERC ¶ 61,129
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Norman C. Bay, Chairman;
Philip D. Moeller, Cheryl A. LaFleur,
Tony Clark, and Colette D. Honorable.

North American Electric Reliability Corporation Docket No. RD14-14-000

ORDER APPROVING RELIABILITY STANDARD

(Issued May 13, 2015)

1. On September 15, 2014, the North American Electric Reliability Corporation (NERC) submitted a petition seeking approval of a modified Protection and Control (PRC) Reliability Standard PRC-004-3 (Protection System Misoperation Identification and Correction), pursuant to section 215(d) of the Federal Power Act (FPA).[1] The modified Reliability Standard requires transmission owners, generator owners, and distribution providers to identify and correct causes of misoperations[2] of certain protection systems.[3] NERC also requests approval of two new defined terms to include in the NERC Glossary of Terms Used in NERC Reliability Standards (NERC Glossary). Finally, NERC requests approval of the implementation plan for Reliability Standard PRC-004-3, as well as approval of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs).

2. As explained below, the Commission finds that revised Reliability Standard PRC-004-3, including the associated new Glossary terms and implementation plan, is just, reasonable, not unduly discriminatory or preferential and in the public interest. The Commission also approves the VSLs associated with the Reliability Standard, as

[1] 16 U.S.C. § 824o(d) (2012).

[2] The NERC Glossary defines "Misoperation" as "[t]he failure of a Composite Protection System to operate as intended for protection purposes. …"

[3] The NERC Glossary defines "Protection System" as "[p]rotective relays which respond to electrical quantities, communications systems necessary for correct operation of protective functions. …"

20150513-3069 FERC PDF (Unofficial) 05/13/2015

proposed by NERC. The Commission, however, directs NERC to submit a compliance filing, within 60 days of the issuance of this order, to address certain concerns regarding the VRF designations for Requirements R1 through R6, as described below.

I. Background

3. The Commission certified NERC as the Electric Reliability Organization (ERO), as defined in section 215 of the FPA, in July 2006.[4] In Order No. 693, the Commission approved 83 of 107 proposed Reliability Standards submitted by NERC, including approval of PRC-004-1 (Analysis and Mitigation of Transmission and Generation Protection System Misoperations).[5] In addition, the Commission directed that NERC (1) consider a commenter's suggestion regarding whether PRC-004-1 should apply to load serving entities and transmission operators; and (2) clarify what entity should develop the procedures for corrective action plans.[6]

4. Subsequently, NERC submitted, and the Commission approved, Reliability Standard PRC-004-2, which included modifications in response to the Commission's directives in Order No. 693.[7]

---

[6] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1469.

[7] *North American Electric Reliability Corp.*, 134 FERC ¶ 61,015 (2011). The Commission has also approved minor revisions to the standard, as well as an interpretation. *See Generator Requirements at the Transmission Interface*, Order No. 785, 144 FERC ¶ 61,221 (2012) (approving PRC-004-2.1a and clarifying that the requirements in PRC-004 extend not only to protection systems associated with the generating facility or station, but also to protection systems associated with the generator interconnection facilities); *North American Electric Reliability Corp.*, 136 FERC ¶ 61,208 (2011) (approving an interpretation for the term "transmission Protection System" as it appears in Requirements R1 and R3).

20150513-3069 FERC PDF (Unofficial) 05/13/2015

5. In Order No. 693, the Commission neither accepted nor remanded Reliability Standard PRC-003-1 (Regional Procedures for Analysis of Misoperations of Transmission and Generation Protection System). The Commission identified the standard as a "fill-in-the-blank" standard and noted that the associated regional procedures had not been submitted. Concluding that additional information was needed regarding the regional procedures, the Commission directed NERC to consider whether greater consistency can be achieved "on an Interconnection-wide basis" in Reliability Standard PRC-003-1.[8]

II. NERC's Petition

6. In its Petition, NERC explains that Reliability Standard PRC-004-3 was developed "as a means to address the reliability risks posed by misoperations."[9] According to NERC, the modified Reliability Standard, which replaces Reliability Standards PRC-004-2.1a and PRC-003-1, requires transmission owners, generator owners, and distribution providers to identify and correct causes of misoperations of certain protection systems. Noting that nearly all major system failures that are not related to severe weather include misoperations as a contributing factor, NERC states that PRC-004-3, in concert with a Section 1600 Misoperations Data Request, provides the means to address protection system misoperations. Specifically, NERC states "reducing the risk to reliability from Protection System misoperations will require consistent collection of Misoperation information along with systematic analysis and correction of the underlying causes of preventable Misoperations. Proposed PRC-004-3, and the parallel Section 1600 Data Request provide means to accomplish this systematic analysis and correction."[10]

7. Reliability Standard PRC-004-3, which applies to transmission owners, generator owners, and distribution providers, contains six requirements. Requirement R1 obligates an applicable entity "that owns a BES [bulk electric system] interrupting device that operated under [specified circumstances] shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation."[11] Pursuant to Requirement R2, an applicable entity must notify other protection system owners of a misoperation. Under Requirement R3, an entity that

[8] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1461.

[9] NERC Petition at 9.

[10] *Id.*

[11] *Id.* at 15.

20150513-3069 FERC PDF (Unofficial) 05/13/2015

owns a portion of a composite protection system[12] and receives notice under Requirement R2 has the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation to determine whether its protection system components caused a misoperation.

8. Requirement R4 requires an entity that owns a "BES interrupting device" to "perform investigative action(s)" to determine the cause or causes of an identified misoperation. NERC explains that an entity must perform at least one investigative action every two full calendar quarters until the investigation is complete. According to NERC, an investigation is considered complete when an entity identifies the cause of a misoperation or declares that no cause was determined.[13] Under Requirement R5, an applicable entity must, within 60 calendar days of identifying a cause of a misoperation, develop a corrective action plan to address the cause of the misoperation and to evaluate its applicability to the entity's protection systems installed in other locations, or explain why corrective actions are beyond the entity's control or would not improve bulk electric system reliability.[14] Finally, Requirement R6 requires entities to "implement" a corrective action plan developed under Requirement R5.

9. NERC explains that PRC-004-3 "eliminates the need for regional procedures by providing continent-wide parameters for investigating Protection System operations and identifying Misoperations," thereby addressing the Commission's concerns with consistency reflected in the Order No. 693 discussion of Reliability Standard PRC-003-1. In addition, NERC notes that proposed Reliability Standard PRC-004-3 applies to underfrequency load shedding "that is intended to trip one or more Bulk Electric System Elements" in order to close a reliability gap where misoperations of such relays were not previously addressed by a reliability standard.[15]

10. NERC states that the standard drafting team addressed the Commission's directive to consider whether to include load serving entities and transmission operators in the applicability section for Reliability Standard PRC-004-3. According to NERC, the standard drafting team concluded that "the proper functional entities to include in the

---

[12] NERC proposes to define a composite protection system as "[t]he total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded."

[13] NERC Petition at 20.

[14] *Id.* at 21.

[15] *Id.* at 10.

20150513-3069 FERC PDF (Unofficial) 05/13/2015

applicability [for Reliability Standard PRC-004-3] are the Transmission Owner, Generator Owner, and Distribution Provider who own the BES Protection Systems."[16] NERC explains that owners of protection systems have the personnel with subject matter expertise, design and setting information, and disturbance data necessary to assess protection system misoperations and, therefore, it is appropriate for the owner to have "the responsibility to assure proper operation and implement corrective actions as needed."[17]

11. NERC also requests approval of the proposed definitions of the terms "Composite Protection System" and "Misoperation." Finally, NERC proposes an implementation plan that includes an effective date for the revised Reliability Standard and definitions that is the first day of the first calendar quarter that is twelve months after the date that the Commission approves the standard. Concurrent with the effective date, the implementation plan calls for the retirement of currently-effective Reliability Standard PRC-004-2.1a and "pending" standard PRC-003-1.[18]

III. Notice of Filing and Responsive Pleading

12. Notice of NERC's Petition was issued on September 18, 2014 and published on September 30, 2014 in the *Federal Register*, with comments, protests and motions to intervene due on or before October 20, 2014.[19] Dominion Resources Services, Inc. (Dominion) filed a timely motion to intervene.

IV. Discussion

13. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.214 (2014), the timely motion to intervene filed by Dominion serves to make it a party to this proceeding.

A. Reliability Standard PRC-004-3

14. We approve Reliability Standard PRC-004-3 and find that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.

---

[16] *Id.* at 24.

[17] *Id.*

[18] *Id.* at Ex. B.

[19] 79 Fed. Reg. 58,760 (2014).

20150513-3069 FERC PDF (Unofficial) 05/13/2015

Reliability Standard PRC-004-3 requires transmission owners, generator owners, and distribution providers to identify and correct causes of misoperations of certain protection systems. We agree with NERC that the modified Reliability Standard clarifies the process and establishes timeframes that registered entities must follow in analyzing and correcting protection system misoperations. In addition, the process in the revised Reliability Standard allows the entities to declare if the cause of the misoperation could not be identified, and the timeframes allow the entities to investigate and correct the causes of the misoperations within a reasonable period of time. These improvements to the Reliability Standard should benefit reliability by providing clear expectations on how applicable entities should investigate, communicate about and mitigate specified misoperations.

15. Further, we agree with NERC that Reliability Standard PRC-004-3 addresses an existing reliability gap by applying the standard to underfrequency load shedding that is intended to trip one or more bulk electric system elements. This improvement to the scope of the standard requires that the analysis of misoperations that may be associated with underfrequency load shedding facilities is performed. Finally, we determine that PRC-004-3 adequately addresses the relevant directives in Order No. 693 by providing a consistent, continent-wide approach to addressing misoperations. Likewise, as directed in Order No. 693, the NERC drafting team considered whether to expand the applicability of the standard and provided a reasonable explanation for the decision not to expand the applicability.

16. In addition, we approve: (1) NERC's implementation plan for Reliability Standard PRC-004-3, which includes retiring Reliability Standards PRC-004-2.1a and PRC-003-1 when PRC-004-3 becomes effective;[20] (2) the addition of the terms "Composite Protection System" and "Misoperation" to the NERC Glossary; and (3) the proposed VSLs designations for Reliability Standard PRC-004-3. Below, we discuss certain concerns with the assigned VRFs for PRC-004-3.

[20] As noted above, the Commission in Order No. 693 did not approve proposed Reliability Standard PRC-003-1 but, rather, pended the standard based on the need for additional information. With our approval of PRC-004-3, Reliability Standard PRC-003-1 will be considered "retired" and no longer pending before the Commission.

20150513-3069 FERC PDF (Unofficial) 05/13/2015

B. Violation Risk Factors

17. On May 18, 2007, the Commission established guidelines for determining whether to approve VRFs proposed by NERC.[21] We conclude that the "medium" VRFs assigned to Requirements R1 through R6 of PRC-004-3 are not consistent with the Commission's guidelines. Nor are the VRF assignments in alignment with NERC's definitions of high, medium and low VRF levels. Specifically, NERC has not adequately justified the proposed "medium" VRF designations considering : (1) the important reliability objectives of the underlying Reliability Standard; and (2) the "high" risk designations for the corresponding Requirements of the currently-effective standard PRC-004-2.1a. Accordingly, we direct NERC to revise the VRF designations to address our concerns discussed below.

18. NERC states that the six discrete requirements of proposed Reliability Standard PRC-004-3 "incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1."[22] NERC states further that:

> The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium

[22] NERC Petition, Ex. F (Analysis of Violation Risk Factors and Violation Severity Levels) at 4.

20150513-3069 FERC PDF (Unofficial) 05/13/2015

> VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.[23]

19. The Commission is not persuaded by NERC's explanation. Reliability Standard PRC-004-2.1a, Requirements R1 and R2, which apply to Protection Systems, are assigned a High VRF. In contrast, Reliability Standards PRC-016-0.1 and PRC-022-1 apply to Remedial Action Schemes and to Under-Voltage Load Shedding Program Performance and not Protection Systems. Regional Standard PRC-004-WECC-1, Requirement R1 applies to the analysis of both Remedial Action Schemes and Protection Systems, while all four provisions of Requirement R2, which require actions to protect the Bulk-Power System from a Protection System or Remedial Action Schemes misoperation, are assigned a High VRF. Thus, while it is true, as NERC claims, that there is not a one-to-one correlation between the currently-effective and proposed PRC-004 requirements, it is clear that the provisions of the currently-effective standards that pertain to protection system performance are assigned "high" VRF levels.

20. Moreover, Commission VRF Guideline 4 calls for consistency between the assignment of a particular VRF and NERC's definition of that VRF level.[24] The Commission-approved NERC VRF definition for "high" VRF states, in pertinent part, that a requirement should have a "high" VRF designation if a violation of the requirement "could place the bulk electric system at an unacceptable risk of instability, separation or cascading failures." NERC has designated protection system misoperations as one of the top priority reliability risks, noting that unnecessary trips resulting from misoperations can lead to cascading failures.[25] In contrast, the Commission-approved NERC VRF definition for "medium" provides that the violation of the underlying requirement could not result in, among other things, a cascading sequence of failures or place the bulk electric system at an unacceptable risk of, among other things, cascading failures. We are not persuaded by NERC's technical justification for lowering the subject VRF assignments to "medium," particularly in light of NERC's findings that misoperations

20150513-3069 FERC PDF (Unofficial) 05/13/2015

can lead to cascading outages.[26] For the reasons stated above, we direct NERC to submit a compliance filing within 60 days of issuance of this order that revises the proposed "medium" VRF designations to "high."

V. Information Collection Statement

21. The information collection requirements contained in this order are subject to review by the Office of Management and Budget (OMB) under section 3507(d) of the Paperwork Reduction Act of 1995.[27] OMB's regulations require approval of certain information collection requirements imposed by agency rules.[28] Upon approval of a collection of information, OMB will assign an OMB control number and expiration date. Respondents subject to the reporting requirements of this order will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number. Under the Paperwork Reduction Act, the Commission solicits comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. Comments are due within 60 days from publication in the Federal Register.

22. Public Reporting Burden: Reliability Standard PRC-004-3 requires each transmission owner, generator owner, and distribution provider to provide notification of BES interrupting devices that operated in accordance with the Requirement R2.[29] Our estimate below regarding the number of respondents is based on the NERC Compliance Registry as of January 30, 2015. According to the NERC Compliance Registry, NERC has registered in the United States 326 transmission owners (TO), 914 generator owners (GO), and 471 distribution providers (DP). However, under NERC's compliance registration program, entities may be registered for multiple functions, so these numbers

[26] *Id.*

[27] 44 U.S.C. 3507(d) (2012).

[28] 5 CFR 1320.11 (2014).

[29] Requirement R2 provides "Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2."

20150513-3069 FERC PDF (Unofficial) 05/13/2015

incorporate some double counting. The total number of unique entities that may be identified as a notification provider (e.g. applicable entity) in accordance with Reliability Standard PRC-004-3 will be approximately 659 entities registered in the United States as a transmission owner, generator owner, and/or distribution provider.

FERC-725G1[30]						
	Number of Respondents (1)	**Annual Number of Responses per Respondent (2)**	**Total Number of Responses (1)*(2)=(3)**	**Average Burden & Cost Per Response**[31] **(4)**	**Total Annual Burden Hours & Total Annual Cost (3)*(4)=(5)**	**Cost per Respondent ($) (5)÷(1)**
Notifications to TO/GO/DP per Requirement R2	659	1	659	8 $584	5,272 $384,856	$584
One-time review and adjustment of existing program	659	1	659	2 $146	1,318 $96,214	$146
Evidence Retention	659	1	659	12 $384	7,908 $253,056	$384
TOTAL					14,498 $734,126	$1,114

[30] FERC-725G is a currently pending request at OMB. Only one submittal can be pending OMB review under each control number, therefore, FERC-725G1 will be used for timely submittal.

[31] The estimates for cost per response are derived using the following formula: Average Burden Hours per Response * $n per Hour = Average Cost per Response. The $73 hourly cost figure is the average of the salary plus benefits for a manager and an engineer (rounded to the nearest dollar); $32/hour is the salary plus benefits for information and record clerks. The figures are taken from the Bureau of Labor Statistics at http://bls.gov/oes/current/naics3_221000.htm.

20150513-3069 FERC PDF (Unofficial) 05/13/2015

NERC states that "moving the periodic reporting of Misoperations from the standard (PRC-004-2.1) and into a separate data request pursuant to Section 1600 of NERC's Rules of Procedure will permit NERC's data analysis to continue separately from compliance with the standard and continue reporting, using a standardized template, for all entities subject to the data request."[32] Therefore, registered entities will still conduct the collection. The burden associated with PRC-004-2.1 will be removed from FERC-725A (1902-0244) and added to FERC-725, as reflected in the table below.

Documentation of Misoperations Analyses and Corrective Action Plans Per PRC-004-2.1						
	Number of Respondents (1)	**Annual Number of Responses per Respondent (2)**	**Total Number of Responses (1)*(2)=(3)**	**Average Burden & Cost Per Response[33] (4)**	**Total Annual Burden Hours & Total Annual Cost (3)*(4)=(5)**	**Cost per Respondent ($) (5)÷(1)**
FERC-725	659	1	659	96 $7,008	63,264 $4,618,272	$7,008
FERC-725A	-659	-1	-659	-96 -$7,008	-63,264 - $4,618,272	-$7,008

[33] The estimates for cost per response are derived using the following formula: Average Burden Hours per Response * $n per Hour = Average Cost per Response. The $73 hourly cost figure is the average of the salary plus benefits for a manager and an engineer (rounded to the nearest dollar); $32/hour is the salary plus benefits for information and record clerks. The figures are taken from the Bureau of Labor Statistics at http://bls.gov/oes/current/naics3_221000.htm.

20150513-3069 FERC PDF (Unofficial) 05/13/2015

Respondents: Businesses or other for-profit institutions; not-for-profit institutions.

Frequency of Responses: Occasional.

Necessity of the Information: Reliability Standard PRC-004-3 provides improvements over the currently-effective PRC-004-2.1a, including clearer requirements that establish what is required of the applicable entities and timeframes for the reliability objectives to be completed.

23. Interested persons may obtain information on the reporting requirements by contacting: Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, Phone: (202) 502-8663, fax: (202) 273-0873].

VI. Effective Date

24. This order will become effective upon issuance.

The Commission orders:

(A) Reliability Standard PRC-004-3 is hereby approved as just, reasonable, not unduly discriminatory, and in the public interest, as discussed in the body of this order.

(B) The revisions to NERC's Glossary of Terms, the proposed implementation plan and the proposed Violation Severity Levels for Reliability Standard PRC-004-3 are hereby approved, as discussed in the body of this order.

(C) NERC is hereby directed to submit a compliance filing within 60 days of this order addressing the proposed Violation Risk Factors, as discussed in the body of this order.

By the Commission.

(S E A L)

Nathaniel J. Davis, Sr.,
Deputy Secretary.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Reliability Technical Conference Docket No. AD15-7-000

SUPPLEMENTAL NOTICE WITH AGENDA

(April 28, 2015)

As announced in the Notice of Technical Conference issued on April 9, 2014, the Commission will hold a technical conference on Thursday, June 4, 2015 from 10:00 a.m. to 4:00 p.m. to discuss policy issues related to the reliability of the Bulk-Power System. The agenda for this conference is attached. Commission members will participate in this conference.

Registration is not required, but is encouraged. Attendees may register at: https://www.ferc.gov/whats-new/registration/06-04-15-form.asp.

After the close of the conference, the Commission will accept written comments regarding the matters discussed at the technical conference. Any person or entity wishing to submit written comments regarding the matters discussed at the conference should submit such comments in Docket No. AD15-7-000 on or before July 9, 2014.

Information on this event will be posted on the Calendar of Events on the Commission's web site, www.ferc.gov, prior to the event. The conference will be transcribed. Transcripts will be available for a fee from Ace Reporting Company (202-347-3700). A free webcast of this event is also available through www.ferc.gov. Anyone with Internet access who desires to listen to this event can do so by navigating to www.ferc.gov's Calendar of Events and locating this event in the Calendar. The event will contain a link to the webcast. The Capitol Connection provides technical support for webcasts and offers the option of listening to the meeting via phone-bridge for a fee. If you have any questions, visit www.CapitolConnection.org or call 703-993-3100.

Commission conferences are accessible under section 508 of the Rehabilitation Act of 1973. For accessibility accommodations, please send an email to accessibility@ferc.gov or call toll free 1-866-208-3372 (voice) or 202-502-8659 (TTY), or send a FAX to 202-208-2106 with the required accommodations.

Commissioner-Led Reliability Technical Conference

Docket No. AD15-7-000
Thursday, June 4, 2015
10:00 a.m. – 4:00 p.m.

10:00 a.m. Commissioners' Opening Remarks

10:15 a.m. Introductions:

10:30 a.m. Panel I: 2015 State of Reliability Report

Presentations: The North American Electric Reliability Corporation (NERC) recently released its 2015 State of Reliability report, which highlights reliability performance, current trends and challenges, and recommendations for maintaining and improving the reliability of the bulk power system. Panelists will be asked to address the following issues:

a. What does the 2015 report show about the effectiveness of NERC's reliability activities and related industry efforts? What progress has been made with respect to the recommendations in the 2014 report and what are the obstacles to continued progress? What priorities have been identified in the 2015 State of Reliability report and how are these different from the 2014 report? Does the 2015 report indicate that more resources should be directed to particular reliability risks or areas?

b. Protection system misoperation and AC substation equipment failures are again identified as major risk areas that are major contributors to system disturbances. In December 2014, NERC staff released an analysis of system protection misoperations.[1] What were the key findings and what steps, if any, should be taken to decrease the number of misoperations, and are there any obstacles that exist to reducing this number? What is the status of NERC's AC Substation Equipment Task Force[2] and what

[1] NERC Staff Analysis of System Protection Misoperations, December 2014
[2] http://www.nerc.com/comm/PC/Pages/AC-Substation-Equipment-Task-Force-(ACSETF).aspx

considerations have been given to reducing AC substation equipment failure?

c. The report indicates that the number of non-weather-related load loss events and the MW load loss amount for the past three years is significantly less than previous years. What are the key factors in continuing this trend?

d. Are there other significant issues that require analysis or changes in the planning and operation of the bulk power system during the next 1-5 years?

Panelists: TBD

12:00 a.m. Lunch

1:00 p.m. Panel II: Emerging Issues

Presentations: Significant changes to our Nation's fuel sources and power supply portfolio could result from such factors as the affordability of domestic natural gas, Federal and state policies on renewable and other resources, and new environmental regulations. Panelists will be asked to address the following issues:

a. What emerging issues are going to challenge NERC and industry? How are these issues being considered in long-term, seasonal and operational planning studies?

b. What progress has been made by NERC's Essential Reliability Services Task Force in developing new approaches to the "reliability building blocks" (voltage support, ramping capability, and frequency support) needed for reliability and for ensuring their provision as the resource mix changes? Are any changes in reliability standards or other regulatory requirements needed or appropriate?

c. What approaches are being developed to address recent declines in reserve margins in several regions as described in the 2014 NERC Long Term Reliability Assessment report? What connection, if any, does this trend have with resource mix changes? Should reserve margin targets be altered or rethought as the overall resource mix changes?

d. Are additional efforts needed to maintain reliability as the growth of natural gas-fired generation continues? What specific additional improvements still need to be made?

e. In March of this year, the Commission completed a series of conferences on EPA's proposed Clean Power Plan. Since that time, is there new or updated information that warrants consideration on this issue?

Panelists: TBD

2:15 p.m. Break

2:30 p.m. Panel III: ERO Performance and Initiatives

Presentations: As the ERO, NERC identifies various evolving issues that face the bulk power system and develops initiatives to address those issues. Panelists will be asked to address the following issues:

a. What are the initial results of the risk-based Compliance Monitoring and Enforcement Program? What specific improvements to reliability performance, reduction to reliability risks, and increased compliance efficiencies are NERC and the industry experiencing as a result of this initiative?

b. Explain the feedback loop from event analysis and compliance monitoring and enforcement to standards development. What are some examples of how standards were modified or developed as a result of bulk-power system events?

c. Are the ESCC and ES-ISAC working well in enhancing security? Would you suggest any changes in how they function?

d. NERC filed its Stage 2 proposal on geomagnetic disturbances early this year. Has any significant new information or analysis been published or issued since then? Similarly, how is work progressing on industry's implementation of the physical security standard and version 5 of the cyber security standards?

Panelists: TBD

3:45 p.m. Commissioners' Closing Remarks

FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM15-9-000]

Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance Reliability Standard

(Issued April 16, 2015)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: Pursuant to the Federal Power Act, the Commission proposes to approve a revised Reliability Standard, PRC-005-4 (Protection System, Automatic Reclosing and Sudden Pressure Relaying Maintenance), developed and submitted by the North American Electric Reliability Corporation (NERC). In addition, the Commission proposes to approve one new definition and four revised definitions referenced in the proposed Reliability Standard, as well as NERC's proposed violation risk factors, violation severity levels, and implementation plan. Consistent with Order No. 758, the proposed Reliability Standard requires applicable entities to test and maintain certain sudden pressure relays as part of a protection system maintenance program.

DATES: Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

Protection System, Automatic Reclosing, and Sudden Pressure Relaying Maintenance Reliability Standard	Docket No. RM15-9-000

NOTICE OF PROPOSED RULEMAKING

(Issued April 16, 2015)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve a revised Reliability Standard, PRC-005-4 (Protection System, Automatic Reclosing and Sudden Pressure Relaying Maintenance), developed and submitted by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO). In addition, the Commission proposes to approve one new definition and four revised definitions referenced in the proposed Reliability Standard, as well as NERC's proposed violation risk factors, violation severity levels, and implementation plan. Consistent with Order No. 758,[2] the proposed Reliability Standard requires applicable entities to test and maintain certain sudden pressure relays as part of a protection system maintenance program.

North American Electric Reliability Corporation Docket No. RR15-8-000

ORDER CONDITIONALLY ACCEPTING REVISIONS TO WORKING CAPITAL AND OPERATING RESERVE POLICY

(Issued June 18, 2015)

1. On March 6, 2015, North American Electric Reliability Corporation (NERC) filed proposed revisions to its Working Capital and Operating Reserve Policy (Reserve Policy). As discussed below, we conditionally accept NERC's proposed revisions to the Reserve Policy, subject to NERC submitting a compliance filing within 60 days of the date of this order.

I. Background

2. On August 22, 2011, the Commission's Office of Enforcement informed NERC by letter that it was commencing a performance audit of NERC pursuant to section 215 of the Federal Power Act (FPA).[1] The audit commencement letter stated that the performance audit would evaluate "NERC's budget formulation, administration, and execution[,] . . . will focus on the costs and resources used to achieve program objectives . . . [and] will cover the period from August 23, 2006 to the present."[2]

[1] 16 U.S.C. § 824o (2012).

[2] The Office of Enforcement's August 22, 2011 letter is available through the Commission's eLibrary document retrieval system in Docket No. FA11-21-000.

3. On May 4, 2012, the Office of Enforcement issued its performance audit report (Audit Report) by delegated letter order.[3] The Audit Report outlined 42 recommendations to remedy the audit findings and enhance performance of NERC's budget process. Specifically, Recommendation Nos. 1 and 2 recommended that NERC do as follows:

> 1. Establish more robust procedures and controls over NERC's use of working capital reserves.
>
> 2. Develop a transparent process that permits the Commission, the [Board of Trustees (Board)] and stakeholders opportunity to review the expenditure of funds approved for specific statutory activities to be redirected to unbudgeted activities, and develop and obtain Board approval of enhanced guidelines governing such expenditures, including criteria for determining when Board and Commission approval is required.[4]

4. On August 24, 2012, in accordance with Audit Recommendation No. 1, NERC submitted the Reserve Policy, governing its working capital and operating reserves, in Exhibit E of NERC's 2013 business plan and budget filing.[5] The Commission accepted the Reserve Policy as part of NERC's 2013 business plan and budget filing, on November 2, 2012.[6]

5. On January 16, 2013, the Commission approved a settlement between NERC and the Office of Enforcement regarding the audit findings.[7] The Settlement Agreement, *inter alia*, modified Recommendation No. 2 regarding NERC's Reserve Policy, by modifying the language of the recommendations and adding sub-requirements.[8]

6. Specifically, *inter alia*, revised Recommendation No. 2 requires NERC to "file for Commission review and approval … proposals to expend $500,000 or more from

[8] *Id.*, Settlement Agreement at P 7.

operating reserves designated for 'unforeseen contingencies.'"[9] The Settlement Agreement stipulates that the need for Commission review and approval is triggered if any amount allocated from the unforeseen contingencies account of operating reserves plus any amount re-directed from previously budgeted funds is, in the aggregate, $500,000 or more for any one specific project or major activity in a program area.[10] The Settlement Agreement also requires NERC to file any proposed revisions to its Reserve Policy for Commission review and approval.[11]

7. On August 23, 2013, NERC submitted its 2014 business plan and budget for Commission approval. On November 1, 2013, while generally approving NERC's filing, the Commission, *inter alia*, rejected NERC's proposal to allocate to "restricted working capital" $3.8 million to offset future liabilities regarding lease agreements and directed NERC to submit a compliance filing concerning how it would allocate the $3.8 million consistent with its Reserve Policy.[12] In a compliance filing, NERC revised its Reserve Policy to further define working capital as "cash balances reasonably necessary to meet current and future obligations under any covenant, financial, or other obligation under the terms of any loan, credit, or lease agreement." NERC's compliance filing was accepted on January 3, 2014.[13]

II. Petition

8. NERC proposes to revise the Reserve Policy to include the following operating reserves: (1) future obligation reserve, (2) system operator certification reserve, (3) Cybersecurity Risk Information Sharing Program (CRISP) reserve, and (4) operating contingency reserve. NERC's revisions to the Reserve Policy also include the addition of

[9] *Id.* P 7(b)(ii).

[10] *Id.*

[11] *Id.* P 7(d) ("The provisions of Section 7(a), (b), and (c) are based on NERC's current Reserve Policy, which, *inter alia*, defines 'working capital reserves,' 'operating reserves,' 'known contingencies' and 'unforeseen contingencies.' NERC will file proposed revisions to the Reserve Policy that would alter any of those definitions, or would change the Reserve Policy's requirement that all excess funds be added to the unforeseen contingency operating reserves and expended in accordance with the Policy's unforeseen contingency guidelines, for Commission review and approval.").

[12] *North American Electric Reliability Corp.*, 145 FERC ¶ 61,097, at P 23 (2013).

[13] *North American Electric Reliability Corp.*, Docket Nos. RR13-9-001 and RR13-9-002 (Jan. 3, 2014) (delegated letter order).

an assessment stabilization reserve.[14] NERC maintains that the proposed categories reflect changes in NERC programs, eliminate unnecessary components, merge old reserve categories, and establish a new assessment stabilization reserve.[15]

9. NERC proposes to revise the Reserve Policy's definition of "working capital" so that it no longer includes "cash balances reasonably necessary to meet current and future obligations under any covenant, financial, or other obligation under the terms of any loan, credit, or lease agreement to which the company is a party," and, instead, establish the future obligation reserve for such needs. NERC states that funds to satisfy future contractual or covenant obligations are not needed to satisfy daily cash flow requirements and are more appropriately classified as a reserve. NERC proposes to define "working capital" as only funds needed to satisfy cash flow requirements throughout the year, while operating reserves will consist of reserves needed to support operations, including contractual and covenant obligations, as well as contingencies.[16]

10. NERC proposes to create an assessment stabilization reserve to mitigate year-to-year swings in assessments, which can result from a variety of factors, such as application of penalty funds collected, surplus funds available from a prior period, a need to replenish the operating contingency reserve, or significant but relatively short-term operating or capital spending needs.[17] NERC states that the goal of the reserve is to have changes in annual assessments track, within a reasonable band, changes in NERC's total annual budget, with the total budget reflecting prudent fiscal discipline and good stewardship of resources. NERC asserts that funds from the assessment stabilization reserve may not be used for any purpose inconsistent with the goal of the reserve except as otherwise approved by the Board.[18] NERC states that this provision provides additional flexibility for the Board in extreme and highly unusual circumstances in a particular year, such as an unexpected and significant litigation expense or a significant Bulk-Power System event that requires extraordinary investigation expenses.[19]

[14] NERC Petition at 1-2; Revised Reserve Policy at 1.

[15] NERC Petition at 1-2.

[16] *Id.* at 5.

[17] NERC Petition at 8; Revised Reserve Policy at 2.

[18] *Id.*

[19] NERC Petition at 8.

11. With regard to the assessment stabilization reserve, NERC requests an exception pursuant to §1107.4 of the NERC Rules of Procedure. NERC notes that Rules of Procedure §1107.2 requires the use of penalty funds as a general offset to NERC's budget requirements for the subsequent fiscal year, but notes that §1107.4 provides that "Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC or any other Applicable Governmental Authority."[20] NERC requests an exception such that it may place penalty funds received prior to July 1 of a year into the assessment stabilization reserve, to be applied in a future budget to mitigate assessment volatility, rather than using the penalty funds as a general offset to NERC's budget requirement for the subsequent fiscal year. NERC indicates that these funds will continue to be used to reduce assessments, but in a future period rather than the next budget year.

12. NERC proposes to establish lower and upper bounds on operating contingency reserve levels equal to 3.5 percent and 7.0 percent, respectively, of NERC's total budgeted expenditures, excluding the CRISP and system operator certification reserves. NERC states that these bounds are intended to provide a reasonable "bandwidth" around the funding amount for operating contingency reserve.[21]

13. NERC proposes to increase the levels of expenditures from operating reserves that must be approved internally (i.e., by the NERC president and chief executive officer (CEO), the Finance and Audit Committee of the Board, and the Board itself). NERC's proposed revisions double each expenditure limit currently required for review by its respective levels of management or oversight. NERC notes that, because the current language referring to "known contingencies" and "unknown contingencies" is being replaced by the proposed operating contingency reserve category, NERC will treat the "unforeseen contingencies" references in Paragraph 7(b)(ii) of the Settlement Agreement as encompassing expenditures from the proposed operating contingency reserve.[22]

14. NERC proposes to eliminate the requirement that budgeted but unspent funds from a budget area be transferred to the unforeseen contingency operating reserve before the president and CEO can expend such funds in other budget areas. NERC's proposed language, instead, gives authority to the president and CEO to reallocate and expend those unspent funds elsewhere so long as NERC's overall approved budget is not exceeded and such expenditures are reported to the Finance and Audit Committee and

[20] NERC Petition at 10-11.

[21] *Id.* at 12.

[22] *Id.* at 15.

submitted in NERC's quarterly variance reports to the Commission.[23] NERC reiterates that any such expenditure and reallocation also will be subject to the Commission filing and approval requirements under Paragraph 7(b)(ii) of the Settlement Agreement if the dollar amount exceeds $500,000.[24]

15. NERC proposes to eliminate the provision in the Reserve Policy regarding review and approval requirements when attempting to add unbudgeted full-time equivalent employees (FTE) or headcount additions beyond what was budgeted for a particular fiscal year, regardless of the source and availability of funding. NERC states that this proposed change is appropriate because increases in its FTEs and headcount are not directly related to the management of operating reserves and are not appropriately included in the Reserve Policy. NERC states that if an increase in FTEs or headcount during a year above the budgeted levels requires either the expenditure of funds from an applicable reserve category or the reallocation of funds from one budget area to another, then the Reserve Policy provides for the appropriate review, approval, and reporting of the expenditures. NERC also contends that the quarterly variance reports that NERC submits to the Commission include information on actual versus budgeted FTEs.[25]

III. Notice of Filing

16. Notice of NERC's March 6, 2015 filing was published in the *Federal Register*, 80 Fed. Reg. 13,528 (2015), with interventions and protests due on or before March 27, 2015. No protests or interventions were filed.

IV. Discussion

17. We conditionally accept NERC's proposed revisions to the Reserve Policy, subject to NERC submitting a compliance filing within 60 days of the date of this order, as discussed below.

18. In its filing, NERC represents that any reallocation and expenditure of budgeted but unneeded funds would be subject to Paragraph 7(b)(ii) of the Settlement Agreement.[26] Further, NERC notes that the assessment stabilization reserve would only be used as approved by the Commission in NERC's business plan and budget filings,

---

[23] *Id.* at 16; Revised Reserve Policy at 4.

[24] NERC Petition at 16.

[25] *Id.* at 20.

[26] *Id.* at 16.

except in extraordinary cases.[27] We expect that any extraordinary use of assessment stabilization reserve funds would also be subject to the limits and filing requirements under Paragraph 7(b)(ii) of the Settlement Agreement. We note, however, that such requirements are not articulated in the revised Reserve Policy. Thus, we direct NERC to submit a compliance filing within 60 days of the date of this order proposing revisions to the Reserve Policy to clarify that any reallocation and expenditure of budgeted funds, including from the assessment stabilization reserve, is subject to the requirements of Paragraph 7(b)(ii) of the Settlement Agreement.

19. While we accept, subject to the condition above, the proposed revisions to the Reserve Policy with regard to the assessment stabilization reserve, we find NERC's request for an exception regarding the use of penalty funds pursuant to NERC Rules of Procedure §1107.4 premature. Rather than providing a blanket exception, we find that any such exception is more appropriately addressed on a case-by-case basis, such as in NERC's annual business plan and budget submissions. In its petition, NERC represents that it may only request to inject into or withdraw funds from the assessment stabilization reserve through its annual business plan and budget submissions.[28] Thus, an exception under Rules of Procedure §1107.4 is not ripe in this proceeding. The Commission will consider the appropriateness of granting an exception under Rules of Procedure §1107.4 based on the specifics of each request by NERC in any future business plan and budget submission.

20. Finally, we note that NERC must continue to seek Commission approval of any future proposed changes to the NERC Reserve Policy as required by Paragraph 7(d) of the Settlement Agreement.

The Commission orders:

(A) NERC's proposed revisions to the Reserve Policy are hereby conditionally accepted, as discussed in the body of this order.

[27] *Id.* at 8-9.

[28] *Id.* at 9 ("any injection of funds into the Assessment Stabilization Reserve … or withdrawal of funds … [will be] subject to approval by the NERC Board and, ultimately, by the Commission as part of its approval of that year's business plan and budget").

(B) NERC is hereby directed to submit a compliance filing within 60 days of the date of this order, as discussed in the body of this order.

By the Commission.

Secretary.

151 FERC ¶ 61,230
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket Nos. RM15-7-000, RM15-12-000, and RM15-13-000]

Revisions to Emergency Operations Reliability Standards; Revisions to Undervoltage Load Shedding Reliability Standards; Revisions to the Definition of "Remedial Action Scheme" and Related Reliability Standards

(Issued June 18, 2015)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Commission proposes to approve Reliability Standards and definitions of terms submitted in three related petitions by the North American Electric Reliability Corporation (NERC), the Commission-approved Electric Reliability Organization. The Commission proposes to approve Reliability Standards EOP-011-1 (Emergency Operations) and PRC-010-1 (Undervoltage Load Shedding). According to NERC, the proposed Reliability Standards consolidate, streamline and clarify the existing requirements of certain currently-effective Emergency Preparedness and Operations (EOP) and Protection and Control (PRC) standards. The Commission also proposes to approve NERC's revised definition of the term "Remedial Action Scheme" as set forth in the NERC Glossary of Terms Used in Reliability Standards, and modifications of specified Reliability Standards to incorporate the revised definition. Further, the Commission proposes to approve the proposed implementation plans, and the retirement of certain currently-effective Reliability Standards. The Commission discusses concerns

regarding several of NERC's proposals and, depending on the comments provided in response, the Commission may direct NERC to develop further modifications to address the concerns and possibly delay the retirement of one currently-effective standard.

DATES: Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER].**

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Revisions to Emergency Operations Reliability Standards	Docket Nos.	RM15-7-000
Revisions to Undervoltage Load Shedding Reliability Standards		RM15-12-000
Revisions to the Definition of "Remedial Action Scheme" and Related Reliability Standards		RM15-13-000

NOTICE OF PROPOSED RULEMAKING

(June 18, 2015)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve Reliability Standards and definitions of terms submitted in three related petitions by the North American Electric Reliability Corporation (NERC), the Commission-approved Electric Reliability Organization (ERO). In particular, the Commission proposes to approve Reliability Standards EOP-011-1 (Emergency Operations) and PRC-010-1 (Undervoltage Load Shedding). NERC explains that the proposed Reliability Standards consolidate, streamline, and clarify the existing requirements of certain currently-effective Emergency Preparedness and Operations (EOP) and Protection and Control (PRC) standards. The Commission also proposes to approve NERC's revised definition of the term "Remedial Action Scheme" as set forth in

[1] 16 U.S.C. 824o.

the NERC Glossary of Terms Used in Reliability Standards (NERC Glossary), and modifications of specified Reliability Standards to incorporate the revised definition. Further, the Commission proposes to approve assigned violation risk factors and violation severity levels, proposed implementation plans, and the retirement of certain currently-effective Reliability Standards. The Commission discusses concerns regarding several of NERC's proposals and, depending on the comments provided in response, the Commission may direct NERC to develop further modifications to address the concerns and possibly delay the retirement of one currently-effective standard.

I. Background

2. Section 215 of the FPA requires a Commission-certified ERO to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval.[2] Once approved, the Reliability Standards may be enforced by the ERO subject to Commission oversight or by the Commission independently. In 2006, the Commission certified NERC as the ERO pursuant to FPA section 215.[3]

3. On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 Reliability Standards filed by NERC, including initial versions of EOP-001,

[2] 16 U.S.C. 824o.

[3] *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g & compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa, Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

EOP-002, and EOP-003.[4] In addition, the Commission directed NERC to develop certain modifications to the EOP standards. In Order No. 693, the Commission also approved several Undervoltage Load Shedding (UVLS)-related Reliability Standards, including PRC-010-0, PRC-021-1 and PRC-022-1.[5] Also, the Commission directed NERC to modify Reliability Standard PRC-010-0 to develop an "integrated and coordinated" approach to all protection systems.[6] In Order No. 693, the Commission approved the NERC Glossary, including NERC's currently-effective Special Protection System and Remedial Action Scheme definitions.

II. NERC Petitions

4. NERC submitted three related petitions that we address together in this notice of proposed rulemaking (NOPR).[7]

A. NERC EOP Petition – Proposed Reliability Standard EOP-011-1 (Docket No. RM15-7-000)

5. On December 29, 2014, NERC submitted a petition seeking Commission approval of proposed Reliability Standard EOP-011-1 and a revised definition of

[4] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[5] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at PP 1509, 1560 and 1565. The Commission neither approved nor remanded Reliability Standard PRC-020-1, explaining that the standard only applied to Regional Reliability Organizations. *Id*. P 1555.

[6] *Id.* P 1509.

[7] The proposed EOP and PRC Reliability Standards are not attached to this notice of proposed rulemaking, nor are the additional standards that NERC proposes to modify to incorporate the revised term Remedial Action Scheme. The proposed Reliability Standards are available on the Commission's eLibrary document retrieval system in the identified dockets and on the NERC website, www.nerc.com.

"Energy Emergency." NERC explains that proposed Reliability Standard EOP-011-1 consolidates the requirements in three existing Reliability Standards: EOP-001-2.1b, EOP-002-3.1 and EOP-003-2 "into a single Reliability Standard that clarifies the critical requirements for Emergency Operations while ensuring strong communication and coordination across the functional entities."[8] NERC seeks retirement of Reliability Standards EOP-001-2.1b, EOP-002-3.1 and EOP-003-2, as well as the approval of the associated implementation plan and violation risk factors and violation severity levels for Reliability Standard EOP-011-1 detailed in the petition. NERC also asserts that proposed Reliability Standard EOP-011-1 satisfies seven Commission directives set forth in Order No. 693.[9]

6. NERC states that the purpose of proposed Reliability Standard EOP-011-1 is "to address the effects of operating Emergencies by ensuring each Transmission Operator and Balancing Authority has developed Operating Plans to mitigate operating Emergencies, and that those plans are coordinated within a Reliability Coordinator area."[10] NERC notes that Requirements R2 and R6 of the proposed Reliability Standard incorporate Attachment 1, which describes three energy emergency levels used by the

[8] NERC EOP Petition at 3.

[9] *Id.* at 12-18.

[10] *Id.* at 2.

reliability coordinator and the process for communicating the condition of a balancing authority experiencing an energy emergency.[11]

7. Proposed Reliability Standard EOP-011-1 includes six requirements, and is applicable to balancing authorities, reliability coordinators and transmission operators. Requirements R1 and R2 require transmission operators and balancing authorities to develop, maintain and implement reliability coordinator-reviewed operating plans to mitigate operating, capacity and energy emergencies.[12] Requirement R1 specifies elements for the plans "as applicable," which is intended to provide flexibility to account for regional differences and pre-existing emergency mitigation methods. NERC states that the requirement for transmission operators and balancing authorities to maintain operating plans includes the expectation that the plans are current and up-to-date.[13]

8. Requirement R3 requires reliability coordinators to review the operating plans submitted by transmission operators and balancing authorities and is designed to ensure

---

[11] Attachment 1 describes three alert levels: Energy Emergency Alert Level 1 (all available generation resources in use, concern about sustaining required contingency reserves); Energy Emergency Alert Level 2 (load management procedures in effect, energy deficient balancing authority implements its emergency Operating Plan but maintains minimum contingency reserve requirements); and Energy Emergency Alert Level 3 (firm load interruption is imminent or in process, energy deficient balancing authority unable to maintain minimum contingency reserve requirements).

[12] Operating Plan is defined in the NERC Glossary as a "document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan."

[13] NERC EOP Petition at 8-9.

that there is appropriate coordination of reliability risks identified in the operating plans. In reviewing operating plans, reliability coordinators shall consider compatibility, coordination and inter-dependency with other entity operating plans and notify transmission operators and balancing authorities if revisions to their operating plans are necessary.[14]

9. Requirement R4 requires transmission operators and balancing authorities to resolve any issues identified by the reliability coordinator and resubmit their revised operating plans within a time period specified by the reliability coordinator. Requirement R5 requires each reliability coordinator to notify balancing authorities and transmission operators in its area, and neighboring reliability coordinators, within thirty minutes of receiving an emergency notification. Requirement R6 requires a reliability coordinator with a balancing authority experiencing a potential or actual energy emergency to declare an energy emergency alert in accordance with Attachment 1.

10. Proposed Reliability Standard EOP-011-1 also includes the following revised definition of Energy Emergency:

> Energy Emergency—A condition when a Load-Serving Entity or Balancing Authority has exhausted all other resource options and can no longer meet its expected Load obligations.

NERC explains that the proposed revised definition is intended to clarify that an energy emergency is not limited to a load-serving entity and, based on a review of the impact on

[14] *Id.* at 10-11.

the body of NERC Reliability Standards, "does not change the reliability intent of other requirements of Definitions."[15]

B. NERC PRC Petition – Proposed Reliability Standard PRC-010-1 (Docket No. RM15-12-000)

11. On February 6, 2015, NERC submitted a petition seeking approval of proposed Reliability Standard PRC-010-1 (Undervoltage Load Shedding), approval of a revised definition of Undervoltage Load Shedding Program (UVLS Program) for inclusion in the NERC Glossary, the implementation plan for the proposed Reliability Standard and the associated violation risk factors and violation severity levels and retirement of four PRC Reliability Standards.[16]

12. In its petition, NERC states that proposed Reliability Standard PRC-010-1 is a single, comprehensive standard that addresses the same reliability principles outlined in the four currently-effective UVLS-related Reliability Standards.[17] NERC explains that the purpose of proposed Reliability Standard PRC-010-1 is to "establish an integrated and coordinated approach to the design, evaluation, and reliable operation of Undervoltage Load Shedding Programs" as directed by the Commission in Order No. 693.[18] Also,

---

[15] *Id.* at 18.

[16] Reliability Standard PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program); Reliability Standard PRC-020-1 (Under-Voltage Load Shedding Program Database); Reliability Standard PRC-021-1 (Under-Voltage Load Shedding Program Data); and Reliability Standard PRC-022-1 (Under-Voltage Load Shedding Program Performance).

[17] NERC PRC Petition at 14.

[18] *Id*. (citing Order No. 693, FERC Stats & Regs ¶ 31,242 at P 1509).

according to NERC, proposed Reliability Standard PRC-010-1 replaces the applicability to and involvement of "Regional Reliability Organization" in Reliability Standards PRC-020-1 and PRC-021-1 and consolidates the four currently-effective UVLS-Related Standards into one comprehensive standard. NERC states that proposed Reliability Standard PRC-010-1 "reflects consideration of the 2003 Blackout Report recommendations,"[19] particularly, Recommendation 21 for NERC to "make more effective and wider use of system protection measures"[20] and Recommendation 21C that "NERC determine the goals and principles needed to establish an integrated approach to relay protection for generators and transmission lines, as well as of UFLS and UVLS programs."[21]

13. Proposed Reliability Standard PRC-010-1 incorporates a proposed definition of UVLS Program, which reads:

> **Undervoltage Load Shedding Program (UVLS Program)**: An automatic load shedding program, consisting of distributed relays and controls, used to mitigate undervoltage conditions impacting the Bulk Electric System (BES), leading to voltage instability, voltage collapse, or Cascading. Centrally controlled undervoltage-based load shedding is not included.

NERC explains that "to ensure that the applicability of the proposed Reliability Standard covers undervoltage-based load shedding systems whose performance has an impact on

---

[19] NERC PRC Petition at 2 (citing the U.S.-Canada Power System Outage Task Force, *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations,* April, 2004 (2003 Blackout Report)).

[20] NERC PRC Petition at 4 (citing 2003 Blackout Report at 3, 158).

[21] NERC PRC Petition at 6.

system reliability, a UVLS Program must mitigate risk of one or more of the following: voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System. By focusing on the enumerated risks, the definition is meant to exclude locally-applied relays that are not designed to mitigate wide-area voltage collapse."[22] NERC states that the proposed UVLS Program definition "clearly identifies and separates centrally controlled undervoltage-based load shedding, which is now addressed by the proposed definition of Remedial Action Scheme."[23]

14. Proposed Reliability Standard PRC-010-1 applies to planning coordinators and transmission planners because "either may be responsible for designing and coordinating the UVLS Program…[and] also applies to Distribution Providers and Transmission Owners responsible for the ownership, operation and control of UVLS equipment as required by the UVLS Program established by the Transmission Planner or Planning Coordinator."[24] NERC explains that the planning coordinator or transmission planner that establishes a UVLS Program is responsible for identifying the UVLS equipment and the necessary distribution provider and transmission owner (referred to as "UVLS entities" in the Applicability section) that performs the required actions.

15. NERC states that proposed Reliability Standard PRC-010-1 "applies only after an entity has determined the need for a UVLS Program as a result of its own planning

[22] *Id.* at 16.

[23] *Id.* at 15. NERC's petition for approval of the proposed definition of Remedial Action Scheme (Docket No. RM15-13-000) is discussed below.

[24] *Id.*

studies."[25] NERC explains that the eight requirements in proposed Reliability Standard PRC-010-1 meet four primary objectives: (1) the proposed standard requires applicable entities to evaluate a UVLS Program's effectiveness prior to implementation, including coordination with other protection systems and generator voltage ride-through capabilities;(2) applicable entities must comply with UVLS program specifications and implementation schedule; (3) applicable entities must perform periodic assessment and performance analysis; and (4) applicable entities must maintain and share UVLS Program data.

16. Proposed Requirement R1 requires each planning coordinator or transmission planner that is developing a UVLS Program to evaluate the viability and effectiveness of its program before implementation to confirm its effectiveness in resolving the undervoltage conditions for which it was designed, and that it is integrated through coordination with generator ride-through capabilities and other protection and control systems. Also, the planning coordinator or transmission planner must provide the UVLS Program specifications and implementation schedule to the applicable UVLS entities. Requirement R2 requires UVLS entities to meet the UVLS Program's specifications and implementation schedule provided by the planning coordinator or transmission planner or address any necessary corrective actions in accordance with Requirement R5.

17. Requirement R3 requires each planning coordinator or transmission planner to perform periodic comprehensive assessments at least every 60 calendar months to ensure

[25] *Id.* at 14.

continued effectiveness of the UVLS program, including whether the program resolves identified undervoltage issues and that it is integrated and coordinated with generator voltage ride-through capabilities and other specified protection and control systems. Requirement R4 requires each planning coordinator or transmission planner to commence a timely assessment of a voltage excursion subject to the UVLS Program, within twelve calendar months of the event, to evaluate whether the UVLS Program resolved the undervoltage issues associated with the event. Requirement R5 requires a planning coordinator or transmission planner to develop a corrective action plan for any program deficiencies identified during an assessment performed under either Requirement R3 or R4, and provide an implementation schedule to UVLS entities within three calendar months of its completion.

18. Pursuant to Requirement R6, a planning coordinator must update the data necessary to model its UVLS Program for use in event analyses and program assessments at least each calendar year. Requirement R7 requires each UVLS entity to provide data to its planning coordinator, according to the planning coordinator's format and schedule, to support maintenance of the UVLS Program database. Requirement R8 requires a planning coordinator to provide its UVLS Program database to other planning coordinators and transmission planners within its Interconnection, and other functional entities with a reliability need, within thirty calendar days of a written request.

19. NERC proposes that PRC-010-1 and the revised definition of UVLS Program shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard and definition are approved by the

Commission. NERC also proposes to retire PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1 at midnight of the day immediately prior to the effective date of PRC-010-1.[26] Further, NERC explains that proposed Reliability Standard PRC-010-1 addresses reliability obligations that are set forth in Requirements R2, R4 and R7 of currently-effective Reliability Standard EOP-003-2.[27] Since NERC has proposed to retire EOP-003-2 in the petition seeking approval of proposed Reliability Standard EOP-011-1 (Docket No. RM15-7-00, discussed above), concurrent Commission action on the two petitions will prevent a possible reliability gap.

C. NERC RAS Petition – Revisions to the Definition of "Remedial Action Scheme" (Docket No. RM15-13-000)

20. On February 3, 2015, NERC submitted a petition seeking approval of a proposed revised definition of Remedial Action Scheme in the NERC Glossary. In addition, NERC seeks approval of modified Reliability Standards that incorporate the new definition of Remedial Action Scheme and eliminate use of the term Special Protection System.[28] NERC states that the defined terms Special Protection System and Remedial Action Scheme are currently used interchangeably throughout the NERC Regions and in

[26] *Id.* Ex. B (Implementation Plan).

[27] *See* NERC EOP Petition at 23.

[28] NERC RAS Petition at 1-2. NERC proposes to modify the following Reliability Standards to incorporate the proposed definition of Remedial Action Scheme and eliminate use of the term Special Protection System: EOP-004-3, PRC-005-3(ii), PRC-023-4, FAC-010-3, TPL-001-0.1(i), FAC-011-3, TPL-002-0(i)b, MOD-030-3, TPL-003-0(i)b, MOD-029-2a, PRC-015-1, TPL-004-0(i)a, PRC-004-WECC-2, PRC-016-1, PRC-001-1.1(i), PRC-005-2(ii), and PRC-017-1. NERC does not propose any changes to the violation risk factors or violation severity levels for the modified standards.

various Reliability Standards. NERC explains that "[a]lthough these defined terms share a common definition in the NERC Glossary of Terms today, their use and application have been inconsistent as a result of a lack of granularity in the definition and varied regional uses of the terms. The proposed revisions add clarity and granularity that will allow for proper identification of Remedial Action Schemes and a more consistent application of related Reliability Standards."[29]

21. NERC states that the revised definition of Remedial Action Scheme consists of a "core" definition, including a list of objectives and a separate list of exclusions for certain schemes or systems not intended to be covered by the revised definition.[30] NERC explains that it is proposing a broad definition because of "all the possible scenarios an entity may develop" for its Remedial Action Scheme and a "very specific, narrow definition may unintentionally exclude schemes that should be covered."[31] Accordingly, NERC proposes the following revised "core" definition of Remedial Action Scheme:

> A scheme designed to detect predetermined system conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). (sic) RAS accomplish objectives such as:
> - Meet requirements identified in the NERC Reliability Standards;
> - Maintain Bulk Electric System (BES) stability;

[29] *Id.* at 4-5.

[30] *Id.* at 16. NERC notes that "for each exclusion, the scheme or system could still classify as a Remedial Action Scheme if employed in a broader scheme that meets the definition of Remedial Action Scheme."

[31] *Id.* at 17.

- Maintain acceptable BES voltages;
- Maintain acceptable BES power flows;
- Limit the impact of Cascading or extreme events.

The definition then lists fourteen exclusions, describing specific schemes and systems that do not constitute a Remedial Action Scheme, because each is either a protection function, a control function, a combination of both, or used for system reconfiguration.[32]

22. In the implementation plan, NERC proposes an effective date for the revised Reliability Standards and the revised definition of "Remedial Action Scheme" on the first day of the first calendar quarter that is twelve months after Commission approval.[33] NERC also proposes that for entities with existing schemes that become newly classified as "Remedial Action Schemes" resulting from the application of the revised definition, the entities will have additional time of up to twenty-four months from the effective date to be fully compliant with all applicable Reliability Standards.[34] Further, NERC asks the Commission to take final action concurrently with the NERC petition on proposed Reliability Standard PRC-010-1 (Docket No. RM15-12-000) because "[t]he proposed definitions of UVLS Program and Remedial Action Scheme in each project have been coordinated to cover centrally controlled UVLS as a Remedial Action Scheme. Final

[32] *Id.* at 18.

[33] *Id.* at 15-16.

[34] NERC RAS Petition, EX. C (Implementation Plan) at 4.

action by the Commission is needed contemporaneously on both petitions to facilitate implementation and avoid a gap in coverage of centrally controlled UVLS."[35]

III. Discussion

23. Pursuant to section 215(d) of the FPA, the Commission proposes to approve as just, reasonable, not unduly discriminatory or preferential, and in the public interest the proposed Reliability Standards and NERC Glossary definitions set forth in NERC's three petitions pertaining to EOP-011-1, PRC-010-1 and a revised definition of Remedial Action Scheme. As discussed below, the Commission believes that the modified Reliability Standards provide greater clarity, and the consolidated EOP and PRC standards will provide additional efficiencies for responsible entities.

A. Proposed Reliability Standard EOP-011-1

24. Pursuant to section 215(d) of the FPA, we propose to approve proposed Reliability Standard EOP-011-1 and the proposed new Energy Emergency definition, as well as the proposed violation risk factors and violation severity levels and implementation plan. We agree with NERC that proposed EOP-011-1 consolidates and reorganizes previously approved standards, and proposes modifications based on current operating practices and experience. We believe that the Reliability Standard enhances reliability by requiring that actions necessary to mitigate capacity and energy emergencies are focused in

single operating plans, and ensures communication and coordination among relevant

[35] NERC RAS Petition at 25.

entities during emergency operations. Also, we are satisfied that the NERC petition adequately addresses the relevant Order No. 693 directives.[36]

B. Proposed Reliability Standard PRC-010-1

25. Pursuant to section 215 of the FPA, we propose to approve proposed Reliability Standard PRC-010-1 as just, reasonable, not unduly discriminatory or preferential and in the public interest. We also propose to approve the proposed, revised definition of UVLS Program for inclusion in the NERC Glossary, the implementation plan and the associated violation risk factors and violation severity levels. Likewise, we propose to approve the retirement of PRC-010-0, PRC-020-1 and PRC-021-1.[37] However, for the reasons explained below, we are concerned whether it is appropriate to retire PRC-022-1, as

[36] Currently effective EOP-002-3.1 applies, *inter alia*, to load-serving entities. Proposed EOP-011-1, which would replace EOP-002-3.1, would apply to balancing authorities, reliability coordinators and transmission operators, but not load-serving entities. The removal of load-serving entities raises questions on who would perform the roles traditionally performed by load-serving entities. For instance, NERC's Functional Model indicates that a load-serving entity has real-time responsibility to receive requests from a balancing authority to voluntarily curtail load and communicate such requests for voluntary load curtailment to end-use customers as directed by the balancing authority. In addition, NERC's Functional Model indicates that a balancing authority has a real-time function to coordinate the use of controllable loads with load-serving entities. The Commission notes that NERC is required to make a compliance filing in July 2015 in Docket No. RR15-4-000. The Commission's decision on that filing will guide our action on this question in this proceeding.

[37] As noted above, the Commission in Order No. 693 did not approve or remand proposed Reliability Standard PRC-020-1 but, rather, took no action on the Reliability Standard pending the receipt of additional information. Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 1555. Approval of Reliability Standard PRC-010-1, as proposed herein, will render PRC-020-1 "retired," i.e., withdrawn, and no longer pending before the Commission.

NERC requests, before an acceptable replacement Reliability Standard is in place to address the potential misoperation of UVLS equipment.

26. The Commission agrees with NERC that proposed Reliability Standard PRC-010-1 will improve system reliability by establishing an integrated and coordinated approach to the design, evaluation and reliable operation of UVLS Programs, and therefore satisfies the Commission's directive issued in Order No. 693.[38] We also propose to approve the proposed UVLS Program definition and agree that it "clearly identifies and separates centrally controlled undervoltage-based load shedding, which is now addressed by the proposed definition of Remedial Action Scheme."[39]

27. In the "Guidelines for UVLS Program Definition," NERC provides an example of a "BES subsystem," in the diagram below, illustrating a UVLS system that would not be included in the definition of UVLS Program if the consequences of the contingency do not impact the BES.[40] The Commission seeks clarification whether this example illustrates a centrally controlled UVLS and would therefore be considered a Remedial Action Scheme.[41] The Commission also seeks clarification regarding the use of the term "BES subsystem," since the term is not defined in the NERC Glossary. Depending on the response from NERC and others, a directive for further modification may be

---

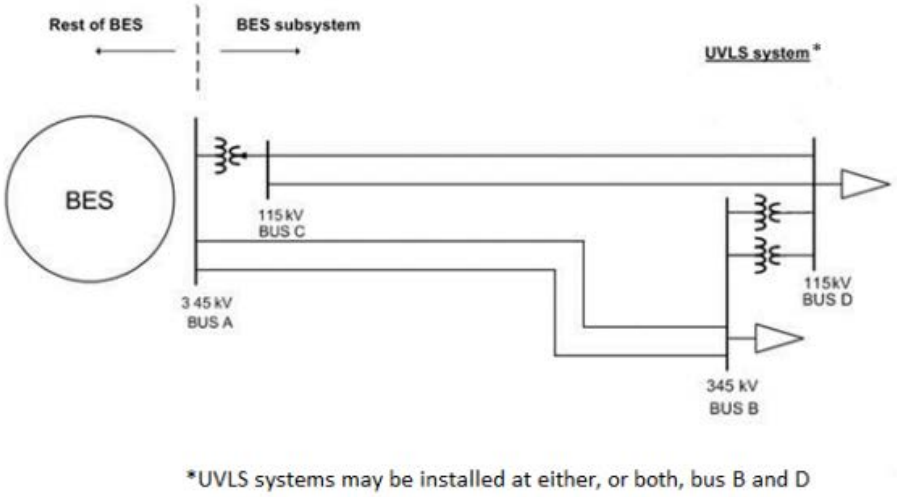
[38] Order No. 693, FERC Stats & Regs. ¶ 31,242 at P 1509.

[39] NERC PRC Petition at 15. NERC's proposed revised definition of Remedial Action Scheme (Docket No. RM15-13-000) is addressed elsewhere in this NOPR.

[40] NERC PRC Petition, Ex. A (Proposed Reliability Standard PRC-010-1) at 12.

[41] *Id.* at 3.

appropriate to ensure that the UVLS standards and related NERC guidance are consistent with the Commission-approved definition of "bulk electric system."[42]



28. NERC proposes to retire Reliability Standard PRC-022-1, which requires transmission operators, load-serving entities and distribution providers to analyze and document all UVLS operations and misoperations. Requirement R1.5 of this Reliability Standard requires that an applicable entity's analysis and documentation should include "[f]or any Misoperation, a Corrective Action Plan to avoid future Misoperations of a similar nature." Proposed Reliability Standard PRC-010-1, Requirement R5 addresses deficiencies in UVLS Programs that a planning coordinator or transmission planner identifies during assessments performed in accordance with either Requirement R3 (periodic UVLS Program effectiveness evaluations) or Requirement R4 (evaluations to

[42] *Revisions to Electric Reliability Organization Definition of Bulk Electric System and Rules of Procedure*, Order No. 773, 141 FERC ¶ 61,236 (2012); *order on reh'g*, Order No. 773-A, 143 FERC ¶ 61,053 (2013), *order on reh'g and clarification*, 144 FERC ¶ 61,174 (2013), *aff'd sub nom.*, *New York* v. *FERC*, 783 F.3d 946 (2d. Cir. 2015).

assess UVLS Program responses to voltage excursions), and requires the entities to develop a Corrective Action Plan to address the deficiencies.

29. NERC correctly states that "[w]hen a UVLS Program does not function as expected and designed during a voltage excursion event, this presents a risk to system reliability."[43] However, we are not persuaded that proposed Reliability Standard PRC-010-1, Requirement R4 is an adequate replacement for currently-effective PRC-022-1, which contains requirements specifically addressing misoperations. Accordingly, we propose to deny NERC's proposal to retire currently-effective Reliability Standard PRC-022-1 concurrent with the effective date of proposed PRC-010-1. Rather, we propose that Reliability Standard PRC-022-1 remain in effect until an acceptable replacement standard is approved and implemented.[44]

C. Revised Definition of Remedial Action Scheme

30. Pursuant to section 215(d) of the FPA, the Commission proposes to approve the proposed definition of Remedial Action Scheme, the proposed exclusions, the proposed Reliability Standards and proposed implementation plan, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. We are persuaded that the use of

[43] *Id.* at 20.

[44] In the PRC Petition, NERC indicates that UVLS misoperations are currently being addressed in Project 2008-02.2 Phase 2 Undervoltage Load Shedding (UVLS): Misoperations. NERC states that "[t]his phase of the UVLS project will address Misoperation of UVLS equipment to complete the work anticipated by the two standard drafting teams." *Id.* at 23. The Commission notes that, on June 9, 2015, NERC filed proposed Reliability Standards PRC-010-2 and PRC-004-5, which include requirements and applicability criteria pertaining to UVLS misoperations.

a broad, core definition with a wide scope, accompanied by a list of specific exclusions will help avoid confusion and achieve a uniform understanding across all the Regional Entities of the proper classification of what schemes and systems constitute a Remedial Action Scheme. We agree with NERC that the proposed definition will improve reliability by eliminating ambiguity and promoting the proper, consistent identification of Remedial Action Schemes and more consistency in the application of related Reliability Standards.[45]

IV. Information Collection Statement

31. The collection of information contained in this Notice of Proposed Rulemaking is subject to review by the Office of Management and Budget (OMB) regulations under section 3507(d) of the Paperwork Reduction Act of 1995 (PRA).[46] OMB's regulations require approval of certain informational collection requirements imposed by agency rules.[47] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

32. We solicit comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any

[45] NERC RAS Petition at 14-16.

[46] 44 U.S.C. 3507(d).

[47] 5 CFR 1320.11.

suggested methods for minimizing respondents' burden, including the use of automated information techniques. Specifically, the Commission asks that any revised burden or cost estimates submitted by commenters be supported by sufficient detail to understand how the estimates are generated.

A. Proposed Reliability Standard EOP-011-1

33. Public Reporting Burden: As of May 2015, there are 99 balancing authorities, 15 reliability coordinators and 171 transmission operators registered with NERC. These registered entities will have to comply with 6-8 new requirements in the proposed Reliability Standard EOP-011-1. As proposed, each registered balancing authority will have to comply with Requirements R2, R4, and, under certain circumstances, R5. Each reliability coordinator will have to comply with Requirements R1 and its subparts, R2 and its subparts, R3 and its subparts, R5 and R6. Each transmission operator will have to comply with Requirements R1 and its subparts and R4.

34. Proposed Reliability Standard EOP-011-1 replaces a combined total of 40 requirements or subparts that are found in Reliability Standards EOP-001-2.1b, EOP-002-3.1 and EOP-003-2. These three Reliability Standards are proposed to be retired, concurrent with the effective date of proposed Reliability Standard EOP-011-1. Accordingly, the requirements in proposed Reliability Standard EOP-011-1 do not create any new burdens for applicable balancing authorities or transmission operators because the requirements in Reliability Standard EOP-011-1 are already burdens or tasks imposed on this set of registered entities by Reliability Standards EOP-001-2.1b, EOP-002-3.1 and EOP-003-2 under FERC-725A (1902-0244).

35. Proposed Reliability Standard EOP-011-1 requires reliability coordinators to perform the additional tasks of reviewing, correcting, and coordinating their balancing authorities' and transmission operators' operating procedures for emergency conditions. The Commission estimates that these tasks will add approximately 1,500 man-hours per year for each reliability coordinator as described in detail in the following table:

RM15-7-000 (Mandatory Reliability Standards: Reliability Standard EOP-011-1)						
	Number of Applicable Registered Entities (1)	***Annual Number of Responses per Respondent (2)***	***Total Number of Responses (1)*(2)=(3)***	***Average Burden (Hours) & Cost Per Response (4)***	***Total Annual Burden Hours & Total Annual Cost (3)*(4)=(5)***	***Cost per Respondent ($) (5)÷(1)***
RC tasks necessary for EOP-011-1 compliance	11	1	11	1,500 $92,387[48]	16,500 $1,016,257	$92,387

B. Proposed Reliability Standard PRC-010-1

36. Public Reporting Burden: As of May 2015, there are 450 registered distribution providers and 175 transmission planners that are not overlapping in their registration with the distribution provider registration. We estimate that five percent of all distribution providers (23) and transmission planners (9) have under voltage load shedding programs that fall under the proposed Reliability Standard. The proposed Reliability Standard is applicable to planning coordinators and transmission planners, distribution providers and

[48] The 1,500 hour figure is broken into 1,300 hours at the engineer wage rate and 200 hours at the clerk wage rate. These estimates assume that the engineer's wage rate will be $66.35 and the clerk's wage rate will be $30.66. These figures are taken from the Bureau of Labor Statistics at http://www.bls.gov/oes/current/naics2_22.htm; Occupation Code: 17-2071 (engineer) and 43-4071 (clerk).

transmission owners. However, only distribution providers and transmission owners would be responsible for the incremental compliance burden under proposed Reliability Standard PRC-010-1, Requirement R2, as described in detail in the following table:

RM15-12-000 (Mandatory Reliability Standards: Reliability Standard PRC-010-1)[49]						
	Number of Applicable Registered Entities (1)	**Annual Number of Responses per Respondent (2)**	**Total Number of Responses (1)*(2)=(3)**	**Average Burden (Hours) & Cost Per Response (4)**	**Total Annual Burden Hours & Total Annual Cost (3)*(4)=(5)**	**Cost per Respondent ($) (5)÷(1)**
DP – Requirement 2	23	1	23	36[50] $1,906.32	828 $43,845.36	$1,906
TP - Requirement 2	3	1	3	36[51] $1,906.32	324 $17,156.07	$1,906
DP - Requirement 2 Data Retention	23	1	23	12 $367.92[52]	276 $8,462.16	$368
TP – Requirement 2 Data Retention	3	1	3	12 $367.92	108 $3,311.28	$368
TOTAL					$72,774.87	

[49] DP = distribution provider and TP = transmission planner.

[50] The 36 hour figure is broken into 24 hours at the engineer wage rate and 12 hours at the clerk wage rate. These estimates assume that the engineer's wage rate will be $66.35 and the clerk's wage rate will be $30.66. These figures are taken from the Bureau of Labor Statistics at http://www.bls.gov/oes/current/naics2_22.htm; Occupation Code: 17-2071 (engineer) and 43-4071 (clerk).

[51] *Id.*

[52] Clerk's wage rate is used for managing data retention.

C. Remedial Action Scheme Revisions

37. Public Reporting Burden: The Commission approved the definition of Special Protection System (Remedial Action Scheme) in Order No. 693. We propose to approve a revision to the previously approved definition. The proposed revisions to the Remedial Action Scheme definition and proposed Reliability Standards are not expected to result in changes to the scope of systems covered by the proposed Reliability Standards and other Reliability Standards that include the term Remedial Action Scheme. Therefore, the Commission does not expect the proposed revisions to affect applicable entities' current reporting burden.

FERC-725G4, Mandatory Reliability Standards: Reliability Standard PRC-010-1 (Undervoltage Load Shedding).

FERC-725S, Mandatory Reliability Standards: Reliability Standard EOP-011-1 (Emergency Operations).

Action: Proposed Collection of Information.

OMB Control No: OMB Control No. 1902-0270 (FERC-725S); OMB Control No. 1902-TBD (FERC-725G4).

Respondents: Business or other for-profit and not-for-profit institutions.

Frequency of Responses: One time and on-going.

Necessity of the Information: The proposed approval of the proposed Reliability Standards implements the Congressional mandate of the Energy Policy Act of 2005 to develop mandatory and enforceable Reliability Standards to better ensure the reliability of the nation's Bulk-Power System. Specifically, the proposed Reliability Standards

consolidate, streamline and clarify the existing requirements of certain currently-effective Emergency Preparedness and Operations and Protection and Control Reliability Standards.

38. Internal review: The Commission has reviewed the requirements pertaining to proposed Reliability Standards PRC-010-1 and EOP-011-1 and made a determination that the proposed requirements of these Reliability Standards are necessary to implement section 215 of the FPA. These requirements conform to the Commission's plan for efficient information collection, communication and management within the energy industry. The Commission has assured itself, by means of its internal review, that there is specific, objective support for the burden estimates associated with the information requirements.

39. Interested persons may obtain information on the reporting requirements by contacting the Federal Energy Regulatory Commission, Office of the Executive Director, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

40. Comments concerning the information collections proposed in this NOPR and the associated burden estimates, should be sent to the Commission in this docket and may also be sent to the Office of Management and Budget, Office of Information and Regulatory Affairs [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at the following e-mail address: oira_submission@omb.eop.gov. Please reference the docket

numbers of this Notice of Proposed Rulemaking (Docket Nos. RM15-13-000, RM15-12-000, and RM15-7-000) in your submission.

V. Regulatory Flexibility Act Analysis

41. The Regulatory Flexibility Act of 1980 (RFA)[53] generally requires a description and analysis of Proposed Rules that will have significant economic impact on a substantial number of small entities. The immediate rulemaking proposes action on three separate, but related, NERC petitions. As discussed above, the consolidated EOP standard and consolidated PRC standards are intended to provide additional efficiencies for responsible entities. Thus, the Commission estimates that the rulemaking will impose only a minimal additional burden on responsible entities, as described below. Proposed Reliability Standard EOP-011-1 is expected to impose an additional burden on 11 entities (reliability coordinators). The remaining 270 entities (balancing authorities and transmission operators and a combination thereof) will maintain the existing levels of burden. Comparison of the applicable entities with FERC's small business data indicates that approximately 7 of the 11 entities are small entities affected by this proposed Reliability Standard.[54]

---

[53] 5 U.S.C. 601-12.

[54] The Small Business Administration sets the threshold for what constitutes a small business. Public utilities may fall under one of several different categories, each with a size threshold based on the company's number of employees, including affiliates, the parent company, and subsidiaries. For the analysis in this NOPR, we use a 500 employee threshold for each affected entity. Each entity is classified as Electric Bulk Power Transmission and Control (NAICS code 221121).

42. On average, each small entity affected may have a one-time cost of $92,387, representing a one-time review of the program for each entity, consisting of 1,500 man-hours at $66.35/hour (for engineers) and $30.66/hour (for record clerks), as explained above in the information collection statement. Proposed Reliability Standard PRC-010-1 is expected to impose an additional burden on 26 entities (distribution providers and transmission planners or a combination thereof). Comparison of the applicable entities with FERC's small business data indicates that approximately 8 are small entities affected by this proposed Reliability Standard.

43. On average, each small entity affected may have a cost of $1,906, representing a one-time review of the program for each entity, consisting of 96 man-hours at $66.35/hour (for engineers) and $30.66/hour (for record clerks), as explained above in the information collection statement. The Commission estimates that the modified definition of the term Remedial Action Scheme and related modifications to Reliability Standards will have no cost impact on applicable entities, including any small entities.

44. The Commission estimates that the combined impact of proposed Reliability Standards EOP-011-1 and PRC-010-1in this NOPR would impose an additional burden on a total of 47 entities. Further, the Commission estimates that 15 respondents are small entities affected by these proposed Reliability Standards. On average, each small entity affected may have a cost of $92,387 and $1,906 (EOP-011-1 and PRC-010-1 respectively), representing a one-time review of the program for each entity. The Commission does not consider these costs to be a significant economic impact on small entities. Accordingly, the Commission certifies that this rulemaking will not have a

significant economic impact on a substantial number of small entities. The Commission seeks comment on this certification.

VI. Environmental Analysis

45. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[55] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[56] The actions proposed herein fall within this categorical exclusion in the Commission's regulations.

VII. Comment Procedures

46. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [**INSERT DATE 60 days after publication in the FEDERAL REGISTER**]. Comments must refer to Docket Nos. RM15-13-000, RM15-12-000, and RM15-7-000, and must include the commenter's name, the organization they represent, if applicable, and address.

[56] 18 CFR 380.4(a)(2)(ii).

47. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

48. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

49. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VIII. Document Availability

50. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

51. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and

Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

52. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

By direction of the Commission.

[Docket No. RM15-16-000]

Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards

(June 18, 2015)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Commission proposes to approve revisions to the Transmission Operations and Interconnection Reliability Operations and Coordination Reliability Standards, developed by the North American Electric Reliability Corporation, which the Commission has certified as the Electric Reliability Organization responsible for developing and enforcing mandatory Reliability Standards.

DATES: Comments are due **[INSERT DATE 60 Days after publication in the FEDERAL REGISTER]**

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.

- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

  Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards — Docket No. RM15-16-000

NOTICE OF PROPOSED RULEMAKING

(June 18, 2015)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve revisions to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) Reliability Standards, developed by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO). The Commission believes that the proposed TOP and IRO Reliability Standards improve on the currently-effective standards by providing a more precise set of Reliability Standards addressing operating responsibilities and improving the delineation of responsibilities between applicable entities. The Commission also believes that the revised TOP Reliability Standards eliminate gaps and ambiguities in the currently-effective TOP requirements and improve efficiency by

[1] 16 U.S.C. 824o (2012).

incorporating the necessary requirements from the eight currently-effective TOP Reliability Standards into three cohesive, comprehensive Reliability Standards. Further, the Commission believes that the proposed standards clarify and improve upon the currently-effective TOP and IRO Reliability Standards by designating requirements in the proposed standards that apply to transmission operators for the TOP standards and reliability coordinators for the IRO standards. Thus, the Commission proposes to find that there are benefits to clarifying and bringing efficiencies to the TOP and IRO Reliability Standards, consistent with the Commission's policy promoting increased efficiencies in Reliability Standards and reducing requirements that are either redundant with other currently-effective requirements or have little reliability benefit.[2]

2. The Commission also proposes to find that NERC has adequately addressed the concerns raised by the Commission in the Notice of Proposed Rulemaking (Remand NOPR) issued in November 2013.[3] In the Remand NOPR, the Commission proposed to remand an earlier version of proposed TOP and IRO Standards due to concerns regarding the proposed treatment of system operating limits (SOLs) and interconnection reliability

[2] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, Order No. 788, 145 FERC ¶ 61,147 (2013).

[3] *Monitoring System Conditions - Transmission Operations Reliability Standard, Transmission Operations Reliability Standards, Interconnection Reliability Operations and Coordination Reliability Standards*, Notice of Proposed Rulemaking, 145 FERC ¶ 61,158 (2013). Concurrent with filing the proposed TOP/IRO standards in the immediate proceeding, NERC submitted a motion to withdraw the earlier petition that was the subject of the Remand NOPR. No protests to the motion were filed and the petition was withdrawn pursuant to 18 CFR § 385.216(b).

operating limits (IROLs) and concerns about outage coordination. Further, the Commission proposes to approve the definitions for operational planning analysis and real-time assessment, and the violation severity level and violation risk factor assignments.

3. While proposing to approve the TOP and IRO Reliability Standards, below the Commission seeks clarifying comments addressing four issues: (A) possible inconsistencies in identifying IROLs; (B) monitoring of non-bulk electric system facilities; (C) removal of the load-serving entity as an applicable entity for proposed Reliability Standard TOP-001-3; and (D) data exchange capabilities. Based on comments and information received on these issues, the Commission may issue directives as appropriate.

I. Background

4. Section 215 of the FPA requires a Commission-certified ERO to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. Once approved, the Reliability Standards are enforced by the ERO, subject to Commission oversight, or by the Commission independently. On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 initial Reliability Standards filed by NERC, including the existing TOP and IRO Reliability Standards.[4] In

[4] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

addition, in Order No. 748, the Commission approved revisions to the IRO Reliability Standards.[5]

5. On April 16, 2013, in Docket No. RM13-14-000, NERC submitted for Commission approval three revised TOP Reliability Standards to replace the eight currently-effective TOP standards.[6] Additionally, on April 16, 2013, in Docket No. RM13-15-000, NERC submitted for Commission approval four revised IRO Reliability Standards to replace six currently-effective IRO Reliability Standards. On November 21, 2013, the Commission issued the Remand NOPR in which the Commission expressed concern that NERC had "removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards."[7] The Commission identified two main concerns and asked for clarification and comment on a number of other issues. Among other things, the Commission expressed concern that the proposed TOP Reliability Standards did not require transmission operators to plan and operate within all SOLs, which is a

[5] *Mandatory Reliability Standards for Interconnection Reliability Operating Limits*, Order No. 748, 134 FERC ¶ 61,213 (2011).

[6] On April 5, 2013, in Docket No. RM13-12-000 NERC proposed revisions to Reliability Standard TOP-006-3 to clarify that transmission operators are responsible for monitoring and reporting available transmission resources and that balancing authorities are responsible for monitoring and reporting available generation resources.

[7] Remand NOPR, 145 FERC ¶ 61,158 at P 4.

requirement in the currently-effective standards. In addition, the Commission expressed concern that the proposed IRO Reliability Standards did not require outage coordination.

6. On December 20, 2013, NERC filed a motion requesting that the Commission defer action, until January 31, 2015, to allow NERC time to consider the reliability concerns raised by the Commission in the Remand NOPR. The Commission granted that motion on January 14, 2014.[8] In response to the Remand NOPR, NERC initiated Project 2014-03 to develop further revisions to the TOP and IRO Reliability Standards.

NERC Petition

7. On March 18, 2015, as supplemented on May 12, 2015, NERC submitted a petition seeking approval of two sets of Reliability Standards to replace the currently-effective TOP and IRO Reliability Standards. NERC states that the proposed TOP Reliability Standards generally address real-time operations and planning for next-day operations, and apply primarily to the responsibilities and authorities of transmission operators, with certain requirements applying to the roles and responsibilities of the balancing authority. NERC adds that the proposed IRO Reliability Standards set forth the responsibility and authority of reliability coordinators to provide for reliable operations. According to NERC, reliability coordinators have an essential role in

[8] *Monitoring System Conditions- Transmission Operations Reliability Standard, Transmission Operations Reliability Standards, Interconnection Reliability Operations and Coordination Reliability Standards,* Order Granting Motion to Defer Action, 146 FERC ¶ 61,023 (2014).

ensuring reliable operations, as they are the functional entities with the highest level of authority and have the wide-area view of the bulk electric system. [9]

8. NERC states that the proposed Reliability Standards include improvements over the currently effective TOP and IRO Reliability Standards in key areas such as: (1) operating within SOLs and IROLs; (2) outage coordination; (3) situational awareness; (4) improved clarity and content in foundational definitions; and (5) requirements for operational reliability data.

9. NERC states that the proposed TOP and IRO Reliability Standards address the coordinated efforts to plan and reliably operate the bulk electric system under both normal and abnormal conditions. NERC states that the proposed Reliability Standards provide a comprehensive framework for reliable operations, with important improvements to ensure the bulk electric system is operated within pre-established limits while enhancing situational awareness and strengthening operations planning. NERC explains that the proposed Reliability Standards establish or revise requirements for operations planning, system monitoring, real-time actions, coordination between applicable entities, and operational reliability data. According to NERC, the proposed Reliability Standards help to ensure that reliability coordinators and transmission operators work together, and with other functional entities, to operate the bulk electric

[9] The TOP and IRO Reliability Standards are not attached to this NOPR. The complete text of the Reliability Standards is available on the Commission's eLibrary document retrieval system in Docket No. RM15-16 and is posted on the ERO's web site, *available at*: http://www.nerc.com.

system within SOLs and IROLs.[10] Further, NERC explains that SOLs and IROLs are vital concepts in the Reliability Standards because they establish acceptable performance criteria both pre- and post-contingency to maintain reliable bulk electric system operations. NERC states that when any facility rating or stability limit is exceeded, or expected to be exceeded, these conditions should be mitigated to avoid the possibility of further deteriorating system conditions and the potential for a cascading event. In addition, NERC states that the standard drafting team developed a white paper on SOL definition and exceedance criteria which clarified the team's position on establishing and exceeding SOLs, and on implementing operating plans to mitigate exceedances. The SOL white paper explains the links between relevant reliability standards and reliability concepts to establish a common understanding necessary for developing effective operating plans to mitigate SOL exceedances.[11]

10. NERC states that it reviewed the report on the Arizona-Southern California Outages on September 8, 2011, Causes and Recommendations ("2011 Southwest Outage Blackout Report") that includes findings and recommendations applicable to transmission

[10] The NERC Glossary of Terms defines IROL as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System." In turn, NERC defines SOL as "[t]he value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. …."

[11] NERC Petition at 46 and Exhibit E, "White Paper on System Operating Limit Definition and Exceedance Clarification."

operators, balancing authorities and reliability coordinators, and provides explanations of how the proposed Reliability Standards address the reliability issues identified following the 2011 Southwest Outage Blackout Report. Further, NERC states that it addressed outstanding Commission directives relevant to the proposed TOP and IRO Reliability Standards.

Revisions to TOP Standards

11. NERC proposes three TOP Reliability Standards to replace the existing suite of TOP standards. The proposed TOP Reliability Standards generally address real-time operations and planning for next-day operations, and apply primarily to the responsibilities and authorities of transmission operators. Among other things, NERC states that the proposed revisions to the TOP Reliability Standards help ensure that transmission operators plan and operate within all SOLs.

TOP-001-3 (Transmission Operations)

12. NERC proposes Reliability Standard TOP-001-3 (Transmission Operations), which contains twenty requirements. The purpose of proposed Reliability Standard TOP-001-3 is to prevent instability, uncontrolled separation, or cascading outages that adversely affect the reliability of the interconnection, by ensuring prompt action to prevent or mitigate such occurrences. According to NERC, the proposed standard achieves this reliability goal by providing appropriate entities with the authority to take actions, or direct the actions of others, to maintain reliability during real-time operations. NERC explains that the standard includes real-time monitoring and real-time assessment

requirements to preserve reliability and ensure that applicable entities identify and address all SOL exceedances.

13. Requirements R1 and R2 require each transmission operator and balancing authority to explicitly and affirmatively act to address the reliability of its area through its own actions or by issuing operating instructions. In contrast, NERC notes that the obligation to act in currently effective Reliability Standard TOP-001-1a is implied, but not an explicit requirement. Requirements R3 and R4 together provide that each applicable entity must comply with each operating instruction issued by its transmission operator, unless doing so would violate safety, equipment, regulatory, or statutory requirements or the action cannot be physically implemented, and require an applicable entity to notify the transmission operator if it is unable to comply with the transmission operator's operating instruction. Similarly, Requirements R5 and R6 require the same actions of applicable entities with respect to an operating instruction issued by a balancing authority.

14. Requirement R7 requires each transmission operator to assist other transmission operators within its reliability coordinator area, and Requirement R8 requires a transmission operator to inform applicable entities of the transmission operator's actual or expected operations that result in, or could result in, an emergency.

15. Requirements R9, R16, and R17 address outage coordination of monitoring and control equipment. Requirement R9 provides that each balancing authority and transmission operator must notify its reliability coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or

more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. Requirements R16 and R17 state that each transmission operator and balancing authority must provide its system operators with the authority to approve planned outages and maintenance.

16. Requirement R10 addresses transmission operator monitoring obligations to help ensure that transmission operators have the necessary situational awareness to maintain reliable operations. Requirement R10 provides that each transmission operator must take certain steps for determining SOL exceedances within its transmission operator area. NERC explains that Requirement R10 addresses the Commission's concerns that the TOP and IRO Reliability Standards, that were the subject of the Remand NOPR, did not have sufficient requirements for real-time monitoring. Requirement R11 is the equivalent of Requirement R10 for balancing authorities.

17. Requirement R12 provides that each transmission operator must not operate outside of any identified IROL for a continuous duration exceeding its associated IROL $T_{v.}$ NERC states that this requirement will provide consistency with the reliability coordinators requirements contained in currently-effective Reliability Standard IRO-009-1.[12] Requirement R13 provides that each transmission operator must ensure that a real-time assessment is performed at least once every 30 minutes. The revised definition of

[12] NERC defines T_v as "[t]he maximum time that an Interconnection Reliability Operating Limit can be violated before the risk to the interconnection or other Reliability Coordinator Area(s) becomes greater than acceptable. Each Interconnection Reliability Operating Limit's T_v shall be less than or equal to 30 minutes."

"real-time assessment" includes additional specificity regarding various inputs for the assessment and how that information may be provided through third-party services, which may provide smaller entities an efficient method for compliance. Requirement R14 provides that each transmission operator must initiate its operating plan to mitigate a SOL exceedance identified as part of its real-time monitoring or real-time assessment.[13]

18. Requirement R15 provides that each transmission operator must inform its reliability coordinator of actions taken to return the system to within limits when a SOL has been exceeded. Requirement R18 provides that each transmission operator must operate to the most limiting parameter in instances where there is a difference in SOLs. Requirements R19 and R20 provide that each transmission operator and balancing authority must have data exchange capabilities with the entities from which it needs data in order to maintain reliability in its area.

19. In addition, NERC states that it removed the load-serving entity (LSE) function from proposed TOP-001-3, Requirements R3 through R6 due to the November 2014 NERC Board of Trustees action to remove the LSE as a functional entity from NERC's Rules of Procedure.[14] On May 12, 2015, NERC supplemented its filing with additional explanation for the removal of the LSE function.

[13] NERC Petition, Exhibit B at 5.

[14] NERC Petition, Exhibit K, Consideration of Comments January 7, 2015, at 2.

TOP-002-4 (Operations Planning)

20. Proposed Reliability Standard TOP-002-4 contains seven requirements relating to operations planning for transmission operators and balancing authorities. NERC explains that the proposed standard addresses next-day planning and provides for the necessary notifications and coordination between various functional entities. NERC adds that the revised definition of "operational planning analysis" specifies the scope and inputs required for next-day analyses. According to NERC, the proposed standard also improves coordination of next-day operations by requiring transmission operators and balancing authorities to provide operating plans to their reliability coordinators.

21. Proposed Requirements R1 through R3 and R6 apply to transmission operators, and proposed Requirements R4, R5, and R7 apply to balancing authorities. Requirement R1 requires each transmission operator to have an operational planning analysis that will allow it to assess whether its planned operations for the next day within its transmission operator area will exceed any of its SOLs. Requirement R2 requires each transmission operator to have operating plans for next-day operations to address potential SOL exceedances identified in the operational planning analysis performed pursuant to Requirement R1. Requirement R4 requires each balancing authority to have operating plans for the next day that address expected generation resource commitment and dispatch, interchange scheduling, demand patterns, and capacity and energy reserve requirements, including deliverability capability. Requirements R3 and R5 require each transmission operator and balancing authority, respectively, to notify the entities identified in their operating plan as to their roles in that plan. Requirements R6 and R7

require each transmission operator and balancing authority to provide its operating plan to its reliability coordinator.

TOP-003-3 (Operational Reliability Data)

22. Proposed Reliability Standard TOP-003-3 (Operational Reliability Data) establishes requirements for the provision of information and data needed by the transmission operator and balancing authority for reliable operations. The purpose of proposed Reliability Standard TOP-003-3 is to ensure that transmission operators and balancing authorities have the data needed to fulfill their operational and planning responsibilities. The proposed Reliability Standard consists of five Requirements, including requirements for balancing authorities and transmission operators to maintain and distribute to relevant entities data specifications needed to perform various analyses and assessments. The proposed Reliability Standard also requires entities receiving data specifications to respond according to mutually agreed upon parameters including format and security protocols.

23. Requirement R1 requires each transmission operator to maintain a documented specification for the data necessary, including non-bulk electric system and external network data, for it to perform its operational planning analysis, real-time monitoring, and real-time assessments. Requirement R2 requires each balancing authority to maintain a documented specification for the data necessary for it to perform its analysis functions and real-time monitoring. Requirements R3 and R4 require each transmission operator and balancing authority to distribute its data specification to the entities that have the necessary data. Requirement R5 requires each applicable entity receiving a data

specification pursuant to Requirement R3 or R4 to satisfy the obligations of the documented data specification.

24. In response to the Commission's concerns in the Remand NOPR with regard to the need for including external networks and sub-100 kV facilities in the operational planning analysis conducted by transmission operators, NERC explains that proposed Reliability Standard TOP-003-3 requires each applicable entity to develop a data specification that would cover its data needs for monitoring and analysis purposes, including non-bulk electric system data and external network data deemed necessary by the transmission operator to support its operational planning analyses, real-time monitoring, and real-time assessments. With respect to sub-100 kV facilities, NERC determined that any sub-100 kV elements that are necessary for reliable operation of the bulk electric system would be included as bulk electric system facilities through the exception process provided in Appendix 5C to the NERC Rules of Procedure. NERC explains that the exception process provides the means for transmission operators and reliability coordinators to include elements in the bulk electric system that are necessary for the reliable operation of the interconnected transmission system but were not identified in the bulk electric system definition. Accordingly, NERC concludes that it is not necessary to include non-bulk electric system monitoring in Reliability Standard TOP-001-3. In addition, NERC explains that proposed Reliability Standard TOP-001-3, Requirement R10 requires transmission operators to monitor bulk electric system facilities within their transmission operator area, and to obtain information deemed

necessary by the transmission operator about such bulk electric system facilities located outside of the transmission operator area when determining SOL exceedances.

25. NERC adds that when non-bulk electric facilities have no impact on the bulk electric system, but are needed for completing system models, the Commission-approved Reliability Standard FAC-001-2, Requirement R3 addresses the issue. This Reliability Standard requires the reliability coordinator to include in its methodology its entire reliability coordinator area and critical modeling details from other reliability coordinator areas that would affect the facility under study. In addition, the reliability coordinator must include details of system models used to determine SOLs.

Revisions to IRO Standards

26. The proposed IRO Reliability Standards, which complement the proposed TOP Standards, are designed to ensure that the bulk electric system is planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions. The proposed IRO Reliability Standards set forth the responsibility and authority of reliability coordinators to provide for reliable operations. NERC states that in the proposed IRO Reliability Standards reliability coordinators must continue to monitor SOLs in addition to their obligation in the currently effective Reliability Standards to monitor and analyze IROLs. These obligations require reliability coordinators to have the wide-area view necessary for situational awareness and provide them the ability to respond to system conditions that have the potential to negatively affect reliable operations.

IRO-001-4 (Reliability Coordination – Responsibilities)

27. Proposed Reliability Standard IRO-001-4 (Reliability Coordination – Responsibilities) contains requirements relating to the reliability coordinator's overall responsibility for reliable operation within the reliability coordinator area. Requirement R1 provides that each reliability coordinator must act to address the reliability of its reliability coordinator area through direct actions or by issuing operating instructions. Requirement R2 provides that each applicable entity must comply with its reliability coordinator's operating instructions unless compliance cannot be implemented or would violate safety, equipment, regulatory, or statutory requirements. Requirement R3 provides that applicable entities must inform the reliability coordinator if they are unable to perform an operating instruction issued by its reliability coordinator.

IRO-002-4 (Reliability Coordination – Monitoring and Analysis)

28. Proposed Reliability Standard IRO-002-4 (Reliability Coordination – Monitoring and Analysis) contains requirements relating to capabilities for monitoring and analysis of real-time operating data. The purpose of the proposed Reliability Standard is to provide system operators with the capabilities necessary to monitor and analyze data needed to perform reliability functions. Requirement R1 requires each reliability coordinator to have data exchange capabilities with its balancing authorities, transmission operators, and other entities as it deems necessary, for it to perform operational planning analyses, real-time monitoring, and real-time assessments. Requirement R2 provides that each reliability coordinator must provide its system operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring, and

analysis capabilities. Requirement R3 provides that each reliability coordinator must monitor facilities, the status of special protection systems and non-bulk electric system facilities identified as necessary within its reliability coordinator area and neighboring reliability coordinator areas, to identify any SOL or IROL exceedances. Requirement R4 provides that each reliability coordinator must have monitoring systems that provide information used by the reliability coordinator's operating personnel, with particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.

IRO-008-2 (Reliability Coordinator Operational Analyses and Real-time Assessments)

29. Proposed Reliability Standard IRO-008-2 (Reliability Coordinator Operational Analyses and Real-time Assessments) contains requirements for reliability coordinators to conduct next-day analyses and assessments of operating conditions in real-time to help prevent instability, uncontrolled separation, or cascading. NERC states that the proposed definitions of operational planning analysis and real-time assessment are integral components of proposed Reliability Standard IRO-008-2 because they specify the scope and inputs for next-day analysis and real-time assessments of operating conditions in real-time. Furthermore, NERC states that proposed Reliability Standard IRO-008-2 enhances next-day operations planning by specifying requirements for coordination of the reliability coordinator's operating plan to address potential SOL and IROL exceedances.

30. Requirement R1 provides that each reliability coordinator must perform an operational planning analysis that will allow it to assess whether the planned operations

for the next day will exceed SOLs and IROLs. Requirement R2 requires each reliability coordinator to have a coordinated operating plan for next-day operations to address potential SOL and IROL exceedances identified as a result of its operating planning analysis. Requirement R3 provides that each reliability coordinator must notify impacted entities identified in its operating plan as to their role in the plan. Requirement R4 states that each reliability coordinator must ensure that a real-time assessment is performed at least once every 30 minutes. Requirement R5 provides that each reliability coordinator must notify impacted transmission operators and balancing authorities within its reliability coordinator area and other impacted reliability coordinators when a real-time assessment indicates an actual or expected condition that results in, or could result in, a SOL or IROL exceedance. Further, Requirement R6 provides that each reliability coordinator must notify impacted entities when a SOL or IROL exceedance has been prevented or mitigated.

IRO-010-2 (Reliability Coordinator Data Specification and Collection)

31. Proposed Reliability Standard IRO-010-2 (Reliability Coordinator Data Specification and Collection) provides a mechanism for a reliability coordinator to obtain the information and data it needs for reliable operations and to help prevent instability, uncontrolled separation, or cascading outages. According to NERC, proposed Reliability Standard IRO-010-2 reflects recommendations from the 2011 Southwest Outage Blackout Report, including more clearly identifying necessary data and information to be included in a reliability coordinator's data specification. Requirement R1 provides that the reliability coordinator must maintain a documented specification for the data,

including non-bulk electric system and external network data, necessary for it to perform its operational planning analyses, real-time monitoring, and real-time assessments. Requirement R2 provides that the reliability coordinator must distribute its data specification to entities that have the required data. Requirement R3 provides that applicable entities receiving a data specification must satisfy the obligations of the documented specification using a mutually-agreeable format, process for resolving data conflicts, and security protocol.

IRO-014-3 (Coordination Among Reliability Coordinators)

32. Proposed Reliability Standard IRO-014-3 (Coordination among Reliability Coordinators) contains requirements for coordination for interconnected operations at the reliability coordinator level. The purpose of the proposed Reliability Standard is to ensure that each reliability coordinator's operations are coordinated such that they will not adversely affect other reliability coordinator areas and to preserve the reliability benefits of interconnected operations. Requirement R1 requires each reliability coordinator to have and implement operating procedures, processes, or plans for activities that require notification or coordination of actions that may affect adjacent reliability coordinator areas. Requirement R2 requires each reliability coordinator to maintain its operating procedures, processes, or plans through annual reviews and updates, with no more than 15 months passing between reviews. Requirement R3 requires each reliability coordinator to notify other impacted reliability coordinators upon identification of an expected or actual emergency. Requirement R4 specifies that, if the reliability coordinators disagree on the existence of an emergency, each must operate as though an

emergency exists. Requirement R5 states that a reliability coordinator that identifies an emergency must develop an action plan to resolve the emergency, and Requirement R6 requires impacted reliability coordinators to implement the action plan. Under Requirement R7, a reliability coordinator must assist another reliability coordinator if the requesting reliability coordinator has implemented its emergency procedures.

IRO-017-1 (Outage Coordination)

33. NERC states that proposed Reliability Standard IRO-017-1 (Outage Coordination) is a new Reliability Standard designed to ensure that outages are properly coordinated in the operations planning time horizon and near-term transmission planning horizon. According to NERC, the requirements in the proposed Reliability Standard, which span both time horizons, provide the necessary requirements for effective coordination of planned outages to support reliable operations.

34. NERC notes that in the Remand NOPR the Commission identified coordination of outages as a critical reliability function that should be performed by the reliability coordinator that was not adequately addressed. NERC explains that proposed Reliability Standard IRO-017-1 addresses the Commission's Remand NOPR concerns by requiring each reliability coordinator to develop, implement and maintain an outage coordination process for generation and transmission outages. NERC also explains that each transmission operator and balancing authority would then be required to perform the functions specified in its reliability coordinator's process. Further, NERC states that each planning coordinator and transmission planner will provide its planning assessment to relevant reliability coordinators and work together to solve any issues or conflicts with

planned outages among the applicable entities. Additionally, NERC states that proposed Reliability Standard IRO-014-3, Requirement R1, Part 1.4 requires reliability coordinators to coordinate with adjacent reliability coordinators the exchange of planned and unplanned outage information to support operational planning analyses and real-time assessments in their operating procedures, processes, or plans.

35. Proposed Reliability Standard IRO-017-1 has four requirements. Requirement R1 provides that each reliability coordinator must develop, implement, and maintain an outage coordination process for generation and transmission outages. Requirement R2 provides that each transmission operator and balancing authority must perform the functions specified in its reliability coordinator's outage coordination process. Requirement R3 provides that each planning coordinator and transmission planner must provide its planning assessment to impacted reliability coordinators. Requirement R4 requires each planning coordinator and transmission planner to jointly develop solutions with its respective reliability coordinators for identified issues or conflicts with planned outages in its planning assessment for the near-term transmission planning horizon.

Definitions

36. NERC also proposes revised definitions for "operational planning analysis" and "real-time assessment."[15] NERC contends that the proposed definitions provide

[15] The proposed definition of operational planning analysis is "[a]n evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange;

(continued ...)

significant additional detail compared to the currently effective definitions to enhance the consistency and the reliability benefit of operational planning analysis and real-time assessments.[16] NERC states that the additional specificity reflected in the proposed definitions addresses concerns raised in the Remand NOPR and includes several inputs that were identified as recommendations in the 2011 Southwest Outage Blackout Report, which, in turn, will enhance situational awareness.

37. The proposed NERC Glossary term "Operating Instruction" defines the scope of commands that are covered by the proposed TOP and IRO Reliability Standards. NERC explains that the revisions in the proposed definitions are intended to ensure that operational planning analyses and real-time assessments contain sufficient details to result in an appropriate level of situational awareness for next-day planning and real-time operations, respectively.

---

known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)"

[16] The proposed definition of real-time assessment is "[a]n evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"

Implementation Plan

38. NERC proposes that, for all standards except proposed Reliability Standards TOP-003-3 and IRO-010-2, the effective date will be the first day of the first calendar quarter twelve months after Commission approval. The twelve month implementation period for all of the standards except TOP-003-3 and IRO-010-2 is intended to allow time for entities to update processes and train operators on the revised requirements. All of the Requirements in proposed TOP-003-3 and IRO-010-2 except TOP-003-3, Requirements R5 and IRO-010-2, Requirement R3 would become effective three months earlier, in order to provide recipients of data requests from their reliability coordinators, transmission operators, and/or balancing authorities time to respond to the requests for data.

39. According to NERC's implementation plan, for proposed TOP-003-3, all requirements except Requirement R5 will become effective on the first day of the first calendar quarter nine months after the date that the standard is approved. For proposed IRO-010-2, Requirements R1 and R2 would become effective on the first day of the first calendar quarter that is nine months after the date that the standard is approved. Requirement R3 would become effective on the first day of the first calendar quarter twelve months after the date that the standard is approved. NERC states that the reason for the difference in effective dates for proposed TOP-003-3 and IRO-010-2 is to allow applicable entities to have time to properly respond to the data specification requests.

II. Discussion

40. Pursuant to section 215(d) of the FPA, we propose to approve NERC's proposed revisions to the TOP and IRO Reliability Standards as just, reasonable, not unduly discriminatory or preferential, and in the public interest. We believe that NERC's approach of consolidating requirements and removing redundancies generally has merit and is consistent with Commission policy promoting increased efficiencies in Reliability Standards and reducing requirements that are either redundant with other currently effective requirements or have little reliability benefit.[17]

41. We agree with NERC that the proposed TOP and IRO Reliability Standards would improve reliability by defining an appropriate division of responsibilities between reliability coordinators and transmission operators.[18] Specifically, NERC states that the proposed TOP Reliability Standards will be improved by eliminating multiple TOP standards, resulting in a more concise set of standards. Thus, we believe that NERC's TOP proposal would reduce redundancy and more clearly delineate responsibilities between applicable entities. In addition, we believe that the proposed Reliability Standards provide a comprehensive framework as well as important improvements to ensure that the bulk electric system is operated within pre-established limits while enhancing situational awareness and strengthening operations planning. We believe that

[17] *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, Order No. 788, 145 FERC ¶ 61,147 (2013).

[18] *See, e.g.*, Order No. 748, 134 FERC ¶ 61,213, at PP 39-40.

the proposed TOP and IRO Reliability Standards address the coordinated efforts to plan and reliably operate the bulk electric system under both normal and abnormal conditions.

42. For these reasons, we propose to approve NERC's revisions to the TOP and IRO Reliability Standards. We also discuss below: (A) concerns raised in the Remand NOPR plus possible inconsistencies of identifying IROLs; (B) other reliability issues including (1) monitoring of non-bulk electric system facilities; (2) removal of the load-serving entity function from proposed Reliability Standard TOP-001-3; and (3) data exchange capabilities.

A. Remand NOPR Issues

1. Operational Responsibilities and Actions of SOLs and IROLs

43. We propose to find that NERC has adequately addressed the concerns raised by the Commission in the Remand NOPR with respect to the treatment of SOLs in the proposed TOP Reliability Standards. In the Remand NOPR, the Commission expressed concern that the proposed TOP standards did not have a requirement "for transmission operators to plan and operate within all SOLs. Without a requirement to plan and operate within all SOLs in the proposed standards and by limiting non-IROL SOLs to only those identified by the transmission operator internal to its area, system reliability is reduced and negative consequences can occur outside of the transmission operator's internal area."[19] The Commission noted that "non-IROL SOLs that appear to be excluded from

[19] Remand NOPR, 145 FERC ¶ 61,158 at P 42.

the proposed standard are non-IROL SOLs that are in a transmission operator's area that impact another transmission operator's area or more than one transmission operator's area."[20]

44. The Commission believes that the proposed TOP Reliability Standards address the Commission's Remand NOPR concerns by requiring transmission operators to plan and operate within all SOLs, and to monitor and assess SOL conditions within and outside a transmission operator's area. Specifically, proposed Reliability Standard TOP-001-3, Requirement R14 requires each transmission operator to initiate its operating plan to mitigate a SOL exceedance identified as part of its real-time monitoring or real-time assessment. Proposed Reliability Standard TOP-001-3, Requirement R10 requires each transmission operator to monitor facilities within its transmission operator area as well as certain facilities outside of its transmission operator area to determine SOL exceedances within its transmission operator area during the real-time operations time horizon. In addition, proposed Reliability Standard TOP-001-3, Requirement R15 requires that each transmission operator inform its reliability coordinator of actions taken to resolve a SOL exceedance.[21] To address the concerns of operational planning, proposed Reliability Standard TOP-002-4, Requirement R1 requires each transmission operator to have an operational planning analysis to assess whether its next-day planned operations will

[20] *Id*. P 51.

[21] NERC Petition at 24-25.

exceed any of its SOLs within its area, and Requirement R2 requires the transmission operator to have a next-day operating plan(s) to address any potential SOLs exceedances identified in its operational planning analysis.[22]

45. Further, proposed Reliability Standard IRO-008-2, Requirements R1, R2, R3, R5, and R6 require reliability coordinators to plan and operate within SOLs and IROLs, which we believe work in tandem with the proposed TOP Standards and address the Commission's concern that the previously-proposed Reliability Standards limited "non-IROL SOLs" to only those internally identified by the transmission operator. Specific to operational planning, proposed Reliability Standard IRO-008-2, Requirement R1 requires the reliability coordinator to have an operational planning analysis to assess whether its next-day planned operations will exceed SOLs and IROLs within its wide area, and Requirement R2 requires the reliability coordinator to have a coordinated next-day operating plan(s) to address potential SOLs and IROLs exceedances identified in its operational planning analysis while considering the next-day operating plan(s) provided by its transmission operators and balancing authorities.[23] Requirement R3 requires the reliability coordinator to notify impacted entities identified in its operating plan cited in Requirement R2 as to their role in such plan(s). The Commission believes that the consideration of the transmission operators' and balancing authorities' operating plans by

[22] NERC Petition at 27.

[23] NERC Petition at 52.

the reliability coordinator in its own operating plan provides the necessary situational awareness of all SOLs, internal and external to the transmission operator or balancing authority.

46. In the Remand NOPR, the Commission raised the concern that the then-proposed version of the TOP/IRO Standards did not consider the possibility that additional SOLs could develop or occur in the same-day or real-time operational time horizon, and therefore would pose an operational risk to the interconnected transmission network.[24] To address this concern, Reliability Standard IRO-008-2, Requirement R5 requires each reliability coordinator to notify impacted transmission operators and balancing authorities within its reliability coordinator area and other impacted reliability coordinators when results of a real-time assessment indicate actual or expected conditions that could result in SOL or IROL exceedances, and Requirement R6 requires reliability coordinator notification to impacted transmission operators, balancing authorities and other impacted reliability coordinators when any SOLs or IROLs have been prevented or mitigated.[25]

47. Likewise, based on NERC's explanation, we believe that the proposed Reliability Standards in the immediate proceeding are designed to improve system performance by giving reliability coordinators the authority to direct actions to prevent or mitigate instances of exceeding IROLs. This delineation of responsibilities between reliability

[24] Remand NOPR, 145 FERC ¶ 61,158 at P 55.

[25] NERC Petition at 32.

coordinators and transmission operators is appropriate because the primary decision-making authority for mitigating IROL exceedances is assigned to reliability coordinators while transmission operators have the primary responsibility for mitigating SOL exceedances.[26] To further support the reliability coordinator's primary responsibility for IROLs to prevent instability, uncontrolled separation, or cascading, proposed Reliability Standard TOP-001-3, Requirement R12 requires that a transmission operator must not operate outside of any identified IROLs for a continuous duration exceeding its associated IROL T_V.[27]

48. In addition, NERC explains that the proposed Reliability Standard IRO-014-3 contains requirements for coordination of interconnection operations at the reliability coordinator level and ensures that each reliability coordinator's operations are coordinated such that they will not adversely affect other reliability coordinators' areas.[28] Proposed Reliability Standard IRO-014-3 requires the reliability coordinator to have and implement operating procedures, processes, or plans for activities that require notification or coordination of actions that may affect adjacent reliability coordinators' areas.

---

[26] *See* Remand NOPR, 145 FERC ¶ 61,158 at P 85. Further, currently-effective Reliability Standard IRO-009-1, Requirement R4 states that "[w]hen actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T_V."

[27] NERC Petition at 25.

[28] NERC Petition at 33.

49. Furthermore, the Commission believes the revised definitions of operational planning analysis and real-time assessment are critical components of the proposed TOP and IRO Reliability Standards and, together with the definitions of SOLs, IROLs and operating plans, work to ensure that reliability coordinators, transmission operators and balancing authorities plan and operate the bulk electric system within all SOLs and IROLs to prevent instability, uncontrolled separation, or cascading. In addition, the revised definitions of operational planning analysis and real-time assessment address other concerns raised in the Remand NOPR as well as multiple recommendations in the 2011 Southwest Outage Blackout Report.[29] For example, the definition of operational planning analysis is used in proposed Reliability Standards TOP-002-4, TOP-003-3, IRO-002-4, IRO-008-2, IRO-010-2, and IRO-014-3 to ensure a consistent approach to operations planning for the reliability coordinators, transmission operators and balancing authorities.[30] Further, the proposed revised operational planning analysis definition adds additional detail and clarity, including the evaluation of pre- and post-contingency conditions as well as the evaluation of multiple applicable inputs that are absent in the currently-effective definition.

50. Likewise, the definition of real-time assessment is used in the following proposed Reliability Standards: TOP-001-3; TOP-003-3; IRO-002-4; IRO-008-2; IRO-010-2; and

[29] NERC Petition at 17-18.

[30] NERC Petition at 19.

IRO-014-3 to ensure a consistent approach to the real-time operation of the Bulk Power System for the reliability coordinators, transmission operators and balancing authorities.[31] The proposed revised real-time assessment definition is the same type of evaluation as the operational planning analysis with the exception that real-time assessment uses real-time data to assess existing conditions and operational planning analysis uses projected system conditions to assess anticipated system conditions.

51. The Commission does note, however, that in Exhibit E (SOL White Paper) of NERC's petition, NERC states that with regard to the SOL concept, the SOL White Paper brings "clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances."[32] The Commission further notes that IROLs, as defined by NERC, are a subset of SOLs that, if violated, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk electric system.[33] The Commission agrees with NERC that clarity and consistency are important with respect to establishing and implementing operating plans to mitigate SOL and IROL exceedances. However, the Commission notes that in

[31] NERC Petition at 18.

[32] NERC Petition, Exhibit E, "White Paper on System Operating Limit Definition and Exceedance Clarification" at 1.

[33] NERC Glossary of Terms defines Interconnection Reliability Operating Limit as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

its 2015 State of Reliability report, NERC states that the Western Interconnection reliability coordinator definition of an IROL has additional criteria that may not exist in other reliability coordinator areas.[34] Based on this information, it is unclear whether NERC regions apply a consistent approach to identifying IROLs. Accordingly, the Commission seeks comment on (1) identification of all regional differences or variances in the formulation of IROLs, (2) the potential reliability impacts of such differences or variations, and (3) the value of providing a uniform approach or methodology to defining and identifying IROLs.

2. Outage Coordination

52. We believe, too, that NERC has addressed the concerns raised in the Remand NOPR with respect to the IRO standards regarding planned outage coordination. In the Remand NOPR, the Commission expressed concern with NERC's proposal because Reliability Standards IRO-008-1, Requirement R3 and IRO-010-1a (subjects of the proposed remand and now withdrawn by NERC) did not require the coordination of

[34] NERC 2015 State of Reliability report at 44, available at www.nerc.com. *See also* WECC Reliability Coordination System Operating Limits Methodology for the Operations Horizon, Rev. 7.0 (effective March 3, 2014) at 18 (stating that "SOLs qualify as IROLs when … studies indicate that instability, Cascading, or uncontrolled separation may occur resulting in uncontrolled interruption of load equal to or greater than 1000 MW"), available at https://www.wecc.biz/Reliability/PhaseII%20WECC%20RC%20SOL%20Methodology%20FINAL.pdf.

outages, noting that outage coordination is a critical reliability function that should be performed by the reliability coordinator.[35]

53. With respect to proposed Reliability Standard IRO-017-1, submitted by NERC for approval in the immediate proceeding, Requirement R1 requires each reliability coordinator to develop, implement and maintain an outage coordination process for generation and transmission outages within its reliability coordinator area. Under Requirement R2, each transmission operator and balancing authority, in turn, would perform the functions specified in its reliability coordinator's outage coordination process. Further, Requirement R3 requires each planning coordinator and transmission planner to provide its planning assessment to the relevant reliability coordinators and to work together to solve any issues or conflicts with planned outages among the applicable entities under Requirement R4. Additionally, proposed Reliability Standard IRO-014-3, Requirement R1, Part 1.4 requires reliability coordinators to include the exchange of planned and unplanned outage information to support operational planning analyses and real-time assessments in the operating procedures, processes, and plans for activities that require coordination with adjacent reliability coordinators. Further, the proposed revised definitions of operational planning analysis and real-time assessments require that these evaluations of system conditions include transmission and generation outages. We

[35] Remand NOPR, 145 FERC ¶ 61,158 at P 90.

believe that these proposed standards and revised definitions adequately address our concerns with respect to outage coordination as outlined in the Remand NOPR.

B. Other Reliability Issues

54. While proposing to approve the TOP and IRO Reliability Standards, the Commission seeks clarifying comments addressing three additional issues: (1) monitoring of non-bulk electric system facilities; (2) removal of the load-serving entity as an applicable entity for proposed Reliability Standard TOP-001-3; and (3) data exchange capabilities. Based on comments and information received on these issues, the Commission may issue directives as appropriate.

1. Monitoring of Non-Bulk Electric System Facilities

NERC Petition

55. NERC explains how the proposed Reliability Standards address the recommendations in the 2011 Southwest Outage Blackout Report, in particular with respect to Finding 17 concerning the impact of sub-100 kV facilities on the reliability of the interconnected transmission network. Finding 17 states:

> WECC RC and affected TOPs and BAs do not consistently recognize the adverse impact sub-100 kV facilities can have on BPS reliability. As a result, sub-100 kV facilities might not be designated as part of the BES, which can leave entities unable to address the reliability impact they can have in the planning and operations time horizons. If, prior to September 8, 2011, certain sub-100 kV facilities had been designated as part of the BES and, as a result, were incorporated into the TOPs' and RC's planning and operations studies, or otherwise had been incorporated into these studies, cascading outages may have been avoided on the day of the event.

Recommendation 17 states:

> WECC, as the RE, should lead other entities, including TOPs and BAs, to ensure that all facilities that can adversely impact BPS reliability are either designated as part of the BES or otherwise incorporated into planning and operations studies and actively monitored and alarmed in [real-time contingency analysis] systems.

NERC states that proposed Reliability Standard IRO-002-4, Requirement R3 addresses monitoring of non-bulk electric system facilities by requiring each reliability coordinator to monitor facilities and necessary non-bulk electric system facilities in order to identify SOL and IROL exceedances within its reliability coordinator area.[36] In addition, NERC states that proposed Reliability Standards IRO-010-2, Requirement R1.1 and TOP-003-3, Requirement R1.1 address non-bulk electric system data by specifically requiring reliability coordinators and transmission operators to incorporate any non-bulk-electric system data as deemed necessary into their operational planning analyses, real-time monitoring, and real-time assessments.[37]

56. However, NERC explains that the standard drafting team concluded it is unnecessary to include non-bulk electric system monitoring in proposed Reliability Standard TOP-001-3, Requirement R10 for the transmission operator, in a similar fashion as proposed Reliability Standard IRO-002-4, Requirement R3 for the reliability

[36] NERC Petition at 61.

[37] *Id.* at 40.

coordinator. Instead, the standard drafting team determined that any non-bulk electric system facility elements that are necessary for reliable operation of the bulk electric system would be included in the bulk electric system through the exception process provided in Appendix 5C to the NERC Rules of Procedure. NERC states that the exception process provides the means for transmission operators and reliability coordinators to include elements in the bulk electric system that are necessary for the reliable operation of the interconnected transmission system but not identified in the bulk electric system definition.[38]

Commission Proposal

57. We propose to find that NERC has adequately addressed the 2011 Southwest Outage Blackout Report recommendation in connection with sub-100 kV facilities for proposed Reliability Standards IRO-002-4, Requirement R3, IRO-010-2, Requirement R1.1 and TOP-003-3, Requirement R1.1. In doing so, we rely primarily on the proposed responsibility of the reliability coordinator to monitor such facilities to the extent necessary.

58. However, the transmission operator may have a more granular perspective than the reliability coordinator of its necessary non-bulk electric system facilities to monitor in order to identify SOL and IROL exceedances, and it is not clear whether or how the transmission operator would communicate any insight it may have to the reliability

[38] *Id.* at 47-48.

coordinator to ensure monitoring of all necessary facilities. Thus, the Commission seeks comment on how NERC will ensure that the reliability coordinator will receive information from the transmission operator regarding which non-bulk electric system facilities should be monitored. Further, as stated above, Recommendation 17 states "…to ensure that all facilities that can adversely impact BPS reliability are either designated as part of the BES or *otherwise incorporated into planning and operations studies and actively monitored and alarmed in [real-time contingency analysis] systems*." (emphasis added.) Including such non-bulk electric system facilities in the definition of bulk electric system through the Rules of Procedure exception process could be an option to address any potential gaps for monitoring facilities. However, there may be potential efficiencies gained by using a more expedited method to include non-bulk electric system that requires monitoring. Thus, the Commission seeks comments on whether the exception process should be used exclusively in all cases.

59. Alternatively, we seek comment regarding whether this concern should be addressed through a review process of the transmission operators' systems to determine if there are important non-bulk-electric system facilities that require monitoring. For example, Commission staff could work with NERC, Regional Entities and applicable entities to review their system modeling and perform an analysis to identify non-bulk electric system facilities that need monitoring. Accordingly, we seek comment from NERC and other interested persons on these alternatives.

2. Removal of Load-Serving Entity Function from TOP-001-3

NERC Petition

60. Proposed Reliability Standard TOP-001-3, Requirement R3 requires that each balancing authority, generator operator and distribution provider shall comply with each operating instruction issued by its transmission operator, and proposed Reliability Standard TOP-001-3, Requirement R4 requires that each balancing authority, generator operator and distribution provider inform its transmission operator of its inability to comply with an operating instruction. Proposed Reliability Standard TOP-001-3, Requirement R5 requires that each transmission operator, generator operator and distribution provider shall comply with each operating instruction issued by its balancing authority, and proposed Reliability Standard TOP-001-3, Requirement R6 requires that each transmission operator, generator operator and distribution provider inform its balancing authority of its inability to comply with an operating instruction.[39]

61. In its petition, NERC states that, during the standard drafting process, the load-serving entity function was removed from proposed Reliability Standard TOP-001-3, Requirements R3 through R6. NERC explains that the removal of the load-serving entity as an applicable entity was based on the November 2014 NERC Board of Trustees action to remove load-serving entity as a functional entity from NERC's Rules of Procedure.[40]

[39] NERC Petition at 22-23.

[40] NERC Petition, Exhibit K, Consideration of Comments January 7, 2015, at 2.

Since that time, the Commission has issued an order in Docket No. RR15-4-000 that denied, without prejudice, NERC's proposal to remove the load-serving entity as a functional entity under NERC's Risk Based Registration petition and directed NERC to submit a compliance filing to address this issue.[41]

62. On May 12, 2015, NERC supplemented its initial petition with additional explanation for the removal of the load-serving entity function from proposed Reliability Standard TOP-001-3. NERC explains that the proposed standard gives transmission operators and balancing authorities the authority to direct the actions of certain other functional entities by issuing an operating instruction to maintain reliability during real-time operations. According to NERC, load-serving entities are not included in the list of entities that must comply with a transmission operator's or balancing authority's operating instructions. NERC contends that the exclusion is justified because none of the functions performed by load-serving entities, as described in the NERC Functional Model, necessitate that load-serving entities be subject to a requirement to comply with such operating instructions to ensure that a transmission operator or balancing authority can maintain reliability.[42] NERC adds that a load-serving entity does not own or operate bulk electric system facilities or equipment or the facilities or equipment used to serve end-use customers and its NERC Functional Model tasks are limited in scope. As

[41] *North American Electric Reliability Corp.*, 150 FERC ¶ 61,213 (2015).

[42] NERC Supplemental Filing at 6.

indicated by the NERC Functional Model, the load-serving entity does not play a role in shedding load in real-time.

63. NERC also explains in its supplemental filing that the standard drafting team did not identify any circumstances under which a transmission operator or balancing authority would need to issue an operating instruction to a load-serving entity to prevent instability, uncontrolled separation, or cascading outages. NERC contends that, with respect to the load-serving entity's role as a provider of information to other functional entities, that role is primarily carried out ahead of real-time and would not be the subject of an operating instruction. Additionally, NERC states that the load-serving entity's real-time role with respect to voluntary load curtailment does not necessitate requiring load-serving entities to comply with operating instructions issued by a transmission operator or balancing authority. In order to maintain reliability in their areas and prevent instability, uncontrolled separation, or cascading outages, there may be circumstances under which transmission operators and balancing authorities need to shed load. NERC states that such action is implemented in real-time to address imminent or existing reliability issues such as an exceedance of an IROL or SOL, or a voltage problem. According to NERC, due to the urgent nature of these circumstances, the reliability coordinator, balancing authority, or transmission operator may issue operating instructions directly to the

distribution provider for physical implementation of load shedding (except when this can be accomplished directly by the transmission operator).[43]

Commission Proposal

64. NERC proposes the removal of the load-serving entity function from proposed Reliability Standard, TOP-001-3, Requirements R3 through R6, as a recipient of an operating instruction from a transmission operator or balancing authority. However, the Commission notes that the issuance and compliance of operating instructions under proposed Reliability Standard TOP-001-3 is not limited to the real-time operations time horizon only.[44]

65. Further, if a transmission operator or balancing authority would issue an operating instruction to a load-serving entity such as to carry out interruptible load curtailments, it is not clear what entity would respond to this operating instruction if the load-serving entity is removed from proposed TOP-001-3, Requirements R3 through R6.[45]

[43] NERC Supplemental Filing at 9.

[44] NERC TOP/IRO Petition, Exhibit A includes the following time horizons for proposed Reliability Standard TOP-001-3, Requirements R3 through R6: "*[Time Horizon: Same-Day Operations, Real-Time Operations]*."

[45] NERC Glossary of Terms defines Interruptible Load as the "[d]emand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment."

66. The Commission notes that NERC is required to make a compliance filing in July 2015 in Docket No. RR15-4-000. The Commission's decision on that filing will guide any action in this proceeding.

3. Data Exchange Capabilities

NERC Petition

67. In Order No. 808, the Commission approved Reliability Standards COM-001-2 (Communications) and COM-002-4 (Operating Personnel Communications Protocols).[46] In Order No. 808, the Commission explained that it had raised concerns in the underlying NOPR proposing to approve these COM Reliability Standards (COM NOPR) whether COM-001-2 addresses "facilities that directly exchange or transfer data."[47] In response to the COM NOPR, NERC and other commenters clarified that Reliability Standard COM-001-2, which covers communications capability requirements, is not intended to address data exchanges or transfers.[48] As the Commission noted in Order No. 808, NERC maintained that Reliability Standard COM-001-2 need not include requirements regarding data exchange capability, "because such capability is covered under other existing or proposed standards."[49] The Commission did not make any determinations

[46] *Communications Reliability Standards*, Order No. 808, 151 FERC ¶ 61,039 (2015).

[47] Order No. 808, 151 FERC ¶ 61,039 at P 54, *quoting Communications Reliability Standards, Notice of Proposed Rulemaking*, 148 FERC ¶ 61,210, at P 33 (2014).

[48] *Id.* P 48.

regarding facilities used for data exchange capability in Order No. 808 and, based on NERC's explanation in its supplemental filing, the Commission stated that it would address these issues in this TOP and IRO rulemaking proceeding.[50]

68. In general, it appears that facilities for data exchange capabilities are addressed in NERC's proposal. For example, proposed Reliability Standard TOP-001-3, Requirements R19 and R20 require some form of "data exchange capabilities" for the transmission operator and balancing authority, respectively. Similarly, proposed Reliability Standard IRO-002-4, Requirement R1 requires some form of "data exchange capabilities" for the reliability coordinator. However, we seek additional explanation from NERC regarding how it addresses data exchange capabilities in the TOP and IRO Reliability Standards in the following areas: (a) redundancy and diverse routing; and (b) testing of the alternate or less frequently used data exchange capability.

(i) Redundancy and Diverse Routing of Data Exchange Capabilities

Background

69. The terms "redundant" and "diverse routing" of data exchange capabilities appear in Reliability Standard COM-001-1, where the reliability coordinator, transmission operator and balancing authority are required to have telecommunication facilities that

---

[49] *Id.* *See also* NERC's Supplemental Comments in Response to Notice of Proposed Rulemaking, *Communications Reliability Standards*, Docket No. RM14-13-000 at 3.

[50] Order No. 808, 151 FERC ¶ 61,039 at P 54.

are "redundant" and "diversely routed" to maintain Bulk-Power System reliability.[51] NERC added two definitions (Interpersonal Communication and Alternative Interpersonal Communication) to Reliability Standard COM-001-2 that addressed redundant and diverse routing of communications between persons and proposed to eliminate the need to use phrases such as "redundant and diversely routed" that it described as ambiguous.[52] With respect to the data exchange capabilities, NERC stated that several proposed or existing standards "provided the necessary mandatory Requirements to ensure proper data exchange is occurring."[53] NERC also asserted that four proposed IRO and TOP standards "include specific coverage related to data exchange," and "collectively require data exchange capability" for reliability coordinators, transmission operators, balancing authorities, generator operators, and distribution providers.[54]

[51] COM-001-1.1 Standard, Requirement R1 requires that "[e]ach Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:" and R1.4 requires that "[w]here applicable, these facilities shall be redundant and diversely routed."

[52] NERC COM Petition at 16.

[53] NERC COM Petition at 16.

[54] NERC Supp. COM Comments at 3. NERC identified these same four standards in its Initial Comments, but provides a more detailed discussion of the proposed standards and their status in its Supplemental Comments.

70. In Order No. 808, the Commission approved NERC's definition of the terms Interpersonal Communication and Alternative Interpersonal Communication. NERC defines Interpersonal Communication as "[a]ny medium that allows two or more individuals to interact, consult, or exchange information." NERC defines Alternative Interpersonal Communication as "[a]ny Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation."[55] Reliability Standard COM-001-2, Requirements R1 through R6 require that reliability coordinators, transmission operators, and balancing authorities have Interpersonal Communication capabilities and Alternative Interpersonal Communication capabilities in place with other defined entities (*e.g.*, other interconnected transmission operators). In its COM Petition, NERC maintained that the defined terms make clear that an entity's communication capability must be redundant and that each of the capabilities must not utilize the same medium, while eliminating the need to use ambiguous phrases such as "redundant and diversely routed" (as used in the prior version of the standard governing communications capability).[56]

71. As noted above, NERC indicated in its response to the COM NOPR that Reliability Standard COM-001-2 need not include requirements regarding data exchange

[55] Order No. 808, 151 FERC ¶ 61,039, at P 45 n.54.

[56] May 14, 2014, NERC COM Petition, Docket No. RM14-13-000 at 15-16.

capability because such capability is or would be covered by other existing or proposed standards. Specifically, NERC explained that data exchange is addressed by the currently enforceable Reliability Standards IRO-010-1a and IRO-014-1. In addition, NERC stated that data exchange transfer capabilities are directly addressed in proposed Reliability Standard TOP-001-3, as well as in proposed Reliability Standard IRO-002-4, Requirement R1. NERC also stated that the data itself is covered in proposed Reliability Standard IRO-010-2 and proposed Reliability Standard TOP-003-3.[57]

NERC Petition

72. In the petition in this proceeding, NERC states that in proposed Reliability Standard TOP-001-3, "Requirements R19 and R20 provide that each Transmission Operator (Requirement R19) and Balancing Authority (Requirement R20) must have data exchange capabilities with the entities from which it needs data in order to maintain reliability in its area."[58] NERC states that Requirements R19 and R20 are consistent with proposed Reliability Standard IRO-002-4, Requirement R1, which provides that each reliability coordinator must have data exchange capabilities with its balancing authorities, transmission operators, and other entities it deems necessary. Requirements R19 and R20 state:

[57] NERC COM Supplemental Comments at 3.

[58] NERC Petition at 26.

> R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area.
>
> R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area.

Reliability Standard IRO-002-4 Requirement R1 states:

> R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

In addition, NERC states that IRO-002-4, Requirement R4 requires "each Reliability Coordinator must have monitoring systems…over a redundant infrastructure."[59]

Commission Proposal

73. The Commission agrees that proposed Reliability Standard TOP-001-3, Requirements R19 and R20 require some form of "data exchange capabilities" for the transmission operator and balancing authority, respectively, and that proposed Reliability Standard TOP-003-3 addresses the operational data itself needed by the transmission operator and balancing authority. In addition, the Commission agrees that Reliability Standard IRO-002-4, Requirement R1 requires "data exchange capabilities" for the reliability coordinator and that proposed Reliability Standard IRO-010-2 addresses the operational data needed by the reliability coordinator. Further, the Commission agrees

[59] *Id.* at 31.

that proposed Reliability Standard IRO-002-4 Requirement R4 requires a redundant infrastructure for system monitoring. However, it is not clear whether redundancy and diverse routing of data exchange capabilities (or an equally effective alternative that eliminates the ambiguity of "redundancy" and "diversely routed") are adequately addressed in proposed Reliability Standards TOP-001-3 and IRO-002-4 for the reliability coordinator, transmission operator, and balancing authority.

74. Unlike the approach taken with COM-001-2, which requires redundancy and use of a diverse medium through the definitions of Interpersonal Communication and Alternative Interpersonal Communication, proposed Reliability Standards TOP-001-3 and IRO-002-4 do not appear to address redundancy and diverse routing of data exchange capabilities. While Reliability Standard IRO-002-4, Requirement R4 requires reliability coordinators to have a redundant infrastructure for system monitoring, it is not clear whether this requirement addresses redundancy and diverse routing of other forms of data exchange capabilities. For example, a redundant infrastructure used for system monitoring could be a subset of the total data exchange capabilities used by reliability coordinators and not include redundant infrastructure for capabilities such as control of equipment or real-time assessments. The Commission seeks explanation or clarification from NERC whether and how the proposed Reliability Standards in the immediate proceeding address redundancy and diverse routing or an equally effective alternative to redundancy and diverse routing. Further, if NERC or others believe that redundancy and diverse routing are not addressed, we seek comment on whether there are associated

reliability risks of the interconnected transmission network for any failure of data exchange capabilities that are not redundant and diversely routed.

(ii) Testing of the Alternate or Less Frequently Used Data Exchange Capability

NERC Petition

75. Reliability Standard COM-001-2, Requirement R9 (approved in Order No. 808) requires each reliability coordinator, transmission operator and balancing authority to test its Alternative Interpersonal Communication capability at least once each calendar month and to initiate action to repair or designate a replacement Alternative Interpersonal Communication capability.[60]

76. As noted above, proposed Reliability Standards TOP-001-3, Requirements R19 and R20 and IRO-002-4, Requirement R1 address primary data exchange capabilities of the transmission operator, balancing authority and reliability coordinator, respectively. However, the proposed TOP and IRO Reliability Standards do not appear to address testing requirements of alternative or less frequently used data exchange capabilities.

Commission Proposal

77. The Commission is concerned that the proposed TOP and IRO Reliability Standards do not appear to address testing requirements for alternative or less frequently

[60] Reliability Standard COM-001-2, Requirement R9 states: "[e]ach Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communication capability at least once each calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communication capability within 2 hours."

used mediums for data exchange to ensure they would properly function in the event that the primary or more frequently used data exchange capabilities failed. The Commission seeks comment on whether and how the TOP and IRO Reliability Standards address the testing of alternative or less frequently used data exchange capabilities for the transmission operator, balancing authority and reliability coordinator. If NERC or others believe that testing requirements for alternative or less frequently used mediums for data exchange is not necessary, we seek comment on why it is not necessary.

III. Information Collection Statement

78. The collection of information contained in this Notice of Proposed Rulemaking is subject to review by the Office of Management and Budget (OMB) regulations under section 3507(d) of the Paperwork Reduction Act of 1995 (PRA).[61] OMB's regulations require approval of certain informational collection requirements imposed by agency rules.[62] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

79. We solicit comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the

[61] 44 U.S.C. 3507(d) (2012).

[62] 5 C.F.R. § 1320.11 (2014).

quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. Specifically, the Commission asks that any revised burden or cost estimates submitted by commenters be supported by sufficient detail to understand how the estimates are generated.

Public Reporting Burden: The Commission proposes to approve revisions to the Transmission Operations and Interconnection Reliability Operations and Coordination Reliability Standards. These revisions will impose new or revised, or retire requirements for the balancing authority, transmission operator, generator operator, distribution provider, generator owner, load-serving entity, purchasing-selling entity, transmission service provider, interchange authority, transmission owner, reliability coordinator, planning coordinator, and transmission planner functions. The Commission based its paperwork burden estimates on the NERC compliance registry as of May 15, 2015. According to the registry, there are 11 reliability coordinators, 99 balancing authorities, 450 distribution providers, 839 generator operators, 80 purchasing-selling entities, 446 load-serving entities, 886 generator owners, 320 transmission owners, 24 interchange authorities, 75 transmission service providers, 68 planning coordinators, 175 transmission planners and 171 transmission operators. The estimates are based on the change in burden from the current standards to the proposed. Not all entity types would experience an increase in burden, which is reflected by absence of those entities from the chart below.

Collectively, the proposed TOP and IRO Reliability Standards along with revised definitions provide for certain enhancements over the currently-effective TOP and IRO Reliability Standards.[63] For example, the revised definitions of operational planning analysis and real-time assessment, which are applicable to multiple proposed TOP and IRO Reliability Standards, were enhanced and provide significant additional detail over the currently-effective definitions such as including inputs that were identified as contributing to past outages on the bulk electric system.[64] As another example, the new proposed Reliability Standard IRO-017-1 establishes operational planning requirements for each reliability coordinator to implement an outage coordination process for its area that address a reliability gap identified in the Southwest Outage Blackout Report and in the Remand NOPR.[65] The Commission estimates the annual reporting burden and cost as follows:

Title: FERC-725Z, Mandatory Reliability Standards: IRO Reliability Standards, and FERC-725A, Mandatory Reliability Standards for the Bulk-Power System

Action: Proposed Changes to Collections.

OMB Control Nos: 1902-0276 (FERC-725Z); 1902-0244(FERC-725A)

Respondents: Business or other for-profit and not-for-profit institutions.

Frequency of Responses: On-going.

80. Necessity of the Information and Internal review: The Commission has reviewed the requirements pertaining to the proposed Reliability Standards TOP-001-3, TOP-002-4, TOP-003-3, IRO-001-4, IRO-002-4, IRO-008-2, IRO-010-2, IRO-014-3, and IRO-017-1 and made a determination that the proposed requirements of these standards are necessary to implement section 215 of the FPA. These requirements conform to the Commission's plan for efficient information collection, communication and management within the energy industry. The Commission has assured itself, by means of its internal review, that there is specific, objective support for the burden estimates associated with the information requirements.

81. Interested persons may obtain information on the reporting requirements by contacting the Federal Energy Regulatory Commission, Office of the Executive Director, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

82. Comments concerning the information collections proposed in this NOPR and the associated burden estimates, should be sent to the Commission in this docket and may also be sent to the Office of Management and Budget, Office of Information and Regulatory Affairs [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at the following e-mail address: oira_submission@omb.eop.gov. Please reference OMB Control Nos. 1902-0276 (FERC-725Z) and 1902-0244 (FERC-725A)) in your submission.

IV. Environmental Analysis

83. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[69] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[70] The actions approved herein fall within this categorical exclusion in the Commission's regulations.

[69] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs. Preambles 1986-1990 ¶ 30,783 (1987).

[70] 18 CFR 380.4(a)(2)(ii).

V. Regulatory Flexibility Act Analysis

84. The Regulatory Flexibility Act of 1980 (RFA) generally requires a description and analysis of Proposed Rules that will have significant economic impact on a substantial number of small entities. [71] The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.[72] The SBA revised its size standard for electric utilities (effective January 22, 2014) to a standard based on the number of employees, including affiliates (from a standard based on megawatt hours).[73] Proposed Reliability Standards TOP-001-3, TOP-002-4, TOP-003-3, IRO-001-4, IRO-002-4, IRO-008-2, IRO-010-2, IRO-014-3, and IRO-017-1 are expected to impose an additional burden on 196 entities (reliability coordinators, transmission operators, balancing authorities, transmission service providers, and planning authorities). Comparison of the applicable entities with the Commission's small business data indicates that approximately 82 of these entities are small entities that will be affected by the proposed Reliability Standards.[74] As discussed above, proposed Reliability Standards

[71] 5 U.S.C. 601-12.

[72] 13 C.F.R. § 121.101 (2013).

[73] SBA Final Rule on "Small Business Size Standards: Utilities," 78 FR 77343 (Dec. 23, 2013).

[74] The Small Business Administration sets the threshold for what constitutes a small business. Public utilities may fall under one of several different categories, each with a size threshold based on the company's number of employees, including affiliates, the parent company, and subsidiaries. For the analysis in this NOPR, we are using a 750 employee threshold for each affected entity to conduct a comprehensive analysis.

TOP-001-3, TOP-002-4, TOP-003-3, IRO-001-4, IRO-002-4, IRO-008-2, IRO-010-2, IRO-014-3, and IRO-017-1 will serve to enhance reliability by imposing mandatory requirements for operations planning, system monitoring, real-time actions, coordination between applicable entities, and operational reliability data. The Commission estimates that each of the small entities to whom the proposed Reliability Standards TOP-001-3, TOP-002-4, TOP-003-3, IRO-001-4, IRO-002-4, IRO-008-2, IRO-010-2, IRO-014-3, and IRO-017-1 applies will incur costs of approximately $147,364 (annual ongoing) per entity. The Commission does not consider the estimated costs to have a significant economic impact on a substantial number of small entities. The Commission seeks comment on this proposal.

VI. Comment Procedures

85. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [**INSERT DATE 60 Days after publication in the FEDERAL REGISTER**]. Comments must refer to Docket No. RM15-16-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

86. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not

in a scanned format. Commenters filing electronically do not need to make a paper filing.

87. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC 20426.

88. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VII. Document Availability

89. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington DC 20426.

90. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number of this document, excluding the last three digits, in the docket number field.

91. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or e-mail at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202)502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

May 2015
Commission Meeting Summaries

These are summaries of orders voted by the Federal Energy Regulatory Commission at its May 14, 2015 public meeting. The summaries are produced by FERC's Office of External Affairs and are intended to provide only a general synopsis of the orders. These summaries are not intended as a substitute for the Commission's official orders. To determine the specific actions and the Commission's reasoning, please consult the individual orders when they are posted to FERC's eLibrary found at www.ferc.gov.

E-1 – Press Release

FERC conditionally accepts compliance filings

E-2, *ISO New England Inc.*, Docket No. ER13-1957-000, *et al*. This order addresses the filings submitted to comply with the interregional transmission coordination and cost allocation requirements of Order No. 1000 by neighboring transmission planning regions ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, LLC. The order finds the compliance filings partially comply with the interregional transmission requirements adopted in Order No. 1000, and conditionally accepts them, subject to further compliance filings.

FERC conditionally accepts compliance filings

E-3, *Public Service Company of Colorado*, Docket No. ER13-75-006, *et al.* This order addresses the Filing Parties' third Order No. 1000 regional compliance filing and requests for rehearing of the Commission's second compliance order. The order denies the rehearing requests and rejects in part and accepts in part the Filing Parties' proposed tariff revisions, subject to conditions.

FERC conditionally accepts compliance filings

E-4, *Avista Corporation*, Docket No. ER13-94-004, *et al*. This order conditionally accepts for filing, subject to further compliance filing, ColumbiaGrid Public Utilities' third Order No. 1000 compliance filings, effective January 1, 2015.

H-4	P-1892-027 P-1855-046 P-1904-074	TransCanada Hydro Northeast Inc.

Kimberly D. Bose,
Secretary.

A free webcast of this event is available through www.ferc.gov. Anyone with Internet access who desires to view this event can do so by navigating to www.ferc.gov's Calendar of Events and locating this event in the Calendar. The event will contain a link to its webcast. The Capitol Connection provides technical support for the free webcasts. It also offers access to this event via television in the DC area and via phone bridge for a fee. If you have any questions, visit www.CapitolConnection.org or contact Danelle Springer or David Reininger at 703-993-3100.

Immediately following the conclusion of the Commission Meeting, a press briefing will be held in the Commission Meeting Room. Members of the public may view this briefing in the designated overflow room. This statement is intended to notify the public that the press briefings that follow Commission meetings may now be viewed remotely at Commission headquarters, but will not be telecast through the Capitol Connection service.

FERC denies rehearing

E-5, *ENE* (*Environment Northeast) v. Bangor Hydro-Electric Co.*, Docket No. EL13-33-001, *et al.* This order denies requests for rehearing of two Commission orders establishing hearing procedures for two complaints challenging the New England Transmission Owners' return on equity.

FERC denies rehearing

E-6, *Golden Spread Electric Cooperative, Inc. v. Southwestern Public Service Co.*, Docket Nos. EL12-59-001 & EL13-78-001 (consolidated). The order denies requests for rehearing of two Commission orders establishing hearing procedures for two complaints in which Golden Spread challenged the return on equity in Southwestern Public Service Co.'s (SPS) transmission formula rates found in the Replacement Power Sales Agreement between SPS and Golden Spread, and the transmission revenue requirement in Xcel Energy Inc.'s open access transmission tariff.

FERC conditionally accepts tariff revisions

E-7, *Nevada Power Company*, Docket Nos. ER15-1196-000 and -001. This order conditionally accepts, subject to further filings, proposed revisions to NV Energy's Open Access Transmission Tariff to enable its participation in the California Independent System Operator Corporation's Energy Imbalance Market.

FERC denies request

E-8, *Northern States Power Company, a Minnesota corporation*, Docket No. QM15-2-000. This order denies Northern States Power Company's (NSPM) application to terminate its obligation to purchase electric energy and capacity from a qualifying facility owned by Twin Cities Hydro LLC (Twin Cities), in light of NSPM's failure to demonstrate that Twin Cities has nondiscriminatory access to the capacity market of the Midcontinent Independent System Operator, Inc.

FERC authorizes a transfer of an electric generating facility

E-9, *PowerMinn 9090, LLC*, Docket No. EC15-76-000. This order authorizes the transfer of a 64-megawatt electric generating facility from PowerMinn 9090 and Fibrominn, LLC to Benson Power, LLC.

FERC authorizes issuance of securities

E-10, *NorthWestern Corporation*, Docket No. ES15-14-000. This order grants NorthWestern's request for authorization to issue securities under section 204 of the Federal Power Act. Though NorthWestern's *pro forma* interest coverage ratio is below 2.0, the facts set forth by NorthWestern, including that its retail rates allow for recovery of its interest expense for the proposed issuances of securities, provide the Commission an alternative basis upon which to conclude that the proposed issuances of securities should not impair NorthWestern's ability to both service the proposed securities and to continue to provide service as a public utility.

FERC accepts a filing

E-12, *Entergy Services, Inc.*, Docket No. ER07-956-008. The order accepts Entergy's comprehensive bandwidth recalculation report for calendar year 2006. The order also accepts Entergy's application of the bandwidth formula to Entergy Texas and Entergy Gulf States Louisiana, the successors to Entergy Gulf States, an entity which no longer exists.

FERC finds compliance filing moot

E-13, *Entergy Services, Inc.*, Docket Nos. ER10-3357-000 and 001. This order finds that Entergy's compliance filing in response to Order Nos. 729 and 676-E is moot due to Entergy's December 19, 2013 integration into Midcontinent Independent System Operator, Inc., which resulted in the cancellation of Entergy's Open Access Transmission Tariff.

FERC grants a petition for declaratory order

E-14, *Avista Corporation*, Docket No. EL15-19-000. The order grants a petition for a declaratory order finding that Avista is exempt from certain books and records-related requirements under the Public Utility Holding Company Act of 2005.

FERC grants request for limited waiver

E-15, *Southwest Power Pool, Inc.*, Docket No. ER15-990-000. This order grants SPP's request for limited waiver of certain provisions in Attachment AE of SPP's tariff to recognize the establishment of certain resource hubs in SPP's Integrated Marketplace.

FERC denies rehearing

G-1, *CAlifornians for Renewable Energy, Inc., Michael E. Boyd, Robert M. Sarvey v. Pacific Gas and Electric Company*, Docket No. RP13-436-001. This order denies a request for rehearing filed by CAlifornians for Renewable Energy, Inc., Michael E. Boyd, and Robert M. Sarvey of the Commission's order denying their complaint that Pacific Gas and Electric Company had violated the terms and conditions of its blanket certificate through failure to meet requirements to maintain its natural gas pipeline system, with regard to events leading up to, during, and following the San Bruno pipeline explosion.

FERC grants intervention and rehearing

H-2, *Brookfield Smoky Mountain Hydropower, LLC*, Project No. 2169-109. This order grants American Whitewater's motion to intervene and request for rehearing of Commission staff's March 11, 2015 order, which incorporated into the license a revised Clean Water Act section 401(a) Water Quality Certification and amended the operating plan for the Brookfield Smokey Mountain Hydro Project No. 2169, located on the Little Tennessee River in Graham and Swain counties, North Carolina, and Blount and Monroe counties, Tennessee. The order amends the operating plan to include American Whitewater as a consulted entity for high flow event planning.

FERC proposes a rule

H-3, *Commencement of Assessment of Annual Charges*, Docket No. RM-15-18-000. This Notice of Proposed Rulemaking (NOPR) proposes to amend the Commission's regulations to commence assessing annual charges to hydropower licensees and exemptees, other than state or municipal entities, with respect to licenses and exemptions authorizing unconstructed projects and new capacity, beginning two years from the effective date of the project license, exemption, or amendment authorizing new capacity, rather than on the date that project construction starts. The proposed revisions will provide administrative efficiency and promote certainty among licensees, exemptees, and Commission staff as to when annual charges will commence.

FERC grants rehearing and approves a filing

H-4, *TransCanada Hydro Northeast, Inc*, Project Nos. 1892-027, 1855-046, and 1904-074. This order grants TransCanada's request for rehearing of a February 21, 2014 determination letter filed by the Director, Office of Energy Projects, on a study plan submitted by TransCanada, licensee for the Wilder Hydroelectric Project No. 1892, Bellows Falls Hydroelectric Project No. 1855, and the Vernon Hydroelectric Project No. 1904, located on the Connecticut River in New Hampshire and Vermont. The order deletes the requirement for a hydroacoustic study to monitor downstream passage of

juvenile American shad and adult American eels at one of the projects and approves TransCanada's Revised Study 22 regarding juvenile shad.

FERC authorizes a cross-border natural gas pipeline project

C-1, *Impulsora Pipeline,LLC,* Docket No. CP14-513-000. This order issues a Presidential Permit and grants authorization under section 3 of the Natural Gas Act to Impulsora Pipeline for a new border crossing pipeline facility that will transport Texas-sourced gas gathered from a proposed intrastate pipeline to a power plant to be constructed near Colombia, Nuevo Léon, Mexico. The project will consist of one 36-inch-diameter, 4,000-foot-long pipeline and one 12-inch-diameter, 2,500-foot-long pipeline that will run parallel to the 36-inch-diameter pipeline. The export facilities will have a design capacity to transport approximately 1.12 million cubic feet of gas per day. In addition to the two pipelines, Impulsora proposes to construct and operate a meter and pigging equipment, consisting of one 12-inch pig receiver and one 36-inch pig receiver that will be situated on 0.6 acre of land.

FERC authorizes new natural gas pipeline facilities

C-2, *Paiute Pipeline Company*, Docket No. CP14-509-000. This order issues a certificate of public convenience and necessity to Paiute Pipeline Company to construct and operate the proposed Elko Area Expansion Project in Nevada. The project would include the construction and operation of approximately 35.2 miles of 8-inch diameter pipeline, modification of Paiute's Elko City Gate and the construction and operation of a new interconnection with Ruby Pipeline, LLC. The proposed project will enable Paiute to provide 21,994 dekatherms of gas per day of incremental firm transportation service to Southwest Gas Corporation-Northern Nevada and Newmont Mining Corporation. The order also examines and rejects an alternative route sponsored by the Bureau of Land Management and Prospector Pipeline Company.

FERC authorizes new natural gas pipeline facilities

C-3, *Algonquin Gas Transmission, LLC,* Docket No. CP14-522-000. This order grants Algonquin Gas Transmission a certificate of public convenience and necessity to construct and operate the Salem Lateral Project which will consist of approximately 1.2 miles of 16-inch-diameter lateral pipeline and a metering and regulating station in Salem, Massachusetts. The project will connect Algonquin's HubLine to a proposed 630-megawatt, quick-start, natural gas-fired generation facility.

FERC approves letters to secretaries of the Defense and State departments

C-5, *Roadrunner Gas Transmission, LLC,* Docket No. CP15-161-000. These letters request comments from the Secretary of State and the Secretary of Defense regarding the application filed by Roadrunner Gas Transmission, LLC for authorization under section 3

of the Natural Gas Act and a Presidential Permit to site, construct, connect, operate, and maintain natural gas pipeline facilities at the international boundary between the United States and Mexico in the vicinity of San Elizario in El Paso County, Texas for the export of natural gas.

FERC grants a certificate of public convenience and necessity

C-6, *Black Hills Shoshone Pipeline, LLC*. Docket No. CP15-32-000. This order grants the requested authorizations, subject to conditions, submitted in a joint application under section 7 of the Natural Gas Act (NGA) by Black Hills Shoshone Pipeline, LLC (Black Hills) and Energy West Development, Inc. (Energy West). The order grants (1) NGA section 7(b) authorization for Energy West to abandon by sale the Shoshone Pipeline, an approximately 30-mile-long, six-inch-diameter pipeline system located in Montana and Wyoming; (2) a certificate of public convenience and necessity under NGA section 7(c) and Part 157 of the Commission's regulations authorizing Black Hills to acquire and operate the Shoshone Pipeline and to provide service at the same rates, terms, and conditions currently applicable to service under Energy West's tariff; (3) a blanket certificate in accordance with Subpart F of Part 157 of the Commission's regulations for Black Hills to perform certain routine construction, operation and abandonment activities; and (4) a blanket certificate in accordance with Subpart G of Part 284 of the Commission's regulations authorizing Black Hills to provide open access firm and interruptible transportation services.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Lesson Learned

Real-Time Contingency Analysis Failure due to a Modeling Error

Primary Interest Groups
Reliability Coordinators (RCs)
Balancing Authorities (BAs)
Transmission Operators (TOPs)
Transmission Owners (TOs)

Problem Statement
A Real-Time Contingency Analysis (RTCA) process failed to converge for 46 minutes.

Details
During the 46-minute period of the event, the state estimator converged intermittently; however, both power flow and contingency analysis were available in study application, and operators had full visibility and control of the system via SCADA.

The system operator did not recognize that the RTCA result had been non-convergent for 29 minutes because the alert status was not in an obvious location on the screen, it was not a prominent color, and it lacked an indication that it was critical. The operator noticed that the RTCA base case diverged after a second alert, so the operator immediately attempted to manually run RTCA two additional times. This action was a procedure used to attempt to correct the problem, but neither run was successful. EMS support personnel were then contacted for assistance. Model updates were made that allowed RTCA to converge approximately 46 minutes after the initial RTCA non-convergence.

An investigation determined that there was an error in a recent model topology .csv change file. Although the topology change was done in accordance with existing processes, it was determined that the error was not present in the development environment used for testing the topology modifications and that the error was introduced during the migration of these changes to the production environment. A .csv file had been prepared with the topology changes and populated on the Development System Network Applications Database. While testing the modifications, corrections were made directly to the Development System Network Applications Database and concurrently to the file that had been used to populate the topology changes on the development system. The concurrent correction made to the file is where the human error occurred and went unnoticed. The incorrectly modified .csv file was then used to populate the topology changes on the Production System Network Applications Database.

It was also determined that the network applications display didn't show the RTCA convergence status in an obvious location, nor did the RTCA status alert clearly indicate that it was critical. In addition, the system operator didn't fully recognize and understand the critical nature of a non-convergent state estimator solution.

Corrective Actions

- A temporary fix was initiated to get a convergent solution. Once the solution was stable, EMS support personnel investigated the non-convergence and identified an error in a recent topology change made to the model, and the error was corrected immediately.
- EMS support personnel modified the process for making Network Applications Database modifications of this nature. The change process now includes an additional step whereby if any changes are made directly to the Development System Network Applications Database during testing, the file will be re-created from the Development System Network Applications Database, the changes will be compared and verified to the original file, and the newly created file will be used to populate the Production System Network Applications database.
- The network applications display was adjusted with the status information moved to a more visible area. The color of the status alert for “non-converged” was changed from brown to red. A unique audible alarm was also added to the “non-converged” status alert.
- The event was communicated to all system operators, detailing the importance of fully understanding what the different solution status terms mean.

Lessons Learned

- An additional change-control procedure needs to be in place to avoid the transfer of bad data to production after it has been successfully tested on the development system.
- For verification of changes, automated review, peer review, or both must be implemented as part of any change process.
- Real-time tools, state estimators, and contingency analysis solutions need to be validated on the production system after a model change.
- Visual tools must prominently display critical alerts to the system operator.
- System operators must be able to recognize when their tools are abnormal and react according to their severity.
- Placement of status indicators, the color of the text based upon the level of the alert, and the type of audible alert must be considered for ease of identification by the system operator.

NERC's goal with publishing lessons learned is to provide industry with technical and understandable information that assists them with maintaining the reliability of the bulk power system. NERC requests that you provide input on this lesson learned by taking the short survey provided in the link below.

Generator Distributed Control System Impact on Automatic Voltage Regulators

Primary Interest Groups
Reliability Coordinators (RCs)
Transmission Operators (TOPs)
Generator Operators (GOPs)
Generator Owners (GOs)

Problem Statement
The RC and TOP within an RC footprint observed unusual generator reactive output following the switching of a shunt reactor near all of the generators' points of interconnection.

Details
The generators at the plant were operating with their automatic voltage regulators (AVRs) regulating to maintain a constant voltage schedule. The expected change in the generators' reactive output was initially observed when the shunt reactor was switched out of service. Shortly thereafter, the generators' reactive output immediately reduced by approximately the output of the reactor. The resulting transmission voltage was slightly higher than it was prior to the switching of the reactor.

This response initially supported the assumption that the generators' AVRs were functioning properly and automatically regulating to maintain a constant voltage schedule. However, the generators' reactive output began to slowly increase after a few seconds. Over a seven-minute period, the reactive output gradually returned to the same precontingency level it had been prior to the shunt reactor switching. Over this period of time, the transmission system voltage increased proportionally with the reactive output of the generators. The response over this period of time suggested that the generators were not automatically regulating to maintain a constant voltage schedule as had been assumed. This generator response is shown in Figure 1.

A coordinated control review with the GOP was conducted to determine why the plant's reactive output behaved in this manner. It was determined that the AVRs on all of the generators at the plant were operating to maintain a constant voltage schedule. However, the distributed control system (DCS) at the plant introduced a slower control function that would increase or decrease the AVR voltage set point until the plant's DCS reactive output objective was met. The plant's DCS reactive output objective was a megavar value entered into the DCS by the plant operator. The megavar value entered into the DCS was the value needed to meet the transmission system voltage schedule for the existing steady-state conditions. This put the DCS objective in conflict with the required postcontingency AVR response.

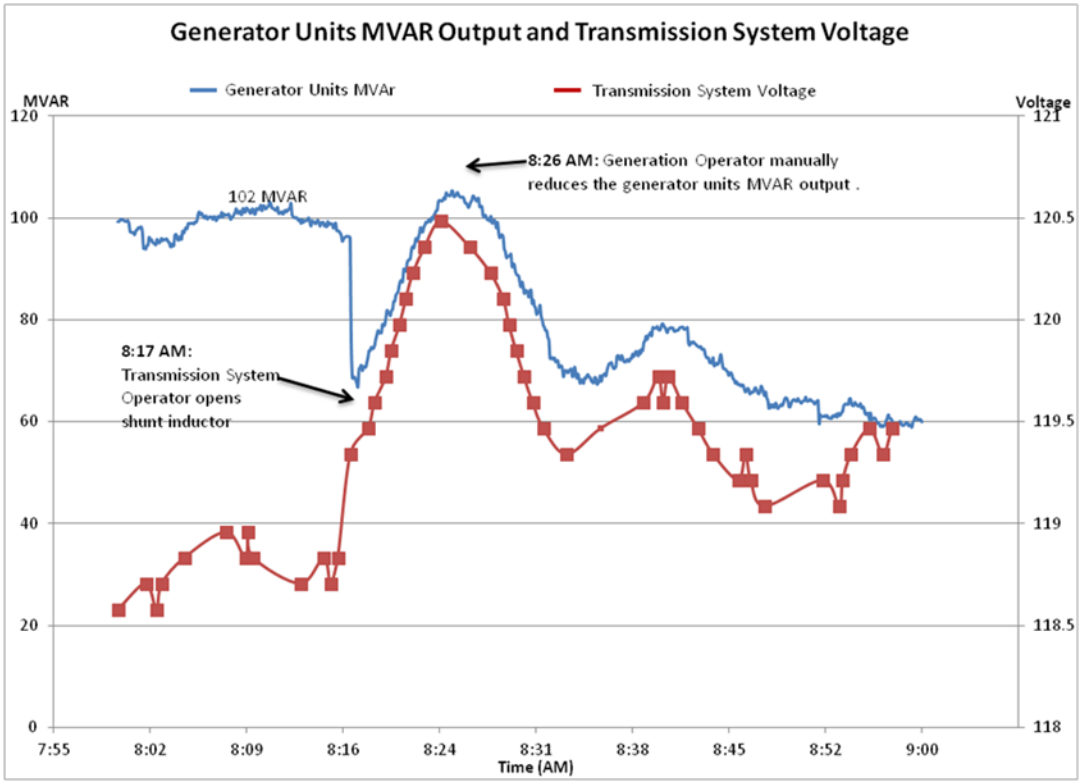

Figure 1: Generator Units MVAR Output and Transmission System Voltage

Corrective Actions

The coordinated control review with the GOP resulted in a modification of the plant's DCS to prevent this behavior. The DCS was modified to have the ability to set the reactive objective to be the transmission system voltage schedule that the plant was directed to control instead of a fixed megavar output. This control change to the DCS system resulted in the desired behavior from the plant following a contingency or a transmission element switching.

After a review of other facilities within the RC's footprint, there were multiple plants found with the same DCS issue. These have been corrected with the same or similar modifications in coordination with the GOP.

Lesson Learned

While a generator AVR may be properly set to control the voltage schedule, other plant control systems may override or counteract the appropriate AVR response. Periodic review of a plant's AVR response to system events must be conducted to determine if this occurs. If a proper AVR response is inhibited, the RC, TOP, and GOP should review the interaction of all related plant control systems to develop a corrective action plan for coordinating the plant control systems to ensure the AVR will have the uninhibited ability to control the desired voltage set point.

Industry Advisory

FAC-003-3 Minimum Vegetation Clearance Distances (MVCD)

Initial Distribution: May 14, 2015

The purpose of this Advisory is to provide Transmission Owners and Generator Owners information about preliminary testing results and anticipated adjustments to the Minimum Vegetation Clearance Distances (MVCDs) specified in the NERC Reliability Standard FAC-003-3. As a result of the preliminary testing, the MVCD listed in the Standard required to prevent a flashover and improve the reliability of the Bulk Power System (BPS) will need to be increased. Transmission and Generator Owners should consider this information in their maintenance strategies or any related vegetation management programs, processes, and procedures.

NERC conducted testing as directed in the Federal Energy Regulatory Commission's (FERC's) Order No. 777 (Revisions to Reliability Standard for Transmission Vegetation Management, 142 FERC ¶ 61,208 (2013)). The testing is intended to support the MVCD calculated based on application of the Gallet equation, with the gap factors for all alternating current system voltages covered in Table 2 of the Standard. The preliminary test results, identified in a collaborative research project under contract with the Electric Power Research Institute (EPRI), determined that the current gap factor requires adjustment.

NERC will initiate efforts to correct the MVCD values in FAC-003-3 following the conclusion of validation testing expected in early to mid-summer. The final adjustments will be based solely on the validated findings of the research.

Instructions:	NERC Advisories are designed to improve reliability by disseminating critical reliability information and are made available pursuant to Rule 810 of NERC's Rules of Procedure, for such use as your organization deems

	appropriate. **No particular response is necessary.** This NERC Advisory is not the same as a NERC Reliability Standard, and your organization will not be subject to penalties for a failure to implement this Advisory. Additionally, issuance of this Advisory does not lower or otherwise alter the requirements of any approved Reliability Standard, or excuse the prior failure to follow the practices discussed in the Advisory if such failure constitutes a violation of a Reliability Standard.
Distribution:	**Initial Distribution:** Generator Owner, Transmission Owner **Who else will get this alert? >>** **What are my responsibilities? >>**
Primary Interest Groups:	Generation Engineering, Generation Operations, Physical Security, System Operations – Transmission Engineering, System Operators, System Operators – System Protection, Transmission Planning

Advisory:

The preliminary findings of NERC's testing determined that the current gap factor in the Gallet equation of 1.3 will likely be adjusted to a value around 1.0. This will result in increased MVCD values for all alternating current system voltages identified in Table 2 of the Reliability Standard. The adjusted MVCD values, reflecting the anticipated 1.0 gap factor, would be as follows:

Nominal AC System Voltage (kV)	MVCD at 1.0 Gap Factor (feet)														
	Sea Level up to 500 ft	Over 500 ft up to 1,000 ft	Over 1,000 ft up to 2,000 ft	Over 2,000 ft up to 3,000 ft	Over 3,000 ft up to 4,000 ft	Over 4,000 ft up to 5,000 ft	Over 5,000 ft up to 6,000 ft	Over 6,000 ft up to 7,000 ft	Over 7,000 ft up to 8,000 ft	Over 8,000 ft up to 9,000 ft	Over 9,000 ft up to 10,000 ft	Over 10,000 ft up to 11,000 ft	Over 11,000 ft up to 12,000 ft	Over 12,000 ft up to 13,000 ft	Over 13,000 ft up to 14,000 ft
765	11.6	11.7	11.9	12.1	12.2	12.4	12.6	12.8	13.0	13.1	13.3	13.5	13.7	13.9	14.0

Table 2 – Table of MVCD values at a 1.0 gap factor (in metric units)

For example, the original MVCD listed in Table 2 of FAC-003-3 for 500kV at sea level was 5.15 feet. The new MVCD, listed in Table 1 above, with the adjusted gap factor is 7.0 feet.

Under FAC-003-3, Transmission Owners and Generator Owners are responsible for ensuring that vegetation encroachments do not occur within the MVCDs of applicable transmission lines. NERC is providing the preliminary findings of the research project to enable Transmission Owners and Generator Owners to make adjustments that may be appropriate in the maintenance strategies, procedures, processes, or specifications used in vegetation management programs.

Background: In Order No. 777, FERC directed NERC to undertake testing to gather empirical data validating the appropriate gap factor used in the Gallet equation to calculate MVCDs, specifically the gap factor for the flashover distances between conductors and vegetation. FERC directed NERC to submit: (1) a schedule for testing; (2) the scope of work; (3) funding solutions; and (4) a deadline for submitting a final report on the test results to FERC, along with interim reports if a multi-year study is conducted. NERC engaged industry through a collaborative research project and contracted EPRI to complete the scope of work. NERC submitted a compliance filing in accordance with Order No. 777 on July 12, 2013 (Compliance Filing of the N. Am. Reliability Corp., Docket No. RM12-4-000) which FERC accepted on September 4, 2013 (N. Am. Elec. Reliability Corp., Docket No. RM12-4-001).

In January 2014, NERC formed an advisory group to assist with developing the scope of work for the project. This team provided subject matter expertise for developing

the test plan, monitoring testing, and vetting the analysis and conclusions to be submitted in a final report. The advisory team comprises NERC staff, arborists, and industry members with wide-ranging expertise in transmission engineering, insulation coordination, and vegetation management. In March 2014, the project's scope of work and a detailed test plan was finalized with EPRI staff, members of industry, and FERC staff.

The testing project commenced in April 2014 and continued through October 2014. EPRI completed the prescribed tests aimed at determining the gap factor applied in the Gallet equation. On July 31, 2014, NERC filed an informational filing with FERC (Informational Filing of NERC, Docket Nos. RM12-4-000 and RM12-4-001) containing the details of the testing work that had been completed through the end of July. The initial analysis, as well as preliminary conclusions and recommendations, was reached in early 2015. Based on these preliminary results, it has become apparent that the gap factor used in the Gallet equation requires adjustment from 1.3 to 1.0. For additional details on the testing project, please follow this link to Project 2010-07.1 Vegetation Management.

NERC will undertake additional tests as needed to finalize the preliminary gap factor determinations, file a final report with FERC by late summer of 2015, and initiate a narrowly prescribed Standard Authorization Request for a NERC Reliability Standards development effort to adjust the MVCD values in FAC-003-3.

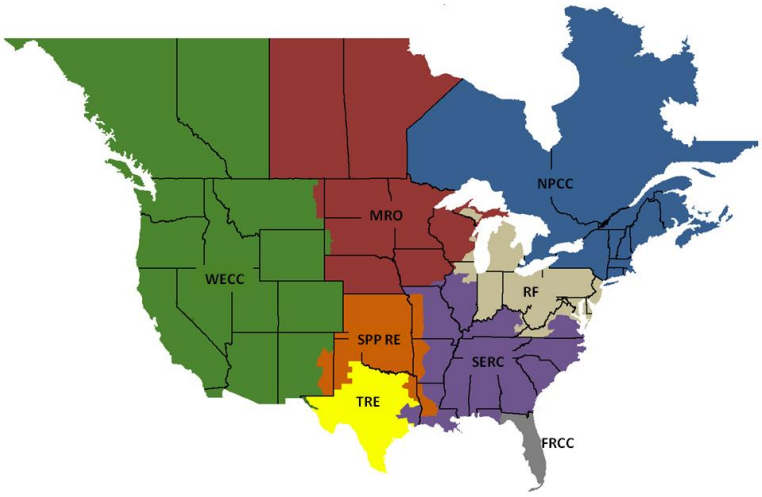
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below. The ERO Enterprise is comprised of NERC and the eight REs.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
Texas RE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Introduction

Purpose

The ERO Compliance Monitoring and Enforcement Program Implementation Plan (Implementation Plan) is the annual operating plan carried out by Compliance Enforcement Authorities (CEAs) while performing their responsibilities and duties as called for in the Compliance Monitoring and Enforcement Program (CMEP). CEAs, which consist of NERC and the eight REs, carry out CMEP activities in accordance with the NERC Rules of Procedure (ROP), including Appendix 4C, the respective Regional Delegation Agreements between NERC and each RE, and other agreements with the Canadian regulatory authorities.

Historically, the Implementation Plan has specified the NERC Reliability Standards and Requirements to be actively monitored and audited by the REs during the implementation year.[1] For the 2015 Implementation Plan and beyond, NERC will replace the approach used to develop the ERO CMEP Implementation Plan and the Actively Monitored List (AML) with processes that identify and prioritize continent-wide risks to the reliability of the BPS, as well as related Reliability Standards and registration functional categories. The new approach will provide input to a more individualized compliance oversight plan for registered entities. The transformation to focus on identifying and prioritizing risks replaces a static, one-size-fits-all list of Reliability Standards and prioritizes functions and Reliability Standards based on risk to determine the appropriate oversight method.

The NERC ROP requires that NERC provide the Implementation Plan to the REs on or about September 1 of the preceding year.[2] REs must submit their Implementation Plans to NERC for review and approval on or about October 1. Regional Implementation Plans provide:

- Details on Regional Risk Assessment processes and results,
- Reliability Standards and Requirements associated with Regional Risk Assessment results,
- Regional compliance oversight plan, which includes its annual audit plan, and
- Other key activities and processes used for CMEP implementation.

Implementation Plan

The ERO Enterprise maintains a consolidated Implementation Plan that provides guidance and implementation information common among the NERC and the eight REs.

During the implementation year, NERC or a RE may update the Implementation Plan. Updates could include, but are not limited to: changes to compliance monitoring processes, changes to regional processes, or updates resulting from a major event, FERC Order, or other matter. When updates occur, NERC will post a revised plan on the NERC website and issue a compliance communication. REs should submit updates to the NERC Compliance Operations group, which will review and act on any proposed changes. NERC will be responsible for updating the ERO CMEP Implementation Plan to reflect any RE changes and will post the updated plan to the website and issue compliance communications.

RE Implementation Plans

The Regional Implementation Plans supplement the ERO CMEP Implementation Plan and provide information that is RE-specific. The Regional Implementation Plan describes Regional risk assessments that identify risks that Regions will consider as part of their compliance oversight plan, which includes the 2015 annual audit plan.

[1] NERC ROP, Section 401 (Scope of the NERC Compliance Monitoring and Enforcement Program).

[2] NERC ROP, Section 403 (Required Attributes of RE Compliance Monitoring and Enforcement Programs).

Appendices 1.1-1.8 contain the Regional Implementation Plans. NERC will update the Implementation Plan on or about November 1 to include the Regional Implementation Plans. Regional Implementation Plans are due to NERC for review on or about October 1.

Risk-based Approach to Compliance Monitoring and Enforcement

Risk-based Compliance Monitoring

Deployment of Risk-based Compliance Oversight

Through a Reliability Assurance Initiative (RAI), NERC has transformed its compliance and enforcement program into one that is forward-looking, focuses on areas that represent a high risk to BPS reliability, and reduces the administrative burden on registered entities. The transformed approach to compliance monitoring emphasizes an examination of reliability risks as the basis for the determination of the appropriate oversight framework, including scope, frequency, and what monitoring tools are appropriate in each case.

During 2015, CEAs will begin deploying processes and tools used to support risk-based compliance oversight. NERC and the REs are committed to ensuring full transformation to risk-based compliance oversight, and NERC and the REs plan continued communications, training, and outreach throughout 2015 to support risk-based compliance oversight.

Risk-based Compliance Oversight Framework

The ERO Enterprise's Risk-based Compliance Oversight Framework (Framework) consists of processes that involve reviewing system-wide risk elements, an assessment of a registered entity's inherent risk, and, on a voluntary basis, an evaluation of a registered entity's internal controls prior to establishing a monitoring plan that is tailored to a particular entity or group of entities.

Figure 1 below illustrates the ERO Enterprise's transformation from a static compliance approach to a dynamic approach. Reliability risk is not the same for all registered entities; therefore, this Framework examines BPS risk as well as individual registered entity risk to determine the most appropriate CMEP tool to use when monitoring a registered entity's compliance with Reliability Standards. This Framework also promotes examination of how registered entities operate. As illustrated by the blue arrows in Figure 1, the Framework tailors compliance monitoring focus to those areas that pose the greatest risk to BPS reliability. The elements in Figure 1 are dynamic and are not independent; rather, they are complementary and interdependent on each another.

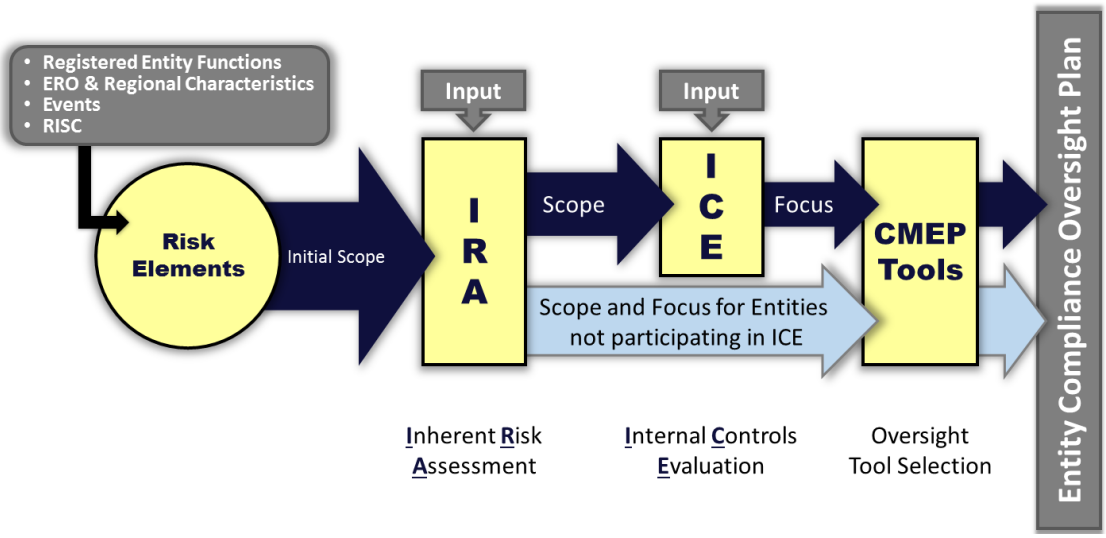


Figure 1: Risk-based Compliance Oversight Framework

Risk Elements

The first step of the Framework consists of identifying and prioritizing continent-wide risks. These risks are identified and prioritized based on, among other things, the work done by NERC staff, the Reliability Issues Steering Committee (RISC), initiatives such as the Standards Independent Experts Review Project, and risks identified in the ERO Enterprise Strategic Plan. Risks are identified and prioritized based on significance, likelihood, vulnerability, and potential impact to the reliability of the BPS. They may be categorized as operational and planning risks, as well as threats to cyber systems or physical security. While risk identification occurs on at least an annual basis, they are dynamic and continually evolve. Accordingly, periodic reviews and updates may be necessary and appropriate to address increased or emerging risks as well as reflect mitigated risks. However, the risks and associated Reliability Standards identified through this process do not constitute the entirety of risks that may affect the reliability of the BPS. Regional Entities are expected to consider local risks and specific circumstances associated with individual registered entities within their footprint when developing their compliance oversight plans.

Inherent Risk Assessment

REs perform an Inherent Risk Assessment (IRA) of registered entities to identify areas of focus and the level of effort needed to monitor compliance with NERC Reliability Standards for a particular registered entity. The IRA is a review of potential risks posed by an individual registered entity to the reliability of the BPS. An IRA considers risk factors such as assets, systems, geography, interconnectivity, prior compliance history, and overall unique entity composition when determining the compliance oversight plan for a registered entity. The IRA will be performed on a periodic basis, with the frequency based on a variety of factors, including, but not limited to, changes to a registered entity and significant changes or emergence of new reliability risks. For monitoring activities performed in 2015, REs may be in various stages of conducting IRAs for registered entities within their footprint. During 2015 and beyond, REs will continue to expand the IRA process to registered entities in their footprints based on risk and compliance monitoring schedules.

Internal Controls Evaluation

To further tailor monitoring plans in accordance with risk for registered entities in their footprints, the Regional Entities also take into account any information obtained through the processes outlined in the **Internal Control Evaluation (ICE)** Guide. For those entities who volunteer to undergo an ICE, REs will select those who will participate in the ICE process based on the risk posed by particular entities and compliance monitoring schedules.

The Internal Controls Evaluation (ICE) enables a further refinement of the registered entity's compliance oversight plan. Registered entities have an opportunity to: (i) provide, on a voluntary basis, information to their respective RE about their internal controls that address the risks applicable to the entity and for identifying, assessing, and correcting noncompliance with Reliability Standards; and (ii) demonstrate the effectiveness of such controls. As a result of the ICE, there may be additional focus of the compliance assurance activities for an entity. Registered entities may elect not to participate in an ICE. In that case, the CEA will use the results of the IRA to determine the appropriate compliance oversight strategy, including focus and tools within the determined scope.

CMEP Tools

Ultimately, the RE will determine which of the compliance monitoring tools (i.e., off-site or on-site audits, spot checks, or Self-Certifications) are warranted. REs will tailor compliance monitoring activities for registered entities in their footprint based on reliability risks. Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to remain on a three-year audit cycle. The determination of the appropriate CMEP tools will be adjusted, as needed, within a given implementation year.

Self-certifications

In the 2015 ERO CMEP Implementation Plan, the ERO identifies continent-wide reliability risks to the BPS and a core set of Reliability Standards and Requirements associated with those risks for specific registered functions.

In developing a compliance oversight plan for registered entities in its footprint, REs should support compliance assurance with these identified Standards and Requirements. Through a risk assessment, an RE may determine that regional risks or risks associated with any particular registered entity drive more, less, or different priorities, and, therefore, the RE may modify the set of core Reliability Standards or pursue compliance assurance through any monitoring tools to address those regional and entity-specific considerations. If an annual self-certification program is not included in a Regional IP, the RE will be expected to address the identified risks through other means.

Compliance Assessments for Events and Disturbances

An important component of the ERO enterprise's risk-based approach to compliance monitoring is the voluntary participation in the Compliance Assessment (CA) Process by registered entities after an event or disturbance. Through the Events Analysis Process, the ERO enterprise promotes a culture of reliability excellence that encourages an aggressive and critical self-review and analysis of operations, planning, and critical infrastructure performance. The CA Process is a complementary review of the event focused on the evaluation of compliance with Reliability Standards. A registered entity completes a CA by reviewing the facts and circumstances of an event or disturbance, identifying relevant Reliability Standards and Requirements, evaluating compliance with these Standards and Requirements, and self-reporting any potential noncompliance. Regional Entity (RE) compliance staff also assesses significant events and disturbances to improve understanding of reliability risks that may guide further compliance monitoring activities.

Registered Entity Responsibilities

The ERO enterprise encourages registered entities to perform a voluntary, systematic CA in response to all system events and disturbances. Registered entities are also expected to share the CA with the RE for all Category 2 and above events. The ERO Events Analysis process document describes the categories for events.[3] Registered entities should use the Sample Compliance Assessment Report Template (Appendix 3 of this document) when performing a CA. In addition to the completed CA template, registered entities should provide to the RE sufficient event information, such as the Brief Report or Event Analysis Report, so the RE may thoroughly understand the event. Registered entities that follow the process above to systematically evaluate their own compliance performance, identify, self-report potential noncompliance, and address reliability issues demonstrate the effectiveness of their internal controls and their commitment to a culture of compliance. Registered entities that are able to demonstrate strong internal controls and a robust culture of compliance that mitigates risk may be afforded some recognition by way of reduced levels and frequency of compliance monitoring activities. Mitigating credit for these actions is also considered during the enforcement of a noncompliance. Such credit is available to the registered entity for comprehensive compliance assessments that clearly demonstrate a systematic review of applicable Standards and, as appropriate, self-reporting.

Regional Entity Responsibilities

REs will review system event reports and CA reports provided by registered entities and may utilize a risk-based approach to prioritize these evaluations. However, the REs will conduct a regional compliance evaluation (RCE) for all Category 2 and above events. By exception, the RE may also examine lower category events that indicate the need for closer examination. As part of its independent evaluation of the CA, the RE may request additional information from the registered entity if it is needed to better understand the event. This process, while informal, may be used to recommend a formal compliance monitoring method, such as a spot check or be used to recommend the modification the scope of an upcoming audit.

The scope of RCEs and the manner in which the REs and NERC evaluate, process, and respond to these reviews is intended to reflect the significance of the event. The registered entity can greatly assist the RE by providing a thorough and systematic self-evaluation with its CA. The RE will share the RCE and CA with NERC staff.

Risk-based Enforcement

The ERO Enterprise recognizes that not all instances of noncompliance require the same type of processing and documentation and that there is a need to streamline processes for resolving minimal and moderate risk issues. This is necessary to enable the ERO Enterprise, as well as industry, to allocate resources to address the issues posing a higher level of risk to reliability. The ERO Enterprise will continue to use more formal enforcement processes, particularly Notices of Penalty, to respond to higher risk issues. Such cases can lead to the identification and implementation of above-and-beyond activities and other non-monetary sanctions, in addition to financial penalties.

Compliance Exceptions

Based on the experience with a streamlined process and a reduced record since 2013, NERC and the REs have exercised discretion when deciding whether to initiate an enforcement action for instances of noncompliance posing a minimal risk to the reliability of the BPS. Issues resolved outside of the enforcement process are referred to as compliance exceptions. The resolution of these issues outside of the enforcement process has not eliminated oversight or visibility over the issues. Rather, these issues are provided for review by NERC and FERC. The process has allowed NERC and the Regional Entities to work with registered entities to identify and mitigate minimal risk issues promptly and more efficiently. Beginning in January 2015, all minimal risk instances of noncompliance will be eligible for resolution as a compliance exception. While compliance exceptions will effectively supersede Find, Fix, Track and Report (FFT) as the process for resolving minimal risk instances of noncompliance in the future, for the time being, the FFT process remains relevant, particularly as it relates to moderate risk issues or minimal risk issues that a region may not deem appropriate to be treated a compliance exception, based on individual facts and circumstances of a particular noncompliance.

Self-Logging Program

Beginning in October 2013, NERC and the Regional Entities began to allow select registered entities with demonstrated effective management practices to self-identify, assess, and mitigate instances of noncompliance to self-log[4] minimal risk instances of noncompliance that would otherwise be individually self-reported. Properly logged items will be presumed appropriate for resolution as compliance exceptions unless there are additional risk factors identified by the CEA. This is consistent with the notion that instances of noncompliance that are self-identified through internal controls, corrected through a strong compliance culture, and documented by the registered entity, should not be resolved through the enforcement process or incur a penalty, absent a higher risk to the BPS.

The self-logging program also encourages the development and communication of management practices by registered entities and rewards registered entities for implementing demonstrated, effective controls in place to detect and correct issues as they arise.

[4] The program is also known as the aggregation program.

Risk Elements Results

The ERO Enterprise has always assessed risks to the reliability of the BPS, as well as mitigating factors that may reduce or eliminate a given reliability risk, and the ERO Enterprise will continue to do so under the Framework referenced above. The ERO Enterprise developed a risk elements Guide to describe a process for identifying risks to the BPS and associated registration functional categories and NERC Reliability Standards to those risks.

In 2015, the ERO Enterprise identified nine risk elements with specific areas of focus. REs will consider the nine risk elements, along with regional risk considerations, to develop their Regional Implementation Plans.

The risk elements identify and prioritize existing risks to the reliability of the BPS. Each of the nine risk elements below is accompanied by a table identifying Reliability Standards and Requirements associated with each risk. The risk elements serve as an input into the overall Regional Risk Assessment to support a risk-informed compliance oversight plan. Risk elements do not serve as a baseline list of Reliability Standards and Requirements, as previously identified through the AML in prior years' CMEP Implementation Plans, nor do they identify Reliability Standards and Requirements that must be audited. Rather, they provide the starting point for the analysis of regional risks which will then be reflected in the Regional Implementation Plans.

2015 Risk Elements

The nine risk elements below are not a comprehensive list of all risks to the reliability of the BPS. Where issues are being addressed through other mechanisms, they are not included herein for compliance assurance activities.[5]

1. Infrastructure Maintenance

As the BPS continues to age, lack of infrastructure maintenance is a reliability risk that continues to grow in importance.

AC Substation Equipment Failures

As reported in the State of Reliability 2014 report, AC Substation Equipment Failures had the largest positive correlation with automatic transmission outage severity in 2013. The correlation is statistically significant: a pattern and underlying dependency exists between AC substation equipment failures and transmission outage severity. While it is unclear whether or not there is a relationship between substation equipment failures and maintenance, such a relationship may exist. The issue of AC Substation Equipment Failure is one that is still being investigated, and action plans to address this concern are being developed. Thus, the ERO CMEP IP may be updated during the year to reflect new activities based on NERC's investigation.

Aging Infrastructure

The general concern of Infrastructure Maintenance has been highlighted in other NERC documents. The 2013 Long-Term Reliability Assessment highlighted this area of concern, stating:

> Aging transmission system infrastructure has many challenges, such as the availability of spare parts, the obsolescence of older equipment, the ability to maintain equipment due to outage scheduling restrictions, and the ability to keep pace with technological advancements … Larger scale "infrastructure revitalization" may be necessary in the future; however, with older generation retiring throughout the next decade, the average age of BPS generation facilities will be relatively young. Implementation of any replacement strategy and in-depth training programs

[5] For example, vegetation management and right-of-way clearances, while key priorities, are not areas of focus for compliance assurance activities because they are being addressed through other ongoing targeted initiatives.

requires additional capital investment, engineering and design resources, and construction labor resources, all of which are in relatively short supply.

Areas of Focus

Table 1 – Infrastructure Maintenance		
Standard	**Requirements**	**Entities for Attention**
PRC-005-2	R3, R4	Generator Owners Transmission Owners Distribution Provider
PRC-008-0	R1, R2	Distribution Providers Transmission Owners
PRC-011-0	R1	Distribution Providers Transmission Owners
PRC-017-0	R1	Distribution Providers Generator Owners Transmission Owners

2. Uncoordinated Protection Systems

Protection systems that trip unnecessarily can contribute significantly to the extent of an event. When protection systems are not coordinated properly, the order of execution can result in either incorrect elements being removed from service or more elements being removed than necessary. This can also occur with Special Protection Systems, Remedial Action Schemes, and Underfrequency Load Shedding and Undervoltage Load Shedding schemes. Such coordination errors occurred in the September 8, 2011 event (see recommendation 19)[6] and the August 14, 2003 event (see recommendation 21).[7] Both the RISC's ERO Priorities: RISC Updates and Recommendations report and NERC's ERO Top Priority Reliability Risks 2014-2017 report recognize protection systems as a significant risk based on the extensive work and detailed analysis contained in the State of Reliability reports from 2012 and 2013.

Areas of Focus

Table 2 – Uncoordinated Protection Systems		
Standard	**Requirements**	**Entities for Attention**
PRC-001-1.1	R3, R5	Generator Operator Transmission Operator
	R4	Transmission Operator

3. Protection System Misoperations

Protection systems are designed to remove equipment from service to avoid damage to equipment when a fault occurs. A protection system that does not trip or is slow to trip may lead to the damage of equipment (which may result in degraded reliability for an extended period of time), while a protection system that trips when it should not can remove important elements of the power system from service at times when they are needed most. Unnecessary trips can even start cascading failures as each successive trip can cause another protection system to trip.

NERC's 2012 and 2013 State of Reliability Reports identified protection system misoperations as a significant threat to BPS reliability. Additional activities are needed to ensure this risk is managed adequately.

[6] See Arizona-Southern California Outages on September 8, 2011.

[7] See Final Report on the August 14, 2003 Blackout.

Key Finding 3 of NERC's State of Reliability 2014 report was based on the continuing history of misoperations being a significant contributor to events. The report notes:

> In 2013, there were 71 transmission-related system disturbances that resulted in a NERC Event Analysis reported event. Of those 71 events, 47 (about 66 percent) had associated misoperations. Of these 47 events, 38 (about 81 percent) experienced misoperations that were contributory to or exacerbated the severity of the event. In several cases, multiple misoperations occurred during a single disturbance. Cause coding has not yet been completed for all 2013 events, but it is estimated that there were 60–75 misoperations associated with these 38 reportable events. Therefore, out of approximately 2,000 total misoperations in 2013, approximately 3.0 to 3.5 percent were causal to or exacerbated by the severity of reportable system disturbances.

Both the RISC's ERO Priorities: RISC Updates and Recommendations report and NERC's ERO Top Priority Reliability Risks 2014-2017 report recognize protection systems and their failures as a significant risk based on the extensive work and detailed analysis contained in the State of Reliability reports from 2012 and 2013.

Areas of Focus

Table 3 – Protection System Misoperations

PRC-023-3[8]	R1.	Transmission Owner Generator Owner Distribution Provider
PRC-025-1	R1	Transmission Owner Generator Owner Distribution Provider

4. Workforce Capability

A lack of knowledge, experience, and capabilities is a common threat in any industry that relies on skilled workers. The RISC, in its ERO Priorities: RISC Updates and Recommendations report, highlighted Workforce Capability and Human Error as a priority area needing focus. Findings of the RISC focused around the need to improve organizational performance and culture to ensure support for the individual worker to gain knowledge and address known issues in advance of their reoccurrence. This is also reflected in NERC's ERO Top Priority Reliability Risks 2014-2017 report.

NERC has also identified the challenge of maintaining a robust and knowledgeable workforce for a number of years. In the 2013 Long-Term Reliability Assessment, NERC notes, "Workers entering the power industry will be tasked with understanding and implementing a variety of new technologies and smarter systems and devices. Across the industry, there is substantial interest in training and hiring workers to support these industry needs as well as transferring the expertise and knowledge of retiring workers."

[8] Reliability Standard PRC-023-3 is effective October 1, 2014. However, PRC-023-2 remains relevant as Criterion 6 of Requirement R1 will remain in effect until PRC-025-1 is fully implemented pursuant to its phased in implementation plan.

Areas of Focus

5. Monitoring and Situational Awareness

Without the right tools and data, operators can make uninformed decisions which may or may not be appropriate to ensure reliability for the given state of the system. NERC's ERO Top Priority Reliability Risks 2014-2017 notes that "stale" data and lack of analysis capabilities contributed the 2003 and 2011 events. Certain essential functional capabilities must be in place, with up-to-date information, available for use on a regular basis, and utilized by staff to make informed decisions.

An essential component of Monitoring and Situational Awareness is the availability of information when needed. Unexpected outages of tools, or planned outages without appropriate coordination or oversight, can leave operators without visibility to some or all of the system they operate. While failure of a decision-support tool is rarely the cause of an event, such failures manifest as latent risk that further hinders the decision-making capabilities of the operator. One clear example of this is the August 14, 2003 event.

NERC has analyzed data and identified that outages of tools and monitoring systems are fairly common occurrences. The RISC's ERO Priorities: RISC Updates and Recommendations report, NERC's ERO Top Priority Reliability Risks 2014-2017 report, and the Cyber Attack Task Force final report recognize this concern.

Areas of Focus

TOP-008-1	R4	Transmission Operator
FAC-011-2	R1, R2, R3	Reliability Coordinator
FAC-014-2	R5, R6	Reliability Coordinator Planning Authority Transmission Planner Transmission Operator

6. Long Term Planning and System Analysis

Long term planning and system analysis is related to several other areas (such as increased use of DSM, integration of variable generation, changes in load and system behavior, Smart Grid, increased dependence on natural gas, fossil requirements and retrofit outage coordination, nuclear generation retirements and outages, and resource planning). Long-term planning and analysis have been highlighted as a concern in RISC's ERO Priorities: RISC Updates and Recommendations report, and in NERC's ERO Top Priority Reliability Risks 2014-2017 report.

Areas of Focus

Table 6 – Long Term Planning and System Analysis		
Standard	**Requirements**	**Entities for Attention**
TPL-001-0.1[10]	R1.	Planning Authority Transmission Planner

7. Threats to Cyber Systems

Threats to cyber systems remain an area of significant importance. The need for attention in this area is addressed in the 2013 Long-Term Reliability Assessment report, in the RISC's ERO Priorities: RISC Updates and Recommendations report, the Cyber Attack Task Force final report, and in NERC's ERO Top Priority Reliability Risks 2014-2017 report. The risk includes threats and vulnerabilities that result from compromise of technology or communications that support the reliable operations of the BPS.

Areas of Focus[11]

Table 7 – Cyber Security		
Standard	**Requirements**	**Entities for Attention**
CIP-002-3	R2, R3	Balancing Authority Generator Operator Generator Owner Reliability Coordinator Transmission Operator Transmission Owner

[10] The effective date of TPL-001-4 is January 1, 2015. However, as a result of the phased implementation plan, earlier versions of the TPL Reliability Standards are referenced here.

[11] While Table 7 lists the CIP version 3 Reliability Standards (as those are currently enforceable), the ERO, through release of its Cyber Security Reliability Standards CIP V5 Transition Guidance, actively encourages and supports registered entities transitioning from compliance with the version 3 Reliability Standards directly to the version 5 Reliability Standards. As stated in that guidance, NERC and the Regional Entities will take a flexible compliance monitoring and enforcement approach for the CIP Reliability Standards, recognizing that the details of implementing a version 3 to version 5 transition may cause a significant impact on certain compliance monitoring activities.

CIP-009-3	R1, R2	Balancing Authority Generator Operator Generator Owner Reliability Coordinator Transmission Operator Transmission Owner

8. Human Error

Human Error remains a key focus for the ERO Enterprise. Included in this subset are communication errors which can pose a significant potential risk to BPS reliability. Human Error was identified as a key issue by both the RISC in its ERO Priorities: RISC Updates and Recommendations report and by NERC in its ERO Top Priority Reliability Risks 2014-2017 report.

Areas of Focus

Table 8 – Human Error		
Standard	**Requirements**	**Entities for Attention**
COM-002-2	R2.	Reliability Coordinator Transmission Operator Balancing Authority

9. Extreme Physical Events

Extreme Physical Events are those events that result in extensive damage to equipment, irrespective of cause. Such events could include earthquake, GMD events, high wind, flooding, physical attack, or sabotage. NERC identified this concern as a significant risk in its ERO Top Priority Reliability Risks 2014-2017 report. As concluded in the report, risk avoidance is insufficient to manage this risk, and additional focus must be given to those things that focus on resiliency and recovery.

Risk mitigation efforts (reducing the potential consequence) are underway, but additional focus is needed to address and minimize both the magnitude and duration of the consequences of an extreme physical event.

Areas of Focus[12]

Regional Risk Assessments

When considering risk elements, REs will perform a Regional Risk Assessment, identifying risks specific to the region that could potentially impact the reliability of the BPS. After determining region-specific risks, REs will also identify the related Reliability Standards and Requirements associated with those risks. These Reliability Standards and Requirements are not intended to be a static list that must be examined during all Compliance Audits. Rather, the risk elements identified by the RE will serve as input considerations when conducting an IRA for a registered entity.

REs are ultimately responsible for identifying and prioritizing risk elements within their footprints. REs should consider risk elements as an input into their Regional Risk Assessments. In doing so, REs are expected to:

- Gather and review RE-specific risk reports and operational information (e.g. interconnection points and critical paths, system geography, seasonal/ambient conditions, etc.),
- Review and prioritize potential RE-specific risks, and
- Identify associated Reliability Standards and Requirements that will be inputs into the IRAs, ICE, and ultimately the compliance oversight plan.

The Regional Implementation Plans will describe the process and results. It should explain how it identified the risk in a particular RE footprint, including reasons why any risk elements identified above are not included or applicable to the RE footprint. Although each RE will consider risk elements, and may use similar risk considerations, the output of the Regional Risk Assessments may differ as a result of regional characteristics and the uniqueness of each RE's footprint.

Regional Compliance Oversight Plan

Based on the RE's consideration and assessment of risk elements and Regional Risk Assessments, each RE will develop a compliance oversight plan, which, in 2015, will include, at a minimum, the list of planned audits for

[12] CIP-014-1 – Physical Security also addresses extreme physical events, but it is not yet FERC-approved. Table 9 may be modified to reflect the Requirements of CIP-014-1 following such approval.

Reliability Coordinators, Balancing Authorities, and Transmission Operators that are in the three-year audit cycle. REs may also identify other registered entities that it will monitor through appropriate CMEP tools based on risk elements and Regional Risk Assessments, and the application of IRA and ICE.

NERC Oversight of Regional Implementation Plans

NERC collects and reviews the Regional Implementation Plans prior to posting the final version of the ERO CMEP Implementation Plan. NERC oversight of the Regional Implementation Plans will focus on how the REs conducted Regional Risk Assessments and how the assessments' results ultimately led to the compliance oversight plan.

The RE should document all processes, conclusions, and results used to develop a registered entity's oversight plan and will not need to obtain prior approval from NERC on oversight plans. However, REs should maintain supporting documentation for review by NERC in connection with its oversight of the compliance assurance program.

The application of the Framework by the REs will reflect RE-specific circumstances including, as noted above, varying stages of conducting IRAs and ICEs. NERC oversight and regular training will ensure that all processes discussed herein are implemented in a consistent manner throughout the ERO Enterprise.

Revision History

Version	Date	Revision Detail
Version 0.0	September 8, 2014	Initial release of ERO CMEP IP
Version 1.0	November 18, 2014	ERO CMEP IP updated to include Regional Entity IPs in Appendices. Additional updates include: • Added section and guidance on Compliance Assessments for Events and Disturbances. Refer to "Risk-based Compliance Monitoring" section and Appendix B. • Added details and guidance for Self-Certification requirements for registered entities in 2015. Refer to "Risk-based Compliance Monitoring" section.
Version 1.1	May 5, 2015	Made updates to Regional Entity IPs in Appendices. Updates reflected in Bold/Underline font. Some specific changes to note include: • NPCC IP-Noted formation of its Risk Assessment group under compliance monitoring and made updates to its compliance oversight plan in Section 4. • RF IP-Added paragraph under self-certifications to capture additional self-certifications that they request throughout the year, which will require entities to provide supporting documentation along with their self-certifications submittals. • Texas RE IP- Updated Regional Risk Element "Operational Communication" by removing MOD-001-1a R4 and R5. Those Standards are not enforceable in the Interconnection. Also updated the CIP outreach to indicate that outreach is occurring with every audit and will be part of TRE's May Workshop with additional details to follow.

Appendix A1 - Florida Reliability Coordinating Council (FRCC) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for the FRCC as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

- In mid-2014, the FRCC Compliance department reorganized to create a department called Risk Assessment and Mitigation (RAM). This group will be focused on risk assessment both before a monitoring activity takes place to help determine the scope of monitoring oversight, and after a possible violation is discovered to help determine the risk posed by that violation so the most efficient disposition can take place. The risk evaluation of an entity, which precedes the entity's compliance oversight plan, will include the Inherent Risk Assessment and voluntary Internal Controls Evaluation(s) of registered entities. In addition to performing risk determinations, RAM is the registered entities' primary contact for self-reporting and mitigation plans.
- The formation of the RAM group and associated new division of responsibilities, has enabled the FRCC enforcement group to concentrate on violation determination and disposition, and compliance department metrics.
- Audit notification letters will be sent to the registered entities ninety (90) days prior to commencement of a Compliance Audit.
- Per CMEP section 3.1.4.2, audit period End Dates are being modified to thirty (30) days following the date of the audit notification letter. The audit period will still begin on the day after the End Date of the registered entity's prior Compliance Audit by the FRCC (or the later of June 18, 2007 or the date the registered entity became subject to Reliability Standards if the registered entity has not previously been subject to a Compliance Audit).
- Compliance audits conducted in 2015 will include a management review of any possible non-compliance findings prior to the completion of the audit. In order to facilitate the management review, audit exit briefings may be conducted remotely, following on-site activities. However, the audit team will present a summary briefing prior to concluding the on-site portion of the audit.

1.2 Other Regional Key Initiatives & Activities

- FRCC enforcement will include the "Exception" method as an option for disposition of minimal risk non-compliances in 2015.
- The FRCC enforcement program will reserve enforcement actions to include the Find, Fix, Track and Report process and Notices of Penalties for those non-compliances that pose moderate or serious/ substantial risks to the reliability of the BPS. As to other non-compliances, FRCC enforcement will exercise appropriate discretion to initiate the Exception process for minimal risk non-compliances of Reliability Standards.
- FRCC will continue to evaluate registered entities for potential inclusion into the Entity Self-Logging program (formerly known as the "Aggregation" pilot program) which allows those registered entities that have demonstrated effective management practices to keep track of minimal risk non-compliances (and associated mitigation) on a log that is periodically reviewed by FRCC.

2. Regional Risk Assessment Process

The FRCC has reviewed the nine ERO identified risk elements and associated areas of focus for implementation plan coordination and concurs with the specified Standards/Requirements in all the areas of focus with additions documented below in the Regional Risks and Associated Reliability Standards section.

FRCC also considered the following risk elements and identified additional Standards/Requirements for monitoring as detailed below in the Regional Risks and Associated Reliability Standards section.

- **Number and type of registered functions**
  As of September 24, 2014, FRCC has sixty-eight (68) registered entities.[13] The FRCC Regional Entity is registered as a Reliability Coordinator and Planning Coordinator. The SERC Regional Entity organization is the Compliance Enforcement Authority for these functions.

  The FRCC has not identified any region-specific risks associated with the number and type of registered functions within the FRCC, and therefore has not included additional Reliability Standards due to registered functions.

- **Geographic location such as seasonal/ambient conditions and terrain**
  The area of the State of Florida that is within the FRCC Region is peninsular Florida east of the Apalachicola River. Areas west of the Apalachicola River are within the SERC Region. The entire FRCC Region is within the Eastern Interconnection and is under the direction of the FRCC Reliability Coordinator.

  The FRCC considers factors such as its susceptibility to tropical storms and hurricanes when selecting additional Reliability Standards for inclusion in its monitoring activities. Such storms increase the probability of the region experiencing transmission line vegetation contact, significant imbalances in generation and load, the need to evacuate control centers, and the need to implement restoration plans. As a result, requirements of the Reliability Standards for Loss of Control Center Functionality, Transmission Vegetation Management, and Automatic Underfrequency Load Shedding have been added.

- **BPS transmission lines (circuit miles, voltage levels, IROL flowgates)**
  The FRCC has not identified any region specific risks associated with the BPS transmission lines located in the FRCC region, and therefore has not included additional Reliability Standards due to BPS transmission lines.

- **BPS generation facilities**
  The FRCC has not identified any region specific risks associated with the BPS generation facilities located in the FRCC region, and therefore has not included additional Reliability Standards due to BPS generation facilities.

- **Blackstart Resources**
  Requirements of the Reliability Standard for System Restoration from Blackstart Resources are already included in NERC's risk elements results. Therefore, no requirements have been added.

- **Interconnection points and critical paths**
  The FRCC region only connects to the Eastern Interconnection on the north side of the region due to its peninsular geography. Therefore, the FRCC considers factors such as susceptibility to system separation when selecting additional Reliability Standards for inclusion in its monitoring activities. As a result of the FRCC's limited interconnection points, and as also mentioned for geographic location previously, requirements of the Reliability Standard for Automatic Underfrequency Load Shedding have been added.

[13] Registered functions include: Balancing Authority, Distribution Provider, Generator Owner, Generator Operator, Interchange Authority, Load Serving Entity, Planning Authority, Purchasing Selling Entity, Resource Planner, Reserve Sharing Group, Transmission Owner, Transmission Operator, Transmission Planner, and Transmission Service Provider.

- **Special Protection Schemes (SPS)**
  The FRCC considers factors such as any major SPS installed in the FRCC region when selecting additional Reliability Standards for inclusion in its monitoring activities. As a result of a major SPS in the FRCC region, and as also mentioned for geographic location and interconnection points previously, requirements of the Reliability Standard for Automatic Underfrequency Load Shedding have been added.

- **System events and trends**
  The FRCC considers internal system events when selecting additional Reliability Standards for inclusion in its monitoring activities. External events are reviewed and considered in NERC's risk elements. As no major internal events have occurred recently, FRCC has not included additional Reliability Standards due to system events and trends.

- **Compliance history trends**
  The FRCC considers historical compliance trends within the region when selecting additional Reliability Standards for inclusion in its monitoring activities. As a result, requirements of the Reliability Standards for Cyber Security – Electronic Security Perimeter(s), Cyber Security – Physical Security of Critical Cyber Assets, Cyber Security – Systems Security Management, Loss of Control Center Functionality, and Facility Ratings have been added.

3. Regional Risks and Associated Reliability Standards

The table below contains the Regional risk focus areas identified during the Regional Risk Assessment. The table also contains associated Reliability Standards/Requirements to identified risks that may be considered in the Regional compliance oversight plan.

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Infrastructure Maintenance	The implementation plan for PRC-005-2 will result in PRC-005-1.1b remaining in effect for 2015. Registered entities are likely to have Protection Systems subject to the current version of the standard, as well as the new version. Therefore, monitoring activities for PRC-005 may include both PRC-005-1.1b and PRC-005-2. This is a clarification on FRCC monitoring, and is not a newly identified regional risk element.	PRC-005-1.1b R2
Extreme Physical Events	FRCC's susceptibility to hurricanes increases the risk of a control center event.	EOP-008-1 R6
Extreme Physical Events	FRCC's susceptibility to hurricanes and frequent storms, along with an extended growth season, increases the risk of vegetation related outages.	FAC-003-3 R1, R2, R6 & R7
Extreme Physical Events	The FRCC's peninsular geography along with its susceptibility to hurricanes, limited connections to the Eastern Interconnect and the existence of a significant SPS that could result in islanding increase the risk of an island event occurring.	PRC-006-1 R8 & R9
Compliance History Trends	FRCC has experienced a high number violations with these Standards/Requirements.	FAC-008-3 R2, R3 & R6 CIP-005-3a R2 CIP-006-3c R2 CIP-007-3c R3

4. Compliance Oversight Plan

Self-Certifications

For 2015 compliance monitoring, FRCC will forgo the annual Self-Certification process and replace annual Self-Certification activities with a more focused risk based approach. FRCC will use Self-Certification in a coordinated approach with the other compliance monitoring methods to address the Standards and requirements that represent the greatest risk to the reliability to the Bulk Power System (BPS) based on the registered entities' overall risk assessment. FRCC will follow the guidance in the 2015 ERO CMEP IP, as well as consider results from Regional risks assessments, registered entity inherent risk assessments, etc. FRCC will implement guided Self-Certification for registered entities to Self-Certify compliance with those Standards and Requirements identified through the risk assessment process. The registered entity should provide the methodology and other documentation used for self-assessment to determine the compliance status for those requirements. This "guided" approach will include more information on the expectations of what the registered entity should consider and include in their response to the FRCC.

Reliability Standards monitored through guided Self-Certification will not be included in the 2015 registered entity Compliance Audit scope.

Those responsible entities that do not have any Critical Assets or Critical Cyber Assets under the CIP V3 Standards will not be scheduled for an off-site audit for the CIP Reliability Standards during the CIP Version 5 Transition Period (August 2014 through March 31, 2016). Instead, those Responsible Entities will be monitored via the guided Self-Certification process for the applicable CIP Standards.

In addition, non-BA/TOP registered entities that were initially scheduled for a six-year audit during 2015 will instead be monitored by guided Self-Certifications. This will allow the RAM department time to perform the necessary IRAs and ICEs.

Periodic Data Submittals

FRCC has identified the Reliability Standards and requirements listed in the table below that require Periodic Data Submittals. The Monthly data submittals are due by the 10th of the month for the previous month's data and the Quarterly data submittals are due by the 15th of the month following the previous quarter. All data submittals are to be submitted via the Compliance Tracking and Submittal system (CTS).

For Quarterly submittals for FAC-003-3 R1 and R2, if an entity does not have any Sustained Outage(s) during a respective quarter, they are not expected to submit a quarterly report. In turn, FRCC will advise NERC that there were no Sustained Outages within the quarter. However, entities are expected to submit a FAC-003-3 Event form for ALL Sustained Outages within the quarter in which the event occurs, as specified in the standard. Again, while not specifically required by FAC-003-3, FRCC strongly encourages and appreciates entities' reporting, within 48 hours, all Sustained Outages for Categories 1A&B, 2A&B and 4A&B utilizing the FAC-003-3 Event form. FRCC will be notified when an event is reported by the CTS system and will follow-up accordingly with the submitting entity and NERC.

2015 Periodic Data Submittal Plan	
Standard & Requirement	**Justification**
BAL-001-1 R1, R2	CPS 1 and CPS 2 data collected by applicable registered entities
BAL-002-1 R1	DCS 2 data collected by applicable registered entities
FAC-003-3 R1 and R2	Sustained Outage data collected by applicable registered entities

Compliance Audits

The audit schedule is also located on the FRCC's website here:

https://www.frcc.com/Compliance/FRCCCompliance/ComplianceDocumentLibrary.aspx

2015 Compliance Audit Plan	
NCR #	**Registered Entity**
NCR00004	Beaches Energy Services of Jacksonville Beach (BES)
NCR00021	Florida Keys Electric Cooperative Assn (FKEC)
NCR00023	Florida Municipal Power Pool (FMPP)
NCR00045	Lee County Electric Cooperative, Inc (LCEC)
NCR00057	Orlando Utilities Commission (OUC)
NCR00068	Seminole Electric Cooperative (SEC)
NCR00073	Tallahassee, City of (TAL)
NCR00079	Vero Beach, City of (VERO)

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Spring Compliance Workshop	April 14-16, 2015
CIP Compliance Workshop	May 12-14, 2015
Fall Compliance Workshop	November 10-12, 2015
Reliability Standard Webinars	Periodic
CIP Compliance Newsletter	Periodic

CIP Version 5 (V5) Outreach

FRCC will also develop a CIP Outreach Program for the FRCC registered entities to educate and provide transparency on outstanding CIP V5 issues. This outreach may involve NERC staff support, evaluating an entity's V5 progress, proactively addressing V5 related questions and spending additional time assessing V5 readiness during CIP Compliance Audits.

Appendix A2 - Midwest Reliability Organization (MRO) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for MRO as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.3 CMEP IP Highlights and Material Changes

Mitigating Activities for Compliance Exceptions

As part of the Annual Implementation Plan, MRO staff will periodically sample Compliance Exceptions to verify that the mitigating activities have been completed. The sample will come from only those Compliance Exceptions that have been identified by a registered entity as already mitigated, or Compliance Exceptions that have a planned mitigation date that has passed. Also, the Compliance Exceptions sampled are not restricted to the registered entities that have an Inherent Risk Assessment performed on them for 2015.

The periodic sampling may occur at any time, and will be reviewed through informal means, Spot Checks, or during a normally scheduled Compliance Audit. MRO staff are required to document the results regardless of whether a formal or informal review process is used.

All mitigation activities relating to enforcement matters that are filed with regulators will be verified for completion.

2. Regional Risk Assessment Process

Analysis performed by MRO on risks related to the Risk Areas within the Risk Elements resulted in the identification of a list of Requirements determined to provide an initial level of risk mitigation within the MRO region. (Section 3 below contains this list of requirements.) The analysis focused on several areas that have been identified as having a larger impact to reliability, including areas identified within the 2003 and 2011 blackout reports. The Requirements in Section 3 are not considered the only or complete way to mitigate the related risks, but were determined to be a starting point to focus oversight in the MRO region related to these risks. As referenced in Section 4 below, these requirements are subject to guided Self-Certifications in 2015. In addition to this oversight, as part of the Inherent Risk Assessments that will be performed on registered entities, additional Standards and Requirements will be considered and potentially scoped into entity-specific oversight plans.

3. Regional Risks and Associated Reliability Standards

The table below contains the Regional risk focus areas identified during the Regional Risk Assessment process. The table also contains Reliability Standards/Requirements associated with identified risks that may be considered in the Regional compliance oversight plan.

Reliability Standards Subject to Regional Monitoring		
Risk Area	**Justification**	**Associated Standard & Requirement(s)**
Protection System Misoperations	It is important for entities with awareness of a wide area of the BES, to determine those facilities which are most important and require relay loadability attention.	PRC-023-2 R6
Long Term Planning and System Analysis	Planning criteria were called out in the 2003 and 2011 blackout reports.	TPL-002-0b R2

Reliability Standards Subject to Regional Monitoring		
Risk Area	**Justification**	**Associated Standard & Requirement(s)**
Threats to Cyber Systems (risk elements)	It is important to periodically assure that the ESP is secure, even if testing is being done after individual changes. Small changes in networks that seem to have no impact locally can cause changes in the security posture of the overall network.	CIP-005-3a R4
Threats to Cyber Systems (risk elements)	It is important to periodically assure that CCAs are secure, even if testing is being done after individual changes. Small changes in systems that seem to have no impact locally can cause changes in the security posture.	CIP-007-3a R8
Human Error (risk elements)	The issuing of directives is crucial to reliable system operation, as they are performed by those entities that have a wide area view, and are used during times of emergency to alleviate events.	COM-002-2 R2
Monitoring and Situational Awareness	Evaluation of planning and operational criteria was a technical initiative from the 2003 blackout.	FAC-014-2 R2
Monitoring Situational Awareness (risk elements)	Real-time operating tools were called out in the 2003 blackout report as well as the 2011 blackout report.	TOP-002-2.1b R11
Extreme Physical Events	It is important to inspect rights of way to determine if unscheduled maintenance needs to occur, in order to preemptively identify vegetation issues that could cause a fault. Poor vegetation management was a contributing factor to the 2003 blackout.	FAC-003-3 R6
Extreme Physical Events	It is important to complete vegetation management in order to prevent transmission line faults, which can lead to cascading events. Poor vegetation management was a contributing factor to the 2003 blackout.	FAC-003-3 R7
Uncoordinated Protection Systems (risk elements)	The performance of protection systems directly impacts the operation of the BES, therefore coordination of changes to protection systems is crucial to reliability. Improved protection system coordination was a recommendation in the 2011 blackout report.	PRC-001-1 R3
Uncoordinated Protection Systems (risk elements)	The performance of protection systems directly impacts the operation of the BES, therefore coordination of changes to the BES that impact protection systems is crucial to reliability.	PRC-001-1 R5

4. Compliance Oversight Plan

Self-Certifications

For 2015, Self-Certifications will include staff guidance and instructions. These "guided" Self-Certifications will focus more on risk and supporting evidence than the previous annual Self-Certifications. As part of the guided Self-Certification process, registered entities will provide MRO with supporting evidence to substantiate determinations.

These guided Self-Certifications are intended to provide MRO with reasonable assurance of compliance based upon the results of the registered entity's assessment. When appropriate, the guided Self-Certification can be used instead of Compliance Audits or Spot Checks as the monitoring tool for specific

Reliability Standards and Requirements. The overall goal of the guided Self-Certification process is to improve the effectiveness of oversight and increase efficiency by relying on the work of registered entities in meeting compliance requirements.

Part of the process of relying upon the work of others includes MRO performing a review of the work and evidence supporting the guided Self-Certification results. MRO may re-perform the work, in part, in order to verify the accuracy of the Self-Certification determinations. In the event that further substantiation is needed, MRO staff may conduct a random Spot Check of the work or include the applicable Standards and Requirements in a subsequent Compliance Audit. The overall goal of the guided Self-Certification process is to provide reasonable assurance that the entity meets compliance with the applicable Standards and Requirements.

Guided Self-Certifications will be performed over the implementation period (January 1 to December 31) on a quarterly basis for an identified baseline set of high impact Reliability Standards that have been deemed important for reliable operations of the BPS. The intent of the quarterly frequency is to disperse the workload to assure sufficient time for completion and review, and to promote continuous self-monitoring of compliance.

In addition to the quarterly guided Self-Certification schedule, guided Self-Certifications may also be used for lower risk compliance monitoring as a result of Inherent Risk Assessments of registered entities and for lower risk events that could or did negatively impact the reliable operation of the region or systems within the region.

The following list of registered entities have been identified as being on the 2015 Compliance Audit schedule. Additional registered entities, at the discretion of MRO, will also be subject to Inherent Risk Assessments (IRAs). Based on IRA results and any subsequent Internal Control Evaluations (ICE), these additional registered entities may also be subject to a Compliance Audit in 2015.

2015 Compliance Audit Schedule	
NCR #	**Registered Entity**
NCR01030	Southern Minnesota Municipal Power Agency
NCR01013	Minnkota Power Cooperative
NCR01012	Minnesota Power
NCR01003	Manitoba Hydro
NCR10102	Tri-State Generation and Transmission Association
NCR00826	Midcontinent Independent System Operator, Inc.
NCR00952	Wisconsin Public Service Corporation
NCR01033	Upper Peninsula Power Company
NCR01029	Saskatchewan Power Corporation
NCR00818	Madison Gas and Electric

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
MRO Newsletter	Six times a year
MRO Hot Topics	Periodically as needed
MRO Operations Conference	Summer 2015
MRO Security Conference	Fall 2015
MRO Compliance and Enforcement Conference	Fall 2015

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Registered Entity-specific conferences and meetings	Periodically as needed

Appendix A3 - Northeast Power Coordinating Council (NPCC) 2015 CMEP Implementation Plan for Entities within the U.S.

This Appendix contains the CMEP Implementation Plan (IP) for the registered entities within the U.S. portion of NPCC as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

In January 2015, the NPCC Entity Risk Assessment (ERA) Group was formed within the NPCC Compliance Department to support the NERC Risk-based Compliance Monitoring and Enforcement Program that was developed through the Reliability Assurance Initiative (RAI). The ERA Group is tasked with implementing the NERC Risk-based Oversight Plan Framework, which includes conducting Inherent Risk Assessments (IRAs) for all registered entities and an Internal Controls Evaluation (ICE) for registered entities that agree to have an ICE performed.

The ERA Group will develop procedures, forms, templates, and necessary tools to conduct and document the IRA and the ICE. The scope, monitoring method, and periodicity of compliance monitoring for each registered entity will be determined based on these tools and documentation.

NPCC will continue to implement a cyber-security outreach program that consists of NPCC Subject Matter Experts visiting critical facilities owned by participating entities (participation is voluntary) and assessing the cyber security posture of the control systems that support the operation of these facilities.

NPCC will continue the physical security outreach program in 2015 (participation is also voluntary) and NPCC staff will hold a Security Information Exchange session, which will include entity presentations, at the spring and fall Compliance Workshops.

As part of the CIP Version 5 transition and consistent with NERC guidance, NPCC will perform CIP audits based on the entity's selected option for maintaining compliance with CIP standards during the Transition Period:

Continue to comply by maintaining a valid RBAM for Critical Asset identification pursuant to CIP-002-3.	Option 1
For Responsible Entities that have already adopted the CIP V4 Critical Asset Criteria (CIP-002-4, Attachment 1), use the CIP V4 Critical Asset Criteria in its entirety, with the exception of criterion 1.4 (Blackstart Resources) and criterion 1.5 (Cranking Paths), to identify assets subject to the controls in CIP-003-3 through CIP-009-3.	Option 2
Use the CIP V5 "High" and "Medium" Impact Rating Criteria (CIP-002-5.1, Attachment 1) to identify assets subject to the controls in the CIP V5 Standards.	Option 3

The on-site CIP Audits will be conducted as directed in the Guidance document. CIP Audits of those entities that have not chosen to move to Version 5 (Options 1 and 2) will be audited to Version 3. If an entity indicates that they have adopted CIP Version 5 (Option 3), NPCC will review their compliance with Version 5 Standards. In all cases, NPCC's approach would be to perform a review of those Standards / Requirements that are "mostly compatible" with the Version 5 Standards. Since Version 3 is enforceable until July 1, 2016, no findings of non-compliance with Version 5 Standards will be issued. A non-public document will be issued indicating any areas of concern where future compliance with version 5 may be in jeopardy.

Previously, off-site CIP audits had been conducted to verify that an entity does not have any Critical Cyber Assets. In accordance with the recently released CIP Transition Guidance, there are no off-site CIP audits scheduled in 2015. NPCC may include selected Spot Checks in place of the Off-site CIP Audits.

NPCC has provided more details on the CIP transition to Version 5 of the Reliability Standards in a webinar that was conducted on March 24 and 25, 2015. Additional information will be presented at NPCC Compliance Workshops, and at a second CIP V5 Transition Seminar to be conducted in the third quarter.

1.2 Other Regional Key Initiatives & Activities

NPCC will continue to participate in the Risk Based Registration Advisory Group (RBRAG) which is charged with the ERO-wide development of criteria for risk-based registration.

NPCC will continue to participate in the **Risk-based Compliance and Enforcement Advisory Group (RBCEAG)** which is monitoring and ensuring the uniform ERO-wide implementation of RAI monitoring and enforcement activities.

NPCC will look to expand the Self-logging of Minimal Risk Issues program to include additional registered entities. In addition, NPCC will also utilize the Compliance Exceptions program for minimal risk violations. The use of these two programs will expedite the processing of minimal risk violations. Therefore, resources will be freed up to more efficiently process more severe violations.

NPCC will continue to be a member of the RAI Regional Entity Group (RAIRE), which is formulating the overall RAI Training and ICE protocol and guidance documents.

NPCC supported all six Webinars associated with the NERC Compliance Auditors Handbook and ERO Checklist. NPCC will continue to provide input to the NERC Manual Task Force (MTF) tasked with maintaining the Auditors Handbook and enhancing Auditor Tools.

NPCC will continue to participate in the development of a program to implement CIP-014-1, Physical Security.

NPCC will continue to participate in the NERC CIP Version 5 Transition Guidance workgroup.

As part of the Events Analysis process, NPCC will continue to encourage registered entities to perform a voluntary, systematic Compliance Analysis (CA) in response to all system events and disturbances. Registered entities are also expected to share the CA with the RE for all Category 2 and above events.

NPCC will continue to participate in ERO Compliance Workshops presenting the NPCC implementation of the Risk-based Compliance Framework and providing support to special ERO presentations (NERC Small ICE Exercise).

2. Regional Risk Assessment Process

NPCC's Regional Risk Assessment Process is a summary and compilation of specific parts of NPCC's Entity Inherent Risk Assessment process and NERC's IRA Assessment Guide that takes into account the nine areas of focus for 2015 consideration.

1. Infrastructure maintenance
2. Uncoordinated protection systems
3. Protection systems misoperations
4. Workforce capability
5. Monitoring and situational awareness
6. Long term planning and system analysis
7. Threats to cyber systems
8. Human error
9. Extreme physical events

NPCC's Regional Risk Assessment Process includes the following:

2.1 Functional Registration Impact Profile

The Functional Registration Impact Profile is used to populate NPCC's standards subject to Regional monitoring. It considers the potential effect on the reliability of the Bulk Power System (BPS) based on NPCC's Regional perspective and registered entity's functions. The following table shows the initial impact classification of registered entities.

Assignment of Initial Functional Registration Impact		
High Impact	**Medium Impact**	**Low Impact**
RC/BA	TO w/o BES facilities	GO/GOP under 200 MW
TOP	GO /GOP between 200 MW and 500 MW	DP peak load under 1000 MW
TO w/ BES facilities	DP peak load over 1000 MW	
GO /GOP over 500 MW		

2.2 NPCC Regional Compliance History

NPCC will examine the past compliance history of the entire Region. This will include an identification of the Standards and Requirements that have been violated the most within the NPCC Region. It will examine past audit performances, including the number and type of violations that were discovered through audits compared with the number and type of violations that were discovered through self-reports or Self-Certifications. It will also incorporate any issues or problems that may have been identified that did not result in a potential violation.

2.3 NPCC Regional Enforcement History Profile

NPCC will analyze violations to identify any trends regarding:

- Level of risk to the **BES** (operational vs. documentation)
- Timeframes of violations (real time, next day, planning)
- Number of repeat violations

2.4 NPCC Overall Evaluation

Based on a registered entity's function, NPCC will specifically examine impact and violations based on the following:

- RC
  - Qualifying IROL/SOL events
  - Qualifying loss of load events
- BA
  - DCS Performance (ACE or restoration of reserve)
  - Qualifying IROL/SOL events
  - Qualifying loss of load events
- TO/TOP
  - Qualifying IROL/SOL events
  - Protection System Misoperations
  - Qualifying loss of load events
- GO
  - Protection System Misoperations

3. Regional Risks and Associated Reliability Standards

The table below contains the Regional risk elements identified during the Regional Risk Assessment. The table also contains associated Reliability Standards/Requirements to identified risks that may be considered in the Regional compliance oversight plan.

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Uncoordinated Protection Systems; Protection System Misoperations; Monitoring and Situational Awareness	NPCC identified three risk elements where it was necessary to develop a Regional Standard to ensure that applicable entities had Disturbance Monitoring Equipment and capabilities to monitor and capture adequate disturbance data to facilitate Bulk Electric System event analyses.	PRC-002-NPCC-01
Infrastructure Maintenance	Basic capability required to manage reliability during emergency conditions	FAC-003-3 R1,R2,R4,R5,R6,R7
Uncoordinated Protection Systems	Basic capability required to manage reliability during emergency conditions NPCC reliability area of focus in 2015	PRC-006-1 R8,R9,R10 PRC-015-0 R1 PRC-005-1.1b R1,R2 **PRC-023-3 R2[14] to R6**
Workforce Capability	NPCC reliability area of focus in 2015 Basic capability required to manage reliability during emergency conditions Process is critical to maintaining the power system equipment capability/reliability	IRO-005-3.1a R6,R7 TOP-002-2.1b R5,R6,R7,R8,R10,R14 TOP-008-1 R1,R2,R3 TOP-007-0 R1 to R4 VAR-002-2b R1 to R3
Monitoring and Situational Awareness	Basic capability required to manage reliability during emergency conditions Conditions/equipment/capability to perform the functions can change as technology changes NPCC reliability area of focus in 2015	BAL-001-1 R1 to R4 BAL-002-1 R1 to R6 BAL-003-0.1b R2,R3,R5 COM-001-1.1 R1,R2 IRO-005-3.1a R9,R12 IRO-009-1 R3

[14] Removed R1. Already part of NERC Table 3, Protection System Misoperations

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Long Term Planning and System Analysis	NPCC reliability area of focus in 2015 Basic capability required to manage reliability during emergency conditions	MOD-001-1a R2 to R5 and R7 to R9 MOD-029-1a R1 to R8 **TPL-003-0b R2[15] to R3**
Human Error	Basic capability required to manage reliability during emergency conditions	PER-003-1 R2
Extreme Physical Events	Basic capability required to manage reliability during emergency conditions	**EOP-001-2.1b R6[16]** EOP-002-3.1 R1,R3,R5 EOP-005-2 R2

4. Compliance Oversight Plan

The specific list of audited standards will be contained in the entity's audit notification letter sent at least 90 days prior to the scheduled audit.

The specific list of 2015 monitored standards and the monitoring method will be documented in the registered entity's Compliance Oversight Plan based on Inherent Risk Assessments and Internal Controls Evaluations (if any). Monitoring methods include Audits, Spot Checks, and Guided Self-Certifications.

NPCC will not audit Interchange Authorities, Load Serving Entities or Purchase-Selling Entities in 2015.

The audit schedule is also located on the NPCC's website here:
https://www.npcc.org/Compliance/Audit%20Schedule/2015%20Preliminary%20Audit%20Schedule.pdf

Audits of Canadian Entities will be conducted in accordance with the appropriate agreements.
The following entities are scheduled for an audit in 2015:

2015 Compliance Audit Plan	
NCR #	**Registered Entity**
NCR07133	**Long Island Power Authority**
NCR07136	**Mass. Municipal Wholesale Electric Company**
NCR07181	**NYSEG**
NCR00124	**Ipswich Municipal Light Department**
NCR07090	**Fortistar North Tonawanda**
NCR07091	**New Hampshire Transmission, LLC**
NCR07101	**Granite Ridge Energy, LLC**
NCR07108	**Huntley Power LLC**
NCR07155	**NB Power**
NCR07111	**Hydro-Quebec Production**
NCR07130	**KIAC Partners**
NCR07132	**Lockport Energy Associates**
NCR07154	**New Athens Generating Company, LLC**
NCR00538	**Astoria Energy, LLC**

[15] Removed R1. Already part of NERC Table 9, Extreme Physical Events

[16] Removed R2. Already part of NERC Table 4, Workforce Capability

2015 Compliance Audit Plan	
NCR #	Registered Entity
NCR00006	Calpine Corporation
NCR07026	Capitol District Energy Center Cogeneration Associates, JV
NCR07141	Middletown Power LLC
NCR11121	GenOn East 1
NCR00200	Dynegy Power, LLC
NCR07087	Flat Rock Windpower L.L.C.
NCR11287	Marble River LLC
NCR11324	Brookfield White Pine Hydro, LLC
NCR11337	ReEnergy Black River
NCR11339	Lakeside New York LLC
N/A	Canadian Hydro Developers
N/A	Caribou Wind Park
NCR11152	Tanner Street Generation, LLC
NCR07110	Hydro-Québec Distribution
NCR07228	Vermont Transco, LLC
NCR07124	ISO-NE
NCR07029	Central Maine Power Company
NCR07180	NSTAR Electric Company
NCR10332	NextEra Energy Resources, LLC
NCR07128	National Grid Generation LLC
NCR07220	TransCanada Hydro Northeast Inc
NCR07124	ISO-NE
NCR00088	TC Ravenswood Services Corp.
NCR00543	TC Ravenswood LLC
NCR04057	Exelon Generation Co., LLC (Power)
NCR07133	Long Island Power Authority

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
NPCC utilizes its semi-annual workshops as a primary mechanism for outreach to its registered entities. An Introduction to NPCC presentation is included at each workshop. NPCC conducts webinars open to all NPCC registered entities on an as needed basis. It also posts webinar question-and-answer documents as appropriate. NPCC responds to individual requests from registered entities, but if an individual concern can be applied to all registered entities, NPCC will post a Compliance Guidance Statement or clarification to address that concern. NPCC conducts surveys of its registered entities as needed to acquire registration data, BES element data, workshop content preferences, etc. NPCC hosts monthly Compliance Committee meetings to disseminate the latest information regarding the compliance program to industry stakeholders. In 2013, NPCC implemented a Physical Security Outreach Program. Under this continuing program, NPCC physical security subject matter experts perform voluntary physical security assessments for certain registered entities. NPCC developed a Cyber Security Outreach Program that began in 2014 and will continue in 2015. In 2015, NPCC **has instituted** a CIP Version 5 transition outreach program, **consisting of Seminars and on-site assessments of Version 5 Transition activities.** NPCC developed an internal entity guide to assist registered entities in meeting quarterly reporting requirements pursuant to PRC-004 and NERC ALR4-1. **NPCC developed a separate processing method and reporting template for Special Protection System (SPS) operations and misoperations, per request from NERC, pursuant to PRC-016 and ALR4-1.** The NPCC website includes links associated with the areas of Standards, Registration, Compliance Monitoring, Enforcement, and **ERA.**	2015 workshop dates: May 19-21 and Nov 17-19.

Appendix A4 - ReliabilityFirst Corporation (ReliabilityFirst) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for ReliabilityFirst as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

ReliabilityFirst will follow and implement the ERO Risk-based Compliance Oversight Framework described in the ERO CMEP IP. The 2015 ERO CMEP Implementation Plan identifies a number of risk elements and areas of focus, which provide a starting point for ReliabilityFirst's risk analysis and Compliance Oversight Plan. However, the plan recognizes that it does not contain complete set of the risks that may affect the BPS, and that Regional Entities are expected to consider local risks and the specific circumstances associated with individual registered entities within their footprint when developing their compliance oversight plans.

As such, ReliabilityFirst performed its Regional Risk Assessment (RRA), which identified areas of focus specific to the ReliabilityFirst region (ReliabilityFirst areas of focus), set forth in Section 3 of this document. ReliabilityFirst may monitor the Reliability Standards (Standards) and Requirements associated with the ReliabilityFirst risk elements in 2015. ReliabilityFirst has the discretion to add, subtract, or modify Standards and Requirements as it deems necessary based on the individual Inherent Risk Assessments (IRA).[17] The ReliabilityFirst RRA is discussed in further detail in Section 2 of this document.

CMEP Implementation Plan Updates and Changes throughout the Year

ReliabilityFirst monitors FERC and NERC activities, system events, and events in the ReliabilityFirst region. Based on these monitoring activities, ReliabilityFirst may modify its CMEP Implementation Plan throughout the year to include Standards that address and mitigate situational awareness and reliability issues as they arise.

1.2 Other Regional Key Initiatives & Activities

Risk-based Enforcement

ReliabilityFirst is implementing a risk based enforcement approach consistent with that of the ERO Enterprise. Specifically, ReliabilityFirst will be exercising enforcement discretion by processing qualified minimal risk issues as "compliance exceptions." Compliance Exceptions will effectively supersede the Find, Fix, Track and Report ("FFT") disposition method for most minimal risk noncompliance.

Self-Logging

ReliabilityFirst is implementing self-logging approach consistent with that of the ERO Enterprise. Self-logging allows qualified registered entities to keep a log of minimal risk noncompliance that is periodically checked by ReliabilityFirst instead of submitting individual self-reports and corresponding mitigation plans for each noncompliance. Once ReliabilityFirst approves the log entries, they are processed as compliance exceptions.

2. Regional Risk Assessment Process

The RRA identifies risks within the ReliabilityFirst region that could potentially impact the reliability of the BPS. To accomplish the RRA, ReliabilityFirst utilizes a cross-functional team of internal Subject Matter Experts (the RRA Team) to review and analyze information and data to determine the highest-priority risks to the ReliabilityFirst region. The types of region-specific information and data the RRA Team reviews includes: US Population & Census Data, Severe Weather Related Outages (*e.g.,* OE-417 reports, Outages), Generation

[17] Additionally, ReliabilityFirst audit teams have the discretion to adjust audit scope during an engagement at a registered entity.

Availability Data System (GADs), Transmissions Availability Data System (TADS), Misoperations, Event Analysis, Load Analysis, Locational Marginal Pricing, System Operating Limits (SOL), Interconnection Reliability Operating Limits (IROL), TIER Power Line Ranking, Interconnection Points, Cyber Security data, Physical Security data, and data on Threats and Vulnerabilities. After a period of information gathering, analysis and decision making, the RRA team develops the results of the RRA in the form of ReliabilityFirst risk elements.

The 2014 ReliabilityFirst RRA identified the following five ReliabilityFirst risk elements *(in no particular order or ranking)*:

- Weather Related
- Physical Threat
- Cyber Security
- Human Error
- Equipment Failure

The five ReliabilityFirst risk elements align with five of the nine NERC risk elements discussed in the 2015 ERO CMEP Implementation Plan:

- Infrastructure Maintenance
- Workforce Capability
- Threats to Cyber Systems
- Human Error
- Extreme Physical Events

ReliabilityFirst believes that the four NERC risk elements that do not align with ReliabilityFirst risk elements, set forth below, are best assessed at the registered entity level during the Inherent Risk Assessment (ReliabilityFirst's Entity Risk Assessment):

- Uncoordinated Protection Systems
- Protection System Misoperations
- Monitoring and Situational Awareness
- Long Term Planning and System Analysis

Section 3 of this document contains additional detail on the five ReliabilityFirst risk elements and their Reliability Standards and Requirements, which ReliabilityFirst may include in the 2015 ReliabilityFirst Compliance Oversight Plans.

The RRA is performed annually and will be updated as necessary. As new and emerging threats and risks are identified, system events take place, and compliance monitoring activities are performed, ReliabilityFirst will update the RRA to keep current with potential issues, threats and risks.

ReliabilityFirst reviews potential risks posed by an individual registered entity to the reliability of the BPS, by utilizing the IRA – Inherent Risk Assessment guide developed as part of the RAI Initiative. This assessment helps identify areas of focus and the level of compliance oversight required. Reliability Standards and Requirements may be added to or removed from the scope of an audit. Going forward, ReliabilityFirst will perform risk assessment prior to each audit, and at least two weeks prior to the development of a registered entity's audit notification package.

In additional to the risk elements and focus areas identified in the RRA, ReliabilityFirst identified Region-specific risk factors that it will consider when evaluating a registered entity. The items below provide Region-specific details on additional risk areas that ReliabilityFirst may consider when identifying and assessing risk.

- Population and geographic location – The ReliabilityFirst region includes three of the most populated areas in the United States (Chicago, Philadelphia, and Washington DC). The ReliabilityFirst region also contains many medium-sized urban areas such as Baltimore, Cleveland, Pittsburgh, Indianapolis, Cincinnati, and Toledo. Maintaining and ensuring reliable service to these areas of the country is critical to the overall well-being of the nation and national security. Any registered entity serving the load in these areas and those registered entities responsible for operating and maintaining reliability of the BPS supplying these areas, or in close proximity to these populated areas, may pose a higher risk.

- Entity Make-up and diversity – The ReliabilityFirst region is a summer peaking region, with several registered entities serving peak loads or operating an individual resource in excess of 500 MWs. Maintaining and ensuring reliable service to these areas of the country is critical to the well-being of the people and in some cases to national security.

- Entity Registration – ReliabilityFirst takes into account Entity Registration (i.e. RC, BA, TOP versus DP, PSE), during the assessment of registered entities. RCs, BAs and TOPs have the authority to issue operating orders, instructions, and directives and ultimately play a larger role in safeguarding the reliability of the BES.

- Transmission Assets – The transmission network in the ReliabilityFirst region consists of 765kV; 500kV; 345kV; 230kV; 138kV and 115kV lines. The majority of transmission facilities are overhead, with large urban areas serviced by underground transmission cables. Overall asset ownership (lines, transformers, generators, voltage, size of units, fuel type, flowgates, SOL, IROL, etc.) are also considered as part of the assessment. These assets form the backbone of the system and will be assessed with a higher risk due to their importance to maintain the reliability of the BPS. A registered entity that owns these types of facilities may have their audit scope adjusted to address owning and maintaining these types of equipment.

- Misoperations – the number of misoperations within the ReliabilityFirst region has been an issue of focus over the last few years. There is a higher risk to the BPS if the cause for a misoperation is due to controllable circumstances. Registered entities having these types of misoperations may have their audit scope adjusted to address resolving these misoperations.

- Special Protection Schemes and Relay Protection – registered entities in the ReliabilityFirst region use special protection schemes to mitigate system constraints until transmission reinforcements can be planned and built. In some cases these special protection schemes are left in place indefinitely. Special protection schemes can present a higher risk to the BPS when they are not properly implemented, coordinated, or operated as intended.

- Emergency Operations and Blackstart Facilities – There are multiple facilities designated as blackstart units in the ReliabilityFirst region. Registered entities are required to regularly test these blackstart units and submit results to ReliabilityFirst annually. There is a potential risk that there may be insufficient blackstart resources designated for an area, or that blackstart resources may not be available if they are not properly tested.

- Generation Assets – ReliabilityFirst generation mix is made up of units that are nuclear, coal, gas, hydro, wind, solar, and refuse power assets. The asset mix for the next few years is expected to change, with a decrease in coal generation and an increase in renewable resources such as wind generation and solar generation. There is a risk that generating capacity and available resources may not be available to meet demand on a real-time, near term and long term time horizon. Registered entities owning these

resources may be subject to standards and requirements to ensure availability and proper maintenance of these resources is retained.

- EMS and Monitoring Tools Availability – Keeping monitoring tools available and operational for system operators' use is imperative to maintaining a reliable grid. Registered entities with these types of monitoring tools may have additional Standards and Requirements in their audit scope to ensure these monitoring tools are maintained and available to the system operator.

The non-physical characteristics considered by ReliabilityFirst during the IRA include the following:

- Operating Performance – ReliabilityFirst analyzes data from the GADS, TADS reports and information from reviewed system events. Since 2008 there have been various system events ranging from local load drop to interconnection frequency excursions. There is always a risk that an event could cause a large scale blackout, but it is more probable that a series of smaller events will occur and if undetected, will manifest into a larger event. This information can help to pinpoint problems or identify trends for a registered entity and help to focus the scope of an audit to deter future events from occurring.

- Compliance History – Assessing the violation history, audit performance, Self-Certification, and self-report performance indicates past performance trends and a registered entity's behavior towards compliance and their implementation of their compliance programs. Registered entities with a history of compliance issues may have their audit scope adjusted to ensure their mitigating measures achieve full compliance and prevent recurrence.

- Normal System Performance – The flow of power across the ReliabilityFirst region is normally from west to east, to supply the beltway of the mid-Atlantic region and northeast (including the New York City Area). There are instances when this normal power flow is disrupted and system constraints are realized. These system constraints rely on operator intervention for resolution. A registered entity's system events (involvement, impact to BPS, significance, availability of operators tools, EMS, etc.), their operational performance (use of Emergency procedures and why), and their overall situational awareness all play a role in their system performance.

- System Maintenance upkeep and replacement (EMS, Physical plant, age of equipment, record keeping, tracking, and overall program) Continued maintenance of equipment is essential to a reliable BPS. As equipment gets older, system maintenance may increase and facility availability may decrease.

Additionally, where ReliabilityFirst has confidence in a registered entity's internal compliance program as a result of an Internal Control Evaluation (ICE), ReliabilityFirst may narrow the audit scope and audit periodicity to reflect the compliance maturity of the registered entity. To support a strong culture of compliance and to demonstrate robust internal controls, registered entities are encouraged to continually perform self-assessments of their compliance program and internal controls on an ongoing basis.

ReliabilityFirst will notify registered entities of the Reliability Standards and Requirements to which they will be monitored against through the posting of the CMS for Self-Certification and Data Submittals, the Compliance Monthly Update Letter, the audit notification packages, as well as any of the outreach programs listed in Section 5 of this document.

3. Regional Risks and Associated Reliability Standards

The table below contains the ReliabilityFirst risk focus areas identified during the ReliabilityFirst RRA. The table also contains the Reliability Standards and Requirements associated with each risk element.

NOTE: Standards and/or Requirements in **BLUE** denote inclusion within the NERC risk elements identified in the 2015 ERO CMEP IP.

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. **2014 Cold Weather Event**: As a result of this event, there is a need to: (1) determine that entities investigate a process for unit testing and preparation of resources in advance of winter operations, including testing dual-fuel capability**,** (2) review operator communications with respect to fuel-limited generation commitment decisions for accuracy and consistency, (3) changes to allow adjustment of start times based on changes in fuel utilized, (4) requirements for generation units whose primary fuel may not be natural gas but that require gas to operate, (5) review the entities emergency procedures to ensure overall communications and coordination of emergency procedures, (6) ensure transmission owners understand their existing voltage reduction capabilities (amount, time frame, etc.), (7) have the entities consider adjustments to the roles and responsibilities for communications during emergency procedures besides refining the training to reinforce processes and tools.	EOP-001-2.1b R4 TOP-001-1a R5 TOP-001-1a R4 PER-005-1, R1.1.1
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. Attachment 1-TOP-005 lists the types of data that BAs and TOPs are expected to share with other BAs and TOPs. Item 2. Other operating information updated as soon as available. Item 2.8. Severe weather, fire, or earthquake. There is a continual need to ensure that the conditions of Item 2.8 are met per R2.	TOP-005-2a R2
Weather Related	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements,	EOP-003-2 R1,R3,R5,R8 TOP-002-2.1b R5,R6,R7

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
(Aligns with ERO risk element: *Extreme Physical Events)*	ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. **2013 Hot Weather Event.** Several days of unusual, extremely hot weather led to emergency conditions in an RC service area. In order to avoid more serious impacts, the RC had to direct transmission owners to implement controlled outages in a few contained areas for limited time periods. Controlled outages such as these are a last resort to prevent uncontrolled blackouts over larger areas **(SEE EOP-003-2, R1, R3, R5 & R8).** During this period, temperatures were approximately 20 degrees above normal, and demand for electricity reached an all-time high. At the same time, some generation and transmission facilities were scheduled out of service for routine maintenance because lower system demand was usually experienced during this period **(SEE TOP-002-2.1b, R5, R6 & R7).**	
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. **2012 Hurricane Sandy Event.** Some TO/DP entities in the RTO, particularly those that were not on the coast, experienced greater damage in other storms, such as the 2012 Derecho storm. However, the damage that others experienced from Hurricane Sandy exceeded that caused by both Hurricane Irene and the Derecho storm. In fact, one entity reported that Sandy was the most damaging storm to them since record keeping began. For one entity, all service areas were impacted. The majority of increased staffing was in the restoration area. Additional areas that received increased staffing were operations centers, primary control centers, and backup control centers. **1.** A large NPGOP had only one nuclear station that was damaged due to the loss of transmission system load and experienced high voltage. Another nuclear facility had a temporary loss of off-site power due to switchyard damage and a bushing on a voltage regulator associated with a transformer. During loss of off-site power at this facility, the reactor shutdown	BAL-005-0.2b R7 COM-001-1.1 R3,R5 EOP-001-2.1b R4 EOP-005-2 R1, R1.2 NUC-001-2.1 R7,R8,R9.4,R9.4.1-3 TOP-001-1a R4,R5 TOP-002-2.1b R7

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
	cooling and spent fuel cooling was temporarily lost but was restored when emergency diesels started and loaded. Fossil units were forced off both pre-storm (in anticipation of potential flooding) and as the stations flooded. **2. Five potential lessons learned were identified for generation stations during the storm:** • ISOs/RCs need to improve communication with generation plants during major events. • ISOs/RCs should develop or document alternate communications methods when normal methods are lost. • More comprehensive weather preparation procedures need to be developed. • Improvements can be made for managing personnel who remain on-site. • Development of anticipated generation reductions is necessary for the loss of one or more nearby transmission elements. **3. Several generation operation risks were identified during the storm. These include:** • Increased potential for Loss of Off-site Power (LOOP) to nuclear facilities. • Possibility of LOOP due to switchyard damage, or loss of normal condenser cooling and loss of availability of service water due to high water. • Curtailments due to wet coal, which is normal with any significant precipitator. • Potential lack of fuel due to damage to the fuel provider's facilities. **4.** The largest challenge for the BA was coordinating load lost on the distribution systems with lost generation—in particular, the loss of entire generating stations or the loss of multiple units within close temporal proximity. This at times forced ACE to go either high or low for extended periods of time. It was also challenging to maintain load/generation balance during restoration as generation and/or load was added back into the system.	
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. EOP-005-2, R6 & R9: A large TOP has not been audited for these requirements.	EOP-005-2 R6, R9

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. EOP-006-2, R1: The two RCs have not been audited for this requirement.	EOP-006-2 R1
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. EOP-010, R1 & R3: Although the results of a GMD are reported under EOP-004-2, means of detection and correction for these types of events will eventually fall under EOP-010 which was recently approved by FERC in June 2014, but has no enforcement date at this time. GMDs are confined to a small eastern portion of PJM. MISO is not significantly impacted by GMDs. PJM addresses GMDs in their Emergency Procedures Manual.	EOP-010-1 R1,R3 (as of 4/1/15)
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. TPL-002-0b, 003-0b & 004.0a: TPs have not been audited for this requirement since 2009 and 2010.	TPL-002-0b R1 TPL-003-0b R1 TPL-004-0a R1
Weather Related (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. 		TPL-003-0b R1 TPL-004-0a R1 VAR-002-2b R2,R3 (v3 as of 10/1/14)
Physical Threat (Aligns with ERO risk element: *Extreme Physical Events)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. In CIP-006-3, failure to comply with the requirements of this standard can lead to threats in cyber and physical security space.	CIP-006-3c R1,R2,R3,R4,R5,R6,R7,R8
Cyber Security (Aligns with ERO risk element: *Threats to Cyber Systems)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. Access control is defined by CIP-004-3a, R4. In CIP-005-3a, CIP-006-3c & CIP-007-3a, failure to comply with the requirements of these standards can lead to threats in cyber and physical security space.	CIP-004-3a R4 CIP-005-3a R1,R2,R3,R4,R5 CIP-006-3c R1,R2,R3,R4,R5,R6,R7,R8 CIP-007-3a R1,R2,R3,R4,R5,R6,R7,R8,R9
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. A medium size entity had an established procedure that required a series of communications in advance of energizing new equipment to assure ratings information is timely updated. It was determined that procedure was not strictly followed for two projects and resulted in a communication gap between the project team and the groups responsible for updating and communicating the facility ratings.	FAC-008-3 R8
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. Due to reconfiguration at a substation for breaker installation and relay replacement by a TO, a line outage resulted in disabling of the primary and backup	IRO-010-1a R3

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
	protection on an energized bus. The implications of removing the 138 kV line facilities and the change in protection status of the bus was not recognized by field personnel. As a result, the system operator was not informed of the disabling of bus protection during the outage resulting in this information not being communicated to the RC.	
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. An oversight in an medium size entity's Generator Protection System Maintenance and Testing Program which required testing of relays that were changed, their associated control circuitry paths, as well as all of the other input paths of the associated lockout relays resulted in these devices not being tested.	PRC-005-1.1b R3 (v2 as of 4/1/15)
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. A large entity's Out-of-Step Blocking (OSB) Relay Loadability Spreadsheet contained an error in the formula used to calculate certain OSB relay loadability values.	PRC-023-2 R2 (v3 as of 10/1/14)
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. A large registered entity recently failed to recognize they had entered an unknown operating state when extremely low substation battery voltage was intermittently occurring which compromised the relay protection at the substation.	TOP-004-2 R4
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015.	

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
	A small GOP identified that they had exceeded their voltage schedule without making notification to the TOP. It was determined that the Control Room Operator failed to recognize the elevated voltage condition in spite of received alarms, operator aids, and training. Another small GOP was unaware of their obligation to notify the TOP when their assigned voltage schedule could not be met. Following a planned outage, a Power System Stabilizer (PSS) status change was not reported within the required 30 minutes. The exciter went through a control upgrade during the outage and during the course of the project, the PSS was disabled. The cause was determined to be an oversight of the operator due to not verifying the PSS was in service during start up due to past routine sequence. A large GOP on numerous occasions, exceeded their voltage schedules at various generating facilities due to lack of operator situation awareness of the AVR status.	VAR-002-2b R2 (v3 as of 10/1/14) VAR-002-2b R3, R3.1 (v3 as of 10/1/14)
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015.	CIP-004-3a R1,R2 COM-002-2 R2 EOP-001-2.1b R2,R3,R4 EOP-003-2 R8 EOP-005-2 R10,R11,R17 EOP-006-2 R9,R10 PER-005-1 R3
Human Error (Aligns with ERO risk element: *Human Error & Workforce Capability)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. In CIP-002-3 - CIP-009-3, there is a possibility of Human Error associated with any of the requirements in these standards.	CIP-002-3 R1,R2,R3, R4 CIP-003-3 R1,R2,R4,R5,R6 CIP-004-3a R1,R2,R3,R4 CIP-005-3a R1,R2,R3,R4,R5 CIP-006-3c R1,R2,R3,R4,R5,R6,R7,R8 CIP-007-3a R1,R2,R3,R4,R5,R6,R7,R8,R9 CIP-008-3 R1,R2 CIP-009-3 R1,R2,R3,R4,R5
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. Per the Compliance Monitoring Section of this standard, Each BA shall perform an Area Interchange Error (AIE) Survey as requested by the NERC Operating	BAL-006-2 R4.3

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
	Committee to determine the BA's Interchange error(s) due to *equipment failures or improper scheduling operations, or improper AGC performance. Note: *ReliabilityFirst wishes to determine if the number of equipment failures that impact AIE is presently known.	
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. During relay testing, a large registered entity recently failed to report a relay failure which would not initiate a breaker trip and thus reduced system reliability for twelve days. The equipment failure and reduced reliability was not reported to the respective entities. It is also believed that this entity had entered an unknown operating state per TOP-004-2, R4.	PRC-001-1.1 R2, R2.2
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. A large registered entity recently failed to recognize they had entered an unknown operating state when extremely low substation battery voltage was intermittently occurring which comprised the relay protection at the substation. The condition was not studied or analyzed to determine any possible impacts to the reliability of the BES.	TOP-004-2 R4
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. A medium-size entity experienced an ECS failure which resulted in loss of monitoring and control capabilities due to failure of their front-end processors. It's RC and neighboring TOPs were only able to monitor the tie-lines. During an ECS outage while the TOCC asked neighboring TOPs to monitor tie lines, the TOCC could not monitor the applicable transmission line status, real and reactive power flows, voltage, and status of rotating and static	TOP-006-2 R1 TOP-006-2 R2

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
	reactive resources. Also, the TOCC did not have control to operate the system during the ECS outage	
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015.	FAC-003 R1,R2,R3,R4,R5,R6,R7 PRC-005-1.1b R3,R4 (v2 as of 4/1/15) PRC-008-0 R1,R2 PRC-011-0 R1 PRC-017-0 R1
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. CIP-008-3 requires an Incident Response Plan for Critical Cyber Assets. Lack of such a plan, in the event of an incident, will leave the entity with the inability to properly respond to the incident.	CIP-008-3 R1
Equipment Failure (Aligns with ERO risk element: *Infrastructure Maintenance)*	As a result of ReliabilityFirst's review of the NERC risk elements and the ReliabilityFirst risk elements, ReliabilityFirst identifies these Standards and Requirements for compliance monitoring focus in 2015. CIP-009-3 requires a recovery plan for Critical Cyber Assets. Lack of such a plan, in the event of equipment failure, will leave the entity with the inability to properly recover from an event.	CIP-009-3 R1,R2,R3,R4,R5

4. Compliance Oversight Plan

Self-Certifications and Spot Checks

ReliabilityFirst will require Self-Certifications by all registered entities, including those that will be audited in 2015. ReliabilityFirst will require all Self-Certifications to be completed on a Requirement-level basis. ReliabilityFirst will publish a list of the Standards and Requirements to which registered entities must self-certify in the ReliabilityFirst 2015 Compliance Monitoring schedule.

ReliabilityFirst presently has no Spot Checks scheduled for 2015, but reserves the option to initiate Spot Checks throughout the year as needed.[18] In addition, ReliabilityFirst may use the Spot Check process to verify mitigation plans as needed.

Compliance Monitoring Schedule for Self-Certifications and Data Submittals

ReliabilityFirst developed a Compliance Monitoring Schedule (CMS) that contains the Standards and Requirements for the Self-Certifications and Data Submittals scheduled for 2015. The CMS is based upon the NERC risk elements set forth in the NERC 2015 ERO CMEP Implementation Plan and the ReliabilityFirst risk

[18] As part of its oversight of the PJM Local Control Centers, ReliabilityFirst conducts one random spot-check of a Local Control Center each year.

elements set forth in Section 3 below. Several Requirements in the CMS include a data submittal. Most of these data submittals are associated with the monthly, quarterly, and or annual reporting requirements set forth in the Requirements.

In addition to the Self-Certification process in the CMS and using the IRA results, ReliabilityFirst may require certain entities to certify compliance, with supporting evidence, to specific Reliability Standards associated with newly identified or emerging risks. The overall goal is to obtain assurance that, entities, through their compliance with applicable Reliability Standards, have mitigated identified risks to reliability.

CIP Self-Certifications and Data Submittals in Lieu of CIP Audits for Registered Entities with no Critical Assets or Critical Cyber Assets

For registered entities subject to the CIP Standards that own no Critical Assets or Critical Cyber Assets, ReliabilityFirst will perform Self-Certifications and data submittals in lieu of conducting an off-site audit. This determination is based upon NERC's Cyber Security Reliability Standards CIP V5 Transition Guidance which states:

> For those Responsible Entities that do not have any Critical Assets or Critical Cyber Assets under the CIP V3 Standards…Regional Entities will forgo off-site audits of the CIP Reliability Standards during the Transition Period. Regional Entities may instead use compliance monitoring methods, such as Spot Checks, Self-Certifications, among others.[19]

Compliance Monitoring of Purchase-Selling Entity (PSEs)

For registered entities registered for the PSE function, ReliabilityFirst will perform Self-Certifications in lieu of conducting an audit, as their ERAs indicate the need. These Self-Certifications will apply to registered entities that are registered for multiple functions in addition to the PSE function (e.g., if a registered entity is registered as a DP, LSE and PSE, the audit scope will only include Standards and Requirements applicable to the DP and LSE functions, and the registered entity will submit Self-Certifications for the Standards and Requirements applicable to the PSE function). This determination is based on ReliabilityFirst's experience to date and will be reevaluated in future Implementation Plans as needed.20 PSEs are obligated to maintain compliance with applicable Reliability Standards at all times.[21]

Monitoring of New or Revised Standards

ReliabilityFirst will monitor new or revised Standards based upon their implementation plans and as required by NERC and FERC. A list of new and revised Standards and their effective dates is set forth below:

Standards Subject to Monitoring in late 2014	
Standard	**Effective Date**
INT-004-3	10-1-2014
INT-006-4	10-1-2014
INT-009-2	10-1-2014
INT-010-2	10-1-2014
INT-011-1	10-1-2014
PRC-023-3	10-1-2014

[19] NERC Cyber Security Reliability Standards CIP V5 Transition Guidance, Section 5, page 7, http://www.nerc.com/pa/CI/Documents/V3-V5%20Transition%20Guidance%20FINAL.pdf.

20 If the Risk-Based Registration Initiative becomes effective prior to 2015 or ReliabilityFirst otherwise identifies a need to change this approach, ReliabilityFirst will update the Implementation Plan as appropriate.

[21] It should be noted that if the Risk Based Registration initiative becomes effective, there is the possibility that the PSE function may be removed and ReliabilityFirst will no longer require these self-certifications.

PRC-025-1	10-1-2014
VAR-001-4	10-1-2014
VAR-002-3	10-1-2014

Standards Subject to Monitoring in 2015	
Standard	**Effective Date**
BAL-003-1	4-1-2015
EOP-010-1	4-1-2015
MOD-032-1	7-1-2015
PRC-005-2	4-1-2015
TPL-001-4	1-1-2015

The audit schedule will not be posted on the ReliabilityFirst website. If an entity has a question concerning its audit, please contact ReliabilityFirst.[22]

2015 Compliance Audit Schedule	
NCR #	**Registered Entity**
NCR08039	Allegheny Ridge Wind Farm, LLC
NCR00680	American Bituminous Power Partners, L.P.
NCR08077	Wheelabrator Falls Inc.
NCR08034	US Operating Services Company - Chambers
NCR08053	Hancock-Wood Electric Cooperative, Inc.
NCR00941	Washington City Light & Power
NCR00761	Duke Energy Ohio/Kentucky PJM
NCR08001	Bryan Municipal Utilities
NCR00711	City of Batavia Municipal Electric Utility
NCR00748	The Dayton Power and Light Company
NCR08019	East Coast Power Linden Holding LLC
NCR10257	EFS Parlin Holdings LLC
NCR00417	Whiting Clean Energy, Inc.
NCR08013	Commonwealth Edison Company
NCR00917	Southern Indiana Gas & Electric Company d/b/a Vectren Energy Delivery of Indiana, Inc.
NCR11235	Gratiot County Wind LLC
NCR00896	Public Service Electric & Gas Company
NCR00822	Michigan Public Power Agency
NCR11097	TAQA Gen X LLC
NCR00721	City of Rochelle
NCR11247	GSG 6, LLC

[22] As mentioned above, for registered entities where the CIP Standards apply, that have declared that they own no Critical Assets (CAs) or Critical Cyber Assets (CCAs), ReliabilityFirst will perform self-certifications and data submittals in lieu of conducting an off-site audit. This determination is based upon Cyber Security Reliability Standards CIP V5 Transition Guidance provided by NERC.

For those registered entities that are also registered for functions that are audited on a six year cycle, ReliabilityFirst will evaluate and determine the scope of those registered entity audits based upon the risk those functions pose to the BES (i.e. a TOP that is also registered as a LSE, etc.). There may be times when these audits are not conducted based upon the registered entity ERA.

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Monthly Newsletter - The ReliabilityFirst Newsletter provides registered entities with news and information relating to reliability activities.	Monthly throughout the year.
Monthly Compliance Update Letter - The ReliabilityFirst Monthly Compliance Update Letter provides registered entities with any changes made to the Compliance Monitoring Schedule and the due dates for compliance submittals.	Updated throughout the year as needed.
ReliabilityFirst Website - The ReliabilityFirst website provides compliance and technical materials to support compliance program implementation.	Monthly throughout the year.
Workshops/Seminars/Webinars - ReliabilityFirst Compliance workshops/seminars or webinars, will be scheduled to assist the registered entities in the understanding of their responsibilities to satisfy compliance to the Reliability Standards throughout the year.	Semi-annual (March and October).
CIP Version 5 Outreach and Awareness – ReliabilityFirst will conduct CIP Version 5 outreach, including training and education engagements, to ensure that registered entities have confidence in their implementation of the CIP V5 Standards and Requirements. These engagements will primarily be conducted as Workshops and Webinars.	Monthly throughout the year.

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Compliance Data Management System (CDMS) - ReliabilityFirst allows its registered entities to report compliance via CDMS, an internet based application. The CDMS home page provides informational announcements, updates, and newsworthy items of interest to the registered entities.	Updated throughout the year as needed.
Periodic Reports - ReliabilityFirst will provide Periodic Reports to its registered entities identifying compliance related activities that the registered entities continue to struggle with. These reports will be posted on the ReliabilityFirst website.	Monthly throughout the year.
Open Compliance Calls - ReliabilityFirst has implemented a monthly conference call to provide an open forum for registered entities to call and voice concerns, ask questions, and to gain information about upcoming compliance items.	Monthly throughout the year.
Assist Visits - ReliabilityFirst has implemented a program whereby a registered entity may request a one on one or a small group meeting where guidance on compliance related activities can be provided. These Assist Visits can be in the form of a conference call, web meeting, or on-site visit. Topics can range from helping an entity become more familiar with compliance related material and activities, to special guidance and education when either the registered entity or ReliabilityFirst believes the registered entity needs special attention or additional help.	As requested by our registered entities.

Appendix A5 - SERC Reliability Corporation (SERC) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for SERC as required by the NERC Rules of Procedure (ROP).

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

As part of SERC's efforts to be more efficient and effective, and to strengthen and support the Compliance area, the Operations and Planning (O&P) and Critical Infrastructure Protection (CIP) audit resources were brought under one monitoring area function, Compliance Monitoring. This will allow SERC to be more consistent in the application of tools and processes in compliance monitoring activities.

SERC will continue to support its Industry Subject Matter Expert (ISME) program, through which SERC frequently uses industry volunteers employed by registered entities in the SERC Region as supplemental compliance audit team members. SERC continues to be a leader among the Regions in this area. In 2014, the program was enhanced to focus on identification, qualification, and assignment of ISMEs to match the technical resource needs of specific audits, evaluation of ISME participation and performance during audits, and training of ISMEs. During 2015, the ISME program will continue to be supported, highlighted during certain SERC outreach events, and have information available on the SERC public website.

1.2 Other Regional Key Initiatives and Activities

Building from the successful momentum with the Reliability Assurance Initiative (RAI) in 2014, SERC will continue to support RAI in 2015 in various ways. SERC will scope the appropriate Compliance Monitoring Plan for each registered entity based on ERO Risk-based Compliance Oversight Framework, as described in the ERO CMEP IP, which includes: - the NERC 2015 risk elements Guide, SERC Regional Risk Assessment, Inherent Risk Assessment (IRA), and Internal Control Evaluation (ICE). The Compliance Monitoring Oversight Plan will include areas of focus, level of efforts, timing, and overall strategy on use of CMEP tool(s). Note, however, each registered entity remains responsible for compliance with all Mandatory and Enforceable Reliability Standard Requirements applicable to its registered function(s).

For registered entities identified as a Multiple Region registered entity (MRRE), the lead Region shall be responsible for the coordination of compliance monitoring oversight activities. The lead Region is responsible for coordinating and conducting the IRA and ICE; however, each Region shall have input to ensure regional risks are identified. The lead Region may modify the Compliance Monitoring Oversight Plan as appropriate.

2. Regional Reliability Assessment Process and Regional Risk Identification

The SERC Region encompasses a large area, has some of the nation's largest cities and utilities, and serves a significant portion of the U.S. population. Protecting the reliability of the electric grid in the SERC Region is the responsibility of SERC members with the support of SERC staff and reliability programs. Reliable operation of the Bulk Power System (BPS) is essential to regional economic viability. While each registered entity within the SERC Region is diligent with respect to reliability and resiliency within their service area, it is the responsibility of SERC to coordinate the reliability-related activities throughout the Region.

It should be recognized that the BPS in the SERC Region has been planned, built, and operated as part of the integrated Eastern Interconnection. This integrated system serves the electric customers in the region under both traditional vertically integrated and market-based generation dispatch mechanisms.

SERC has worked with its members since 2012 to develop and implement a continuous program of Region-wide assessments of potential reliability risks that could impact the SERC Region BPS. The SERC Regional Reliability Risk Assessment program is a robust, centralized process for analyzing, prioritizing, addressing, and

communicating significant risks and risk-controlled initiatives. This is the first application of the output of this program communicating the choice of Standards for inclusion in the SERC CMEP.

The SERC Standing Committees, the SERC Reliability Risk Team (RRT)[23], and SERC Reliability Assessment and Performance Analysis staff contribute to the SERC Regional Reliability Risk Assessment Program. The objective of the program is to improve BPS reliability through a coordinated effort that identifies, analyzes, prioritizes, and addresses reliability risks. In conformance with the ERO RAI risk management program, the SERC process consists of the following major activities:

- Identify/Nominate Risks
- Determine Time Horizon (e.g. immediate, next-day, operational, seasonal, and long-term).
- Assess and Rank Risk
  - Determination of the consequence, or severity impact(s)
  - Determination of the probability of occurrence
  - Assignment of High, Medium, or Low from the Risk Assessment Matrix
  - Prioritization of risks
  - Stored in the Risk Registry
- Develop Risk Control Initiatives
- Monitor and Reevaluate Risk Impact

The coordination of the efforts with the SERC registered entities, the SERC technical committees, SERC staff, neighboring system personnel, and other members of the ERO is vital to the understanding and analysis of potential major reliability issues. SERC, through its members and staff, is heavily engaged with NERC and its risk initiatives. SERC's risk management programs enable it to focus compliance monitoring oversight activities on those Reliability Standards which, if violated, would pose the greatest risk to the reliable operation of the SERC portion of the BPS. The Reliability Standards listed in Section 3 are the program's recommendation for 2015 and are based on what is known at the time of this submittal.

SERC has recognized one NERC Reliability Standard, PRC-006, as needing greater specificity to achieve successful coordination of the registered entities within the SERC Region. PRC-006 has Requirements that identify the Planning Coordinator (PC) as the registered entity responsible for developing under frequency load shedding (UFLS) schemes within their PC area. However, the NERC Standard does not provide specific guidance regarding the extent of cooperation with surrounding PCs which may lead to inconsistent set points and other regional inconsistencies for key UFLS parameters. In response, SERC created a Regional Reliability Standard, PRC-006-SERC-01, to establish consistent and coordinated Requirements for the design, implementation, and analysis of UFLS programs among applicable SERC registered entities. The Regional Standard adds specificity not contained in the NERC Standard for development and implementation of the UFLS scheme in the SERC Region that effectively mitigates the consequences of an under-frequency event.

SERC has numerous UFLS schemes deployed within its Region; therefore, SERC developed and implemented the Regional Standard to ensure more comprehensive UFLS testing to identify possible regional gaps.

3. Regional Risk Focus Areas and Associated Reliability Standards

The table below contains the Regional risks focus areas identified during the Regional Reliability Assessment process. The table also links associated Reliability Standards/Requirements to identified risks that may be

[23] The RRT includes SERC Engineering Committee, Operating Committee, and CIP Committee members and was explicitly created to formalize and apply a process to carry out the basic elements of reliability risk monitoring, classification and management. It is noteworthy that the RRT monitors many risks not defined in the Reliability Standards, but are in support of best practices that promote BPS reliability.

considered in the Regional Compliance Monitoring Plan. Note that the Standards/Requirements listed below are in addition to the Standards/Requirements identified in the 2015 ERO risk elements Guide.

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
External Risks associated with Critical Cyber Assets	Electronic Access Points (EAP) often provide the first level of defense against vulnerability-based attacks, and based on SERC's most violated Reliability Standards/Requirements (previous three years) CIP-005 is the Region's third most violated CIP Standard. Given the EAP is often the first level of defense, controlling access into the perimeter and monitoring for cyber-based attacks is critical to protecting cyber assets within and reducing the risk of degradation to the BPS.	CIP-005-3a R2, R3
Physical Events/Threats	Physical Events represent those events that result in extensive damage to equipment, irrespective of cause. Based on SERC's most violated Reliability Standards/Requirements report (previous three years) CIP-006 is the Region's second most violated CIP standard. Additional focus is needed to address and minimize both the magnitude and duration of the consequences of a physical event. Physical access to cyber systems must be restricted and appropriately managed to ensure the integrity of the cyber systems within the Physical Security Perimeter.	CIP-006-3c R2, R5, R6
Cyber System Integrity Risks	As the top violated Reliability Standard within the SERC Region, additional focus must be placed on cyber system integrity. Two key parts of ensuring system integrity are security patch and user account management. Security patch management is crucial in monitoring and addressing known security vulnerabilities prior to those vulnerabilities being exploited in a malicious manner that could degrade, or render unavailable, the cyber systems required to ensure the reliability of the BPS. User account management is essential in ensuring only authorized personnel can gain electronic access to Critical Cyber Assets.	CIP-007-3 R3, R5
Cold weather impacts on transmission and generation	The SERC and NERC Polar Vortex related research, final and preliminary reports reveal numerous operational risks inherent to SERC registered entities, which may degrade the SERC Region's BPS reliability performance below what is required by the NERC Standards.	BAL-001-1 R1, R2; BAL-002-1 R1; BAL-005-0.2b R7; COM-002-2 R1, R2

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Major storm events such as hurricanes and tornados	The SERC Region historically has experienced severe weather events, such as hurricanes and tornados. The most recent noteworthy weather events are hurricane Katrina and recurring mass tornado events in 2008 and 2011. These events usually create system contingencies beyond existing planning criteria; however, emergency procedures and other operating standards still apply. Over the years, the Region has identified this risk and emphasized system preparedness through the 2012 Assessment of SERC Performance Information for Identifying Potential Reliability Risk, as well as through the NERC Reliability Assessment reporting process.	COM-002-2 R1, R2
Power System coordination and modeling	Increased BPS use in a manner for which the system wasn't originally designed, coupled with insufficient operating experience, coordinated studies and coordinated operations, can introduce risk to reliable operation of the BPS in the SERC Region. The NERC Arizona-Southern California Outages report highlighted potential areas of vulnerability. Significant changes in generation dispatch, particularly if such changes are unstudied, increases reliability risk. As a result, additional focus on registered entities impacted by these issues with respect to these Standards is warranted. References to neighboring system coordination and recommendations can be found in the NERC Arizona-Southern California Outages report."	MOD-001-1a R6; FAC-008-3 R6; FAC-014-2 R1, R2, R3, R4 ; IRO-003-2 R1, R2; IRO-004-2 R1; VAR-001-4 R1, R2; VAR-002-3 R1, R2, R3
UFLS Schemes	The SERC UFLS Regional Standard is to establish consistent and coordinated requirements for the design, implementation, and analysis of UFLS programs among SERC applicable registered entities. The regional standard adds specificity not contained in the NERC standard for development and implementation of the UFLS scheme in the SERC Region that effectively mitigates the consequences of an under-frequency event.	PRC-006-SERC-01 R1, R2, R3, R4, R5, R6

4. Compliance Oversight Plan

Scheduling of Audits

Registered entities registered as a Balancing Authority (BA), Reliability Coordinator (RC), or Transmission Operator (TOP) will continue to be audited every three years per the current NERC ROP. SERC will continue to monitor registered entities that are scheduled for an audit based on SERC's long term monitoring plan in 2015. For all registered entities scheduled for an audit in 2015, flexibility to adjust the periodicity, as well as

audit scope, will be considered and adjusted based upon the Regional Risk Assessment, the Risk-based Compliance Oversight Plan provided by NERC, and the Inherent Risk Assessment (IRA) of the registered entity performed by SERC.

For registered entities registered only as a Purchasing-Selling Entity (PSE), SERC will use the Self-Certification monitoring method in lieu of conducting an audit of these registered entities. This monitoring method was selected based upon SERC's Regional Risk Assessment conducted for 2015 and the limited number of reliability issues posed by PSE operation.

SERC will not conduct an off-site or on-site CIP audit for registered entities that have declared that they own no Critical Assets (CAs) or Critical Cyber Assets (CCAs). This determination is based upon the Cyber Security Reliability Standards CIP V5 Transition Guidance provided by NERC that states, "*For those Responsible Entities that do not have any Critical Assets or Critical Cyber Assets under the CIP V3 Standards, however, Regional Entities will forgo off-site audits of the CIP Reliability Standards during the Transition Period.*" SERC may determine to use another monitoring method based on the registered entity IRA.

SERC is gathering CIP V5 data from its registered entities to better understand the scope and focus of required outreach during 2015 and beyond. SERC is conducting a survey during the implementation period to determine the status of each registered entity's transition to the CIP V5 Standards. Based on the data obtained, SERC will further align its outreach activities.

Self-Certification Monitoring

SERC will use Self-Certifications based on the guidance in the ERO CMEP IP, SERC's annual Regional Risk Assessments, registered entity IRA, internal controls evaluations (if applicable), compliance history, etc. Self-Certifications may also use guided self-certifications that include specific questions and/or data requests. SERC will require all Self-Certifications to be completed on a Requirement basis. This will require a Self-Certification in which all sub-Requirements must be completed for each Requirement listed. SERC will provide additional guidance on Self-Certification requirements to registered entities throughout 2015 as needed

Spot Checking

SERC will determine the need for Spot-Checks based on the outcome of the registered entity IRA. In addition, SERC may use the Spot Check process to verify Mitigation Plans as needed.

Periodic Data Submittals

SERC will still have a number of Standards and Requirements that require a data submittal. Most of these data submittals serve as reminders to our registered entities of a monthly, quarterly, and/or annual reporting Requirement in the Standard.

The audit schedule below shows registered entities that are subject to an audit during 2015 based on the three year cycle prescribed by NERC's ROP. The schedule is also located on the SERC's website here: http://www.serc1.org/Documents/Compliance/2015%20Program/2015%20SERC%20Audit%20Schedule.pdf

2015 Compliance Audit Schedule	
NCR #	**Registered Entity**
NCR01312	South Carolina Public Service Authority-Audit
NCR00070	Southeastern Power Administration-Audit
NCR01225	East Kentucky Power Cooperative-Audit
NCR01223	LG&E and KU Services Company-Audit
NCR01151	Tennessee Valley Authority-Audit
NCR01359	USACE-Mobile District-Audit

2015 Compliance Audit Schedule	
NCR #	**Registered Entity**
NCR01359	City of Springfield, IL-CWLP-Audit
NCR00826	Midwest Independent Transmission System Operator Inc. (RFC Lead)-Audit
NCR01315	South Mississippi Electric Power Association-Audit
NCR01361	USACE-Savannah District-Audit
NCR01234	Entergy-Audit
NCR01320	Southern Company Services, Inc.– Trans-Audit
NCR11305	Smoky Mountain Transmission LLC-Audit

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
SERC Compliance Portal SERC registered entities submit Self-Certifications, Self-Reports, Mitigation Plans, and Data Submittals via the SERC Portal. Surveys are conducted for feedback to allow SERC to incorporate enhancements based on the needs of the users and outreach events include training on upgrades and enhancements.	As needed throughout the year
Outreach Events SERC outreach events are planned throughout the year to accommodate the training needs of registered entities. Planned events, listed here, with specific themes will also feature compliance and reliability topics of importance at the time of the event. All events are posted to the SERC website, listed in the SERC Outreach & Training Catalog on the website, featured in the monthly *SERC Transmission* newsletter, and email notifications and reminders are sent to primary and alternate compliance contacts for all registered entities within the SERC Region footprint. • Open Forum (WebEx): SERC's Redesigned Website • Spring Compliance Seminar • Small Entity Workshop: CIP V5 Transition • Open Forum (WebEx) • Open Forum (WebEx) • CIP Compliance Seminar • Fall Compliance Seminar	 Jan 26, 2015 Feb 24-25, 2015 Feb 25, 2015 Apr 13, 2015 Jul 20, 2015 Sep 29-30, 2015 Oct 27-28, 2015
Focused Workshops / Webinars Supplemental focused events will be scheduled on an as-needed basis to provide outreach and training for new or revised Reliability Standards, targeted groups of registered entities based on functional Registration, and ERO initiatives.	As needed throughout the year
Lessons Learned Lessons Learned website postings will share information among registered entities.	As available throughout the year

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Training and Education Catalog SERC maintains a catalog of recorded and upcoming training and education activities on its website to increase the number of people who are aware and are able to take advantage of SERC's training and education programs.	Updated as needed throughout the year
Compliance Outreach Assistance Upon receipt of a New Registration Application, a document containing links to "Compliance 101" files on the FERC, NERC, and SERC websites will be sent to the applicant to provide basic compliance information in one convenient location. A sample of the links includes information such as the Energy Policy Act (EPA) of 2005 on the FERC site, ROP and Reliability Standards on the NERC site, and Acronym Reference Index and SERC Filing Due Dates on the SERC site. The *SERC Transmission* newsletter is distributed to registered entities within the SERC Region on a monthly basis. Articles contain links to scheduled outreach information for both SERC and NERC events, along with other topics helpful to maintain BPS reliability.	Updated as needed throughout the year

Appendix A6 - Southwest Power Pool Regional Entity (SPP RE) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for the SPP RE as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

SPP RE budgeted for four open positions in 2015 – the Compliance Director, two (2) Lead Engineers and a CIP Compliance Specialist. SPP RE will also utilize contractors or consultants during the 2015 year to assist Staff during audits, investigations and/or enforcement activities.

SPP RE will be developing new tools and templates to implement the Reliability Assurance Initiative (RAI) activities.

1.2 Other Regional Key Initiatives & Activities

SPP RE will continue to collaborate with NERC, Regional Entities and the registered entities to identify changes to enhance the risk-based approach to the monitoring and enforcement processes.
SPP RE CIP Staff will begin an Outreach Program that will assist the registered entities in the transition to CIP version 5.

2. Regional Reliability Assessment Process and Regional Risk Identification

SPP RE has developed a Regional Audit Scope Plan that identifies the risk elements within the SPP RE footprint. The SPP RE risk focus areas identified include the top violated requirements, facility rating impacts, newly enforceable Reliability Standards, System Awareness and protection of Cyber Assets.

SPP RE will consider these Regional risk focus areas when following the ERO Risk-based Compliance Oversight Framework described in the ERO CMEP. SPP RE will also consider the Regional risk focus areas when conducting risk assessments for the registered entities that are scheduled for audits during 2015 to develop the audit scope.

3. Regional Risks Focus Areas and Associated Reliability Standards

The table below contains the Regional risk focus areas identified during the Regional Risk Assessment process. The table also contains associated Reliability Standards/Requirements for identified risks that may be considered in the Regional compliance oversight plan.

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Protection of Cyber Assets	Essential to ensure the system protecting the cyber system can continue to maintain a security perimeter.	CIP-005-3 R2, R3
Protection of Cyber Assets	Essential to ensure the protection of Cyber Assets from unauthorized physical access.	CIP-006-3 R2, R3, R6
Protection of Cyber Assets	Essential to ensure applicable security patches are identified and installed on the CIP systems.	CIP-007-3 R3, R5
Facility Ratings Impacts	Essential to ensure Generator Owners and Transmission Owners develops, maintain and coordinate accurate facility ratings.	FAC-008-3 R1, R2, R3, R6, R7

Reliability Standards Subject to Regional Monitoring		
Regional Risk Focus Areas	**Justification**	**Associated Standard & Requirement(s)**
Facility Ratings Impacts	Essential to ensure Transmission Operators and Planning Authorities and Reliability Coordinators establish and coordinate SOLs and IROLs.	FAC-014-2 R2
System Awareness	Essential to ensure the Balancing Authorities and Transmission Operators operates and maintains the reliability of the system.	TOP-002-2.1b R6
System Awareness	Essential to ensure the Balancing Authorities and Transmission Operators operates and maintains the reliability of the system.	TOP-004-2 R1, R4
New Requirements	Essential to ensure Generator Owners have a strategy to prevent vegetation encroachment into the MVCD.	FAC-003-3 R3 (GO only)
Top Violated	Top violated in the SPP RE area. Essential to ensure the BPS infrastructure is maintained.	PRC-005-1.b R1, R2

4. Compliance Oversight Plan

SPP RE will use the following monitoring tools for 2015:

On-Site Audits –SPP RE will continue to audit the Transmission Operator and Balancing Authority entities that are on the three (3) year cycle for the Ops & Planning and CIP audits in 2015.

Off-Site Audits- SPP RE will continue to audit the registered entities that are scheduled for a six (6) year audit cycle and for registered entities that have been registered within the last two (2) years for the Ops & Planning, CIP will not perform off-site audits in 2015 per the CIP V3 to V5 Transition Documentation.

Spot-Checks – Spot-Checks may be used in lieu of Off-Site audits for entities that have a lower risk identified through the entity assessment. There are no mandatory Spot Checks listed in the 2015 NERC IP. However, SPP RE may initiate a Spot Check at any time to verify or confirm Self Certifications, Self Reports, and Periodic Data Submittals or in response to operating problems or system events. SPP RE may initiate Spot-Checks for the six (6) year audit cycle registered entities that had Area of Concerns identified in the audits during 2012.

Self-Certification – SPP RE will continue to require SPP RE registered entities to perform a Self-Certification to ensure that the entity is maintaining the rigor of their internal controls for reviewing compliance with the Reliability Standards. SPP RE has identified such requirements based on the ERO CMEP IP and Regional Assessment for the registered entities. Self-Certification will be conducted using webCDMS. Entities will receive additional notice and instructions before each quarterly reporting window. Periodic Data Submittal - The 2015 NERC IP does not identify Reliability Standards and Requirements that require periodic data submittals. SPP RE will require specific Reliability Standards and Requirements that contain periodic data submittal requirements for which SPP RE or SPP RTO will collect on a monthly, quarterly, or annual basis.

The reporting requirements and the Audit Scope Plan are located on the SPP RE's website here: http://www.spp.org/section.asp?group=3290&pageID=27

The audit schedule is also located on the SPP RE's website here:
http://www.spp.org/section.asp?group=3290&pageID=27

2015 Compliance Audit Schedule	
NCR #	**Registered Entity**
NCR01056	American Electric Power Service Corp. (AEPW)
NCR01062	Borger Energy Associates, LP (BOEA)
NCR11291	Chisholm View Wind Project, LLC
NCR11250	Dogwood Power Management, LLC (DPM)
NCR01227	East Texas Electric Cooperative, Inc. (ETEC)
NCR01107	Kansas City Power & Light Company (KCPL)
NCR06047	Lea County Electric Cooperative, Inc. (LCEC)
NCR00826	Midcontinent Independent System Operator, Inc (MISO)
NCR01118	Midwest Energy, Inc. (MIDW)
NCR03044	MISO-MBHydro Contingency Reserve Sharing Group (MRSG)
NCR11236	NAES Corporation - Goodman Energy Center (NAESGEC)
NCR01096	NextEra Energy Resources, LLC (NEXTERA)
NCR06054	North American Energy Services - Dogwood (NAESDOGW)
NCR01124	Northeast Texas Electric Cooperative, Inc (NTEC)
NCR11224	PIC Group, Inc.- Mustang (PICMUS)
NCR11264	Post Rock Wind Power Project, LLC
NCR01148	Sunflower Electric Power Corporation (SECI)
NCR01152	Terrebonne Parish Consolidated Government (TERREBONNE)
NCR01342	Tex-La Electric Cooperative Of Texas, Inc (TEXL)
NCR01160	Western Farmers Electric Cooperative (WFEC) w/ TRE
NCR01081	City Utilities of Springfield
NCR01144	Southwestern Power Administration
NCR01160	Western Farmers Electric Cooperative (WFEC) w/ TRE
NCR00826	Midcontinent Independent System Operator, Inc (MISO)
NCR01101	Grand River Dam Authority
NCR01130	Oklahoma Gas & Electric Company

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Newsletters	Monthly
SPP.org RE webpages (http://www.spp.org/section.asp?pageid=87)	Updated as needed
2015 Spring Compliance Workshop	March 10-11, Little Rock
2015 CIP Workshop	June 2-3, Kansas City
2015 Fall Compliance Workshop	September 29-30, Dallas
Webinars	Approx. 9 per year
Training Videos (http://www.spp.org/section.asp?pageID=92)	As developed
Event Analysis Lessons Learned (http://www.spp.org/section.asp?group=2243&pageID=27)	As developed

Appendix A7 - Texas Reliability Entity (Texas RE) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for the Texas RE as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

Texas RE in 2015 will continue to implement the Reliability Assurance Initiative (RAI), the Electric Reliability Organization's strategic initiative to transform the current compliance and enforcement program into a program that is forward-looking and focuses on high risks to the Bulk Power System (BPS).

In Section 4 below, Texas RE provides a list of registered entities that are planned to undergo compliance monitoring in the Texas Interconnection in 2015 and additional information on its compliance monitoring. Consistent with the NERC Rules of Procedure and approved practices, registered entities were selected for compliance monitoring based on three-year and six-year cycles.

1.2 Other Regional Key Initiatives & Activities

Texas RE will be engaged in a significant amount of outreach associated with transition to CIP Version 5 throughout 2015. The outreach will consist of frequent, information-rich calls, newsletters and specialized workshops (as needed), intended to provide guidance and support for all entities.

Texas RE will continue its collaborative effort between NERC, the Regional Entities, and registered entities to identify and implement changes that enhance the effectiveness of the Compliance Monitoring and Enforcement Program.

2. Regional Reliability Assessment Process and Regional Risk Identification

As part of the Reliability Assurance Initiative, the level of scrutiny a registered entity receives in terms of compliance monitoring will be directly commensurate with the risk it poses to the reliability of the BPS. For entities that do not pose a significant reliability risk, the minimum compliance monitoring activities may suffice. For entities that do pose a significant risk to reliability, it will be necessary for those entities to undergo additional compliance monitoring such as additional focused spot checks, a greater number of Self-Certifications, or broader and deeper audits of greater frequency.

To assist Texas RE in determining how much risk an entity poses to reliability, Texas RE utilizes dedicated staff to review risk within the ERCOT Interconnection. The staff relies heavily on feedback from other groups within Texas RE such as Registration, Enforcement, Reliability Services, and Compliance to achieve an understanding of the risks encountered or emerging within the region. Additionally, Texas RE reviews externally created reports and discussions focusing on reliability risks. The recently developed risk elements Guide provides basic guidance for determining risks for which some level of compliance monitoring may be appropriate. Texas RE will utilize the risk elements Guide to focus on risks within the region by involving local subject matter experts. For example, the Texas RE Reliability Services department creates an annual state of reliability report. Some aspects within the report correlate to the risk elements determined within the risk elements Guide but others are corollaries, such as "Unplanned generation outages with emphasis on winter preparation," a localized issue requiring localized focus. Texas RE will utilize determined risks to facilitate engagements with registered entities in such a way that prioritizes the evaluation of compliance for the determined risks. Texas RE will apply the appropriate risk element or risk elements to the appropriate registered entity to maintain focus on reliability.

Every registered entity is subject to an evaluation of compliance for all Standards determined to be within the Areas of Focus described within the risk elements Guide. Additional risk elements may be added as needed throughout the year. For Critical Infrastructure Protection requirements, Texas RE will utilize the approved transition guide and apply RAI concepts to determine relevant risks to reliability and appropriate Compliance Monitoring and Enforcement Program processes.

3. Regional Risk Focus Areas and Associated Reliability Standards

The table below contains examples of Regional risk focus areas identified during the Regional Reliability Assessment process. The table also contains examples of associated Reliability Standards/Requirements to identified risks that may be considered in the Regional compliance monitoring plan. This table may be updated as needed and in no way restricts Texas RE from utilizing other regional risks and associated Standards/Requirements determined throughout the year.

Reliability Risks Subject to Regional Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Planning	Planning is considered a risk due to the nature of this Interconnection. The list of requirements covers a broad perspective of the different facets of planning requirements that have an impact on reliability.	BAL-001-1 R1-R2; BAL-003-0.1b R1, R2, R4, R5, R6; EOP-001-2.1b R2-R4;EOP-002-3.1 R2; EOP-003-2 R2-R8;EOP-004-2 R1-R3; EOP-005-2 R1, R3, R4, R6; EOP-006-2 R1; FAC-008-3 R3, R6- R8; FAC-010-2.1 R1-R4; FAC-011-2 R1-R4; FAC-013-2 R1; FAC-014-2 R1-R4; PRC-006-1 R1-R14; VAR-001-4 R1-R5; VAR-002-3 R5, R6
Emergency Response and Recovery	The nature of this Interconnection requires monitoring of the reliability related activities needed to respond and recover to emergencies.	BAL-001-1 R1-R2; BAL-002-1 R1; COM-001-1.1 R5; COM-002-2 R1-R2; EOP-001-2.1b R1-R6; EOP-002-3.1 R1-R9; EOP-003-2 R1, R2; EOP-005-2 R1-R18; EOP-006-2 R1-R10 ; EOP-008-1 R1-R8; EOP-010-1 R1-R3; FAC-010-2.1 R2; FAC-011-2 R2; FAC-014-2 R1-R4, R6; IRO-001-1.1 R3, R8; IRO-002-2 R1, R4, R6, R7; IRO-003-2 R1, R2; IRO-005-3.1 R12; IRO-006-5 R1; IRO-006-TRE-1 R1-R2; IRO-009-1 R1-R5; IRO-010-1a R1, R3; IRO-016-1 R1; PER-001-0.2 R1; PER-004-2 R1, R2; PER-005-1 R3; PRC-001-1.1 R2, R6; TOP-001-1a R1-R6, R8; TOP-002-2.1b R6; TOP-003-1 R1; TOP-004-2 R4-R6; TOP-006-2 R5, R6; TOP-007-0 R1-R4; TOP-008-1 R1-R4; TPL-002-0b R1-R3; TPL-003-0b R1-R3; TPL-004-0a R1-R2
SPS Management	SPS remains a facet of operations that can have an impact on reliability. There has been a significant amount of change with respect to the quantity of SPS's within this Interconnect	PRC-001-1.1 R1-R6; PRC-005-2 R1-R5; PRC-015-0 R1-R3; PRC-016-0.1 R1-R3; PRC-017-0 R1-R2

Reliability Risks Subject to Regional Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
UVLS Management	There are areas within this Interconnect that require monitoring of this operational tool.	EOP-003-2 R2, R4, R7; PRC-001-1.1 R1-R5; PRC-004-2.1a R1-R3; PRC-005-2 R1-R5; PRC-010-0 R1; PRC-011-0 R1-R2; PRC-021-1 R1-R2; PRC-022-1 R1
UFLS Management	Frequency control is significant within this Interconnection and monitoring the UFLS aspect is important to ensure reliability.	PRC-001-1.1 R1-R5; PRC-004-2.1a R1-R3; PRC-005-2 R1-R5; PRC-006-1 R1-R12; PRC-008-0 R1-R2;
Local Emergency Management	There are localized emergencies that, if not managed well, could lead to broader impacts to the Interconnection.	COM-001-1.1 R5; COM-002-2 R1-R2, EOP-001-2.1b R1-R5; EOP-002-3.1 R1-R9, EOP-003-2 R1-R8; EOP-005-2 R1-R18; EOP-006-2 R1-R10; IRO-006-TRE-1 R1-R2; TOP-001-1a R1-R6, R8; TOP-002-2.1b R1, R4, R6, R10; TOP-003-1 R1-R3; TOP-004-2 R1-R4, R6; TOP-006-2 R1, R2, R4; TOP-007-0 R1-R4; TOP-008-1 R1-R4
Operations Guides (RAP, MP, PCAP, TOAP, etc…)	The management of the various operating tools available to preserve reliability require a level of compliance monitoring.	IRO-006-TRE-1 R1-R2
SOL/IROL Coordination	The nature of the Interconnection requires this risk to be closely monitored and reviewed.	COM-002-2 R1-R2; EOP-001-2.1b R1-R3; FAC-002-1 R1; FAC-008-3 R1-R3, R6, R8; FAC-010-2.1 R1-R4; FAC-011-2 R1-R4; FAC-013-2 R1, R2, R4, R5; FAC-014-2 R1-R5 ; IRO-001-1.1 R1, R2, R4, R6-R9; IRO-002-2 R3-R5, R7; IRO-003-2 R1-R2; IRO-004-2 R1; IRO-005-3.1a R1, R2, R5, R9, R12; IRO-006-5 R1; IRO-006-TRE-1 R1-R2; IRO-008-1 R1-R2; IRO-009-1 R1-R5; IRO-010-1a R1-R2; IRO-014-1 R1-R4; IRO-015-1 R1; MOD-010-0 R1; MOD-012-0 R1-R2; MOD-018-0 R1; NUC-001-2.1 R4, R9; PER-004-2 R2; PER-005-1 R3; TOP-001-1a R1-R3, R7; TOP-002-2.1b R1, R2, R4, R10, R11, R13, R16, R18; TOP-003-1 R1, R2; TOP-004-2 R1, R4-R6; TOP-005-2a R2; TOP-006-2 R3, R5, R6; TOP-007-0 R1, R2, R4; TOP-008-1 R1-R4; TPL-001-0.1 R1-R2; TPL-002-0b R1-R2; TPL-003-0b R1-R2; TPL-004-0a R1; VAR-002-3 R2
Critical Voltage Support	This risk is closely related to the UVLS management but covers risks in other portions of the Interconnect that may not have UVLS.	CIP-002-3 R1; COM-002-2 R1; FAC-002-1 R1; FAC-008-3 R6, R7, R8; IRO-002-2 R4, R5; PRC-010-0 R1; PRC-011-0 R1-R2; TOP-003-1 R2; TOP-006-2 R2, R5; VAR-001-4 R1-R5; VAR-002-3 R1-R4, R6

Reliability Risks Subject to Regional Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
SCADA/EMS Outage and Problems	NERC has recognized this as a re-occurring event that requires monitoring to determine impacts to reliability.	CIP-003-3 R1,R2, R4-R6;; CIP-005-3a R1-R4; CIP-006-3c R2-R6; CIP-007-3a R1-R9; CIP-008-3 R1-R2; CIP-009-3 R1-R4; COM-001-1.1 R1-R5; COM-002-2 R1-R2; EOP-001-2.1b R2, R3, R5; EOP-003-2 R5, R6, R8; EOP-004-2 R1-R2; EOP-005-2 R1, R3, R10; EOP-008-1 R1-R8; IRO-001-1.1 R1, R4; IRO-002-2 R5, R6, R7, R8; IRO-003-2 R1, R2; IRO-005-3.1a R1, R2, R5, R7, R8, R9; IRO-006-TRE-1 R1, R2; IRO-010-1a R1; PER-005-1 R1; PRC-001-1.1 R6; TOP-001-1a R1-R5, R7-R8; TOP-002-2.1b R1, R5, R6, R10, R11, R14, R16; TOP-004-2 R1, R4, R6; TOP-005-2a R2; TOP-006-2 R1-R6; TOP-007-0 R1; TOP-008-1 R1-R4
Internal Access Points PSP	Even with the transition to CIP V5 there is a need to maintain security and provide monitoring activities associated with CIP.	BAL-005-0.2b R3; CIP-002-3 R1-R2; CIP-003-3 R1, R5; CIP-004-3a R1-R4; CIP-006-3c R1-R6, R8
External Access Points ESP	Even with the transition to CIP V5 there is a need to maintain security and provide monitoring activities associated with CIP.	BAL-005-0.2b R3; CIP-002-3 R1-R3; CIP-003-3 R1, R4-R6; CIP-004-3a R1-R4; CIP-005-3a R1-R4
Network Architecture	Even with the transition to CIP V5 there is a need to maintain security and provide monitoring activities associated with CIP.	BAL-005-0.2b R3; CIP-002-3 R1-R3; CIP-003-3 R1,R2, R4-R6; CIP-004-3a R1-R4; CIP-005-3a R1-R4; CIP-006-3c R2-R6; CIP-007-3a R1-R9
Critical Assets Selection	Even with the transition to CIP V5 there is a need to maintain security and provide monitoring activities associated with CIP.	BAL-005-0.2b R3; CIP-002-3 R1-R4
Frequency Response and Control	The nature of this Interconnection requires monitoring of the reliability related activities needed to maintain frequency.	BAL-001-1 R1-R3; BAL-001-TRE-1 R2, R3, R6-R10; BAL-003-0.1b R1, R4; BAL-005-0.2b R14; COM-002-2 R1; EOP-001-2.1b R2; EOP-002-3.1 R5; EOP-003-2 R6, R7; EOP-006-2 R7; PRC-006-1 R1-R14; PRC-008-0 R1, R2; TOP-006-2 R7
Protection System Performance	Protection System performance remains a risk requiring focused attention.	PRC-001-1.1 R2-R6; PRC-004-2.1a R1-R3; PRC-023-3 R1-R6,; PRC-025-1 R1;

Reliability Risks Subject to Regional Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Operational Communication	Communication is a critical aspect of reliability.	BAL-003-0.1b R1; BAL-004-0 R2, R4; BAL-005-0.2b R4; BAL-006-2 R2-R5; COM-001-1.1 R1, , R3, R4; COM-002-2 R1, R2; EOP-001-2.1b R3, R6; EOP-002-3.1 R3, R7, R9; EOP-003-2 R3; EOP-005-2 R1-4, R8, R15; EOP-006-2 R2, R4, R5, R7, R8, R10; EOP-008-1 R8; EOP-010-1 R2; FAC-001-1 R1;; IRO-002-2 R1-R3; IRO-004-2 R1; IRO-005-3.1a R3, R4, R6, R9, R10, R12; IRO-006-5 R1; IRO-009-1 R4; IRO-016-1 R1; PRC-001-1.1 R2, R6; TOP-001-1a R3-R5, R7, R8; TOP-002-2.1b R3, R4, R11, R13-R17,; TOP-003-1 R1-R3,; TOP-004-2 R6,; TOP-005-2a R1-R3; TOP-006-2 R1; TOP-007-0 R1, R4; TOP-008-1 R3; VAR-001-4 R3; VAR-002-3 R1-R4, R6
Renewables Integration	The management of renewable integration is important to reliability due to the nature of this Interconnection. The Interconnect has had a significant change in topology to allow integration and the results of that integration are becoming more apparent during grid operations.	BAL-001-TRE-1 R2, R3, R6-R10; BAL-005-0.2b R1, R14; CIP-002-3 R1-R3,; COM-002-2 R1-R2; EOP-004-2 R1, R2; FAC-001-1 R1-R3; FAC-002-1 R1; FAC-008-3 R1, R2, R6, R7; IRO-002-2 R1-R8; MOD-026-1 R2-R5; MOD-027-1 R1-R5; PRC-001-1.1 R3; PRC-018-1 R1-R6; TOP-001-1a R3, R6, R7; TOP-002-2.1b R13- R15; TOP-006-2 R1; VAR-002-3 R1-R2

4. Compliance Oversight Plan

Texas RE will use the approved ERO Compliance Oversight Framework, as described in the ERO CMEP IP, to determine the scope of each compliance engagement and the method for conducting the engagement (such as by audit, Self-Certification, or spot check). Texas RE will evaluate risk elements and apply compliance monitoring subject to NERC Standards and Requirements applicable to the risks. Each registered entity will undergo an Inherent Risk Assessment using characteristics of the specific entity to help determine the scope of the compliance review. The scope of review may be further tailored for those registered entities that opt to undergo an Internal Control Evaluation.

Texas RE will notify registered entities of upcoming compliance engagements within the timeframes required by Appendix 4C to the NERC Rules Procedure (at least 90 days before an audit, 30 days before a Self-Certification, and 20 days before a spot check).

Texas RE will evaluate Operations and Planning Requirements and Critical Infrastructure Protection Standards and Requirements concurrently during an engagement instead of conducting separate engagements. For Critical Infrastructure Protection Requirements, Texas RE will refer to the approved transition guide.

Texas RE will also implement a change for use of Self-Certifications for registered entities within the Texas RE footprint. Texas RE will require more information from entities selected to self-certify, and the Self-Certification will be limited to Standards and Requirements related to risks identified through the compliance monitoring processes. The intent of this change is to implement RAI goals by focusing on risks and properly leveraging the resources of registered entities and Texas RE.

Texas RE will use the approved Compliance Oversight Framework to determine the scope of each compliance engagement and the method for conducting the engagement (such as by audit, Self-Certification, or spot check). Texas RE will notify registered entities of upcoming compliance engagements within the timeframes required by Appendix 4C to the NERC Rules Procedure (at least 90 days before an audit, 30 days before a Self-Certification, and 20 days before a spot check). The candidate list below is considered an initial list and is subject to change.

2015 Compliance Audit Schedule	
NCR #	**Registered Entity**
NCR01160	Western Farmers Electric Cooperative
NCR01342	Tex-La Electric Cooperative of Texas, Inc.
NCR02910	Nextera Energy Resources, LLC
NCR04003	Forest Creek Wind Farm, LLC
NCR04004	Sand Bluff Wind Farm LLC
NCR04006	American Electric Power Service Corp.
NCR04010	Barney M Davis Unit 1
NCR04013	Bluebonnet Electric Co Op, Inc.
NCR04018	Brownsville Public Utilities Board
NCR04021	Brownsville Public Utilities Board Silas Ray
NCR04027	Calpine Power Management, LP
NCR04038	CPS Energy
NCR04056	ERCOT ISO
NCR04082	Ingleside Cogeneration, LP
NCR04092	Lower Colorado River Authority
NCR04094	Magic Valley Electric Coop Inc.
NCR04118	San Bernard Electric Coop, Inc.
NCR04119	Sharyland Utilities LP
NCR04121	Sid Richardson Carbon LTD
NCR04124	South Texas Electric Cooperative, Inc.
NCR04127	STP Nuclear Operating Company
NCR04160	Weatherford Municipal Utility System
NCR10004	City of Georgetown
NCR10090	NRG Texas Power, LLC
NCR10173	Champion Wind Farm, LLC
NCR10174	Roscoe Wind Farm, LLC
NCR10211	Electric Transmission Texas, LLC
NCR10219	Luminant Generation Company, LLC
NCR10249	Panther Creek Wind Farm I & II, LLC
NCR11074	Wind Energy Transmission Texas, LLC
NCR11076	Lone Star Transmission, LLC
NCR11383	EC&R QSE, LLC

5. Compliance Outreach

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Spring Compliance Workshop	Spring 2015
Fall Compliance Workshop	Fall 2015

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Talk With Texas RE	Projected Monthly (subject to change)
Texas *Re*view Newsletter	Projected Monthly
CIP Compliance Workshop(s)	**Summer 2015**

Appendix A8 - Western Electricity Coordinating Council (WECC) 2015 CMEP Implementation Plan

This Appendix contains the CMEP Implementation Plan (IP) for WECC as required by the NERC Rules of Procedure.

1. Compliance Monitoring and Enforcement

1.1 CMEP IP Highlights and Material Changes

Enhanced Regional Coordination

In 2014, WECC coordinated enforcement activities for some registered entities across multiple regions. In addition, WECC continued to identify registered entities that could qualify for coordinated compliance and enforcement activities under a forthcoming Multi-Regional registered entity (MRRE) Process. WECC plans to work with NERC and the other Regions in 2015 to implement the MRRE Process as appropriate.

Departmental Reorganization: Enforcement and Compliance Risk Analysis

In 2014, the WECC Compliance Department restructured to more appropriately allocate resources to prepare to implement the Reliability Assurance Initiative (RAI) in 2015. Subject matter experts previously working within the WECC Enforcement Team moved to the newly created Compliance Risk Analysis functional group. The Compliance Risk Analysis Group will continue to focus on conducting reviews and technical assessments of all self-identified violations and mitigation plans. In addition, this group will focus on Inherent Risk Assessments (IRAs) and Internal Controls Evaluations (ICEs) as part of the RAI.

Strengthened Settlement Process

During 2014, WECC continued to leverage information gained from risk analysis, lessons learned, best practices, and other information to enhance monitoring and enforcement activities. For example, in negotiating settlement agreements disposing of violations, WECC may propose reliability-focused terms aimed at improving reliability, culture of compliance, internal controls, and internal compliance programs. Most settlements reached in 2014 included such reliability-focused activities. In addition, WECC began sharing best practices and lessons learned on its Compliance website during 2014 and will continue to expand this information in 2015.

1.2 Other Regional Key Initiatives & Activities

During 2015, WECC will implement the ERO's risk-based approach to compliance monitoring in conducting CMEP-related activities. WECC will phase in implementation of IRA and ICE activities to help determine the best use of its resources and understand that WECC's processes will evolve throughout the year.

Risk-based Framework for Off-site Audits

In 2015, WECC will implement the ERO Risk-based Compliance Oversight Framework, as described in the ERO CMEP IP, for conducting off-site audits for certain registered entities, different from the annual "one-size-fits-all" formal off-site compliance audit strategy that WECC has implemented since 2007. This tailored audit strategy considers the inherent risks posed by the registered entities in choosing the appropriate monitoring engagement.

WECC conducted a risk assessment of all entities scheduled for off-site audits in 2015. Based on the risk assessment, WECC will conduct off-site audits as usual for some entities. However, for most entities otherwise due for the off-site audit, WECC will substitute the annual Self-Certification process, combined with a focused validation of the annual Self-Certifications. WECC plans to continue to perform all on-site audits during 2015 as scheduled.

Inherent Risk Assessment (IRA) Process

WECC Compliance will perform an IRA of registered entities to identify areas of focus and the level of effort needed to monitor compliance with NERC Reliability Standards for a particular Entity or category of Entity. While the IRA is similar in nature to what WECC has been doing in the past several years when scoping audits, the IRA will strengthen the process. In 2015, WECC plans to conduct IRAs for registered entities that have an on-site audit scheduled. If resources permit, during 2015 WECC may conduct IRAs for other registered entities as well.

Internal Controls Evaluation (ICE) Process

WECC Compliance may perform an ICE of certain registered entities to assess their internal controls, which may further focus the level and effort needed to monitor compliance with NERC Reliability Standards for a particular Entity. For 2015, WECC will roll out the ICE process on a limited basis. Any entity that has a scheduled audit in third or fourth quarters 2015 may volunteer for the ICE program. WECC will contact each such entity in early 2015 to provide more information and discuss the Entity's options. If a registered entity volunteers for the ICE process, WECC will evaluate its internal controls that support compliance with the Reliability Standards. WECC will assess the strength of these controls and provides the entity with feedback. WECC will use its evaluation of internal controls to determine the scope and depth of the compliance monitoring activity and any potential impacts on enforcement processing of violations and mitigation plans submitted by entities. Registered entities may elect not to participate in an ICE. In that case, WECC will use the results of the IRA to determine the appropriate compliance monitoring strategy. WECC also will provide more information in 2015 regarding the expansion of this program in 2016 and beyond. For Entities not eligible for this process in 2015, WECC will work with interested entities to recommend how it could focus on identifying, organizing, and strengthening detective, preventative and corrective controls pertaining to the Reliability Standards. WECC will post guidance specific to its ICE review process in early 2015 and will update ICE-related information during the year as appropriate.

Internal Compliance Program Assessment (ICPA)

WECC will continue its voluntary ICPA Program, originally launched during 2012, in 2015. The ICPA Program is a tool Entities can but are not required to use to assist in the development of strong Internal Compliance Programs (ICPs). WECC provides feedback, highlighting exemplary practices and providing recommendations for improvement where appropriate. As the ICE process develops, WECC will consider merging the ICPA process with the ICE process.

CIP v5 Implementation

In 2014, WECC made significant efforts to prepare both staff and registered entities to be compliant with CIP v5. WECC will follow NERC's Transition Guidance for CIP-related monitoring and enforcement during 2015, in anticipation of the 2016 compliance date. During 2014, WECC conducted numerous outreach activities and materials to assist registered entities in making the transition. All presentations and associated material are available via WECC's website.

The WECC Cyber Security Audit Team will use the NERC CIP v5 transition guidance in conjunction with the NERC RAI program during its 2015 audit engagements. While maintaining its schedule of 2015 on-site audits, the WECC Cyber Security Audit Team will continue to engage its registered entities, NERC and the other Regions in ensuring a consistently applied audit approach on CIP v5.

WECC encourages registered entities to take a proactive approach in transitioning to CIP v5. If registered entities encounter any issues in its transition, WECC encourages them to contact WECC to work through the issues.

Physical Security Standard Implementation

WECC has been actively engaged in CIP-014 activities during 2014, dedicating resources and leveraging key relationships with Standard Drafting Team members and industry to inject subject matter expertise and practical experience into both the Standard and RSAW. WECC has a number of CIP auditors with strong physical security credentials. To share this expertise, WECC has developed and delivered multiple presentations to both industry and other Regions, providing a "next-steps" perspective aimed at aiding registered entities in a move toward increased security and compliance with CIP-014. Presentations and other materials are on WECC's website.

2. Regional Risk Assessment Process

This section provides a description of how WECC assessed risk in the Western Interconnection and determined associated Reliability Standards for consideration its Regional compliance monitoring plan. In identifying risks, WECC considered risks identified by NERC in its risk elements Guide for Development of the 2015 CMEP IP. In addition, for the Western Interconnection, WECC specifically considered factors such as footprint and registered entity characteristics, registered functions, geographic locations, system events and trends, compliance history, SCADA systems, FERC Orders and Guidance, et al. A summary of the specific risks, and associated standards, follows, for both Critical Infrastructure Protection (CIP) and Operations and Planning (O&P) Standards:

3. Regional Risks and Associated Reliability Standards

The standards identified below generally will be in scope for compliance monitoring for entities to which the standards apply, and thus they are similar to the Actively Monitored Lists in the past. During 2015, as WECC phases in and matures its RAI-related activities, it will begin to tailor monitoring activities to more closely match individual entity risks. WECC may contact individual Entities to provide more focused scope for audits or Self-Certifications, for example. WECC will give priority to focusing on entities scheduled for on-site audits during 2015, and to other Entities for which it may have conducted the Inherent Risk Analysis and, if applicable, the Internal Controls Evaluation.

Critical Infrastructure Protection (CIP)

Over the past several years, cyber security threats have been on the rise in the electricity sector. As Entities have become more reliant on automated systems and integrated technology, it has become more important to identify the cyber security risks associated with using these advanced technologies. While the electric sector has yet to experience a cyber-attack affecting reliable operation of the Bulk Power System, WECC believes the risk of a large-scale cyber-attack is significant and must be addressed to the extent possible through standards monitoring. To help focus compliance monitoring and enforcement efforts, WECC has identified seven cyber security areas of risk that pose the greatest threat to the Western Interconnection.

WECC's Compliance Risk Analysis and Cyber Security Audit teams developed the seven areas of risk identified below. These risks were identified by considering the risks identified by NERC, the history of most violated CIP Standards in the Western Interconnection, and WECC's experience in conducting Cyber Security audits, reviewing self-disclosed violations, and professional expertise of Compliance Risk Analysis and Cyber Security Audit teams.

- **Event and incident response, continuity of operations**: This area relates to establishing and maintaining plans, procedures, and technologies to detect, analyze, and respond to cyber security events.
- **Threat and vulnerability management**: This area relates to establishing and maintaining plans, procedures, and technologies to detect, identify, analyze, manage, and respond to cyber security threats and vulnerabilities.
- **Risk management**: This area relates to establishing, operating, and maintaining an enterprise cyber security risk management program to identify, analyze, and mitigate cyber security risk to the organization.

- **Asset and configuration management**: This area relates to managing an entity's information technology assets, including hardware and software.
- **Identity and access management**: This area relates to creating and managing logical or physical access to an entity's assets.
- **Workforce management**: This area relates to establishing and maintaining plans, procedures, technologies, and controls to create a culture of cyber security and to ensure the ongoing suitability and competence of personnel.
- **Situational awareness**: This area relates to establishing and maintaining activities and technologies to collect, analyze, alarm, present, and use power system and cyber security information, including status and summary information.

As part of this project, WECC also identified the CIP Standards most commonly associated with these areas of risk. Based on the degree of association of the CIP Standards with a given risk area, WECC created a list of Standards most closely associated with these areas of risk:

CIP Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Event and incident response, continuity of operations	It is essential for registered entities to develop plans to respond to cyber-security events. Failure to do so could significantly increase the exposure of the threat and time a realized threat exists. Significant impact could occur if entities cannot properly and quickly respond to threats. This area has been reported on as needing attention in the NERC Cyber Attack Task Force final report and the ERO Priorities – RISC Updates and Recommendations report.	CIP-007 R6 CIP-008 R1 CIP-009 R2
Threat and vulnerability management	Not having procedures to detect and respond to cyber vulnerabilities could adversely affect organizational operations, including logical and physical assets. This risk area has been highlighted in the NERC Cyber Attack Task Force final report, ERO Priorities – RISC Updates and Recommendations report, 2013 Long-Term Reliability Assessment report, and ERO Top Priority Reliability Risks 2014-2017 report.	CIP-005 R4 CIP-007 R8 CIP-008 R1
Risk management	A risk management program that oversees an organization's cyber security risk could have far reaching affects throughout all the entity's cyber security programs to mitigate threats both physical and logical. This area makes the foundation of a registered entity's cyber security framework. The DOE guide "Risk Management Process" highlights the need for cyber security risk management being a part of an organization's mission and business requirement.	CIP-002 R1 CIP-008 R1

CIP Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Asset and configuration management	Not knowing which assets are performing critical functions for the entity could lead to misconfigured assets and lack of necessary protections for those assets. Since asset configurations impact the security and operation of every asset, it is critical to properly account for, and manage this area.	CIP-002 R2 CIP-002 R3 CIP-003 R6 CIP-005 R1 CIP-007 R1 CIP-007 R2 CIP-007 R3 CIP-007 R4
Identity and access management	Identity and access management is one of the most important components of a registered entity's security infrastructure. An entity's information assets must be accessible only to individuals who are granted explicit entitlements to specific information. Failure to manage identity and access to cyber assets could allow malicious individuals to have access to key facilities, devices and services.	CIP-004 R4 CIP-005 R2 CIP-006 R1 CIP-006 R4 CIP-007 R5
Situational awareness	Not having information about an entity's systems does not allow the entity to take corrective actions to detect and prevent failure and compromise. It is essential for registered entities to have awareness about their environment. Failing to do so could them from being protected against attacks. The RISC's ERO Priorities – RISC Updates and Recommendations report, NERC's ERO Top Priority Reliability Risks 2014-2017 report, and the Cyber Attack Task Force final report highlight this concern.	CIP-005 R3 CIP-006 R5 CIP-007 R6

Operations and Planning (O&P)

The O&P Audit team and Compliance Risk Analysis team have identified areas of risk to the Western Interconnection. These risks were identified by considering the risks identified by NERC documents (*ERO Top Priority Reliability Risks 2014-2017* and *2015 ERO Compliance Monitoring and Enforcement Implementation Plan*), history of most violated Operations and Planning Standards in the Western Interconnection, Event analysis reports, WECC's experience in conducting Operations and Planning audits, reviewing self-disclosed violations, and professional expertise of WECC Compliance Risk Analysis and Operations and Planning Audit teams.

- **Human Performance**: This area relates to a range of issues facing the electricity industry today, including the imminent loss of critical skills and knowledge with the retirement of an aging workforce, cognitive overload of System Operators complicating the task of maintaining reliability, and an apparent shift in operating philosophy toward operating to standards rather than to reliability.
- **Equipment Failure**: This area relates to equipment failure due to aging infrastructure of generation facilities, transmission facilities, and substations. In addition to this, there is a risk associated with failure of adequate coordination with other entities and consideration of impact on the BPS.
- **Changing Resources: Variable Generation Integration**: This area refers to the composition of installed electric generation capacity that makes up the resource portfolio. Additionally this area also refers to the challenges faced due to integration of variable generation, planning for changes in system composition, replacing retired capacity or coal generation.

- **Protection System Reliability:** This area relates to Special Protection Scheme/Remedial Action Scheme (SPS/RAS) effectiveness, SPS/RAS proliferation, misoperation of the protection system devices, and increasing RAS events. In addition to this, there is a risk associated with failure of adequate coordination with other entities and consideration of impact on the BPS.
- **Situational Awareness**: Situational awareness refers to the ability to see and comprehend what is happening on the system. This area relates to importance of including Real-Time Contingency Analysis (RTCA) Tools, next-day studies in planning studies. It also relates to inadequate data coordination, data failure, data shrinkage (unexpected outages of tools providing data to operators) leading to operators not having enough visibility to some or all the system they operate.
- **Changing Load Composition**: This area relates to changing load shape, changing load patterns, increased A/C penetration like plug-in vehicles.
- **Vegetation and Right of Way issues**: This area relates to outages that are caused due to inability to maintain vegetation like grow-in issues in the transmission line or Right of Way clearance issues. It refers to recently approved new NERC standard that specifically relates to the outages caused due to interrelationship between vegetation growth rates, vegetation control methods and inspection frequency which if ignored might lead to encroachment into minimum vegetation clearance distances. This can lead to loss of load or generation.
- **Transmission Planning Adequacy:** This area relates to need and importance of transmission study models in forecasting and monitoring load, transmission, generation, and facility devices.
- **High-Impact Low-Frequency Events:** This area relates to specific events that might not happen frequently but might pose a higher impact to the reliability of the BPS.
- **Adequacy of Reserves:** This area relates to changing Reserve Sharing requirements due to increasing risk of distributed generation, retirement of certain generations due to environmental regulations.

As a result of this project, WECC identified the O&P Standards most commonly associated with these areas of risk. Based on the degree of association of the O&P Standards with a given risk area, WECC created a list of Standards most closely associated with these areas of risk:

O&P Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Human Performance	Human Error has been responsible for many historical outages. Human performance challenges encompass a range of issues including the imminent loss of critical skills and knowledge with the retirement of an aging workforce, cognitive overload of System Operators complicating the task of maintaining reliability, and an apparent shift in operating philosophy toward operating to standards rather than to reliability. These issues are pervasive and require coordinated industry efforts to address.	COM-002-2 R2 PER-005-1 R3

O&P Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Equipment Failure	As the components of the BPS continue to age, the likelihood of failure increases. Additionally, engineering margins have been minimized through advances in technology which means that BPS components construction practices are less robust. For example, a 1940's transformer may have been over-built to take system changes, but today's transformers are built with thinner margins and are less likely to withstand system dynamics as well. Hence, tracking the rate of occurrence aids industry in understanding and identifying potential systemic issues, such as manufacturing flaws or operational practices. The 2013 and 2014 NERC State of Reliability Reports identified AC substation equipment failure as significant contributors to disturbance events, with a positive correlation to increased transmission outage severity.	FAC-501-WECC-1 R3 PRC-005-1 R2 PRC-005-2 R3 PRC-005-2 R4 PRC-008-0 R1 PRC-008-0 R2 PRC-011-0 R1 PRC-017-0 R1
Changing Resources: Variable Generation Integration	With the increased installation of variable generation, fluctuations in generation and load increase the dependency of system reserves, peaking plants, and energy storage systems. Also, as generation and load fluctuate, facilities need to ramp up and down more frequently increasing maintenance requirements and the risk of mechanical and electrical failures. As more renewable resources are brought online and traditional resources are decommissioned, the available rotating inertia and base-load is reduced which may increase the risk to BES stability. Maintaining resource adequacy will be an ongoing challenge as the resource mix changes. As noted in the WECC annual Power Supply Assessment Report's current projection, the reserve margins will be adequate for the next seven to ten years. Changes outside the assumptions used in resource adequacy evaluations could present challenges. Coal plants are also used for base loading. With the expansion in variable generation, base load plants are needed to provide operating reserves during periods of generation fluctuations (solar and wind). The loss of these plants will increase generation availability risk and grid volatility.	BAL-002-WECC-2 R1 BAL-002-WECC-2 R2 BAL-002-WECC-2 R3 BAL-002-WECC-2 R4

O&P Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Protection System Reliability	A failure of the protection system reliability could result in increased risk of cascading events, system instability, and interconnection separations. While protection systems continue to be upgraded to microprocessor based systems, the older Electro-Mechanical and solid state designs are still used and, given their age, impose a risk to reliability. Additionally, interaction of Remedial Action Scheme (RAS) poses a challenge. RAS are designed and tested for specific systems or parts of systems, so their operation in protecting those systems is well understood. But understanding of how RAS interact or impact one another is less well understood. Evaluating the potential interactions, and then managing those interactions that present a risk, is important for reliability.	PRC-001-1.1 R3 PRC-001-1.1 R4 PRC-001-1.1 R5 PRC-001-1.1 R6 PRC-004-2.1a R1 PRC-004-2.1a R2 PRC-004-WECC-1 R1 PRC-004-WECC-1 R2 PRC-005-1 R2 PRC-005-2 R3 PRC-005-2 R4 PRC-008-0 R1 PRC-008-0 R2 PRC-011-0 R1 PRC-016-0.1 R1 PRC-016-0.1 R2 PRC-017-0 R1 PRC-023-3 R1 PRC-025-1 R1
Situational Awareness	Situational Awareness refers to the ability to see and comprehend what is happening on the system. There are a number of processes necessary to maintaining situational awareness, including real-time monitoring and real-time and near-term contingency analysis studies. The coordination and sharing of data is critical to situational awareness because each process relies on various types of data. The lack of adequate situational awareness limits entities' ability to identify and plan for the next most critical contingency, which, in turn, impacts the reliability of the entire system.	COM-002-2 R1 EOP-010-1 R2 EOP-006-2 R1 EOP-006-2 R9 EOP-006-2 R10 EOP-008-1 R3 EOP-008-1 R4 IRO-002-2 R6 IRO-002-2 R7 IRO-002-2 R8 IRO-005-3.1a R1 IRO-008-1 R1 IRO-008-1 R2 PER-005-1 R3 TOP-002-2.1b R4 TOP-002-2.1b R11 TOP-002-2.1b R19 TOP-004-2 R6 TOP-006-2 R2 TOP-007-WECC-1a R1

O&P Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Changing Load Composition	Load composition refers to the combination of energy consumption patterns, e.g., peaks, and types of demand, e.g., residential or commercial. Both consumption patterns and types of demand are changing. Future changes to load composition could present operational and planning challenges like mechanism for reducing demand, mechanism for removing load, high penetration of new types of demand and load changes that affect stability considerations.	BAL-002-WECC-2 R1 BAL-002-WECC-2 R2 BAL-002-WECC-2 R3 BAL-002-WECC-2 R4 PER-005-1 R3 TPL-001-0.1 R1 TPL-002-0b R1 TPL-003-0b R1 TPL-004-0a R1
Vegetation and Right of Way issues	Vegetation management and Right of Way issues refer to the encroachment of vegetation due to lack of trimming or due to incorrect clearances of the transmission lines. Aging transmission lines might not adhere to the minimum clearances. Having less clearance along with vegetation growth issues could lead to vegetation related outages. Per NERC Technical Reference, trees that have grown out of specification could contribute to a cascading grid failure, especially under heavy electrical loading conditions.	FAC-003-3 R1 FAC-003-3 R2 FAC-003-3 R6 FAC-003-3 R7
Transmission Planning Adequacy	Maintaining a healthy transmission system is vital for reliability of the grid. Transmission Planning adequacy refers to accuracy and reliability of various study models to study load forecast, transmission system behavior for addition or retirement of generating facilities and facility designs. A coordinated and accurate transmission model becomes important for identifying system behaviors and planning for future load demand. Additionally, planning and operational models that use different representations lead to inconsistent understanding of contingencies and duplication of modeling efforts, both of which may lead to inaccurate prediction of power system behavior.	FAC-014-2 R5 FAC-014-2 R6 TOP-004-2 R6 TOP-006-2 R2 TOP-008-1 R4 TPL-001-0.1 R1 TPL-002-0b R1 TPL-003-0b R1 TPL-004-0a R1
High-Impact Low-Frequency Events	High-impact low-frequency events refer to events such as coordinated physical or cyber-attack, pandemic, geomagnetic disturbance, or large-scale disasters. A coordinated attack on the electric system could result in damage to key systems and components and render part or all of the system inoperable for an extended period of time.	EOP-001-2.1b R2 EOP-001-2.1b R3 EOP-001-2.1b R4 EOP-003-2 R8 EOP-005-2 R1 EOP-005-2 R6 EOP-005-2 R9 EOP-005-2 R10 EOP-005-2 R11 EOP-005-2 R17 EOP-006-2 R1 EOP-006-2 R9 EOP-006-2 R10 EOP-008-1 R3

O&P Reliability Standards Subject to WECC Monitoring		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
		EOP-008-1 R4 PER-005-1 R3
Adequacy of Reserves	Plant retirements due to implemented environmental regulations increase uncertainty in future resources. Additionally, other potential environmental regulations are leading to cases where resources may be inadequate to ensure firm demand is served at all times. As the system continues to change, some concerns are identified with insufficient reserve margins by some entities.	BAL-002-WECC-2 R1 BAL-002-WECC-2 R2 BAL-002-WECC-2 R3 BAL-002-WECC-2 R4

4. Compliance Oversight Plan

WECC will perform all on-site audits during 2015 as scheduled, as required by the NERC Rules of Procedure. Entities scheduled for on-site audits during 2015 are included in the table titled "2015 Audit Schedule" below. For all such audits, WECC will apply a risk-based approach in accordance with the RAI.

For Entities due for an off-site audit during 2015, WECC has conducted a risk assessment. Based on that assessment, WECC has, for most of these entities, substituted the annual Self-Certification process for reporting year 2014 combined with a focused validation of the Self-Certifications. WECC will conduct off-site audits as scheduled for all other Entities. Entities still scheduled for an off-site audit are included in the 2015 Audit Schedule below

Compliance Audits

WECC will conduct scheduled Compliance Audits for 2015 using the Reliability Standard Requirements listed in the tables titled "CIP Reliability Standards Subject to WECC Monitoring" and "O&P Reliability Standards Subject to WECC Monitoring" in Section 3 above (collectively, the "Reliability Standards Subject to WECC Monitoring in 2015") as a baseline, as well as an Entity's Registered Functions. A summarized list of CIP and O&P Reliability Standards subject to Audit for 2015 is included in the Reliability Standards Subject to WECC Monitoring – 2015 document on the WECC website. The scope of each audit, however, may be adjusted based on WECC's risk IRA (and ICE if available) of the registered entity.

Annual Self-Certification

As noted in WECC's 2014 CMEP Implementation Plan, the annual Self-Certification for reporting year 2014 will begin December 15, 2014, when WECC will post the Self-Certification Schedule and Forms and send notification to registered entities. The submittal period will run from January 1 through March 2, 2015.

In 2016, WECC will conduct the annual Self-Certification for reporting year 2015. WECC will post the Self-Certification Schedule and Forms and send the Self-Certification notification to registered entities on December 15, 2015. The notification will inform Entities of the reporting period (January 1 through December 31, 2015) and the submittal period (January 1 through March 1, 2016), as well as provide information on the Reliability Standard Requirements covered. Subject to an entity's Registered Functions, the Reliability Standards Requirements for Self-Certification will be determined, in part, by those listed in the tables titled "CIP Reliability Standards Subject to Regional Monitoring" and "O&P Reliability Standards Subject to Regional Monitoring" in Section 3 above. In addition, Reliability Standard Requirements listed in the table titled "Additional Reliability Standards Subject to Self-Certification" below is included to make up the Self-Certification baseline. A summarized list of Reliability Standards subject to Self-Certification for 2015 is included in the Reliability Standards Subject to WECC Monitoring – 2015 document on the WECC website. The

scope of each Self-Certification, however, may be adjusted based on WECC's IRA (and ICE if available) of the registered entity.

WECC may also validate the accuracy of Self-Certification submittals of Compliant, Not Applicable and/or Do Not Own through various analyses, including sending data requests to registered entities for randomly selected Self-Certifications for certain Reliability Standard Requirements and Registered Functions.

Additional Reliability Standards Subject to Self-Certification		
Regional Risk Focus Area	**Justification**	**Standard & Requirement**
Repeat Violations	Reliability Standard Requirements with repeat violations over the most recent 12-month period can be one indication of the possibility of increased risk. These Standard Requirements are included in addition to those listed in the tables in Section 3 titled "CIP Reliability Standards Subject to Regional Monitoring" and "O&P Reliability Standards Subject to Regional Monitoring" to form the baseline of Reliability Standard Requirements subject to Self-Certification for reporting year 2015.	CIP-002 R4 CIP-003 R2 CIP-004 R3 CIP-005 R5 CIP-006 R2 CIP-006 R6 CIP-007 R9 CIP-009 R5 EOP-001 R5 FAC-008 R2 FAC-008 R3 FAC-010 R1 FAC-010 R4 FAC-010 R3 IRO-010 R3 PER-005 R1 PRC-005 R1 VAR-001 E.A.14 VAR-002 R3 VAR-002 R2

Periodic Data Submittals (PDS)

As part of the CMEP, registered entities must submit Periodic Data Submittals (PDS) on schedules required by applicable Reliability Standards, or as established by NERC, or on an as-needed basis where requested by WECC. These Reliability Standards are listed in the table below titled Reliability Standards Subject to Periodic Data Submittal. A summarized list at the Sub-Requirement level is also included in the Reliability Standards Subject to WECC Monitoring - 2015 on the WECC website.

Reliability Standards Subject to Periodic Data Submittal	
Justification	**Standard & Requirement**
These Reliability Standards include requirements for registered entities with applicable Registered Functions to submit data on a periodic basis as indicated in the Requirement or relevant Sub-Requirement.	BAL-001-1 R1 BAL-001-1 R2 BAL-002-1 R1 BAL-002-1 R2 BAL-002-1 R3 BAL-002-1 R4 BAL-002-1 R5 BAL-002-1 R6 BAL-003-0.1b R1.2 BAL-006-2 R4 COM-002-2 R2 EOP-004-2 R2 FAC-003-3 R1 FAC-003-3 R2 FAC-003-3 R6 FAC-003-3 R7 IRO-006-WECC-1 R1 IRO-006-WECC-1 R2 PRC-004-2.1a R3 PRC-004-WECC-1 R3 PRC-021-1 R1 PRC-023-3 R5 PRC-023-3 R6 TPL-002-0b R3 TPL-003-0b R3 TPL-004-0a R2 VAR-002-WECC-1 R1 VAR-002-WECC-1 R2 VAR-501-WECC-1 R1 VAR-501-WECC-1 R2

2015 Audit Schedule

Note that the WECC audit schedule may be revised from time to time during 2015. Thus, the "2015 Audit Schedule" shown below for both on-site and off-site audits applies only as of November, 2014. The most up-to-date audit schedule, including all revisions and updates, is on the WECC's website here: WECC 2015 Audit Schedule. The on-line schedule should be consulted to ensure accuracy as this 2015 IP will not be re-published and re-posted to reflect each change to the audit schedule during 2015.

2015 Audit Schedule	
NCR #	**Registered Entity**
NCR05335	Public Utility District No. 1 of Snohomish County
NCR11458	RockTenn
NCR10292	Shiloh Wind Project 2, LLC
NCR05402	Southwest Transmission Cooperative, Inc.
NCR05321	Platte River Power Authority
NCR05441	US Bureau of Reclamation
NCR05441	US Bureau of Reclamation
NCR10310	Brush Cogeneration Partners
NCR10311	Colorado Energy Management - BCP
NCR10347	Panoche Energy Center LLC
NCR11150	GenOn Delta
NCR10289	Peak Reliability
NCR05282	NorthWestern Corporation
NCR05153	Eugene Water & Electric Board
NCR05106	Colorado Springs Utilities
NCR05465	Western Area Power Administration - Sierra Nevada Region
NCR05430	Transmission Agency of Northern California
NCR10323	Midway Peaking, LLC
NCR11054	South Feather Power Project
NCR10350	Windy Flats Partners, LLC
NCR10030	Tri-State Generation and Transmission Association, Inc. - Reliability
NCR11226	Intermountain Rural Electric Association
NCR05377	San Diego Gas & Electric
NCR05315	Pend Oreille County Public Utility District No. 1
NCR10348	Sunray Operating Services, LLC
NCR10349	EthosEnergy Group
NCR10345	Three Buttes Windpower LLC
NCR05030	Black Hills Corporation
NCR05206	Klickitat County PUD
NCR05163	NextEra Energy Resources, LLC
NCR05191	Idaho Power Company
NCR05366	Rocky Mountain Reserve Group
NCR05281	Northwest Power Pool Reserve Sharing Group
NCR10378	Colorado Energy Management - MPC
NCR05464	Western Area Power Administration - Rocky Mountain Region
NCR05023	Basin Electric Power Cooperative

2015 Audit Schedule	
NCR #	**Registered Entity**
NCR05315	Pend Oreille County Public Utility District No. 1
NCR05299	Pacific Gas and Electric Company
NCR05398	Southern California Edison - Transmission & Distribution Business Unit
NCR10396	Otay Mesa Energy Center, LLC
NCR11104	NAES Corporation - Harvest Wind Project
NCR05377	San Diego Gas & Electric
NCR05299	Pacific Gas and Electric Company
NCR05048	California Independent System Operator
NCR03036	Trans Bay Cable LLC

5. Compliance Outreach

WECC conducts seminars and workshops for Registered Entities to assist them in their compliance activities. The seminars and workshops are important learning exercises for those subject to Reliability Standards. During 2015, WECC will continue its outreach efforts to provide education, seminars, workshop and panel discussions to increase registered entities' awareness of and understanding of Reliability Standards. A few of WECC's outreach efforts are as follows:

Compliance Outreach Activities	
Outreach Activity	**Anticipated Date**
Compliance User Group (CUG)/Critical Infrastructure Protection User Group (CIPUG)	January 27-29, 2015 Anaheim, CA
Compliance User Group (CUG)/Critical Infrastructure Protection User Group (CIPUG)	June 2-4, 2015 Portland, OR
Compliance User Group (CUG)/Critical Infrastructure Protection User Group (CIPUG)	October 13-15, 2015 San Diego, CA
CIP 101 Seminar	Sept. 9-10, 2015 Salt Lake City, UT
CIP Low Impact Assets Seminar	Feb. 3-5, 2015 Salt Lake City, UT
WECC Open Webinar	Third Thursdays of most months
Compliance 101 Webinar	Three times a year prior to CUG/CIPUG

Monthly Open Webinars

Since many of the questions the WECC Compliance Staff receives are very similar, WECC answers questions in an open forum for greater efficiency. WECC Compliance Subject Matter Experts participate on this webinar and respond to questions. In fairness to everyone on the call, WECC does not address entity-specific questions and issues.

Compliance User Group (CUG)

The CUG meeting provides in-depth, in-person, and detailed training and education through structured lecture and presentation, panels of experts, interactive dialog in an open forum, direct question and answer sessions and invaluable networking opportunities. Workshops cover the entire compliance sphere with focus reflecting the attendees' and industries' issues. These meetings provide direct access to the

WECC Compliance management team, staff, and Subject-Matter Experts. Participants may also attend telephonically or via webinar.

Critical Infrastructure Protection User Group (CIPUG)

The mission of the CIPUG is to provide an open forum for the exchange of information regarding the WECC Compliance Program's enforcement of mandatory CIP Standards in the Western Interconnection. Its meetings are structured similarly to those of the Compliance User Group, and it is a forum for WECC to provide information regarding NERC and WECC CIP activities and related training and workshops for registered entities on an as-needed basis.

Information for these workshops and seminars (and others as they are finalized) and the dates on which they are scheduled to occur will be posted on the WECC website.

Appendix B - Compliance Assessment Report

Compliance Assessment Process for Events and Disturbances

The ERO encourages registered entities to perform an initial compliance assessment (CA) concurrent with the registered entity's event review and analysis. When completing a CA, the registered entity should follow these steps:

1. Refer to the causes and contributing factors of the event as determined by the registered entity's events analysis process.
2. Identify all applicable NERC Reliability Standards and Requirements that may have been implicated by the causes and contributing factors of the event.
3. After reviewing the facts and circumstances of the event, develop conclusions that are relevant to step 2 above as they apply to the applicable NERC Reliability Standards Requirements.
4. Self-report any findings of noncompliance to the RE per the CMEP procedures.
5. Provide a copy of its CA report to the RE Compliance organization. The CA should be accompanied by the separate Event Analysis Report, "Brief Report," or similar document that provides sufficient information for the RE to understand the event.

Sample Compliance Assessment Report Template

Event Cause or Contributing Factor	Applicable Reliability Standards and Requirements	Details of CA Efforts	Findings
Cause–Example 1	AAA-000-0 R 1	1. Identify the process used to assess compliance with this Requirement. 2. Identify any evidence that demonstrates compliance 3. Identify any evidence that suggests noncompliance	Finding conclusion
Equipment failure of a high side transformer—cleared along with two transmission lines.	TOP-002-2a R6. Each BA and TOP shall plan to meet unscheduled changes in system configuration and generation dispatch (at a minimum N-1 contingency planning) in accordance with NERC, Regional Reliability Organization, sub-regional and local reliability Requirements	Established transfer limits were followed such that the event did not result in instability. The limit for operating across this internal interface is established in the RC. "XYZ Interface All Lines In Stability Guide" (document provided)	No findings of noncompliance

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM15-11-000]

Reliability Standard for Transmission System Planned Performance for Geomagnetic Disturbance Events

(May 14, 2015)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Federal Energy Regulatory Commission (Commission) proposes to approve Reliability Standard TPL-007-1 (Transmission System Planned Performance for Geomagnetic Disturbance Events). Proposed Reliability Standard TPL-007-1 establishes requirements for certain entities to assess the vulnerability of their transmission systems to geomagnetic disturbance events (GMDs), which occur when the sun ejects charged particles that interact and cause changes in the earth's magnetic fields. Entities that do not meet certain performance requirements, based on the results of their vulnerability assessments, must develop a plan to achieve the requirements. The North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization, submitted the proposed Reliability Standard for Commission approval in response to a Commission directive in Order No. 779. In addition, the Commission proposes to direct that NERC develop modifications to the benchmark GMD event definition set forth in Attachment 1 of the proposed Reliability Standard so that the

20150514-3102 FERC PDF (Unofficial) 05/14/2015

definition is not based solely on spatially-averaged data. The Commission also proposes to direct NERC to submit a work plan, and subsequently one or more informational filings, that address specific GMD-related research areas.

DATES: Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**.

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document

FEDERAL ENERGY REGULATORY COMMISSION

Reliability Standard for Transmission System Planned Performance for Geomagnetic Disturbance Events — Docket No. RM15-11-000

NOTICE OF PROPOSED RULEMAKING

(May 14, 2015)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve Reliability Standard TPL-007-1 (Transmission System Planned Performance for Geomagnetic Disturbance Events). Proposed Reliability Standard TPL-007-1 establishes requirements for certain entities to assess the vulnerability of their transmission systems to geomagnetic disturbance events (GMDs), which occur when the sun ejects charged particles that interact and cause changes in the earth's magnetic fields. Entities that do not meet certain performance requirements, based on the results of their vulnerability assessments, must develop a plan to achieve the requirements. The North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO), submitted the proposed Reliability Standard for Commission approval in response to a Commission directive in Order No. 779.[2] The

[1] 16 U.S.C. 824o.

[2] *Reliability Standards for Geomagnetic Disturbances*, Order No. 779, 78 FR 30,747 (May 23, 2013), 143 FERC ¶ 61,147, *reh'g denied*, 144 FERC ¶ 61,113 (2013).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Commission also proposes to approve one definition for inclusion in the NERC Glossary of Terms submitted by NERC as well as the proposed Reliability Standard's associated violation risk factors and violation severity levels, implementation plan, and effective dates.[3]

2. In addition, as discussed below, the Commission proposes to direct NERC to develop modifications to Reliability Standard TPL-007-1 and submit informational filings to address certain issues described herein.

3. Geomagnetic disturbances are considered to be "high impact, low frequency" events.[4] In other words, while the probability of occurrence of a severe geomagnetic disturbance may be low, a geomagnetic disturbance of sufficient magnitude could have potentially severe consequences to the reliable operation of the Bulk-Power System.[5] Such events could cause widespread blackouts and cause damage to equipment that could result in sustained system outages.[6] On that basis, it is important that NERC, planning

[3] NERC, Glossary of Terms Used in NERC Reliability Standards (April 2015) (NERC Glossary), *available at* http://www.nerc.com/files/glossary_of_terms.pdf.

[4] *See* NERC Petition at 3; *see also* NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

[5] Order No. 779, 143 FERC ¶ 61,147 at P 15 (quoting NERC comment that "as a high-impact, low frequency event, GMDs pose a unique threat to Bulk-Power System reliability, and NERC is committed to working with stakeholders and the Commission to address these challenges consistent with its responsibilities as the ERO").

[6] *Id.* PP 3, 16 (citing NERC, 2012 Special Reliability Assessment Interim Report: Effects of Geomagnetic Disturbances on the Bulk Power System at 69 (February 2012) (GMD Interim Report); Oak Ridge National Laboratory, Electromagnetic Pulse: Effects

(continued ...)

20150514-3102 FERC PDF (Unofficial) 05/14/2015

coordinators, transmission planners, transmission owners and generator owners take appropriate actions to prepare to withstand potentially harmful geomagnetic disturbances. For that reason, Order No. 779 required NERC to identify what severity GMD events (i.e., benchmark GMD events) responsible entities will have to assess, and that NERC should technically support its choice. In the proposed reliability standard, NERC set the benchmark GMD event as a "1-in-100 year" event.

4. We believe, based on information available at this time, that the provisions of proposed Reliability Standard TPL-007-1 are just and reasonable and address the specific parameters for the Second Stage GMD Reliability Standards on geomagnetic disturbance events, as set forth in Order No. 779. For example, the proposed Reliability Standard requires responsible entities to maintain system models needed to complete "GMD Vulnerability Assessments" (Requirements R1 and R2),[7] have criteria for acceptable system steady state voltage performance during a benchmark GMD event (Requirement R3), and complete a GMD Vulnerability Assessment once every 60 calendar months, based on the benchmark GMD event definition described in Attachment 1 of the proposed Reliability Standard (Requirement R4). Further, if an applicable entity

---

on the U.S. Power Grid: Meta-R-319 at page 1-14, Tables 4-1, 4-2, 4-3 (discussing at-risk transformers) (January 2010)).

[7] NERC proposes to define the term GMD Vulnerability Assessment to mean a "documented evaluation of potential susceptibility to voltage collapse, Cascading, or localized damage of equipment due to geomagnetic disturbances." *See* NERC Petition, Ex. B (Implementation Plan for TPL-007-1) at 1.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

concludes, based on the GMD Vulnerability Assessment, that its system does not meet specified performance requirements, it must develop a corrective action plan that addresses how the performance requirements will be met (Requirement R7). We propose to determine that the framework of the proposed Reliability Standard, as outlined above, is just and reasonable and provides a basis for approval. We believe that, when tested against an appropriate benchmark GMD event, compliance with the proposed Reliability Standard should provide adequate protection for an applicable entity's system to withstand a geomagnetic disturbance based on a 1-in-100 year GMD event design.

5. Our primary concerns with the proposed Reliability Standard pertain to the benchmark GMD event described in Attachment 1 of the proposed Reliability Standard. While there is limited historical geomagnetic data and the scientific understanding of geomagnetic disturbance events is still evolving, we have concerns regarding the proposed Reliability Standard's heavy reliance on spatial averaging. Thus, while proposing to approve proposed Reliability Standard TPL-007-1, we also propose to direct NERC to make several modifications to better ensure that, going forward, the study and benchmarking of geomagnetic disturbance events are based on a more complete set of data and a reasonable scientific and engineering approach. Further, we propose specific revisions to Requirement R7 of the proposed Reliability Standard to ensure that, when an applicable entity identifies the need for a corrective action plan, the entity acts in a timely manner.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

I. Background

A. Section 215 and Mandatory Reliability Standards

6. Section 215 of the FPA requires the Commission to certify an ERO to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval. Once approved, the Reliability Standards may be enforced in the United States by the ERO, subject to Commission oversight, or by the Commission independently.[8]

B. GMD Primer

7. GMD events occur when the sun ejects charged particles that interact and cause changes in the earth's magnetic fields.[9] Once a solar particle is ejected, it can take between 17 to 96 hours (depending on its energy level) to reach earth.[10] A geoelectric field is the electric potential (measured in volts per kilometer (V/km)) on the earth's surface and is directly related to the rate of change of the magnetic fields.[11] The geoelectric field has an amplitude and direction and acts as a voltage source that can cause geomagnetically-induced currents (GICs) to flow on long conductors, such as

---

[9] GMD Interim Report at i-ii. On April 30, 2015, the Space Weather Operations, Research, and Mitigation Task Force, under the auspices of the National Science and Technology Council, sought comment on a draft 2015 National Space Weather Strategy, which is designed to "articulate high-level strategic goals for enhancing National preparedness to space weather events." *National Science and Technology Council; National Space Weather Strategy*, 80 FR 24,296 (Apr. 30, 2015).

[10] GMD Interim Report at ii.

[11] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

transmission lines.[12] The magnitude of the geoelectric field amplitude is impacted by local factors such as geomagnetic latitude and local earth conductivity.[13] Geomagnetic latitude is the proximity to earth's magnetic north and south poles, as opposed to earth's geographic poles. Local earth conductivity is the ability of the earth's crust to conduct electricity at a certain location to depths of hundreds of kilometers down to the earth's mantle. Local earth conductivity impacts the magnitude (i.e., severity) of the geoelectric fields that are formed during a GMD event by, all else being equal, a lower earth conductivity resulting in higher geoelectric fields.[14]

C. Order No. 779

8. In Order No. 779, the Commission directed NERC, pursuant to FPA section 215(d)(5), to develop and submit for approval proposed Reliability Standards that address the impact of geomagnetic disturbances on the reliable operation of the Bulk-Power System. The Commission based its directive on the potentially severe, wide-spread impact on the reliable operation of the Bulk-Power System that can be caused by GMD events and the absence of existing Reliability Standards to address GMD events.[15]

[14] *Id.*

[15] Order No. 779, 143 FERC ¶ 61,147 at P 3.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

9. Order No. 779 directed NERC to implement the directive in two stages. In the first stage, the Commission directed NERC to submit, within six months of the effective date of Order No. 779, one or more Reliability Standards (First Stage GMD Reliability Standards) that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System.[16]

10. In the second stage, the Commission directed NERC to submit, within 18 months of the effective date of Order No. 779, one or more Reliability Standards (Second Stage GMD Reliability Standards) that require owners and operators of the Bulk-Power System to conduct initial and on-going assessments of the potential impact of benchmark GMD events on Bulk-Power System equipment and the Bulk-Power System as a whole. The Commission directed that the Second Stage GMD Reliability Standards must identify benchmark GMD events that specify what severity GMD events a responsible entity must assess for potential impacts on the Bulk-Power System.[17] Order No. 779 explained that, if the assessments identify potential impacts from benchmark GMD events, the Reliability Standards should require owners and operators to develop and implement a plan to protect against instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System

[16] *Id.* P 2.

[17] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

equipment, or otherwise, as a result of a benchmark GMD event. The Commission directed that the development of this plan could not be limited to considering operational procedures or enhanced training alone, but should, subject to the potential impacts of the benchmark GMD events identified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, system configuration, or location of specific equipment.[18] Order No. 779 observed that these strategies could, for example, include automatically blocking GICs from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, isolating certain equipment that is not cost effective to retrofit, or a combination thereof.

D. Order No. 797

11. In Order No. 797, the Commission approved Reliability Standard EOP-010-1 (Geomagnetic Disturbance Operations).[19] NERC submitted Reliability Standard EOP-010-1 for Commission approval in compliance with the Commission's directive in Order No. 779 corresponding to the First Stage GMD Reliability Standards. In Order No. 797-A, the Commission denied the Foundation for Resilient Societies' (Resilient Societies) request for rehearing of Order No. 797. The Commission stated that the rehearing

[18] *Id.*

[19] *Reliability Standard for Geomagnetic Disturbance Operations*, Order No. 797, 79 FR 35,911 (June 25, 2014), 147 FERC ¶ 61,209, *reh'g denied*, Order No. 797-A, 149 FERC ¶ 61,027 (2014).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

request "addressed a later stage of efforts on geomagnetic disturbances (i.e., NERC's future filing of Second Stage GMD Reliability Standards) and [that Resilient Societies] may seek to present those arguments at an appropriate time in response to that filing."[20] In particular, the Commission stated that GIC monitoring requirements should be addressed in the Second Stage GMD Reliability Standards.[21]

E. NERC Petition and Proposed Reliability Standard TPL-007-1

12. On January 21, 2015, NERC petitioned the Commission to approve proposed Reliability Standard TPL-007-1 and its associated violation risk factors and violation severity levels, implementation plan, and effective dates.[22] NERC also submitted a proposed definition for the term "Geomagnetic Disturbance Vulnerability Assessment or GMD Vulnerability Assessment" for inclusion in the NERC Glossary. NERC maintains that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. NERC further contends that the proposed

[20] Order No. 797-A, 149 FERC ¶ 61,027 at P 2.

[21] *Id.* P 27 (stating that the Commission continues "to encourage NERC to address the collection, dissemination, and use of geomagnetic induced current data, by NERC, industry or others, in the Second Stage GMD Reliability Standards because such efforts could be useful in the development of GMD mitigation methods or to validate GMD models").

[22] Proposed Reliability Standard TPL-007-1 is not attached to this notice of proposed rulemaking (NOPR). The proposed Reliability Standard is available on the Commission's eLibrary document retrieval system in Docket No. RM15-11-000 and on the NERC website, www.nerc.com. NERC submitted an errata on February 2, 2015 containing a corrected version of Exhibit A (Proposed Reliability Standard TPL-007-1).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Reliability Standard satisfies the directive in Order No. 779 corresponding to the Second Stage GMD Reliability Standards.[23]

13. NERC states that proposed Reliability Standard TPL-007-1 applies to planning coordinators, transmission planners, transmission owners and generation owners who own or whose planning coordinator area or transmission planning area includes a power transformer with a high side, wye-grounded winding connected at 200 kV or higher. NERC explains that the applicability criteria for qualifying transformers in the proposed Reliability Standard is the same as that for the First Stage GMD Reliability Standard in EOP-010-1, which the Commission approved in Order No. 797.

14. The proposed Reliability Standard contains seven requirements.

15. Requirement R1 requires planning coordinators and transmission planners to determine the individual and joint responsibilities in the planning coordinator's planning

[23] We note that Resilient Societies has submitted to NERC, pursuant to Section 8.0 of the NERC Standards Process Manual, an appeal alleging certain procedural errors in the development of proposed Reliability Standard TPL-007-1. *See* NERC Rules of Procedure, Attachment 3A (Standards Process Manual), Section 8.0 (Process for Appealing an Action or Inaction). The appeal is currently pending NERC action. On May 12, 2015, Resilient Societies submitted a request for stay of the proceedings in Docket No. RM15-11-000, asking that the Commission refrain from issuing a notice of proposed rulemaking until NERC acts on Resilient Societies' appeal. We deny Resilient Societies' request. We see no irreparable harm in issuing a proposal for public comment as we do today. Rather, we will consider any necessary issues pertaining to the appeal before or in a final rule issued in this proceeding.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

area for maintaining models and performing studies needed to complete the GMD Vulnerability Assessment required in Requirement R4.[24]

16. Requirement R2 requires planning coordinators and transmission planners to maintain system models and GIC system models needed to complete the GMD Vulnerability Assessment required in Requirement R4.

17. Requirement R3 requires planning coordinators and transmission planners to have criteria for acceptable system steady state voltage limits for their systems during the benchmark GMD event described in Attachment 1 (Calculating Geoelectric Fields for the Benchmark GMD Event).

18. Requirement R4 requires planning coordinators and transmission planners to conduct a GMD Vulnerability Assessment every 60 months using the benchmark GMD event described in Attachment 1 to the proposed Reliability Standard. The benchmark GMD event is based on a 1-in-100 year frequency of occurrence and is composed of four elements: (1) a reference peak geoelectric field amplitude of 8 V/km derived from statistical analysis of historical magnetometer data; (2) a scaling factor to account for local geomagnetic latitude; (3) a scaling factor to account for local earth conductivity; and (4) a reference geomagnetic field time series or wave shape to facilitate time-domain

[24] Proposed Reliability Standard TPL-007-1, Requirements R2, R3, R4, R5, and R7 refer to planning coordinators and transmission planners as "responsible entities."

20150514-3102 FERC PDF (Unofficial) 05/14/2015

analysis of GMD impact on equipment.[25] The product of the first three elements is referred to as the regional geoelectric field peak amplitude.[26]

19. Requirement R5 requires planning coordinators and transmission planners to provide GIC flow information, to be used in the transformer thermal impact assessment required in Requirement R6, to each transmission owner and generator owner that owns an applicable transformer within the applicable planning area.

20. Requirement R6 requires transmission owners and generator owners to conduct thermal impact assessments on solely and jointly owned applicable transformers where the maximum effective GIC value provided in Requirement R5 is 75 amperes per phase (A/phase) or greater.

21. Requirement R7 requires planning coordinators and transmission planners to develop corrective action plans if the GMD Vulnerability Assessment concludes that the system does not meet the performance requirements in Table 1 (Steady State Planning Events).

II. Discussion

22. Pursuant to section 215(d) of the FPA, the Commission proposes to approve Reliability Standard TPL-007-1 as just, reasonable, not unduly discriminatory or

[25] *See* Proposed Reliability Standard TPL-007-1, Att. 1; s*ee also* NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

[26] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

preferential, and in the public interest. The proposed Reliability Standard addresses the directives in Order No. 779 corresponding to the development of the Second Stage GMD Reliability Standards. Proposed Reliability Standard TPL-007-1 does this by requiring applicable Bulk-Power System owners and operators to conduct initial and on-going vulnerability assessments regarding the potential impact of a benchmark GMD event on the Bulk-Power System as a whole and on Bulk-Power System components.[27] In addition, the proposed Reliability Standard requires applicable entities to develop and implement corrective action plans to mitigate any identified vulnerabilities.[28] Potential mitigation strategies identified in the proposed Reliability Standard include, but are not limited to, among other things, the installation, modification, or removal of transmission and generation facilities and associated equipment.[29] Accordingly, proposed Reliability Standard TPL-007-1 constitutes an important step in addressing the risks posed by GMD events to the Bulk-Power System.

23. While proposed Reliability Standard TPL-007-1 addresses the Order No. 779 directives, pursuant to FPA section 215(d)(5), the Commission proposes to direct NERC to develop modifications to the Reliability Standard concerning: (1) the calculation of the reference peak geoelectric field amplitude component of the benchmark GMD event

[27] *See* Order No. 779, 143 FERC ¶ 61,147 at PP 67, 71.

[28] *Id.* P 79.

[29] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

definition; (2) the collection of GIC monitoring and magnetometer data; and (3) deadlines for completing corrective action plans and the mitigation measures called for in corrective action plans. In addition, to improve the understanding of GMD events generally and address the specific research areas discussed below, the Commission proposes to direct that NERC submit informational filings. These proposals are discussed in greater detail below.

24. The Commission seeks comments from NERC and interested entities on these proposals.

A. Benchmark GMD Event Definition

NERC Petition

25. NERC states that the purpose of the benchmark GMD event is to "provide a defined event for assessing system performance during a low probability, high magnitude GMD event."[30] NERC explains that the benchmark GMD event represents "the most severe GMD event expected in a 100-year period as determined by a statistical analysis of recorded geomagnetic data."[31] The benchmark GMD event definition is used in the GMD Vulnerability Assessments and thermal impact assessment requirements of the proposed Reliability Standard.

[30] NERC Petition at 15.

[31] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

26. As noted above, NERC states that the benchmark GMD event definition has four elements: (1) a reference peak geoelectric field amplitude of 8 V/km derived from statistical analysis of historical magnetometer data; (2) a scaling factor to account for local geomagnetic latitude; (3) a scaling factor to account for local Earth conductivity; and (4) a reference geomagnetic field time series or wave shape to facilitate time-domain analysis of GMD impact on equipment.[32]

27. The standard drafting team determined that a 1-in-100 year GMD event would cause an 8 V/km reference peak geoelectric field amplitude at 60 degree geomagnetic latitude using Québec's earth conductivity.[33] The standard drafting team stated that:

> the reference geoelectric field amplitude was determined through statistical analysis using … field measurements from geomagnetic observatories in northern Europe and the reference (Quebec) earth model …. The Quebec earth model is generally resistive and the geological structure is relatively well understood. The statistical analysis resulted in a conservative peak geoelectric field amplitude of approximately 8 V/km …. The frequency of occurrence of this benchmark GMD event is estimated to be approximately 1 in 100 years.[34]

28. The standard drafting team explained that it used field measurements taken from the IMAGE magnetometer chain, which covers Northern Europe, for the period 1993-2013 to calculate the reference peak geoelectric field amplitude used in the benchmark

---

[32] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 5.

[33] *Id.*

[34] *Id.* (footnotes omitted).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

GMD event definition.[35] As described in NERC's petition, the standard drafting team "spatially averaged" four different station groups of IMAGE data, each spanning a square area of approximately 500 km (roughly 310 miles) in width.[36] The standard drafting team justified the use of spatial averaging by stating that the proposed Reliability Standard is designed to "address wide-area effects caused by a severe GMD event, such as increased var absorption and voltage depressions. Without characterizing GMD on regional scales, statistical estimates could be weighted by local effects and suggest unduly pessimistic conditions when considering cascading failure and voltage collapse."[37]

29. NERC states that the benchmark GMD event includes scaling factors to enable applicable entities to tailor the reference peak geoelectric field to their specific location for conducting GMD Vulnerability Assessments. NERC states that the scaling factors in the benchmark GMD event definition are applied to the reference peak geoelectric field

[35] *Id.* at 8. The International Monitor for Auroral Geomagnetic Effects (IMAGE) consists of 31 magnetometer stations in northern Europe maintained by 10 institutes from Estonia, Finland, Germany, Norway, Poland, Russia, and Sweden. *See* IMAGE website, *available at* http://space.fmi.fi/image/beta/?page=home#.

[36] As applied by the standard drafting team, spatial averaging refers to the averaging of geoelectric field amplitude readings within a given area. NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 9.

[37] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 9.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

amplitude to adjust the 8 V/km value for different geomagnetic latitudes and earth conductivities.[38]

30. The standard drafting team also identified a reference geomagnetic field time series from an Ottawa magnetic observatory during a 1989 GMD event that affected Québec.[39] The standard drafting team used this time series to estimate a geoelectric field, represented as a time series (i.e., 10-second values over a period of days), that is expected to occur at 60 degree geomagnetic latitude during a 1-in-100 year GMD event. NERC explains that this time series is used to facilitate time-domain analysis of GMD impacts on equipment.[40]

Discussion

31. The Commission proposes to approve proposed Reliability Standard TPL-007-1, including the proposed benchmark GMD event definition submitted by NERC. However, pursuant to FPA section 215(d)(5) , the Commission proposes to direct that NERC develop modifications to the benchmark GMD event definition set forth in Attachment 1 of the proposed Reliability Standard so that the definition is not based solely on spatially-averaged data. The Commission also seeks comment from NERC and other interested entities regarding the scaling factor used to account for geomagnetic

[38] NERC Petition at 18-19.

[40] *Id.* at 5-6.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

latitude in the benchmark GMD event definition. The Commission also proposes to direct NERC to submit a work plan, and subsequently one or more informational filings, that address the specific issues discussed below.

32. The benchmark GMD event definition proposed by NERC complies with the directive in Order No. 779 requiring that the Second Stage GMD Reliability Standards identify benchmark GMD events that specify what severity GMD events a responsible entity must assess for potential impacts on the Bulk-Power System. Order No. 779 did not specify the severity of the storm or define the characteristics of the benchmark GMD event. Instead, the Commission directed NERC, through the standards development process, to define the benchmark GMD events. Consistent with the guidance provided in Order No. 779, the benchmark GMD event definition proposed by NERC addresses the potential widespread impact of a severe GMD event, while taking into consideration the variables of geomagnetic latitude and local earth conductivity.[41] Accordingly, we propose to approve the definition submitted by NERC. Nonetheless, while acceptable as consistent with FPA section 215 and the Order No. 779 directives, we believe that the

[41] *See* Order No. 779, 143 FERC ¶ 61,147 at P 71 ("the benchmark GMD events should be based on factors that may include, but are not limited to, varying severity of the GMD … duration, geographic footprint of the GMD, how the GMD's intensity varies with latitude, system configuration, and the orientation of the magnetic fields produced by the GMD); *see also id*. P 70 ("[GMD] vulnerability assessments would be based on uniform criteria (e.g., geographic location and geology) but the values for such criteria would be entity-specific").

20150514-3102 FERC PDF (Unofficial) 05/14/2015

benchmark GMD event definition should be improved through the proposed revision and research discussed below.

33. First, the proposed Reliability Standard's exclusive use of spatial averaging to calculate the reference peak geoelectric field amplitude could underestimate the impact of a 1-in-100 year GMD event, which was the design basis arrived upon by the standard drafting team. NERC states that the benchmark GMD event "expands upon work conducted by the NERC GMD Task Force in which 1-in 100 year geoelectric field amplitudes were calculated from a well-known source of dense high-resolution geomagnetic data commonly used in space weather research [i.e., IMAGE data]."[42] However, the application of spatial averaging significantly reduces the reference peak geoelectric field amplitude using the IMAGE data compared with a prior analysis of nearly the same data set. As noted in the NERC petition, the GMD Interim Report described a study that used the same IMAGE magnetometers and data as the standard drafting team for the period 1993-2006.[43] That study calculated a 1-in-100 year peak geoelectric amplitude of 20 V/km for Québec.[44] The study calculated a significantly higher figure (20 V/km versus 8 V/km) using similar data as the standard drafting team because, instead of averaging geoelectric field values occurring simultaneously over a

[42] NERC Petition at 17.

[43] GMD Interim Report at 22.

[44] *Id.*

20150514-3102 FERC PDF (Unofficial) 05/14/2015

large geographic area, the study cited by the GMD Interim Report used the magnitude of the geoelectric amplitude in individual geomagnetic observatories.

34. Based on our review of NERC's petition, it does not appear that spatial averaging of geomagnetic fields is discussed in the studies cited by the standard drafting team except in the standard drafting team's GMD Benchmark Event White Paper. In addition, it is unclear how the standard drafting team determined that spatial averaging should be performed using a square area 500 km in width. The GMD Benchmark Event White Paper explains that the IMAGE magnetometers were organized into four groups comprised of squares 500 km wide, and the readings within a group were averaged. The GMD Benchmark Event White Paper also states, citing to the statistical analysis in its Appendix I, that "geomagnetic disturbance impacts within areas of influence of approximately 100-200 km do not have a widespread impact on the interconnected transmission system."[45] While Appendix I of the GMD Benchmark Event White Paper discusses why local geomagnetic disturbances do not have a significant impact on all transformers operating within a square 500 km in width, it does not explain why the standard drafting team chose a square area 500 km in width as opposed to a square with a smaller or larger total area. These questions largely inform our concerns regarding the proposed Reliability Standard's heavy reliance on spatial averaging.

[45] NERC Petition, Ex. D (White Paper on GMD Benchmark Event Description) at 4.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

35. The geoelectric field values used to conduct GMD Vulnerability Assessments and thermal impact assessments should reflect the real-world impact of a GMD event on the Bulk-Power System and its components. A GMD event will have a peak value in one or more location(s), and the amplitude will decline over distance from the peak. Only applying a spatially-averaged geoelectric field value across an entire planning area would distort this complexity and could underestimate the contributions caused by damage to or misoperation of Bulk-Power System components to the system-wide impact of a GMD event within a planning area. However, imputing the highest peak geoelectric field value in a planning area to the entire planning area may incorrectly overestimate GMD impacts. Neither approach, in our view, produces an optimal solution that captures physical reality.

36. To address this issue, the Commission proposes to direct NERC to develop modifications to the Reliability Standard so that the reference peak geoelectric field amplitude element of the benchmark GMD event definition is not based solely on spatially-averaged data. For example, NERC could satisfy this proposal by revising the Reliability Standard to require applicable entities to conduct GMD Vulnerability Assessments and thermal impact assessments using two different benchmark GMD events: the first benchmark GMD event using the spatially-averaged reference peak geoelectric field value (8 V/km) and the second using the non-spatially averaged peak

20150514-3102 FERC PDF (Unofficial) 05/14/2015

geoelectric field value found in the GMD Interim Report (20 V/km).[46] The revised Reliability Standard could then require applicable entities to take corrective actions, using engineering judgment, based on the results of both assessments. That is, the applicable entity would not always be required to mitigate to the level of risk identified by the non-spatially averaged analysis; instead, the selection of mitigation would reflect the range of risks bounded by the two analyses, and be based on engineering judgment within this range, considering all relevant information. This proposed revision is consistent with the directive in Order No. 779 that owners and operators develop and implement a plan to protect against instability, uncontrolled separation, or cascading failures of the Bulk-Power System.[47] Alternatively, NERC could propose an equally efficient and effective modification that does not rely exclusively on the spatially-averaged reference peak geoelectric field value.[48]

[46] Conducting a GMD Vulnerability Assessment using essentially two measures of the same benchmark GMD events is consistent with Order No. 779 because, in that order, the Commission contemplated that an applicable entity could be required to assess GMD vulnerabilities using multiple benchmark GMD events. Order No. 779, 143 FERC ¶ 61,147 at P 2 ("The Second Stage GMD Reliability Standards must identify 'benchmark GMD events' that specify what severity GMD events a responsible entity must assess for potential impacts on the Bulk-Power System.").

[47] Order No. 779, 143 FERC ¶ 61,147 at P 2.

[48] For example, responsible entities could calculate GIC flows and resulting Bulk-Power System impacts using models that utilize both spatially averaged and non-spatially averaged peak geoelectric field values to simulate GMD conditions.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

37. The Commission also seeks comment from NERC and other interested entities regarding the scaling factor used in the benchmark GMD event definition to account for differences in geomagnetic latitude. Specifically, the Commission seeks comment on whether, in light of studies indicating that GMD events could have pronounced effect on lower geomagnetic latitudes, a modification is warranted to reduce the impact of the scaling factors.[49]

38. Next, the record submitted by NERC and other available information manifests a need for more data and certainty in the knowledge and understanding of GMD events and their potential effect on the Bulk-Power System. For example, NERC's proposal is based on data from magnetometers in northern Europe, from a relatively narrow timeframe with relatively low solar activity, and with little or no data on concurrent GIC flows. Similarly, the adjustments for latitude and ground conductivity are based on the limited information currently available, but additional data-gathering is needed. To address this

[49] *See*, *e.g.*, Ngwira, C. M., Pulkkinen, A., Kuznetsova, M. M., Glocer, A., "Modeling extreme 'Carrington-type' space weather events using three-dimensional global MHD simulations," 119 Journal of Geophysical Research: Space Physics 4472 (2014) (finding that in Carrington-type events "the region of large induced ground electric fields is displaced further equatorward … [and] thereby may affect power grids … such as [those in] southern states of [the] continental U.S."); Gaunt, C. T., Coetzee, G., "Transformer Failures in Regions Incorrectly Considered to have Low GIC-Risk," 2007 IEEE Lausanne 807 (July 2007) (stating that twelve transformers were damaged and taken out of service in South Africa (at -40 degrees latitude) during a 2003 GMD event).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

limitation on relevant information, we propose to direct that NERC conduct or oversee additional analysis on these issues.[50]

39. In particular, we propose to direct that NERC submit informational filings that address the issues discussed below. In the first informational filing, NERC should submit a work plan indicating how NERC plans to: (1) further analyze the area over which spatial averaging should be calculated for stability studies, including performing sensitivity analyses on squares less than 500 km per side (e.g., 100 km, 200 km); (2) further analyze earth conductivity models by, for example, using metered GIC and magnetometer readings to calculate earth conductivity and using 3-D readings; (3) determine whether new analyses and observations support modifying the use of single station readings around the earth to adjust the spatially averaged benchmark for latitude; and (4) assess how to make GMD data (e.g., GIC monitoring and magnetometer data) available to researchers for study.[51] We propose that NERC submit the work plan within six months of the effective date of a final rule in this proceeding. The work plan submitted by NERC should include a schedule to submit one or more informational

[50] *See, e.g., Revisions to Reliability Standard for Transmission Vegetation Management*, Order No. 777, 142 FERC ¶ 61,208 (2013) (approving Reliability Standard but directing that NERC perform a study to develop empirical evidence on one input to the "Gallet equation" used to calculate minimum clearances for vegetation).

[51] The Commission seeks comment on the barriers, if any, to public dissemination of GIC and magnetometer readings, including if the dissemination of such data poses a security risk and if any such data should be treated as Critical Energy Infrastructure Information or otherwise restricted to authorized users.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

filings that apprise the Commission of the results of the four additional study areas as well as any other relevant developments in GMD research. Further, in the submissions, NERC should assess whether the proposed Reliability Standard remains valid in light of new information or whether revisions are appropriate.

B. Thermal Impact Assessments

NERC Petition

40. Proposed Reliability Standard TPL-007-1, Requirement R6 requires owners of transformers that are subject to the proposed Reliability Standard to conduct thermal analyses to determine if the transformers would be able to withstand the thermal effects associated with a benchmark GMD event. NERC states that transformers are exempt from the thermal impact assessment requirement if the maximum effective GIC in the transformer is less than 75 A/phase during the benchmark GMD event as determined by an analysis of the system. NERC explains that "based on available power transformer measurement data, transformers with an effective GIC of less than 75 A per phase during the Benchmark GMD Event are unlikely to exceed known temperature limits established by technical organizations."[52]

41. As provided in Requirements R5 and R6, "the maximum GIC value for the worst case geoelectric field orientation for the benchmark GMD event described in Attachment 1" determines whether a transformer satisfies the 75 A/phase threshold. If the 75

[52] NERC Petition at 30.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

A/phase threshold is satisfied, Requirement R6 states, in relevant part, that a thermal impact assessment should be conducted on the qualifying transformer based on the effective GIC flow information provided in Requirement R5.

Discussion

42. The Commission proposes to approve proposed Reliability Standard TPL-007-1, Requirement R6. However, the Commission has two concerns regarding the proposed thermal impact assessment in Requirement R6. These concerns reflect in part the difficulty of replacing large transformers quickly, as reflected in studies, such as an April 2014 report by the Department of Energy that highlighted the reliance in the United States on foreign suppliers for large transformers.[53]

43. First, as discussed in the previous section, the Commission proposes to direct NERC to develop modifications to the Reliability Standard such that the benchmark GMD event definition's reference peak geoelectric field amplitude element does not rely on spatially-averaged data alone. The proposed modification is relevant to thermal impact assessments, as it is relevant to GMD Vulnerability Assessments, because both are ultimately predicated on the benchmark GMD event definition. Indeed, the concern is even greater in this context because a thermal impact assessment assesses the localized

[53] U.S. Department of Energy, Large Power Transformers and the U.S. Electric Grid (April 2014), *available at* http://energy.gov/sites/prod/files/2014/04/f15/LPTStudyUpdate-040914.pdf

20150514-3102 FERC PDF (Unofficial) 05/14/2015

impact of a GMD event on an individual transformer. Thus, we propose to direct NERC to modify the Reliability Standard to require responsible entities to apply spatially averaged and non-spatially averaged peak geoelectric field values, or some equally efficient and effective alternative, when conducting thermal impact assessments.

44. Second, Requirements R5.1 and R6 provide that the geoelectric field orientation causing the maximum effective GIC value in each transformer should be used to determine if the assessed transformer satisfies the 75 A/phase qualifying threshold in Requirement R6. However, Requirement R6 does not use the maximum GIC-producing orientation to conduct the thermal assessment for qualifying transformers (i.e., transformers with an maximum effective GIC value greater than 75A/phase). Instead, Requirement R6 uses the effective GIC time series described in Requirement R5.2 to conduct the thermal assessment on qualifying transformers.[54] The Commission seeks comment from NERC as to why qualifying transformers are not assessed for thermal impacts using the maximum GIC-producing orientation. NERC should address whether, by not using the maximum GIC-producing orientation, the required thermal impact assessments could underestimate the impact of a benchmark GMD event on a qualifying transformer.

[54] *See also* NERC Petition, Ex. E (White Paper on Transformer Thermal Impact Assessment) at 8-9.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

C. Monitoring Devices

NERC Petition

45. Proposed Reliability Standard TPL-007-1, Requirement R2 requires responsible entities to "maintain System models and GIC System models of the responsible entity's planning area for performing the study or studies needed to complete GMD Vulnerability Assessment(s)." NERC states that proposed Reliability Standard TPL-007-1 contains "requirements to develop the models, studies, and assessments necessary to build a picture of overall GMD vulnerability and identify where mitigation measures may be necessary."[55] NERC explains that mitigating strategies "may include installation of hardware (e.g., GIC blocking or monitoring devices), equipment upgrades, training, or enhanced Operating Procedures."[56]

Discussion

46. The Commission proposes to direct NERC to develop revisions to Reliability Standard TPL-007-1 requiring installation of monitoring equipment (i.e., GIC monitors and magnetometers) to the extent there are any gaps in existing GIC monitoring and magnetometer networks, which will ensure a more complete set of data for planning and operational needs. Alternatively, we seek comment on whether NERC itself should be responsible for installation of any additional, necessary magnetometers while affected

[55] NERC Petition at 13.

[56] *Id.* at 32.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

entities would be responsible for installation of additional, necessary GIC monitors. As part of NERC's work plan, we propose to direct that NERC identify the number and location of current GIC monitors and magnetometers in the United States to assess whether there are any gaps.

47. NERC maintains that the installation of monitoring devices could be part of a mitigation strategy. We agree with NERC regarding the importance of GIC and magnetometer data. As the Commission stated in Order No. 779, the tools for assessing GMD vulnerabilities are not fully mature.[57] Data from monitors are needed to validate the analyses underlying NERC's proposed Reliability Standard and the analyses to be performed by affected entities.[58] GIC monitors also can facilitate real-time adjustments to grid operations during GMD events, to maintain reliability and prevent significant equipment damage, by enhancing situational awareness for grid operators. For example, PJM's operating procedures for GMDs are triggered when GICs are above 10 A for 10 minutes at either of two specified locations, and confirmed by other sources of information.[59]

---

[57] Order No. 779, 143 FERC ¶ 61,147 at P 68.

[58] *See*, *e.g.*, *Disturbance Monitoring and Reporting Requirements Reliability Standard*, 80 FR 22,441 (Apr. 16, 2015), 151 FERC ¶ 61,042 (2015) (notice of proposed rulemaking proposing to approve Reliability Standard PRC-002-2 requiring the collection of disturbance monitoring data).

[59] *See* PJM Manual 13 (Emergency Operations), Revision 57, at 55 (2015).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

48. Accordingly, rather than wait to install necessary monitoring devices as part of a corrective action plan, GIC and magnetometer data should be collected by applicable entities at the outset to validate and improve system models and GIC system models, as well as improve situational awareness. To be clear, we are not proposing that every transformer would need its own GIC monitor or that every entity would need its own magnetometer. Instead, we are proposing the installation and collection of data from GIC monitors and magnetometers in enough locations to provide adequate analytical validation and situational awareness. We propose that NERC's work plan use this criterion in assessing the need and locations for GIC monitors and magnetometers.

49. Cost recovery is potentially available for costs associated with or incurred to comply with proposed Reliability Standard TPL-007-1, including for the purchase and installation of monitoring devices.[60] The Commission seeks comment on whether it should adopt a policy specifically allowing recovery of these costs.

[60] Order No. 779, 143 FERC ¶ 61,147 at P 14 n.20 (stating that "nothing precludes entities from seeking cost recovery if needed"); *see Extraordinary Expenditures Necessary to Safeguard National Energy Supplies*, 96 FERC ¶ 61,299, at 61,129 (2001) (stating that the Commission "will approve applications to recover prudently incurred costs necessary to further safeguard the reliability and security of our energy supply infrastructure in response to the heightened state of alert. Companies may propose a separate rate recovery mechanism, such as a surcharge to currently existing rates or some other cost recovery method"); *see also Policy Statement on Matters Related to Bulk Power System Reliability*, 107 FERC ¶ 61,052, at P 28 (2004) (affirming and clarifying that "the policy extends to the recovery of prudent reliability expenditures, including those for vegetation management, improved grid management and monitoring equipment, operator training and compliance with NERC standards").

20150514-3102 FERC PDF (Unofficial) 05/14/2015

D. Corrective Action Plan Deadlines

NERC Petition

50. Proposed Reliability Standard TPL-007-1, Requirement R7 provides that:

> Each responsible entity, as determined in Requirement R1, that concludes, through the GMD Vulnerability Assessment conducted in Requirement R4, that their System does not meet the performance requirements of Table 1 shall develop a Corrective Action Plan addressing how the performance requirements will be met ….

NERC explains that the NERC Glossary defines corrective action plan to mean, "A list of actions and an associated timetable for implementation to remedy a specific problem."[61] Requirement R7.3 states that the corrective action plan shall be provided within "90 calendar days of completion to the responsible entity's Reliability Coordinator, adjacent Planning Coordinator(s), adjacent Transmission Planner(s), functional entities referenced in the Corrective Action Plan, and any functional entity that submits a written request and has a reliability-related need."

Discussion

51. The Commission proposes to direct that NERC revise Reliability Standard TPL-007-1 to include deadlines concerning the development and implementation of corrective action plans under Requirement R7.

52. In accordance with Order No. 779 directives, Requirement R7 requires applicable entities to develop and implement measures when vulnerabilities from a benchmark

[61] NERC Petition at 31.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

GMD event are identified.[62] However, Requirement R7 does not establish deadlines for developing or implementing corrective action plans. Requirement R7 only requires responsible entities to distribute corrective action plans within 90 days of completion to certain registered entities. By contrast, other NERC Reliability Standards include deadlines for developing corrective action plans, such as Reliability Standard PRC-006-2 (Automatic Underfrequency Load Shedding) and Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements). In addition, by definition, a corrective action plan includes "an associated timetable for implementation" of a remedy.[63] Consistent with the definition of corrective action plan and the other NERC Reliability Standards, the Commission proposes to direct that NERC modify Reliability Standard TPL-007-1 to require corrective action plans to be developed within one year of the completion of the GMD Vulnerability Assessment.

53. A corrective action plan is defined in the NERC Glossary as "[a] list of actions and an associated timetable for implementation to remedy a specific problem." Because of the complexities surrounding GMDs and the uncertainties about mitigation techniques, the time needed to implement a corrective action plan may be difficult to determine. At

[62] Order No. 779, 143 FERC ¶ 61,147 at P 2 ("If the assessments identify potential impacts from benchmark GMD events, the Reliability Standards *should* require owners and operators to develop and implement a plan to protect against instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, as a result of a benchmark GMD event.").

[63] NERC Glossary at 26.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

the same time, the absence of reasonable deadlines for completion of corrective actions may risk significant delay before identified corrective actions are started or finished. The Commission, therefore, proposes to direct NERC to modify the Reliability Standard to require a deadline for non-equipment mitigation measures that is two years following development of the corrective action plan and a deadline for mitigation measures involving equipment installation that is four years following development of the corrective action plan. The Commission recognizes that there is little experience with installing equipment for GMD mitigation and thus we are open to proposals that may differ from our proposal, particularly from any entities with experience in this area.

54. We seek comments from NERC and interested entities on these proposals. Further, we seek comment on appropriate alternative deadlines and whether there should be a mechanism that would allow NERC to consider, on a case-by-case basis, requests for extensions of required deadlines.

E. Minimization of Load Loss and Curtailment

NERC Petition

55. Proposed Reliability Standard TPL-007-1, Requirement R4 states that each responsible entity "shall complete a GMD Vulnerability Assessment of the Near-Term Transmission Planning Horizon once every 60 calendar months." Requirement R4.2 further states that the "study or studies shall be conducted based on the benchmark GMD event described in Attachment 1 to determine whether the System meets the performance requirements in Table 1."

20150514-3102 FERC PDF (Unofficial) 05/14/2015

56. NERC maintains that Table 1 sets forth requirements for system steady state performance. NERC explains that Requirement R4 and Table 1 "address assessments of the effects of GICs on other Bulk-Power System equipment, system operations, and system stability, including the loss of devices due to GIC impacts."[64] Table 1 provides, in relevant part, that load loss and/or curtailment are permissible elements of the steady state:

> Load loss as a result of manual or automatic Load shedding (e.g. UVLS) and/or curtailment of Firm Transmission Service may be used to meet BES performance requirements during studied GMD conditions. The likelihood and magnitude of Load loss or curtailment of Firm Transmission Service should be minimized.

Discussion

57. The Commission seeks comment from NERC regarding the provision in Table 1 that "Load loss or curtailment of Firm Transmission Service should be minimized." Because the term "minimized" does not represent an objective value, the provision is potentially subject to interpretation and assertions that the term is vague and may not be enforceable. Similarly, use of the modifier "should" might indicate that minimization of load loss or curtailment is only an expectation or a guideline rather than a requirement.

58. The Commission seeks comment from NERC that explains how the provision in Table 1 regarding load loss and curtailment will be enforced, including: (1) whether, by

[64] NERC Petition at 39.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

using the term "should," Table 1 requires minimization of load loss or curtailment, or both; and (2) what constitutes "minimization" and how it will be assessed.

F. Violation Risk Factors and Violation Severity Levels

59. Each requirement of proposed Reliability Standard TPL-007-1 includes one violation risk factor and has an associated set of at least one violation severity level. NERC states that the ranges of penalties for violations will be based on the sanctions table and supporting penalty determination process described in the Commission-approved NERC Sanction Guidelines.

60. The Commission proposes to approve the violation risk factors and violation severity levels submitted by NERC, for the requirements in Reliability Standard TPL-007-1, consistent with the Commission's established guidelines.[65]

G. Implementation Plan and Effective Dates

61. NERC proposes a phased, five-year implementation period.[66] NERC maintains that the proposed implementation period is necessary: (1) to allow time for entities to develop the required models; (2) for proper sequencing of assessments because thermal impact assessments are dependent on GIC flow calculations that are determined by the responsible planning entity; and (3) to give time for development of viable corrective action plans, which may require applicable entities to "develop, perform, and/or validate

[65] *North American Electric Reliability Corp.*, 135 FERC ¶ 61,166 (2011).

[66] NERC Petition, Ex. B (Implementation Plan for TPL-007-1).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

new or modified studies, assessments, procedures … [and because] [s]ome mitigation measures may have significant budget, siting, or construction planning requirements."[67]

62. The proposed implementation plan states that Requirement R1 shall become effective on the first day of the first calendar quarter that is six months after Commission approval. For Requirement R2, NERC proposes that the requirement shall become effective on the first day of the first calendar quarter that is 18 months after Commission approval. NERC proposes that Requirement R5 shall become effective on the first day of the first calendar quarter that is 24 months after Commission approval. NERC proposes that Requirement R6 shall become effective on the first day of the first calendar quarter that is 48 months after Commission approval. And for Requirement R3, Requirement R4, and Requirement R7, NERC proposes that the requirements shall become effective on the first day of the first calendar quarter that is 60 months after Commission approval.

63. The Commission proposes to approve the implementation plan and effective dates submitted by NERC. However, given the serial nature of the requirements in the proposed Reliability Standard, we are concerned about the duration of the timeline associated with any mitigation stemming from a corrective action plan. As a result, the Commission seeks comment from NERC and other interested entities as to whether the length of the implementation plan, particularly with respect to Requirements R4, R5, R6, and R7, could be reasonably shortened.

---

[67] *Id.* at 2.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

III. Information Collection Statement

64. The collection of information contained in this notice of proposed rulemaking is subject to review by the Office of Management and Budget (OMB) regulations under section 3507(d) of the Paperwork Reduction Act of 1995 (PRA).[68] OMB's regulations require approval of certain informational collection requirements imposed by agency rules.[69]

65. Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

66. We solicit comments on the need for this information, whether the information will have practical utility, the accuracy of the burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. Specifically, the Commission asks that any revised burden or cost estimates submitted by commenters be supported by sufficient detail to understand how the estimates are generated.

---

[68] 44 U.S.C. 3507(d).

[69] 5 CFR 1320.11 (2014).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Public Reporting Burden: The Commission proposes to approve Reliability Standard TPL-007-1 and the associated implementation plan, violation severity levels, and violation risk factors, as discussed above. Proposed Reliability Standard TPL-007-1 will impose new requirements for transmission planners, planning coordinators, transmission owners, and generator owners. Proposed Reliability Standard TPL-007-1, Requirement R1 requires planning coordinators, in conjunction with transmission planner, to identify the responsibilities of the planning coordinator and transmission planner in the planning coordinator's planning area for maintaining models and performing the study or studies needed to complete GMD Vulnerability Assessments. Proposed Requirements R2, R3, R4, R5, and R7 refer to the "responsible entity, as determined by Requirement R1," when identifying which applicable planning coordinators or transmission planners are responsible for maintaining models and performing the necessary study or studies. Proposed Requirement R2 requires that the responsible entities maintain models for performing the studies needed to complete GMD Vulnerability Assessments, as required in proposed Requirement R4. Proposed Requirement R3 requires responsible entities to have criteria for acceptable system steady state voltage performance during a benchmark GMD event. Proposed Requirement R4 requires responsible entities to complete a GMD Vulnerability Assessment of the near-term transmission planning horizon once every 60 calendar months. Proposed Requirement R5 requires responsible entities to provide GIC flow information to transmission owners and generator owners that own an applicable bulk electric system power transformer in the planning area. This information is necessary for applicable transmission owners and generator owners to conduct the

20150514-3102 FERC PDF (Unofficial) 05/14/2015

thermal impact assessments required by proposed Requirement R6. Proposed Requirement R6 requires applicable transmission owners and generator owners to conduct thermal impact assessments where the maximum effective GIC value provided in proposed Requirement R5, Part 5.1 is 75 A/phase or greater. Proposed Requirement R7 requires responsible entities to develop a corrective action plan when its GMD Vulnerability Assessment indicates that its system does not meet the performance requirements of Table 1 – Steady State Planning Events. The corrective action plan must address how the performance requirements will be met, must list the specific deficiencies and associated actions that are necessary to achieve performance, and must set forth a timetable for completion. The Commission estimates the annual reporting burden and cost as follows:

FERC-725N, as modified by the NOPR in Docket No. RM15-11-000 (TPL-007-1 Reliability Standard for Transmission System Planned Performance for Geomagnetic Disturbance Events)[70]

[70] Eng.=engineer; RK =recordkeeping (record clerk); PC=planning coordinator; TP=transmission planner; TO=transmission owner; and GO=generator owner.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

	Number of Respondents (1)	Annual Number of Responses per Respondent (2)	Total Number of Responses (1)*(2)=(3)	Average Burden Hours & Cost Per Response [71] (4)	Total Annual Burden Hours & Total Annual Cost (3)*(4)=(5)	Cost per Respondent ($) (5)÷(1)
(One-time) Requirement 1	121 (PC & TP)	1	121	Eng. 5 hrs. ($331.75); RK 4 hrs. ($149.80)	1,089 hrs. (605 Eng., 484 RK); $58,267.55 ($40,141.75 Eng., $18,125.80 RK)	$481.55
(On-going) Requirement 1	121 (PC & TP)	1	121	Eng. 3 hrs. ($199.05); RK 2 hrs. ($74.90)	605 hrs. (363 Eng., 242 RK); $33,147.95 ($24,085.05 Eng., $9,062.90 RK)	$273.95

[71] The estimates for cost per response are derived using the following formula: Burden Hours per Response * $/hour = Cost per Response. The $66.35/hour figure for an engineer and the $37.45/hour figure for a record clerk are based on data on the average salary plus benefits from the Bureau of Labor Statistics obtainable at **Error! Hyperlink reference not valid.**http://bls.gov/ oes/current/naics3_221000.htm and http://www.bls.gov/news.release/ecec.nr0.htm.

Title: FERC-725N, Mandatory Reliability Standards: TPL Reliability Standards

Action: Proposed Additional Requirements.

OMB Control No: 1902-0264.

Respondents: Business or other for-profit and not-for-profit institutions.

Frequency of Responses: One time and on-going.

Necessity of the Information: The Commission has reviewed the requirements pertaining to proposed Reliability Standard TPL-007-1 and has made a determination that the

[72] Of the 57,640 total burden hours, 42,137 hours are one time burden hours, and 15,503 hours are on-going annual burden hours.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

proposed requirements of this Reliability Standard are necessary to implement section 215 of the FPA. Specifically, these requirements address the threat posed by GMD events to the Bulk-Power System and conform to the Commission's directives regarding development of the Second Stage GMD Reliability Standards, as set forth in Order No. 779.

Internal review: The Commission has assured itself, by means of its internal review, that there is specific, objective support for the burden estimates associated with the information requirements.

67. Interested persons may obtain information on the reporting requirements by contacting the Federal Energy Regulatory Commission, Office of the Executive Director, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

68. Comments concerning the information collections proposed in this notice of proposed rulemaking and the associated burden estimates, should be sent to the Commission in this docket and may also be sent to the Office of Management and Budget, Office of Information and Regulatory Affairs [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at the following e-mail address: oira_submission@omb.eop.gov. Please reference FERC-725N and OMB Control No. 1902-0264 in your submission.

IV. Environmental Analysis

69. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect

20150514-3102 FERC PDF (Unofficial) 05/14/2015

on the human environment.[73] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[74] The actions proposed here fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act

70. The Regulatory Flexibility Act of 1980 (RFA)[75] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.[76] The SBA revised its size standard for electric utilities (effective January 22, 2014) to a standard based on the number of employees, including affiliates (from a standard based on megawatt hours).[77] Under SBA's new size standards, planning coordinators, transmission planners,

[73] *Regulations Implementing the National Environmental Policy Act*, Order No. 486, FERC Stats. & Regs. Preambles 1986-1990 ¶ 30,783 (1987).

[74] 18 CFR 380.4(a)(2)(ii).

[75] 5 U.S.C. 601-12.

[76] 13 CFR 121.101.

[77] SBA Final Rule on "Small Business Size Standards: Utilities," 78 FR 77,343 (Dec. 23, 2013).

20150514-3102 FERC PDF (Unofficial) 05/14/2015

transmission owners, and generator owners are likely included in one of the following categories (with the associated size thresholds noted for each):[78]

- Hydroelectric power generation, at 500 employees
- Fossil fuel electric power generation, at 750 employees
- Nuclear electric power generation, at 750 employees
- Other electric power generation (e.g., solar, wind, geothermal, biomass, and other), at 250 employees
- Electric bulk power transmission and control,[79] at 500 employees

71. Based on these categories, the Commission will use a conservative threshold of 750 employees for all entities.[80] Applying this threshold, the Commission estimates that there are 440 small entities that function as planning coordinators, transmission planners, transmission owners, and/or generator owners. However, the Commission estimates that only a subset of such small entities will be subject to the proposed Reliability Standard given the additional applicability criteria in the proposed Reliability Standard (i.e., to be subject to the requirements of the proposed Reliability Standard, the applicable entity must own or must have a planning area that contains a large power transformer with a high side, wye grounded winding with terminal voltage greater than 200 kV).

---

[78] 13 CFR 121.201, Sector 22, Utilities.

[79] This category covers transmission planners and planning coordinators.

[80] By using the highest number threshold for all types of entities, our estimate conservatively treats more entities as "small entities."

20150514-3102 FERC PDF (Unofficial) 05/14/2015

72. Proposed Reliability Standard TPL-007- 1 enhances reliability by establishing requirements that require applicable entities to perform GMD Vulnerability Assessments and to mitigate any identified vulnerabilities. The Commission estimates that each of the small entities to whom the proposed Reliability Standard TPL-007-1 applies will incur one-time compliance costs of $5,193.34 and annual ongoing costs of $5,233.50.

73. The Commission does not consider the estimated cost per small entity to impose a significant economic impact on a substantial number of small entities. Accordingly, the Commission certifies that the proposed Reliability Standard will not have a significant economic impact on a substantial number of small entities.

VI. Comment Procedures

74. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER]**. Comments must refer to Docket No. RM15-11-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

75. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

20150514-3102 FERC PDF (Unofficial) 05/14/2015

76. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC, 20426.

77. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VII. Document Availability

78. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington DC 20426.

79. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

80. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference

20150514-3102 FERC PDF (Unofficial) 05/14/2015

Room at (202) 502-8371, TTY (202)502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

By direction of the Commission.

Kimberly D. Bose,
Secretary.

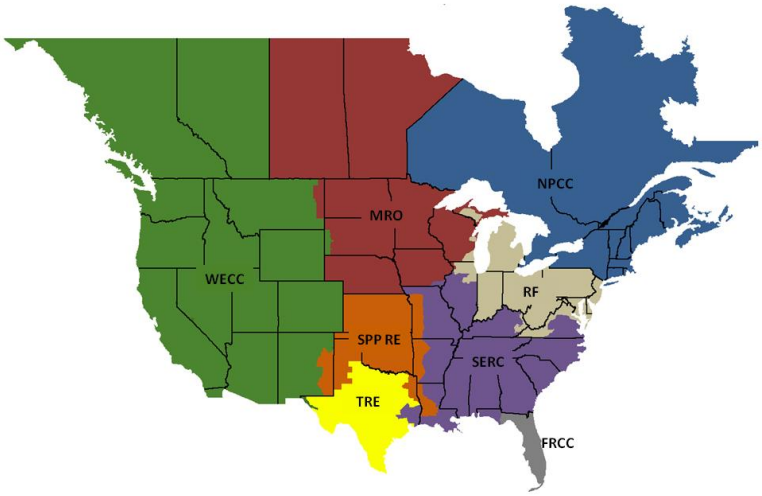
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to assure the reliability of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Notice

This report presents metrics and trends derived from the data available at the time of publication and may be modified pending further review and analysis.

Executive Summary

The *State of Reliability 2015* report presents NERC's independent view of ongoing bulk power system (BPS) trends via data compiled through December 2014 to objectively provide an integrated view of reliability performance. The key findings and recommendations serve as technical input to NERC's risk assessment, Reliability Standards project prioritization, compliance process improvement, event analysis, reliability assessment, and critical infrastructure protection efforts. The analysis of BPS performance developed as part of this report provides a reference of historical reliability, offers analytical insights regarding industry action, and enables the identification and prioritization of specific steps that can be taken to manage risks that have an effect on reliability.

The analysis of available data provided in the report demonstrates that, excluding weather effects, BPS reliability remained within defined performance objectives to provide an Adequate Level of Reliability (ALR).[1] Weather continues to be a significant stress factor on BPS reliability, specifically impacting generator performance. Several of the most important reliability performance findings were (1) there was no loss of load due to cyber or physical security events in 2014; (2) average transmission outage severity declined; (3) protection system misoperations continue to escalate risk in Qualified Events, and (3) there was a significant decrease in unplanned transmission outages that resulted in a loss of load. Excluding the impact of extreme weather, BPS performance for events that can be controlled by industry action demonstrated that the reliability risk of non-weather events is manageable.

In its mission to ensure the reliability of the BPS, NERC carries out multiple initiatives and assessments. One such initiative is the development and maintenance of performance metrics. This report introduces new performance metrics in two key areas: compliance and security. When performance metrics were first introduced in 2010, the Key Compliance Monitoring Index (KCMI) was developed to track the impact of "Standard-driven" risks of compliance violations. Due to the number of Reliability Standards modifications, it became difficult to update the changing set of requirements while maintaining meaningful tracking of the compliance violation data that could provide informative trends. Two metrics are proposed to replace the retired KCMI. One metric relies on ERO Enforcement staff's determination of the risk of a potential violation, and the other metric is a quarterly count of the number of reported Reliability Standards noncompliances with observed reliability impact.

NERC also developed a set of security performance metrics. The metrics include the total number of Reportable Cyber Security Incidents[1] and physical security reportable events[2] that occur over time and identify how many of these incidents have resulted in a loss of load. They also include Electricity Sector Information Sharing and Analysis Center (ES-ISAC) membership and Incident Bulletins published by the ES-ISAC based on information voluntarily submitted by ES-ISAC member organizations. These metrics provide lagging and leading indicators for security performance applicable to reliable BES operation.

The goal of the *State of Reliability 2015* report is to quantify risk and performance, highlight areas for improvement, and reinforce and measure success in controlling risks to reliability. The ongoing work in NERC's Performance Analysis staff, working with the Performance Analysis Subcommittee, provides a foundation for these risk assessments, which is documented in this report.

[1] Definition of "Adequate Level of Reliability," http://www.nerc.com/comm/Other/Adequate_Level_of_Reliability_Task_Force_ALRTF_DL/Final_Documents_Posted_for_Stakeholders and Board of Trustee Review/10_04_12_ALR_Definition_clean.pdf (The assessment objectives relate to planning assessments, which are not covered in the report).

[1] Ref. NERC Glossary of Terms: "A Cyber Security Incident that has compromised or disrupted one or more reliability tasks of a functional entity."

[2] Reportable events are defined in Reliability Standard EOP-004-2 Event Reporting, Attachment 1.

Chapter 1 – Key Findings

2014 Reliability Performance

The 2014 reliability performance continued to remain high, sustaining the positive trends documented in the review of 2013 performance in the *State of Reliability 2014* report. In late 2012, NERC adopted a revised definition of Adequate Level of Reliability, which forms the basis for the reliability indicators that are used as metrics to evaluate the performance of the BES. The five performance objectives, two assessment objectives, and associated expected performance outcomes were developed to encompass NERC's responsibility to ensure reliability of the BES.[2] The severity risk index (SRI)[3] and metrics measuring the ALR characteristics indicate that the BPS is within defined performance objectives. Based on the data and analysis presented within this report, the following key findings were identified:

- Weather continues to stress BPS reliability
- No load loss due to cyber or physical security events[4]
- Decline of average transmission outage severity
- Significant decrease in unplanned transmission outages resulting in loss of load
- Stable frequency response trend
- Protection system misoperations trending lower, but continue to escalate risk in Qualified Events[5]
- Continued decline of the use of Energy Emergency Alert Level 3 (declared by Balancing Authorities (BAs) or Load-Serving Entities (LSEs) when they are deficit in resources)

Key Finding 1: Weather Continues to Stress BPS Reliability

The analysis of SRI in Chapter 3 and the metrics in Chapter 4 demonstrate that BPS reliability remained within the ALR performance objectives. Weather continues to be a significant stress factor on BPS reliability, leading primarily to generator outages and deratings. Load-loss events were not the primary driver of high SRI days during 2014. All of the top-10 most severe events in 2014 were initiated or exacerbated by weather. There were three high-stress days (i.e., days with an SRI greater than 5.0) in 2014. Two of the days were associated with the polar vortex;[6] the remaining high-stress day was associated with an extreme weather event in California. The calculated SRI for all but two of the 10 highest SRI days for the year was driven by generation performance and, to a lesser extent, transmission outage performance, and did not involve a significant degree of load loss. While the BPS is expected to perform at a high level during weather events, system performance must continue to be examined in light of extreme weather. To the extent that weather is determined as a large impact to day-to-day and extreme-day performance, other metrics that report on BPS reliability (specifically load-loss events) that retain weather impacts should be developed. Excluding the impact of these extreme days, BPS performance for events that can be controlled by industry action was consistently above the ALR performance objectives, demonstrating that the reliability risk of non-weather events is manageable. Chapter 3 contains further discussion on this topic.

---

[2] Definition of "Adequate Level of Reliability," http://www.nerc.com/comm/Other/Adequate_Level_of_Reliability_Task_Force_ALRTF_DL/Final_Documents_Posted_for_Stakeholders and Board of Trustee Review/10_04_12_ALR_Definition_clean.pdf (The assessment objectives relate to planning assessments, which are not covered in the report).

[3] SRI is a "stress" index, measuring risk impact from events resulting in transmission loss, generation loss, and load loss.

[4] A Reportable Cyber Security Incident is defined as "A Cyber Security Incident that has compromised or disrupted one or more reliability tasks of a functional entity." A reportable physical event is defined in Reliability Standard EOP-004-2 Event Reporting, Attachment 1.

[5] A Qualified Event is an event that meets a category description in the Electric Reliability Organization Event Analysis Process, found at http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf.

[6] http://www.nerc.com/pa/rrm/January 2014 Polar Vortex Review/Polar_Vortex_Review_29_Sept_2014_Final.pdf.

Recommendation
NERC and industry should develop metrics that provide insight into weather impacts on BPS performance, especially during load-loss events.

Key Finding 2: No Load Loss Due to Cyber or Physical Security Events

Analysis of the newly developed security performance metric data showed that no Reportable Cyber Security Incidents or physical security reportable events resulted in loss of load on the BPS in 2014. As recommended in the *State of Reliability 2014* report, the NERC Performance Analysis Subcommittee (PAS) collaborated with the BES Security Metrics Working Group (BESSMWG) to develop security performance metrics. The BESSMWG developed an initial set of five metrics, presented in Chapter 9.

NERC Actions to Support BES Security

NERC is committed to analyzing and advising industry on cybersecurity compromises that could lead to impacts on reliability. On November 22, 2013, FERC approved Version 5 of the critical infrastructure protection cybersecurity standards (CIP Version 5), representing significant progress in mitigating cyber risks to the BPS. NERC initiated a program to support industry transition directly from the currently enforceable CIP Version 3 standards to CIP Version 5. The goal of the transition program is to improve industry's understanding of the technical security requirements for CIP Version 5, as well as the expectations for compliance and enforcement.

The Electricity Sector Information Sharing and Analysis Center (ES-ISAC) establishes situational awareness, incident management, coordination, and communication capabilities within the electricity sector through timely, reliable, and secure information exchange. The ES-ISAC, in collaboration with the Department of Energy and the Electricity Sector Coordinating Council (ESCC), serves as the primary security communications channel for the electricity sector and enhances the sector's ability to prepare for and respond to cyber and physical threats, vulnerabilities, and incidents. ES-ISAC member organizations include NERC registered entities and others in the electricity sector. A strategic review of the ES-ISAC is ongoing, and expected to conclude in the summer of 2015.

As part of its ongoing training and education efforts, NERC conducted its second industry-wide grid security exercise, GridEx II, in November 2013. The exercise, a coordinated cyber and physical attack on the BPS, promoted coordination and highlighted urgent issues facing the industry. A report[7] summarizing the exercise highlights recommendations and lessons learned for industry to use when preparing for and responding to cyber and physical threats, vulnerabilities, and incidents. The results are also incorporated into strategic action by NERC's Critical Infrastructure Protection Committee (CIPC) and the ESCC. Planning for GridEx III, which is scheduled for late 2015, has begun. The scenario will include robust cyber and physical threats to the BPS to exercise crisis response and recovery, improve crisis communications, gather lessons learned, and engage senior industry and government leaders.

On March 7, 2014, FERC issued an order directing NERC to address physical security risks and vulnerabilities of critical facilities on the BPS. In response to the order, Reliability Standard CIP-014-1 was adopted by the Board and subsequently filed with and approved by FERC, to become effective on October 1, 2015. FERC directed NERC to remove the term "widespread" from the standard or, alternatively, propose modifications to the Reliability Standard that address FERC's concerns. While NERC is proceeding through the Standards Development Process to incorporate these refinements, implementation of the standard is underway.

[7] http://www.nerc.com/pa/CI/CIPOutreach/GridEX/GridEx II After Action Report.pdf.

Recommendations

- NERC, with support from CIPC, should deploy the security metrics presented in Chapter 9.
- Working with industry and forums such as the North American Transmission Forum (NATF), NERC should analyze information from these security metrics and consider development of additional metrics that could provide valuable information on cybersecurity.
- NERC, working jointly with the ESCC, should conclude expeditiously the strategic review of the ES-ISAC.

Key Finding 3: Decline of Average Transmission Outage Severity

The average transmission outage severity continued to decrease in 2014. After realizing a significant decrease from 2012 to 2013, it reduced again from 2013 to 2014, based on analysis of year-over-year changes in calculated transmission outage severity of TADS events by Initiating Cause Code (ICC). This analysis, presented in Appendix A, shows continuing positive performance in the average transmission outage severity for each ICC and for the 2012–2014 dataset. Events initiated by the ICCs of Misoperations and Failed AC Substation Equipment remained high in total transmission outage severity and were the greatest contributors to transmission outage severity relative risk.

NERC Actions to Support Reducing Misoperations

NERC actions to address misoperations are addressed in Key Finding 6.

NERC Actions to Support Reducing the Risk of Failed AC Substation Equipment

In 2014, NERC produced a report investigating reliability issues related to ac substation equipment failures,[8] with recommendations on bus configuration evaluations, breaker lubrication practices, service advisory tracking, and proactive equipment replacement.

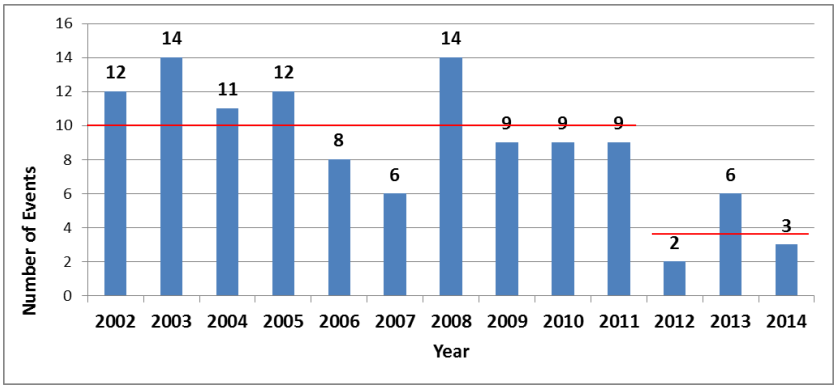
Recommendations

- NERC, working with the NATF, should evaluate the failure rate of circuit breakers and determine the impact of bus configuration on ac transmission circuit outages.
- Entities should evaluate the impact of breaker failures on system performance when choosing bus configurations for new installations or modifying existing substations.
- NERC, working with IEEE and other applicable industry forums, should develop a consistent method for the collection and distribution of ac substation equipment failure data.

[8] http://www.nerc.com/comm/PC/AC Substation Equipment Task Force ACSETF/Final_ACSETF_Report.pdf.

Key Finding 4: Significant Decrease in Unplanned Transmission Outages Resulting in Loss of Load

Analysis of unplanned transmission outage data shows that the number of BPS transmission-related events resulting in loss of firm load from 2002 to 2011 was relatively constant (average of 10 events per year), then dropped significantly over the last three years to an average of less than four per year. Metric M-2 measures BPS transmission-related events resulting in the loss of load, excluding weather-related outages. The analysis of data for this metric is presented in Chapter 4.



NERC Actions to Support Continued Reduction of Unplanned Transmission Outages Resulting in Loss of Load

NERC's focus on this metric in past state of reliability reports resulted in a range of actions. NERC Reliability Standard TOP-003-1 – Planned Outage Coordination was developed and required that scheduled generator and transmission outages potentially affecting the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators. Also, Reliability Standard FAC-014-2 – Establish and Communicate System Operating Limits requires that System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs) are established and consistent with documented methodology. These standards help ensure that the impact on the BPS from unplanned transmission outages is mitigated. Finally, transmission outage events that meet the definition of a Qualified Event in NERC's Event Analysis Process are evaluated for root causes to derive potential lessons learned that are shared with industry.

Key Finding 5: Stable Frequency Response Trend

From 2012 to 2014, the Eastern, Western, ERCOT, and Québec Interconnections have shown steady frequency response performance, trending above the recommended Interconnection Frequency Response Obligation (IFRO) at all times during the time period studied. NERC annually applies statistical tests to interconnection frequency response datasets,[9] including additional analyses on time of year, load levels, and other attributes. The Eastern Interconnection frequency response has shown a statistically significant positive increase from 2012 to 2014. The Western Interconnection and the ERCOT Interconnection are statistically stable. The Québec Interconnection frequency response experienced a statistically significant decline from 2012 to 2014, but remains well above the calculated IFRO for the Interconnection. It is important to monitor these trends to determine whether any events approach or drop below the IFRO for any Interconnection and to identify any underlying causes and corrective courses of action. The study methods and statistical results are summarized in Chapter 4 and detailed in Appendix D.

NERC Actions to Support Sustained Frequency Response

NERC Reliability Standard BAL-003-1 was approved by the Federal Energy Regulatory Commission (FERC) on January 16, 2014, and has phased-in effective dates of April 1, 2015, and April 1, 2016. The standard requires an annual collection of data for calculating Frequency Bias and for determining compliance with the Frequency Response Obligation (FRO).

[9] Datasets described in the Frequency Response Initiative Report, October 2012 http://www.nerc.com/docs/pc/FRI_Report_10-30-12_Master_w-appendices.pdf

There were no reported Event Analysis Process[10] Qualified Events in 2014 where frequency response performance was cited as a causal factor for initiating or sustaining an event. NERC will examine incidents in 2014 where frequency response was below the IFRO to determine any root causes and actions necessary to improve the frequency response performance.

On February 5, 2015, NERC issued an Industry Advisory on generator governor frequency response.[11] NERC determined that a significant portion of the Eastern Interconnection generator dead bands or governor control settings could inhibit or prevent frequency response. With the exception of nuclear generators, entities with generators greater than 75 MVA were advised to review generator governor and Distributed Control System (DCS) settings to conform to specifications mentioned in the Advisory.

Recommendations

- NERC should monitor the effectiveness of the Industry Advisory on generator governor frequency response on the Eastern Interconnection.
- NERC should assess the impact of BAL-003-1 on frequency response for all Interconnections subsequent to the Reliability Standard's effective dates.
- NERC, with support from the Resources Subcommittee, should identify root causes and any necessary actions for incidents in 2014 where frequency response was less than the IFRO.
- NERC should determine whether additional actions, beyond those currently being pursued in NERC Reliability Standards, are required to maintain and improve frequency response performance.

Key Finding 6: Protection System Misoperations Trending Lower, but Continue to Escalate Risk in Qualified Events

The analysis of data showed that the protection system misoperation rate began to decline in 2014. The majority of protection system misoperations do not lead to Qualified Events;[12] approximately three percent cause or exacerbate the severity of reportable system disturbances. However, those protection system misoperations that do occur can severely increase risk to reliability. For example, more than 68 percent of transmission-related Qualified Events have protection system misoperations associated with them that either initiated the event or caused it to be more severe. The analysis of these data and events are presented in Chapter 4.

NERC Actions to Support Improved Protection System Performance

NERC is completing revisions to a number of Reliability Standards that involve protection systems[13] to improve their performance. These standards are designed to implement a corrective action program in which specific mitigation of misoperation root causes is required. To increase awareness, NERC conducts industry webinars[14] on protection systems and publishes Lessons Learned on how Generator Owners (GOs) and Transmission Owners (TOs) are achieving high levels of protection system performance. In addition, NERC staff analyzed and reported on the top-three protection system misoperation cause codes reported by entities.[15] This analysis sets the stage for NERC and industry action toward protection system misoperation reduction.

[11] http://www.nerc.com/pa/rrm/bpsa/Alerts DL/2015 Alerts/NERC Alert A-2015-02-05-01 Generator Governor Frequency Response.pdf
[12] A Qualified Event is an event that meets a category description in the Electric Reliability Organization Event Analysis Process, found at http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf.
[13] http://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx.
[14] http://www.nerc.com/files/misoperations_webinar_master_deck_final.pdf.
[15] http://www.nerc.com/pa/RAPA/PA/Performance Analysis DL/NERC Staff Analysis of Reported Misoperations - Final.pdf.

For example, based on reviews of the Qualified Events for protection system misoperations, there are two main causes of incorrectly set ground instantaneous overcurrent elements. The first is an increase in the maximum value of ground fault short circuit current available over time, rendering the ground settings too sensitive. The second is setting the ground instantaneous overcurrent element without enough margin to accommodate short circuit modeling tolerances and other component anomalies.

In its February 10, 2015 Lessons Learned,[16] NERC advised entities to consider reviewing the maximum value of ground fault short circuit current that was used to develop the protection system settings and ensure that the short circuit current available is appropriate. In addition, entities should review their philosophies for setting ground instantaneous overcurrent elements and determine the appropriate percentage of line length to protect with the instantaneous setting.

Recommendations

- Entities should review the maximum value of ground fault short circuit current that was used to develop the protection system settings and ensure that the short circuit current available is appropriate. In addition, entities should review their philosophies for setting ground instantaneous overcurrent elements and determine the appropriate percentage of line length to protect with the instantaneous setting.
- NERC and the Regions should develop training modules on the importance of standard design templates to address design, logic settings, and peer review.
- NERC should work with the Protection System Misoperations Task Force to develop a guideline on quality control to improve protective relay settings.
- NERC and the Regions, in partnership with protection system equipment manufacturers, should develop an industry outreach program that targets specific organizations that have the greatest impact on protection system misoperation reduction.
- NERC should work with microprocessor relay manufacturers to determine whether any technical bulletins or industry alerts should be developed to address protection system equipment failures.
- The NATF, in coordination with NERC, should engage its membership on key topical areas of improvement and develop targeted improvement plans for its members.

Key Finding 7: Use of Energy Emergency Alert Level 3 Continues to Decline

In 2014 there were four Energy Emergency Alert Level 3 (EEA3) events declared, which is fewer than any other year for which data was reported. Of the four EEA3 events, only one resulted in load shed. This event was due to conditions during the polar vortex[17] that resulted in record-low temperatures and high demand. The other three reported EEA3 alerts did not result in loss of load and were generally caused by transmission limitations resulting in a localized area's inability to make use of the reserves that existed within the region.

NERC Actions to Support Evaluation of EEA3 Events

NERC continues to evaluate each reported EEA3 event to determine the potential impact to reliability. As historical data is gathered by NERC on EEAs, trends provide a relative indication of performance measured at a Regional Entity or interconnection level. The issuance of an EEA3 indicates an issue with the real-time adequacy of the electric supply system. It may be due to a lack of fuel or dependence on transmission for imports into a constrained area, not simply a lack of available generation resources. Events that meet the definition of a Qualified Event in

NERC's Event Analysis Process are evaluated for root causes to derive potential lessons learned that are shared with industry.

Chapter 2 – 2014 Year in Review

The *State of Reliability 2015* report gathers data and metrics needed to evaluate the reliability of the BPS. This chapter describes the conditions in which the electric industry operated during 2014 and other environmental, regulatory, and policy-related issues that took place during 2014 to provide context to the observations and data presented in this report.

Reliability Assurance Initiative

The Reliability Assurance Initiative (RAI) was a collaborative, multiyear effort among NERC, the Regional Entities, and industry to enhance the effectiveness of the Compliance Monitoring and Enforcement Program (CMEP). The initiative focused on the development and implementation of a risk-based approach to compliance monitoring and enforcement. This approach focused NERC, the Regional Entities, and industry resources on higher-risk reliability issues. These methods successfully address high-risk issues while also accounting for lesser-risk reliability issues, which continue to be identified, corrected, and tracked.

Further, the approach focuses on how the ERO performs oversight and obtains assurance on compliance with NERC Reliability Standards, and it does so without creating new or additional requirements (beyond those established in Reliability Standards) for registered entities operating the grid. This approach enables the ERO to leverage registered entity management practices in use at registered entities and inform industry of lessons learned by their peers. The emphasis of this initiative shifted at the end of 2014 toward implementation through the Risk-Based Compliance Monitoring and Enforcement Program.

Transition to Critical Infrastructure Protection Version 5

In 2013, FERC approved Version 5 of the Critical Infrastructure Protection Reliability Standards (CIP Version 5), which represent a significant improvement—and change—over the currently effective CIP Version 3 standards. They include new cybersecurity controls and extend the scope of systems to which the CIP Reliability Standards apply.

NERC initiated the CIP Version 5 Transition Program to collaborate with Regional Entities and applicable entities to implement the CIP Version 5 standards in a manner that is timely, effective, and efficient. The goals of the program are to improve industry's understanding of the technical security requirements for CIP Version 5 and clarify the expectations for compliance and enforcement.

In 2014, NERC concluded a nine-month CIP Version 5 implementation study with a representative sample of six responsible entities focused on the technical solutions and processes needed to implement the CIP Version 5 standards. In so doing, NERC, Regional Entities, and responsible entities developed a deeper understanding of compliance and enforcement matters applicable to CIP Version 5.

As anticipated, NERC, the Regional Entities, and the implementation study participants identified a number of issues during the implementation study that called for additional guidance and clarity. To further ensure confidence in the transition to CIP V5, NERC continued working with the Regional Entities and implementation study participants to develop lessons learned and frequently asked question (FAQ) documents on specific issues. As documents are finalized, they will be shared with industry. Working in collaboration with the Regional Entities, implementation study participants, and other stakeholders, NERC also developed a transition guidance document and compatibility tables that compare requirements in CIP Version 5 with requirements in CIP Version 3. In addition, NERC addressed stakeholder concerns with a document that clarifies how the risk-based compliance monitoring and enforcement processes developed under RAI will apply to CIP Version 5.

Risk-Based Registration Initiative

NERC's Risk-Based Registration initiative seeks to ensure that the right entities are subject to the right set of applicable NERC Reliability Standards using a consistent approach to risk assessment and registration across the ERO. In 2014, NERC established the Risk-Based Registration Advisory Group (RBRAG) and the RBRAG technical task force to provide input and advice on the design framework and implementation plan.

The framework includes refined thresholds based on sound technical analysis, risk considerations, and support; reduced NERC Reliability Standard applicability based on sound technical analysis, risk considerations, and support; and clearly defined terms, criteria, and procedures that are risk-based and ensure the reliability of the BPS as outlined in the new BES definition. The proposed enhancements reduce unnecessary burdens while preserving BPS reliability and enable entities to avoid causing or exacerbating instability, uncontrolled separation, or cascading failures.

Polar Vortex Review

As part of NERC's ongoing efforts to identify risks to BPS reliability and to inform stakeholders of the impacts of those risks, NERC reviewed the extreme weather event (polar vortex) that occurred January 6–8, 2014. The *Polar Vortex Review*[18] details how the BPS exhibited its resiliency during the polar vortex, as BPS reliability was maintained despite sustained record-low temperatures occurring over a large geographic area in North America. Many areas experienced daytime-high and overnight-low temperatures that were between 20 and 30 degrees below average, with 49 cities setting new record lows.

North America GOs and TOs responded well to prevent major impacts to the BPS through industry preparations and operational effectiveness. NERC examines the impact of these events to ensure lessons learned and related information are shared to prevent reoccurrences where possible and, most importantly, sustain successful operation and maintenance practices. As expected, key factors during the event included fuel deliverability issues, natural gas pipeline outages, gas service interruptions, frozen electricity and gas equipment, and other extreme cold weather operating challenges.

During the event, grid operators employed techniques such as voltage reduction and demand-side management to ensure that BES reliability was maintained. Only one BA shed firm load during the polar vortex event, which is an indication of a strong overall performance by industry under extremely challenging circumstances.

2014 Long-Term Reliability Assessment

The *2014 Long-Term Reliability Assessment*[19] provided a forward-looking, independent perspective of the resources needed to maintain reliability of the North American BPS over the next 10 years. NERC examined key indicators including load forecasts, expected resources, and transmission additions. The assessment identified three key reliability findings facing industry in the coming years: downward trends in reserve margins, uncertain impacts of environmental rules, and an ongoing resource mix transformation.

In several assessment areas, reserve margins trended downward because of ongoing generation retirements, despite low load growth. Uncertainty remains for a large amount of existing conventional generation that may be vulnerable to retirement resulting from pending regulations, particularly the EPA's proposed Clean Power Plan.

Potential Reliability Impacts from the Proposed Clean Power Plan

[18] http://www.nerc.com/pa/rrm/January 2014 Polar Vortex Review/Polar_Vortex_Review_29_Sept_2014_Final.pdf
[19] http://www.nerc.com/pa/RAPA/ra/Reliability Assessments DL/2014LTRA_ERATTA.pdf

A preliminary reliability review of the EPA assumptions and potential reliability impacts of the Environmental Protection Agency's proposed Clean Power Plan under Section 111(d) of the Clean Air Act was completed in November. This assessment, *Potential Reliability Impacts of EPA's Proposed Clean Power Plan*,[20] examined the potential reliability concerns that could result from the proposed plan's implementation. As noted in the *2014 Long-Term Reliability Assessment*, the BPS is undergoing a fundamental transformation toward increasing dependency on natural gas, wind, and solar resources. The Clean Power Plan substantially accelerates that shift and proposes a very different mix of power resources. NERC's role is to identify emerging reliability issues that must be adequately addressed to ensure future reliability of the electricity supply.

The Clean Power Plan assessment provided a foundation for future reliability analyses and evaluations required by the ERO, stakeholders, and federal and state policy makers to create a framework with timelines that accommodate the expected infrastructure deployments needed to support BPS reliability while achieving the environmental objectives of the proposed rule.

BES Definition and BESnet

FERC approved the revised definition of "BES" on March 20, 2014, as outlined in Order Nos. 743, 773, and 773-A. The definition includes bright-line core criteria with enumerated inclusions and exclusions. The ERO developed enterprise-wide processes and tools to provide a uniform, clear way of determining assets contained within the BES. The tools offer a consistent way to identify assets and manage workflow, which will enhance the reliability of the BPS. The ERO Enterprise-wide software application, the BES Notification and Exceptions Tool, or BESnet, is used by entities to submit notifications of changes to BES assets that affect their responsibilities for compliance with the Reliability Standards.

As a result of the new definition, all elements and facilities necessary for the reliable operation and planning of the BPS will be included as BES Elements. FERC also approved the process for review of elements on a case-by-case basis to enable exceptions from the definition, where appropriate, as well as a process for entities to self-notify Regions of their determinations of BES Elements.

Physical Security of the BES

Physical security was noted as an emerging focus in the *2014 State of Reliability* report. On March 7, 2014, FERC directed NERC to submit a Reliability Standard within 90 days that would require TOs to identify critical facilities, evaluate the potential threats and vulnerabilities of these facilities, and develop and implement security plans on critical facilities such as transmission stations or substations and their associated primary control centers that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation, or cascading failures on the BPS. On May 23, 2014, NERC filed with FERC for approval of its proposed Reliability Standard CIP-014-1, and on November 20, 2014, FERC issued its final rule, largely approving this standard.

NERC explained in the filing that the proposed Reliability Standard is just part of its "multi-pronged approach" to ensuring the physical security of the nation's BPS, which includes posting security guidelines and best practices and holding periodic grid security exercises and an annual grid security conference. The new standard also would complement two existing standards:

1. EOP-004-2 requires registered entities to report to NERC and law enforcement any physical damage or threats to a facility, and
2. CIP-006-5 addresses the management of physical access to critical cyber systems.

[20] http://www.nerc.com/pa/RAPA/ra/Reliability Assessments DL/Potential_Reliability_Impacts_of_EPA_Proposed_CPP_Final.pdf.

With FERC approval, the standard requires a TO Risk Assessment under Requirement R1 to be completed no later than September 30, 2015. Thus, as a first step, each TO is required to develop a Risk Assessment for all of the facilities that meet the specified applicability criteria in the standard. The Risk Assessment consists of transmission analyses designed to identify the critical facilities. Further, as required by the standard, an unaffiliated third party will verify the Risk Assessment no later than December 31, 2015. After the Risk Assessment identifying critical stations or substations is verified, the TO will identify potential threats to those facilities and their primary control centers. A physical security plan for the identified facilities will be created and reviewed by an unaffiliated third party with expertise in physical security.

Essential Reliability Services

The changing generation mix, along with the retirement of conventional generation, increasing demand response, and the introduction of distributed resources, can lead to the loss essential reliability services at both the micro and macro levels. NERC, through the Planning and Operating Committees, commissioned the ERS Task Force (ERSTF) in 2014 to define the reliability services and identify the quantity needed and required location of the services to maintain BPS reliability.

The mission of the ERSTF is to provide a roadmap that ensures BPS reliability for the transition to a generation mix with a high penetration of renewables and reduced conventional and synchronous generation. Conventional generation (steam, hydro, and steam turbine technologies) inherently provides essential reliability services needed to reliably operate the BPS. NERC has identified the building blocks of these essential reliability services, which include voltage support, ramping capability, and frequency support. Generators must be able to continuously balance load and demand throughout the BPS to support transmission voltage and frequency response. Wind, solar, and other variable energy resources that are an increasingly greater share of the BPS provide a significantly lower level of essential reliability services than conventional generation.

The ERSTF developed a concept paper[21] to inform regulators and industry of essential reliability services affected by the integration of renewable resources and retirements of baseload generating plants. The ERSTF then developed four subgroups to review and develop a framework for measures for the essential services:

- Load and Resources Balance
- Frequency Support
- Voltage Support
- Policy and Advisory

The ERSTF developed a Measures Framework Report that lists various measures slated to be evaluated by these subgroups. Five measures were endorsed by the Planning and Operating Committees to pilot by gathering data:

- Synchronous Inertial Response at an Interconnection Level
- Synchronous Inertial Response at the Balancing Authority Level
- Initial Frequency Deviation following largest contingency
- Ramping Variability Needs
- System Reactive and Voltage Support

The task force is also evaluating four other measures in parallel with the pilot. All these measures will be part of the overall recommendations to industry and policy makers. The review and analyses of the above-mentioned measures will be concluded at the end of 2015.

Chapter 3 – Severity Risk Assessment and Availability Data Systems Summary

Overview of SRI Analysis

The SRI has been useful for measuring the performance of the BPS. During 2013, the Performance Analysis Subcommittee (PAS) undertook significant efforts to enhance and modify the SRI; those efforts are included in this report. All SRIs from prior years have been recalculated using the modified method for year-over-year comparisons.

Key conclusions were:

- All of the highest stress days were the result of extreme weather, notably the polar vortex event in the Eastern Interconnection and the significant pacific coast storms in the Western Interconnection.
- The performance on the highest SRI days[22] in 2014 were poorer than those recorded in many of the previous years, but are directly attributable to weather.
- Load-loss events were not the primary driver of a high SRI day during 2014. In fact, all but two of the top-10 days for the year were driven by generator performance and, to a lesser extent, transmission outage performance attributed to weather, and they did not involve load loss.
- There were only three high-stress days (SRI greater than 5.0) in 2014.
- For SRI values less than 5.0, the average was slightly elevated compared with the prior four years; however, the daily variation was less.[23]

NERC Assessment

Figure 3.1 captures the daily SRI values from 2010 to 2014. The SRI is comprised of three key components, notably Generation Severity, Transmission Severity, and Load-Loss Severity. For context throughout this report, each of these severity measures is calculated based on certain assumed and average values as outlined in the SRI white paper[24] and do not rely on individual analyses that measured the specific impact of any given element's function. In particular, Generation Severity reflects the unscheduled generation unavailability of a given unit with a plant capacity as a percentage of all available plant capacity. Transmission Severity reflects the unscheduled unavailability of a particular TADS element event, the impact of which is calculated by a voltage-weighted value divided by the total inventory of TADS elements. Load-Loss Severity is calculated as an average customer usage at peak for the day during which the load-loss event occurred.

As the year-to-year performance is evaluated in Figure 3.1, certain portions of the graph become relevant for specific analysis. First, the left side of the graph, where the system has been substantially stressed, should be considered in the context of the prior years' high-stress days. Next, the slope of the central part of the graph reveals year-to-year changes in performance for the majority of the days of the year and demonstrates routine system resilience. Finally, the right portion of the curve may also provide useful information about how many days with lower SRI occurred during any year compared to other years.

[22] High-stress days are those days in which the BPS performance, as measured by the SRI, has experienced noteworthy impacts to any or all of its components, specifically generation, transmission or load components. Based on past analysis, the count of days that exceed 5 (on the scale of 0 to 1000) are often memorable and may provide lessons learned opportunities. If no days exceed 5, the highest 10 days for the year are generally reviewed for their initiating causes.

[23] For details of the statistical analysis of SRI see Appendix F.

[24] Severity Risk Index, http://www.nerc.com/comm/PC/Performance Analysis Subcommittee PAS 2013/SRI Enhancement Whitepaper.pdf.

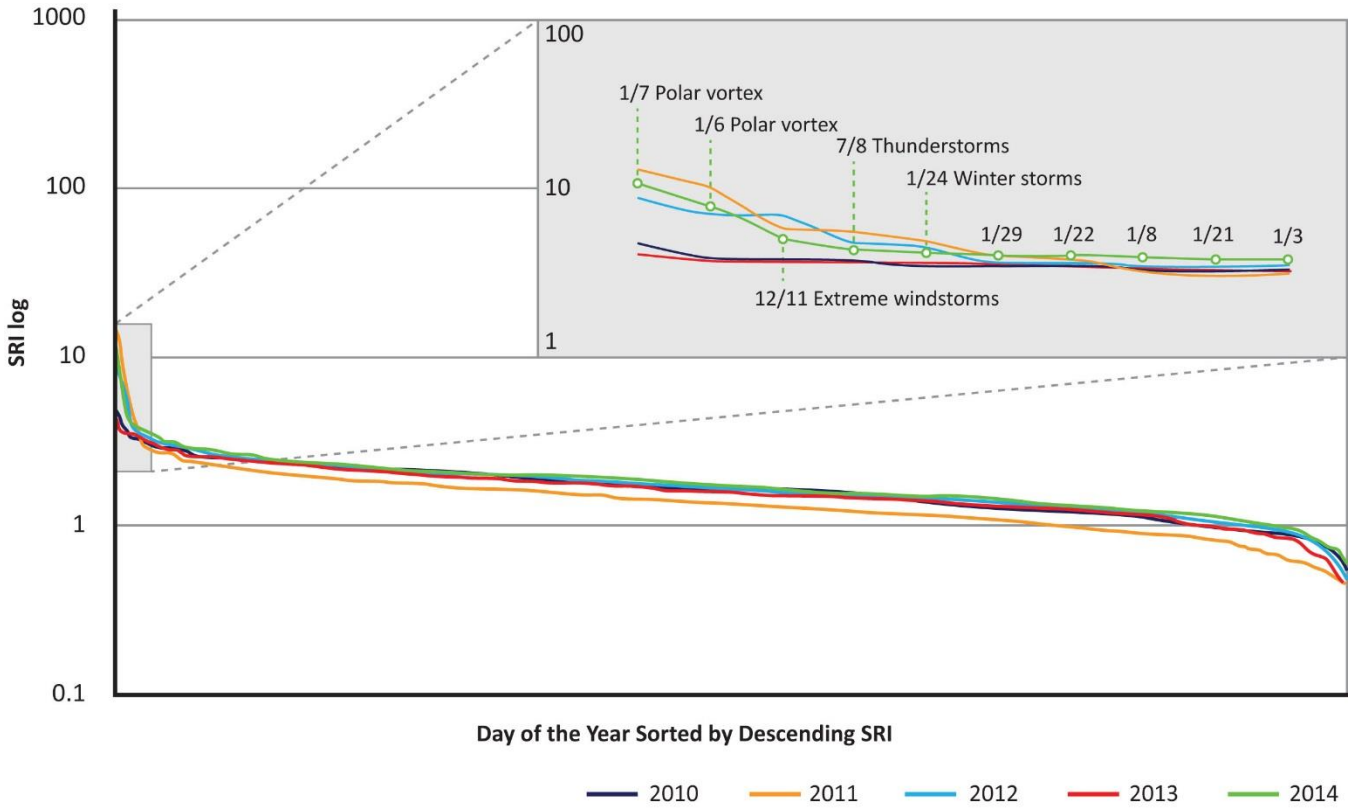

Figure 3.1: NERC Annual Daily Severity Risk Index (SRI) Sorted Descending

The inset shown in Figure 3.1 indicates that in 2014 there were three days for which SRI exceeded 5.0 (viewed as an indicator of a significant day). The first two, January 6 and 7, were associated with the highly discussed polar vortex (as were the eighth and tenth largest SRI days, January 3 and 8); the next one, on December 11, was associated with an extreme weather event in California. Table 3.1 lists the 10 event dates with the highest daily SRI values in 2014 and indicates the component contribution to the SRI. Separately, PAS reviewed OE-417 reports[25] to evaluate the consistency between the load-loss calculation and the OE-417 notification results, and all but one were supported by OE-417 notifications.

[25] https://www.oe.netl.doe.gov/oe417.aspx.

Table 3.1: 2014 Top Ten SRI days

Date	NERC SRI and Weighted Components 2015				G/T/L	Weather Influenced (Verified by OE-417)?	Rank	Event Type	Regions
	SRI	Weighted Generation	Weighted Transmission	Weighted Load Loss					
1/7/2014	11.1	9.8	0.9	0.4		✓	1	Polar Vortex	RF, TRE, SERC
1/6/2014	8.0	6.7	1.2	0.2		✓	2	Polar Vortex	RF, TRE, SERC
12/11/2014	5.0	1.1	0.4	3.6		✓	3	Extreme Windstorm	WECC
7/8/2014	4.2	1.6	0.5	2.0		✓	4	Thunderstorms	RF, NPCC
1/24/2014	4.1	3.1	0.9	0.1		✓	5	Winterstorm	RF, NPCC

1/3/2014	3.7	3.4	0.2	0.1		✓	10	Polar Vortex	RF, TRE SERC

Figure 3.2 shows each day's SRI by day of year for 2010 through 2014. On a daily basis, a general normal range of performance exists. Days that were extreme can be detected by their significant deviation from that normal level. It is apparent that these extreme days happen throughout the year, although in 2014 they were heavily weighted within the winter season, as shown in Table 3.1. The top-10 SRI days for the study period are shown in Table 3.2. The Event Rank in Table 3.2 corresponds to the spike numbers in Figure 3.2.

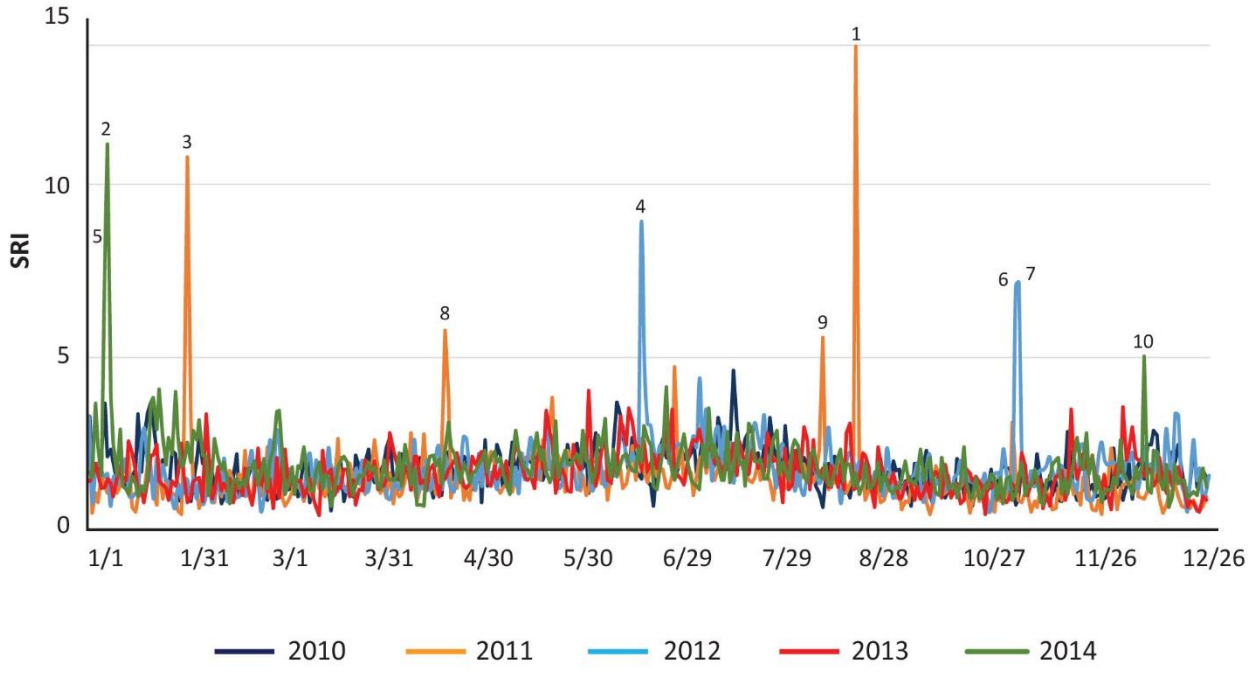

Figure 3.2: NERC Daily SRI (2010–2014)

Table 3.2: Top-10 SRI Days (2010–2014)				
Event Rank as Indicated in chart above	**Date**	**Event Ranking**	**SRI**	**Event Type**
1	9/8/2011	1	14.0	Southwest Blackout
2	1/7/2014	2	11.1	Polar Vortex
3	2/2/2011	3	10.8	Cold Weather Event
4	6/29/2012	4	8.9	Thunderstorm Derecho
5	1/6/2014	5	8.0	Polar Vortex
6	10/30/2012	6	7.2	Hurricane Sandy
7	10/29/2012	7	7.0	Hurricane Sandy
8	4/27/2011	8	5.8	Tornadoes, Severe Storm
9	8/28/2011	9	5.6	Hurricane Irene
10	12/11/2014	10	5.0	Extreme Windstorm

Figure 3.3 shows the annual cumulative performance of the BPS. If a step change occurs on the graph, it represents a stress day as measured by the SRI. Thus, the more gentle and linear the slope of the cumulative curve, the better the performance of the system through the evaluation period. During 2014 it is apparent that the year began worse than any other year, but the balance of the year is somewhat similar to other years.

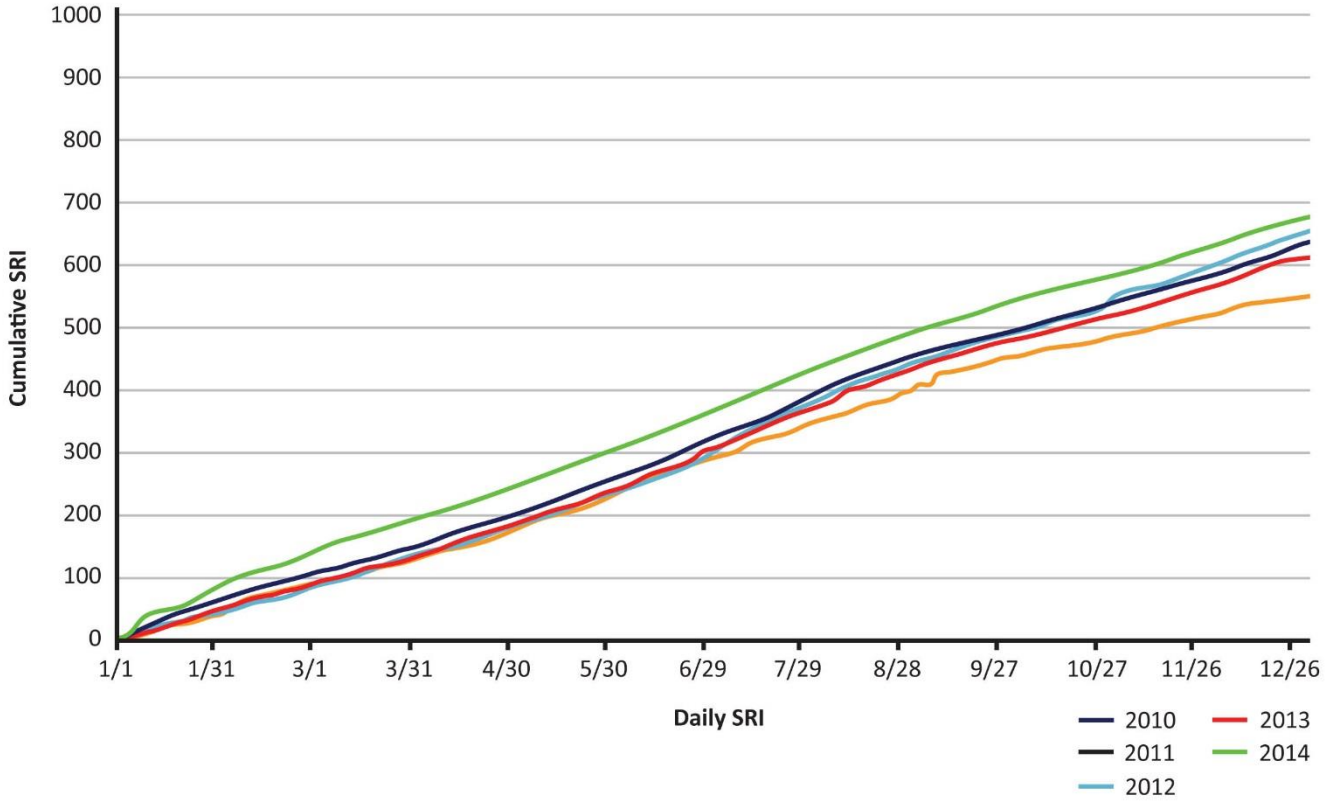

Figure 3.3: BPS Cumulative SRI (2010–2014)

Figure 3.4 breaks down the 2014 cumulative performance by BPS segment. The components are generation, transmission, and load loss, in that order. In Figure 3.4, the load-loss component shows day-to-day load-loss

events but doesn't demonstrate any significant step changes. As noted in previous state of reliability reports, unplanned generation unavailability is the largest contributor to daily SRI. Ongoing GADS analysis[26] will help improve the understanding of how the generation fleet is performing. Additionally, further assessment of the SRI weighting factors should be considered to determine whether modifications to this measure are appropriate. Finally, with the significant role that weather played during 2014, additional studies should be completed to determine the extent of acceptable weather impacts to BPS performance. To the extent that weather is determined as a large impact to day-to-day and extreme-day performance, other metrics that report on load-loss events that retain weather impacts should be developed.

Recommendations

- NERC, through the PAS, should reevaluate SRI criteria to consider weather impacts.
- NERC, through the PAS, should develop metrics that retain weather impacts on load-loss events.

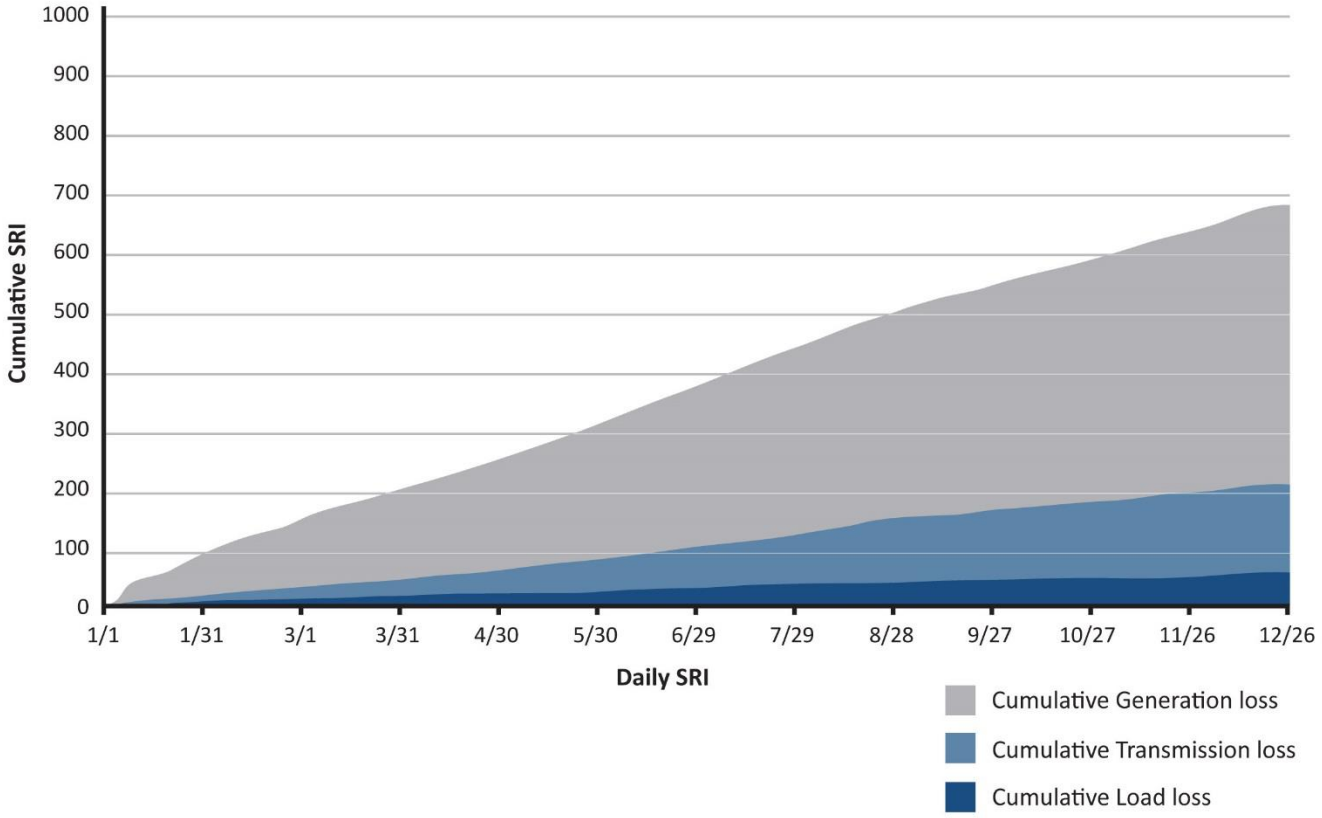

Figure 3.4: NERC Cumulative SRI by Component for 2014

[26] http://www.nerc.com/pa/RAPA/gads/Pages/default.aspx.

Overview of TADS Data Analysis

A complete analysis of Transmission Availability Data System (TADS) data is presented in Appendix A. First, NERC performed an analysis of all TADS outage events (momentary and sustained). Then NERC limited the study to outage events that resulted in multiple transmission element outages (common or dependent-mode (CDM) events). Next, NERC performed a study on all outage events that lasted for more than a minute (defined as a sustained outage). Finally, NERC studied the transmission outage severity of TADS events by Regional Entity. This year was the first time that NERC performed these studies on sustained outages and Regional Entity variations.

Figure 3.5 represents an analysis of the risk profile of the 2012–2014 TADS events combined study. The x-axis is the magnitude of the correlation of a given Initiating Cause Code (ICC) with transmission outage severity. The y-axis represents the expected transmission outage severity of an event when it occurs. The color of the marker indicates if there is a correlation of transmission outage severity with the given ICC (either positive— Red, negative—Green, or no significant correlation—Blue). The size of the marker indicates the probability of an event initiating in any hour with a given ICC.

The Misoperation ICC (which represents TADS ICCs Failed Protection System Equipment and Human Error associated with Misoperations) and the Failed AC Substation Equipment ICC both show a statistically significant positive correlation with transmission outage severity and show a higher relative transmission risk. Power System Condition, while showing a positive correlation of transmission outage severity, has a lower relative transmission risk, based on the probability of this TADS outage event initiating in any hour and its expected transmission outage severity. On the other end of the risk spectrum, Lightning shows a high relative transmission risk but has no significant correlation with transmission outage severity.

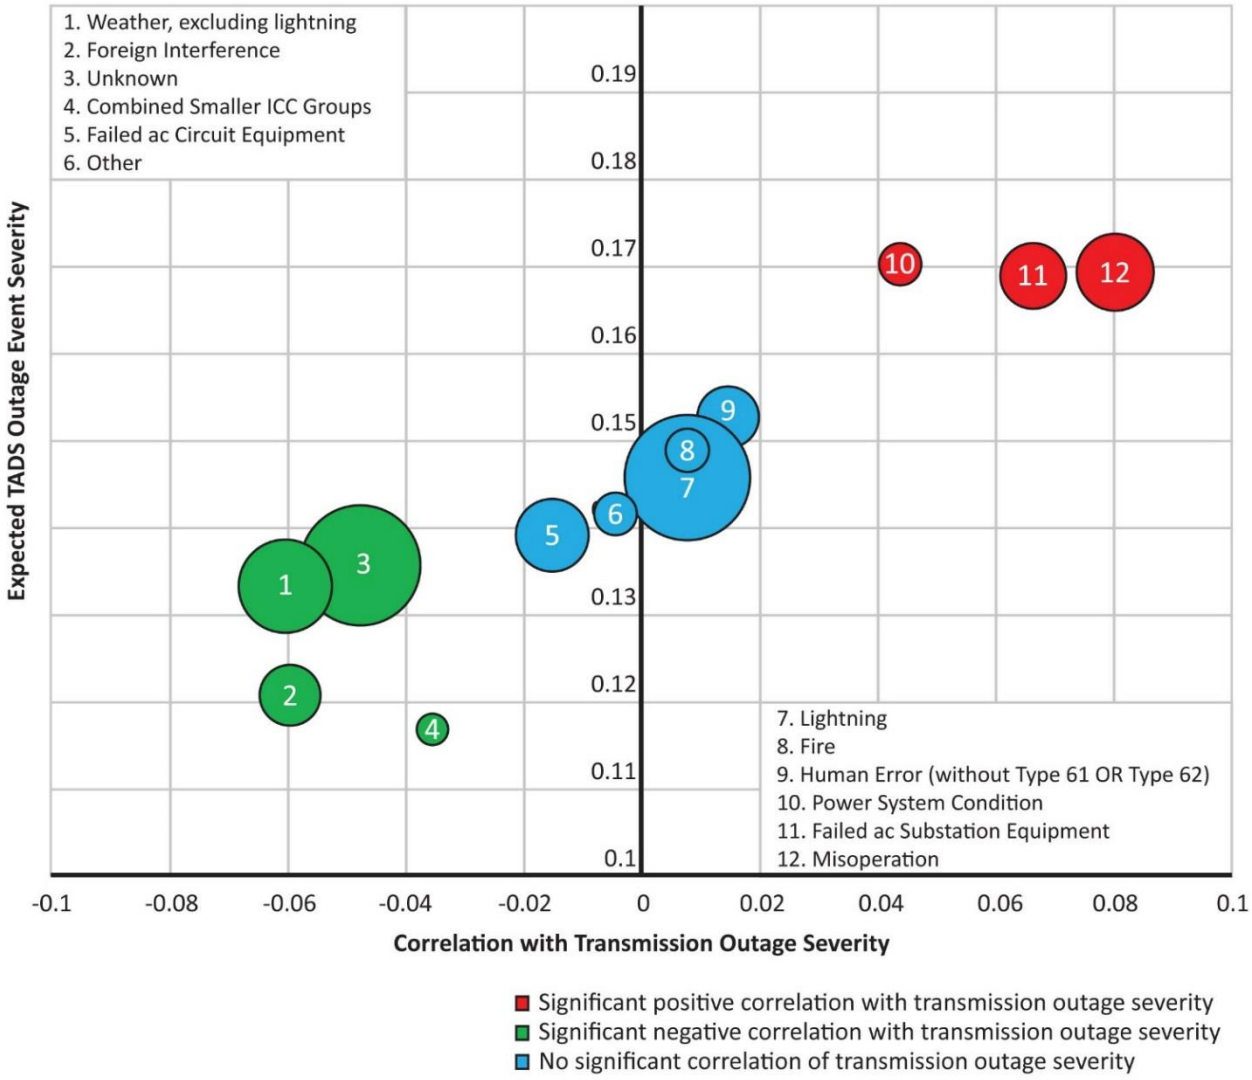

Figure 3.5: Risk Profile of the 2012–2014 TADS Events by ICC

The statistical analysis of the 2012–2014 TADS data on the transmission outage severity and initiating causes of TADS outage events yields the following observations:

- Excluding weather-related and Unknown ICCs, Misoperations and Failed AC Substation Equipment remain the two largest contributors to transmission outage severity risk for all TADS events (momentary and sustained) and all sustained TADS events.
- TADS outage events initiated by either of these ICCs have statistically significant higher expected outage severity than all other TADS outage events.
- Among other ICCs, only Power System Condition has a statistically significant positive correlation with transmission outage severity, but events initiated by this reported cause are less frequent and together contribute only 2.9 percent to the total transmission outage severity of the 2012–2014 TADS events.
- Statistical tests show that the average transmission outage severity of the events initiated by both Misoperations and Failed AC Substation Equipment significantly decreased in 2014 versus 2012.

- Sustained TADS outage events with Unknown ICCs require further review by the TADS Working Group (TADSWG) to determine:
    - The sustained outage events that have an Unknown ICC, and
    - The relative risk of events with both an ICC and sustained cause code of Unknown.
- The ICCs of TADS outage events are very different by Region.

Overview of GADS Data Analysis

A complete analysis of GADS data is presented in Appendix B. An analysis of the age of the existing fleet shows:

- There is an age bubble around 39–47 years, and that population is driven by coal and some gas units.
- There is a significant age bubble around 11–13 years comprised almost exclusively of gas units.

The data set shows a clear shift toward gas-fired unit additions, and the overall age of that fleet across North America is almost 10 years younger than the age of the coal-fired baseload plants that have been the backbone of power supply for many years. This is a trend that is projected to continue given current forecasts around price and availability of natural gas as a power generation fuel.

To understand generator performance, NERC reviewed the top-10 causes of unit outages for the summer and winter seasons, as well as the annual causes, for the 2012–2014 period. The analysis focused on the top causes for non-weather-related outages, measured in terms of lost MWh, so it captures both the amount of capacity during the outage and the duration of the outages. Although only three years of data is available, some observations were made:

- In calendar year 2014, lack of fuel was one of the top-10 causes of generator outages and the second-most frequent cause in winter months. This was the first time that this type of outage placed in the top 10.
- Energy lost during summer has remained relatively consistent over the three-year period.
- Generally, energy lost in the winter season is greater than other periods of the year.
- The energy lost in the 2014 winter showed a significant increase driven in large part by outages related to the polar vortex.
- The sharp increase in the annual value of lost energy reported in 2014 was driven by the winter seasonal outages.

Overview of DADS Data Analysis

A complete analysis of Demand Response Availability Data System (DADS) data is presented in Appendix C. Mandatory collection of detailed demand response data began with the 2011 Summer Period. A review of the summer period data was provided in the *2012 State of Reliability* report. Since 2012, the DADS Working Group (DADSWG) has been working to improve the data quality and process within DADS. Actions taken in the last year include:

- Revising the DADS glossary of definitions,
- Streamlining event type reporting,
- Implementing changes to the webDADS portal, and
- Updating the historically reported event type to align with revised terms.

An analysis of the DADS data for 2014 provides the following observations:

- The registered demand response capacity for all product service types was 44,285 MW for August 2013 and 44,583 MW for 2014, an increase of less than 1 percent.
- Load as a Capacity Resource appears to be the most common use of demand response resources for reliability (66 percent in 2013 and 58 percent in 2014), followed by Direct Control Load Management.
- The impact of the polar vortex is evident in the number of days that demand response was dispatched and the number of affected areas in January 2014.
- Across North America, demand response is used an average of six times a month to respond to reliability events, dispatching an average of 500 MW each month.

Chapter 4 – Reliability Indicator Trends

Reliability Indicator Trends – Summary

NERC Reliability Indicators are intended to tie the performance of the BPS to the set of specified objectives and outcomes for the NERC Reliability Performance Objectives to measure whether an adequate level of reliability (ALR) exists. Based on the events that occurred in 2014 and the metrics data analyzed, the system shows a continuing trend toward sustaining a high level of reliability performance.

One of the stated purposes for the ALR indicators is for the NERC Performance Analysis Subcommittee (PAS) to assess BES reliability and identify gaps in performance and data collection. In 2014, the PAS focused on aligning the existing reliability indicators with the new BES definition.[27] This included evaluating existing metrics to determine those that should continue (with possible modification) and those that should be retired. The PAS also evaluated whether new metrics should be developed.

Table 4.1 shows the mapping of the 14 metrics monitored in 2014 to the seven Reliability Performance Objectives of the ALR definition approved in 2012.[28] In 2013, the PAS introduced a new naming convention (M-x) for the existing 14 metrics shown below. This naming convention was first introduced in the *State of Reliability 2013* report. Both metric naming conventions (M-x and ALRxx) are used in this chapter, but in future reports, the new metric names will be used.

Table 4.1 Adequate Level of Reliability Metrics

Reliability Performance Objectives	System Stability	System Frequency	System Voltage	Manage Contingencies	Coordinate Restoration	Transmission Adequacy	Resource Adequacy
New ID (ALR Metrics)	M-2 (ALR1-4) M-4 (ALR1-12) M-9 (ALR4-1)	M-4 (ALR1-12) M-6 (ALR2-4)		M-2 (ALR1-4) M-6 (ALR2-4) M-7 (ALR2-5) M-8 (ALR3-5) M-11 (ALR6-2)	M-2 (ALR1-4) M-11(ALR6-2)	M-2 (ALR1-4) M-8 (ALR3-5) M-10 (ALR6-1) M-12(ALR6-11) M-13(ALR6-12) M-14(ALR6-13) M-15(ALR6-14) M-16(ALR6-15)	M-1 (ALR1-3) M-11(ALR6-2)

These metrics exist within a reliability framework. The current 14 performance metrics align with the performance objectives for the design, planning, and operation of the BES. These metrics contribute to the Reliability Performance Objectives, which will lead to a more resilient and reliable BES. There is at least one existing performance metric associated with each of the performance objectives listed in the table, except system voltage. The existing metric for system voltage performance M-3 (ALR 1-5) was retired in 2014. Efforts are underway to develop one or more metrics to more effectively determine system voltage performance.

The definition of ALR speaks to the state of the BES in which the Performance Objectives are met. It is therefore intuitive that one could not base such an assessment of reliability on one metric only. Rather, it is necessary to look at the entire set of metrics to evaluate that the ALR state has been attained. Any comparisons of individual metrics alone or between Regions, or to value one metric higher than another, should be evaluated with care.

[27] http://www.nerc.com/pa/Stand/Pages/Project2010-17_BES.aspx.

[28] Definition of "Adequate Level of Reliability," http://www.nerc.com/comm/Other/Adequate_Level_of_Reliability_Task_Force_ALRTF_DL/Final_Documents_Posted_for_Stakeholders and Board of Trustee Review/10_04_12_ALR_Definition_clean.pdf (The last two performance objectives relate to planning assessments, which are not covered in the report).

Another metric reporting principle is to retain anonymity of individual reporting organizations. Thus, details are presented in this report at a NERC level, and a Regional Entity level, and do not compromise anonymity of individual reporting organizations.

Process Overview

Building upon previous metric reviews, the results of the approved performance metrics continue to be assessed. Each metric is designed to provide a measure of one or more Reliability Performance Objectives. Due to varying data availability, each of the performance metrics does not address the same time period (some metrics have just been established or modified, while others represent data collected over many years). At this time, the number of metrics is expected to remain relatively stable; however, the PAS annually reviews the set of metrics and, working with industry subject matter experts, may recommend changes to metrics, or new metrics, as gaps are identified in reliability data needed to assess the state of reliability of the BES.

In 2014, The PAS performed this review, which resulted in the retirement of metrics ALR1-5 and ALR2-3 and the modification of several others. Specific changes to metrics that were approved in 2014 and those that are ongoing will be described in greater detail in this section.

Table 4.2 provides an overview of the ALR metric trends through 2014. Although a number of performance categories have been assessed, some do not yet have sufficient data to derive conclusions from the metric results. Assessment of these metrics should continue as additional data becomes available to determine if the metric is a good indicator of the performance objective it is meant to measure. As indicated below, most of the ALR metrics have been revised in the past two years.

The following provides a discussion of each metric and activity on certain metrics where changes have been implemented and those that are associated with key findings. The full set of metrics and their descriptions, along with the results and trending, are on the NERC public website.[29]

M-2 (ALR1-4) BPS Transmission-Related Events Resulting in Loss of Load

Background

This metric measures BPS transmission-related events resulting in the loss of load, excluding weather-related outages. Planners and operators can use this metric to validate their design and operating criteria by identifying the number of instances when loss of load occurs. For the purposes of this metric and consistent with the revised metric approved by the Operating and Planning Committees in March, 2014, an "event" is an unplanned disturbance that produces an abnormal system condition due to equipment failures/system operational actions (either intentional or unintentional) that result in the loss of firm system demands, utilizing the subset of data provided in accordance with EOP-004-2. The reporting criteria for such events beginning with data for events occurring in 2013 are outlined below:[30]

1. Loss of firm load for 15 minutes or more:
   a. 300 MW or more for entities with previous year's demand of 3,000 MW or more.
   b. 200 MW or more for all other entities.

[29] Assessments & Trends: Reliability Indicator, http://www.nerc.com/pa/RAPA/Pages/ReliabilityIndicators.aspx.
[30] http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf.

2. BES Emergency requiring manual firm load shedding of 100 MW or more.
3. BES Emergency resulting in automatic firm load shedding of 100 MW or more (via automatic under voltage or under frequency load shedding schemes, or SPS/RAS).
4. Transmission loss event with an unexpected loss within an entity's area, contrary to design, of three or more BES Elements caused by a common disturbance (excluding successful automatic reclosing) resulting in a firm load loss of 50 MW or more.

This metric was reviewed by the PAS in 2013, and changes were made to make the criteria consistent with the approved changes to EOP-004-2 reporting criteria pertaining to transmission-related events that result in loss of load. The criteria presented above were approved for implementation in the first quarter of 2014. Changes in the annual measurement between 2012 and 2013 therefore reflect the addition of criterion 4, which has been applied to the 2013 and 2014 data. For the first part of the analysis below, historical data back to 2002 was used, and the new criterion 4 was not included, to enable trending of the other aspects of the metric over time. Figure 4.3 includes all of the criteria; therefore, it was only evaluated for 2013 and 2014, the time period for which data collection associated with the new criterion was available.

Assessment

Figure 4.1 shows the number of BPS transmission-related events resulting in loss of firm load from 2002 to 2014. Figure 4.2 provides a breakdown of the events per year by load interrupted. In 2014, there were fewer events than any other year in the data set except for 2012. The year 2014 has the second-lowest average level of load lost in megawatts of all years for which data exists, with three events resulting in 1160 MW of load lost.

With three years of data indicating that the number and megawatt load loss amount for the past three years is significantly less than previous years, M-2 has shown marked improvement over the assessment period.

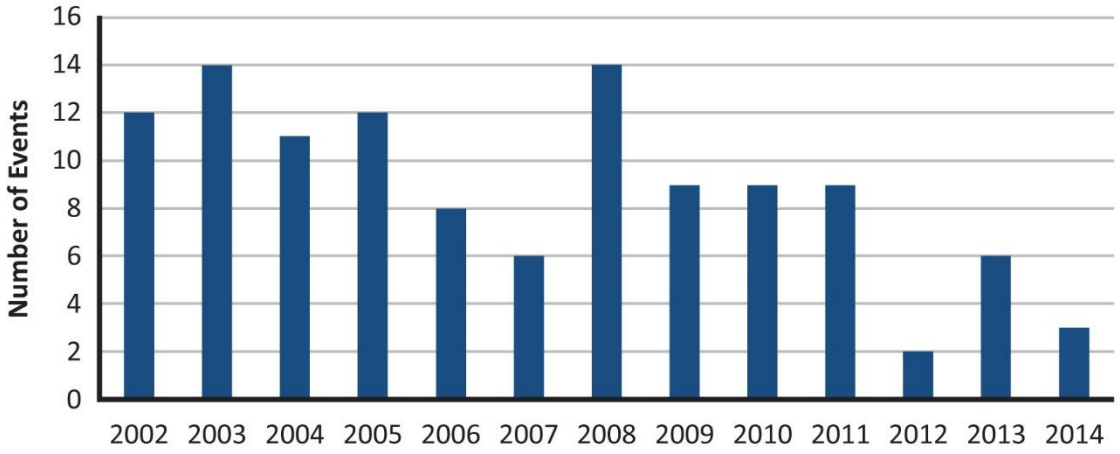

Figure 4.1: M-2 (ALR1-4) BPS Transmission-Related Events Resulting in Load Loss (2002–2014 – Excluding Criteria 4)

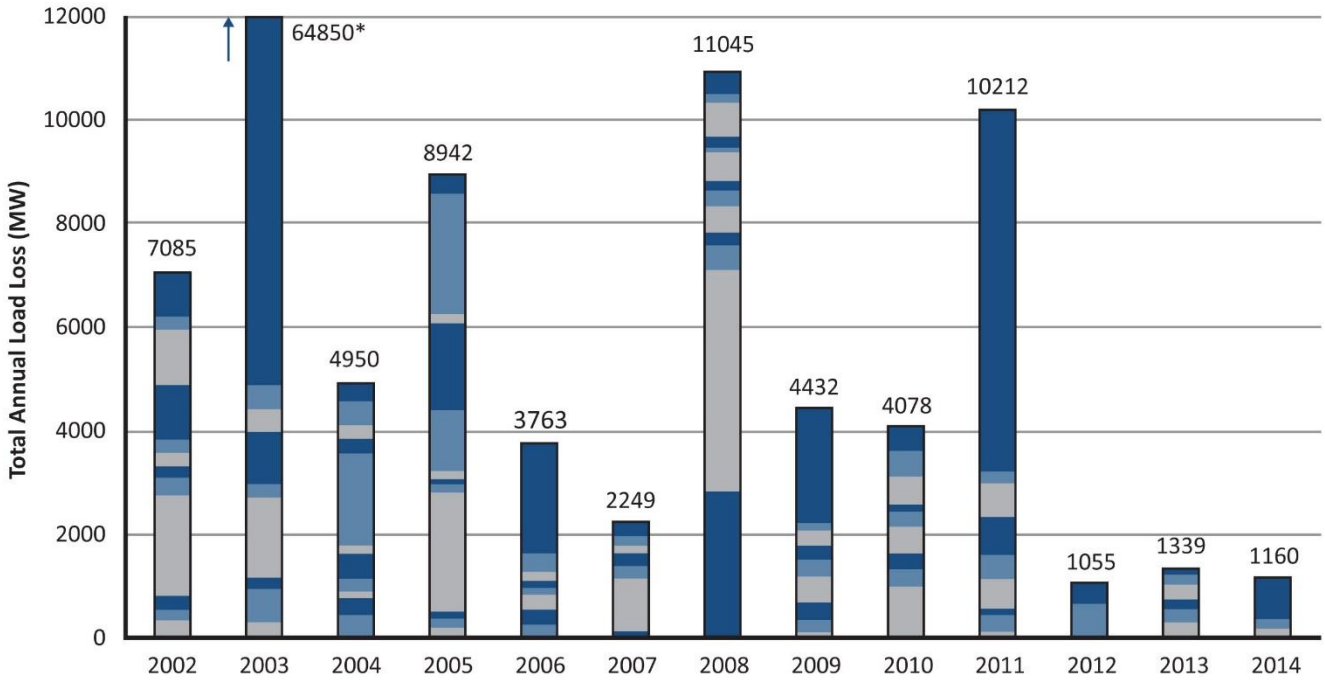

Each band of color represents a different event.

**Vertical axis scale has been reduced due to large value of 2003 NE blackout event.*

Figure 4.2: M-2 (ALR1-4) BPS Transmission-Related Events Resulting in Load Loss (Excluding Criteria 4)

Table 4.3 shows total megawatt loss values and duration of events resulting in firm load loss of 50 MW or greater and includes all four criteria for this metric. This table shows that in 2014, in addition to the three events that were reported and shown in Figures 4.1 and 4.2 under criteria 1, 2, and 3, there were three additional events that were associated with the new criterion. While Figures 4.1 and 4.2 show 2014 transmission-related load-loss events based on the historical metric language, Table 4.3 shows what the number and load loss would be for transmission-related load loss events in 2013 and 2014. Further analysis and continued assessment of the trends over time will continue.

Table 4.3: 2013 and 2014 Events with Load Loss ≥ 50 MW (Including Criteria 4)

Duration (hours)	2013	2014
3.83	300	
2.73	240	
10.33	200	
1.5	297	
1.63	200	
1.25	102	
3.03	51	
3.82	90	
7.27	90	
2.82	70	
1.3	50	
3		797
1.7		200
1.67		163
0.83		95
0.97		71
1.02		63

Special Considerations

The collected data does not indicate whether load loss during an event occurred as designed. Data collection will be refined in the future for this metric to allow enable data grouping into categories, such as separating load loss as designed from unexpected firm load loss. Also, differentiating between load loss as a direct consequence of an outage compared to load loss as a result of an operator-controlled action to mitigate an IROL/SOL exceedance should be considered.

M-3 (ALR1-5) System Voltage Performance

Background

This metric was removed from the monitored set in 2014 and will no longer be included in future reports.

Data collection consisted of the total number of key buses/nodes being monitored at 345 kV and above, the total number of minutes by quarter that the voltage was either above the predetermined upper threshold or below the predetermined lower threshold. With more than two years of data collected and reviewed, the PAS determined that there was insufficient information about voltage performance in the collected data for the M-3 metric and data collection has been discontinued.

Future Development

In 2014, NERC established the Essential Reliability Services Task Force (ERSTF), a team tasked with identifying those Essential Reliability Services that are the elemental reliability building blocks necessary to maintain BPS reliability and associated measures. The ERSTF has recommended a measure[31] that was approved by the Operating Committee (OC) and Planning Committee (PC) for data collection and testing, which may support development of new voltage and reactive support metrics going forward.

M-4 (ALR1-12) Interconnection Frequency Response

Background

The purpose of this metric is to monitor interconnection frequency response, which is a measure of an interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load. It is a critical component to the reliable operation of the BPS, particularly during disturbances. The metric measures the average frequency response for all events where frequency deviates more than the interconnection's defined threshold.

The following are frequency response calculations of the Eastern, Western, ERCOT, and Québec Interconnections. Figure 4.3 shows the criteria for calculating average values A and B used to report frequency response. The event starts at time t±0. Value A is the average from t-16 to t-2 seconds, and Value B is the average from t+20 to t+52 seconds. The difference of value A and B is the change in frequency[32] used for calculating frequency response. The monthly frequency event candidate lists are posted on the NERC Resources Subcommittee[33] website. These lists are vetted by the NERC Frequency Working Group and the final list is published on a quarterly basis. The data is used to support Reliability Standard BAL-003-1. The frequency event data collection process is described in the BAL-003-1 Frequency Response Standard Supporting Document.[34]

[33] Resource Subcommittee (RS), http://www.nerc.com/comm/OC/Pages/Resources-Subcommittee-(RS)-2013.aspx.

[34] BAL-003-1 Frequency Response & Frequency Bias Setting Standard, 07/18/2011, http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/NOPR_Proposal for BAL-003-1.pdf.

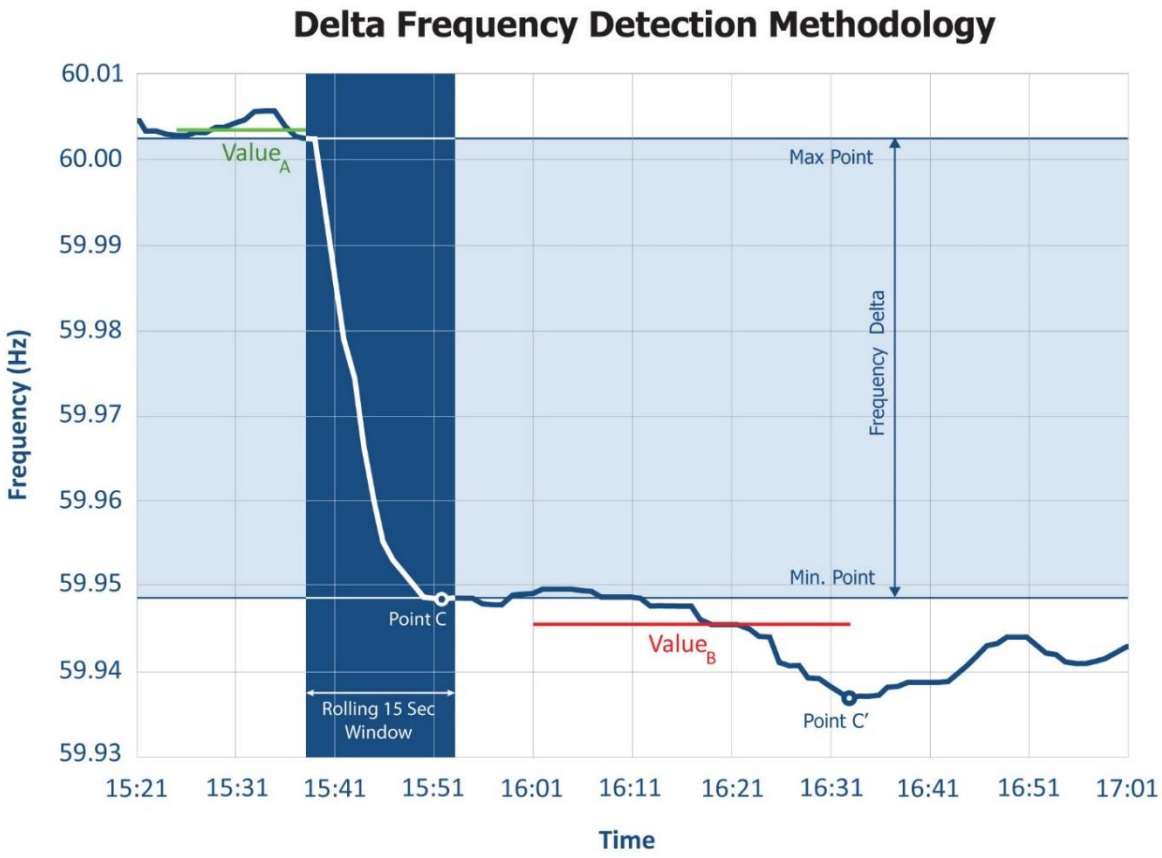

Figure 4.3: Criteria for Calculating Value A and Value B

The actual megawatt loss from a generation frequency event is determined jointly by NERC and Regional Entity situation awareness staff to develop the monthly frequency event candidate list. Both the change in frequency and the megawatt loss determine whether the event qualifies for further consideration for use in the M-4 metric or for the measurement of BA performance under Reliability Standard BAL-003-1 by the NERC Frequency Working Group. If the event qualifies, then the actual MW loss is converted to a beta value (MW/.1 Hz) for use in Figure 4.3 above. The final monthly datasets of approved frequency events[35] are then used to analyze the interconnection frequency response performance.

In examining the frequency event selection process, NERC staff found that process to be too restrictive in event selection. The Resources Subcommittee and NERC staff have made recommendations to improve the process for selecting frequency events.[36]

[35] Starting in 2014, all frequency events selected for use in BAL-003 shall be also used for the ALR 1-12 frequency performance metric.
[36] http://www.nerc.com/FilingsOrders/us/NERC Filings to FERC DL/Final_Info_Filing_Freq_Resp_Annual_Report_03202015.pdf

Table 4.4 shows a proposed set of revisions to the event detection and selection triggers for M-4.

Table 4.4: ALR 1-12 Frequency Event Candidate Triggers

Interconnection	Detection		Selection	
	MW Load Loss[37]	MW Resource Loss	MW Load Loss[34]	MW Resource Loss
Eastern	800	750	800	800
Western	700	650	700	700
ERCOT	450	400	450	450
Québec	450	400	450	450

The recommended criteria for frequency events also include the following:

- All BAL-003-1 frequency events should be a subset of the ALR 1-12 event set.
- All event detection windows are to remain at 15-second rolling windows.
- No change is recommended to the BAL-003-1 event selection process.
- Actual net megawatt loss will be verified for each megawatt loss event. Megawatt changes for load loss or pumped storage load rejection events will rely on FNet[38] estimates until better data sources become available.
- Data for all candidate events will be collected from the FNet system (Values A and B, Point C, Point C', and 300 seconds of high-speed frequency data surrounding the event). These data will be stored in a database for use in the annual analysis.
- Events could be triggered from several sources:
  - The FNet system alarms
  - Reliability Coordination Information System (RCIS) messages
  - E-mail
  - Telephone calls
- Screen only actual megawatt change against the megawatt criteria.
- No criteria will be applied on frequency change parameters, allowing for purer statistical analysis of interconnection performance.
- Weekly reviews will be conducted by NERC staff to screen candidate events for ALR 1-12 selection.
- Investigate the potential for applying a T=+0 to Point C slope (arresting slope) criteria to eliminate shallow slopes that may not be reflective of primary frequency response.

Data errors were determined to have existed in the 2013 data set; however, this did not alter the findings of the report. It changed one slightly negative trend to a positive one and resulted in key information being

[37] Or Pumped-Storage Load Rejection.

[38] Operated by the Power Information Technology Laboratory at the University of Tennessee, FNet is a low-cost, quickly deployable GPS-synchronized wide-area frequency measurement network. High dynamic accuracy Frequency Disturbance Recorders (FDRs) are used to measure the frequency, phase angle, and voltage of the power system at ordinary 120 V outlets. The measurement data are continuously transmitted via the Internet to the FNet servers hosted at the University of Tennessee and Virginia Tech.

identified for the industry. The following summarizes the findings of NERC staff in their analysis of frequency response performance and the modifications to 2013 data:[39]

- Frequency event selection errors during 2013 were found in the ALR 1-12 Frequency Response metric that were presented in the *State of Reliability 2014* report. This resulted in 19 Eastern Interconnection events being eliminated from the set of ALR 1-12 events. This resulted in a change from the slightly negative trend reported in the *State of Reliability 2014* report to a statistically significant positive trend. The analysis for the Eastern Interconnection is corrected in this report, and that correction has been made to the NERC Reliability Indicators dashboard.[40]
- Frequency step-change[41] anomalies were found in the 2013 1-second Eastern Interconnection frequency data used to determine the starting frequency for the IFRO calculations. The problem was traced back to toggling back and forth between two data sources in the calculation of the 1-second averaged data. The entire 2013 1-second database was recalculated to correct the anomalies.
- An error was discovered in several start times for frequency events in the Eastern, Western, ERCOT, and Québec Interconnections starting in July 2013.[42] The problem arose from a sign error in an adjustment factor used to remove a time skew inherent in the high-speed metrology; instead of removing the time skew, the adjustment factor was doubling it. This impacted several of the adjustment factors used in the IFRO calculation related to Point C. The error was corrected and all timing of frequency events have been recalculated for this and future analyses.

Table 4.5 shows the number of frequency events per year for each interconnection from 2012 through 2014. This represents a change in the frequency response data provided in the 2013 and 2014 *State of Reliability* reports. The trend results and statistical analysis provided in this section and in Appendix D include the updated set of frequency events.

Table 4.5: Annual Number of Frequency Events

Interconnection	2012	2013	2014
Eastern	16	36	45
ERCOT	53	48	37
Quebec	21	29	24
Western	10	23	35

The new threshold, which is 36 mHz below 59.960 Hz (Point C in Figure 4.3) and delta Hz more than 30 mHz within a 15-second time window, resulted in an increase in the number of events for the Eastern Interconnection in 2013. Care must be taken to select events that impact frequency beyond the expected deadband settings for each Interconnection. Beta megawatt projections for events that are slightly larger than the Interconnection megawatt cutoff threshold can potentially result in outliers. The resulting frequency response for these smaller events may be small if generator governors have dead bands set higher than the expected value. Another factor that can impact the projected beta megawatt value is the 32-second average value chosen for point B. If the frequency response is not sustained for the duration of the 32-second average, the resulting frequency response will be lower and consequently result in a lower beta megawatt value. Lack of sustained frequency response is evident in the Eastern Interconnection and is referred to as the "Lazy L" in frequency over time charts.

[39] http://www.nerc.com/FilingsOrders/us/NERC Filings to FERC DL/Final_Info_Filing_Freq_Resp_Annual_Report_03202015.pdf.

[40] Located at: http://www.nerc.com/pa/RAPA/ri/Pages/InterconnectionFrequencyResponse.aspx.

[41] Abrupt changes in frequency.

[42] This problem did not affect the 2013 IFRO calculations because it began after the time frame used in those calculations.

On February 5, 2015, NERC issued an Industry Advisory on generator governor frequency response.[43] NERC determined that a significant portion of the Eastern Interconnection generator dead bands or governor control settings inhibit or prevent frequency response. With the exception of nuclear generators, entities with generators greater than 75 MVA were advised to review generator governor and Distributed Control System (DCS) settings to conform to specifications mentioned in the Advisory.

Assessment

NERC annually applies statistical tests to interconnection frequency response datasets,[44] and additional analyses on time of year, load levels, and other attributes have been conducted annually since 2013. Frequency response is the absolute value of the ratio of the megawatts lost when generation is tripped and the difference in frequency before and after the event. A large value of frequency response is considered better than a small value.

Frequency Response Trending

From 2012 through 2014, the historical frequency response shows the following trends:

- Frequency response performance in ERCOT and the Western Interconnection was stable, with a time trend being statistically flat.
- Frequency response in the Eastern Interconnection has shown a statistically significant improvement with the average monthly rate of increase of 15.0 MW/0.1 Hz.
- The Québec Interconnection experienced a statistically significant decline with the average monthly rate of decrease of 6.8 MW/0.1 Hz.

The differences in the evaluations of the frequency response performance compared with the *State of Reliability 2014* report are due to the addition of the 2014 data, and also to a removal of the 2009–2011 data (based on new selection criteria) and a major revision of the 2012–2013 data as described above. Still, the current three-year datasets are relatively small, and a future addition of annual frequency response values might change the trends.

Statistical Significance Test Results

Statistical significance tests were applied to Interconnection frequency response datasets, and additional analysis on time of year, load levels, and other attributes were also conducted. Following are the overall observations and test results:

- The Eastern Interconnection frequency response has shown a statistically significant increase from 2012 to 2014, with an average monthly rate of increase of 15.0 MW/0.1 Hz.[45]
- The ERCOT Interconnection frequency response was stable from 2012 to2014, with a statistically flat time trend.[46]

[43] http://www.nerc.com/pa/rrm/bpsa/Alerts DL/2015 Alerts/NERC Alert A-2015-02-05-01 Generator Governor Frequency Response.pdf.

[44] Datasets described in the Frequency Response Initiative Report, October 2012 http://www.nerc.com/docs/pc/FRI_Report_10-30-12_Master_w-appendices.pdf.

[45] The correlation between time variable and frequency response is positive ,and this is equivalent to the fact that the slope is positive and the trend line is increasing function with the average monthly growth of 15.0 MW/Hz*0.1; moreover, the correlation is statistically significant (p=0.03). This leads to the rejection of the null hypothesis of zero correlation. So, the observed increasing trend for frequency response unlikely occurred by chance.

[46] The correlation between time variable and frequency response is positive and this is equivalent to the fact that the slope is e and the trend line is increasing function. However, the correlation is not statistically significant. This leads to the failure to reject the null hypothesis of zero correlation. So even though the increasing trend for frequency response in time was observed, there is a high probability that the positive correlation and the positive slope occurred by chance.

- The Québec Interconnection frequency response experienced a statistically significant decline in 2012–2014, with an average monthly rate of decrease of 6.8 MW/0.1 Hz.[47]
- The Western Interconnection frequency response was stable from 2012 to –2014, with a statistically flat time trend.[48]

The statistical analysis of the observed trends can be found in Appendix D.

[47] The correlation between time variable and frequency response is negative, and this is equivalent to the fact that the slope is negative and the trend line is a decreasing function with the average monthly decrease of 6.8 MW/Hz*0.1; moreover, the correlation is statistically significant (p=0.007). This leads to the rejection of the null hypothesis of zero correlation. So, the observed decreasing trend for frequency response unlikely occurred by chance.

[48] The correlation between time variable and frequency response is negative and this is equivalent to the fact that the slope is negative and the trend line is decreasing function. However, the correlation is not statistically significant. This leads to the failure to reject the null hypothesis of zero correlation. So even though the decreasing trend for frequency response in time was observed, there is a high probability that the negative correlation and the negative slope occurred by chance.

Eastern Interconnection

Figure 4.4 is a scatter plot of the frequency response of reviewed events in the Eastern Interconnection for 2012 to 2014. The time trend line had a statistically significant positive slope, which demonstrates that frequency response is improving over time in the Eastern Interconnection. The IFRO is shown as well, and none of the frequency response values fell below the IFRO. The sample statistics by year are listed in Table 4.6. The last column lists the number of frequency response events that fell below the absolute IFRO.[49]

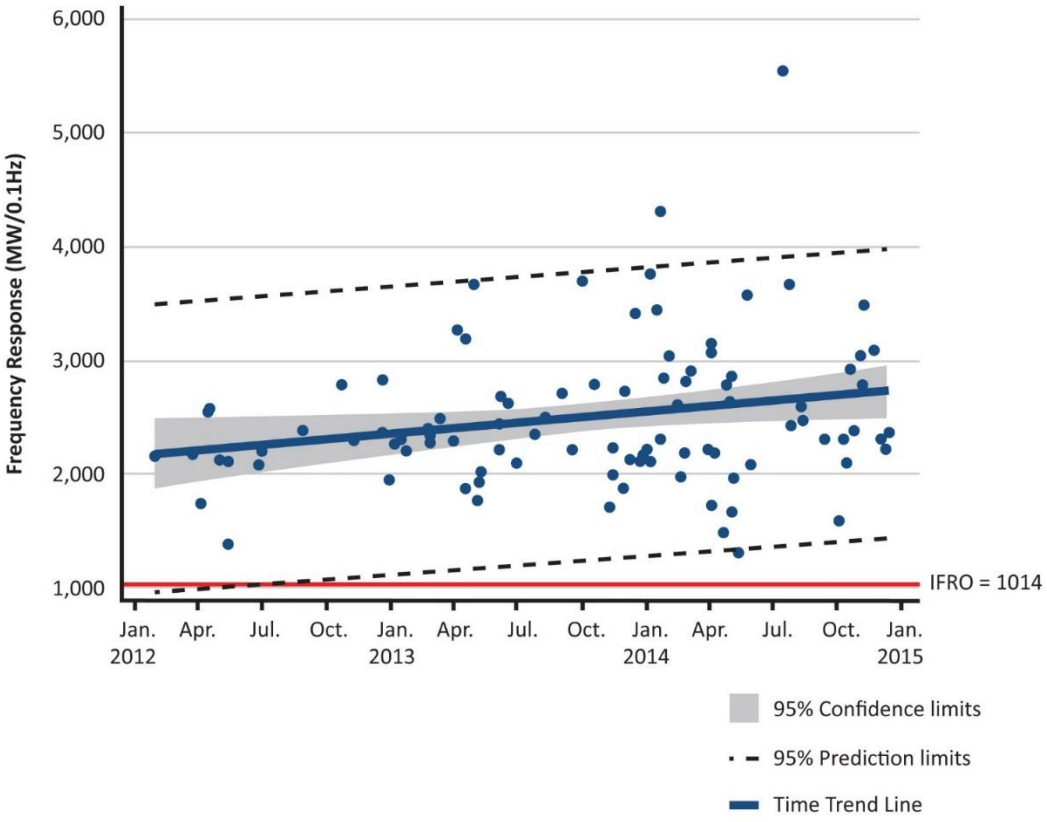

Figure 4.4: Eastern Interconnection Frequency Response Trend 2012–2014

Table 4.6: Sample Statistics for Eastern Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 1014 MW/0.1 Hz
2012-2014	**97**	**2488.28**	**642.43**	**2307.43**	**1300.26**	**5552.36**	**0**

Western Interconnection

Figure 4.5 is a scatter plot of the frequency response of reviewed events in the Western Interconnection from 2012 to 2014. The time trend line had a nonsignificant negative slope, which demonstrates that frequency response has been stable from 2012 through 2014 in the Western Interconnection. The sample statistics by year are listed in Table 4.7. The last column lists the number of frequency response events that fell below the absolute IFRO.[50] In 2012–2014, there were four occurrences of frequency response events with values below the IFRO, which is 907 MW/0.1 Hz.

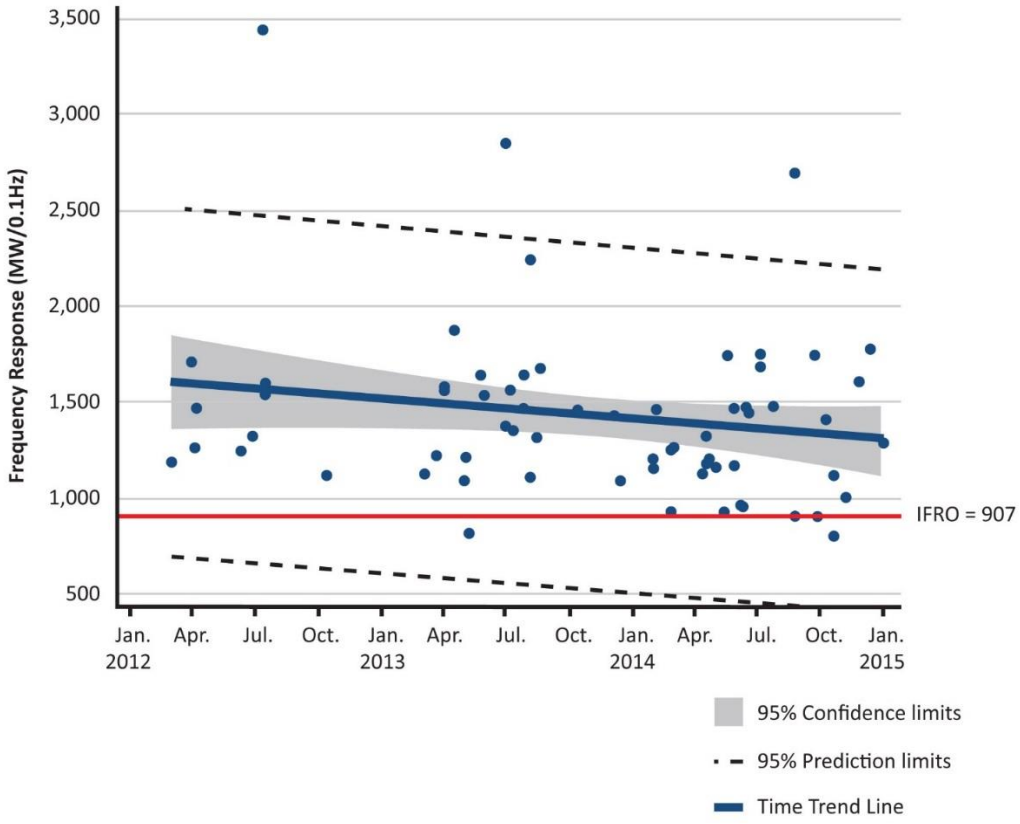

Figure 4.5: Western Interconnection Frequency Response Trend 2012–2014

Table 4.7: Sample Statistics for Western Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 907 MW/0.1 Hz
2012-2014	**68**	**1419.06**	**444.92**	**1336.80**	**798.34**	**3439.70**	**4**

ERCOT Interconnection

Figure 4.6 is a scatter plot of the frequency response of reviewed events in the ERCOT Interconnection from 2012 to 2014. The time trend line had a nonsignificant positive slope, which demonstrates that frequency response has been stable from 2012 through 2014 in the ERCOT Interconnection. The sample statistics by year are listed in Table 4.8. The last column lists the number of frequency response events that fell below the absolute IFRO.[51] In 2012–2014 there were 21 occurrences of frequency response events with values below the IFRO, which is 471 MW/0.1 Hz.

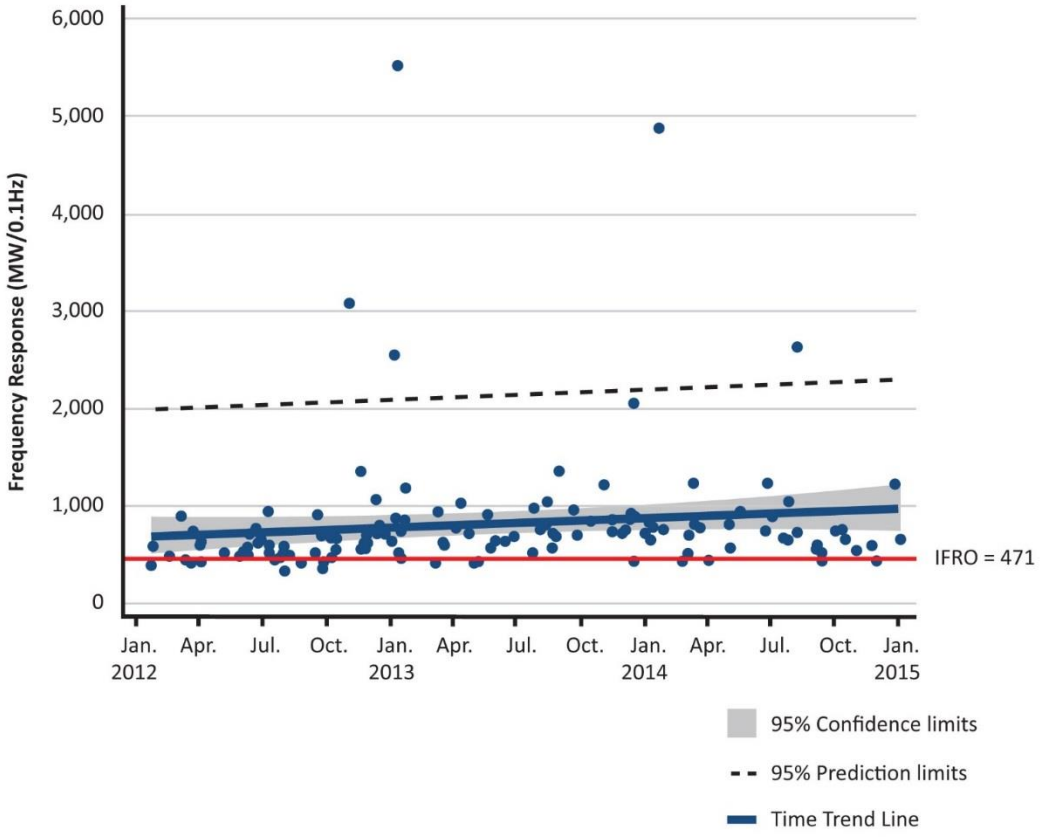

Figure 4.6: ERCOT Frequency Response Trend 2012–2014

Table 4.8: Sample Statistics for ERCOT Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 471 MW/0.1 Hz
2012-2014	**138**	**809.70**	**661.67**	**663.83**	**336.77**	**5530.50**	**21**

Québec Interconnection

Figure 4.7 is a scatter plot of the frequency response of reviewed events in the Québec Interconnection for 2012–2014. The time trend line had a statistically significant negative slope, which demonstrates that frequency response is decreasing over time in the Québec Interconnection. The sample statistics by year are listed in Table 4.9. The last column lists the number of frequency response events that fell below the absolute IFRO.[52]

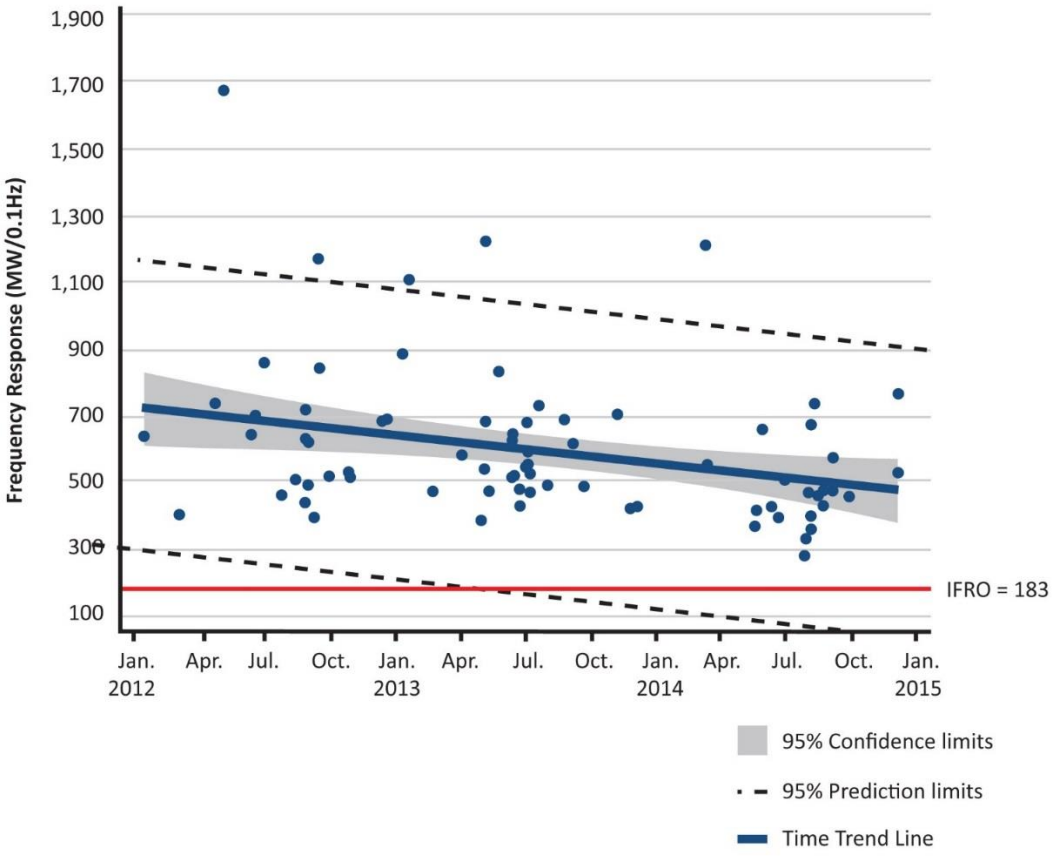

Figure 4.7: Québec Interconnection Frequency Response Trend 2012–2014

Table 4.9: Sample Statistics for Quebec Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 183 MW/0.1 Hz
2012-2014	**74**	**591.8**	**220.6**	**526.9**	**288.3**	**1673.6**	**0**

2013	29	606.5	192.2	545.9	389.1	1227.8	0
2014	24	517.7	192.8	465.1	288.3	1212.4	0

[52] http://www.nerc.com/FilingsOrders/us/NERC Filings to FERC DL/Final_Info_Filing_Freq_Resp_Annual_Report_03202015.pdf.

Relation to Interconnection Frequency Response Obligations

The expected frequency response for each interconnection was compared to their respective IFROs from the *2014 Frequency Response Annual Analysis*. In all cases, the statistically expected frequency response for each interconnection has been greater than the recommended absolute IFRO values.[53]

The historical frequency responses show the following:

- There were no events during the assessment period for which the frequency response of the Eastern Interconnection or the Québec Interconnection was below the IFRO.
- The Western Interconnection had four events with frequency response values below the absolute IFRO, which amounts to 6 percent of all Western Interconnection events for the three years. Three of the events occurred in 2014.
- The ERCOT Interconnection had 21 events with frequency response values below the absolute IFRO, or 15 percent of all events for the three years. Four of these events occurred in 2014, showing an improvement in frequency performance over time.

Recommendations from NERC Staff and the Resource Subcommittee for M-4 (ALR 1-12) Frequency Event Detection and Selection Process Changes

In the annual review of frequency response, NERC staff identified several concerns. The recommendations outlined in the *2014 Frequency Response Annual Analysis* were incorporated into the data collection process for this report and include the following:

- Monthly processing of 1-second data and weekly review of frequency event candidates for both M-4 (ALR 1-12) and BAL-003-1 are recommended to discover problems earlier and ensure consistency in event selection.
- The Resources Subcommittee and NERC staff recommend that the process for selecting M-4 events be carefully reviewed and analyzed prior to the publication of the *State of Reliability 2015* report.
- The selection process discounted events that started above 60 Hz that did not fall below certain frequency deviation thresholds. This tends to corrupt any analysis of the statistical relationship between frequency response performance and starting frequency or ending frequency, and potentially eliminates events of high frequency response performance for large events or low frequency response for large megawatt changes in an Interconnection.

M-5 (ALR2-3) Under Frequency Load Shedding

Background

This metric was removed from the monitored set in 2014 and will no longer be included in future reports. The purpose of Under Frequency Load Shedding (UFLS) is to balance generation and load when an event causes a significant drop in frequency of an interconnection or islanded area. Such occurrences are very few, and little value from trending is available. Additionally, the metric M-2 captures emergency automatic load shed including load shedding of 100 MW or greater associated with UFLS operation.

M-8 (ALR3-5) Interconnection Reliability Operating Limit Exceedances

Background

The *State of Reliability 2014* report reviewed the IROL/System Operating Limit (SOL) Exceedances metric. In the past, this metric has been used to determine the number of times an IROL was exceeded in the Eastern Interconnection and the number of times an SOL was exceeded in the Western and ERCOT Interconnections. Since the metric was first introduced, all Regional Entities now recognize IROLs and are anticipated to be able to report on IROL exceedances in 2014. Therefore, M-8 (ALR3-5) was modified to remove the SOL reporting language in late 2013.

[53] Current recommended IFRO values are presented in the Frequency Response Annual Analysis, February 2015, Annual Analysis, http://www.nerc.com/FilingsOrders/us/NERC Filings to FERC DL/Final_Info_Filing_Freq_Resp_Annual_Report_03202015.pdf.

This metric measures the number of times that a defined IROL was exceeded and the duration of the exceedances. Exceeding an IROL could lead to widespread outages if prompt operator control actions are not taken to return the system to within normal operating limits. In addition, exceeding the limits may not directly lead to an outage but may put the system at unacceptable risk if the operating limits are exceeded beyond T_v.[54] The data is grouped into four time segments to monitor how quickly an IROL is returned to within normal limits, as shown in Table 4.10.

Table 4.10: Exceedance Duration Segment

Time Range	IROL/SOL Duration
Time Range 1	10 seconds < Duration ≤ 10 minutes
Time Range 2	10 minutes < Duration ≤ 20 minutes
Time Range 3	20 minutes < Duration ≤ 30 minutes
Time Range 4	Duration > 30 minutes

Eastern Interconnection

Figure 4.8 shows the number of IROL exceedances by quarter and time range of exceedance for the Eastern Interconnection for 2011 through 2014. The second quarter consistently shows the most exceedances for the Eastern Interconnection in all years due to planned transmission outages that result in congestion and higher flows on the remaining paths.

In 2013 and 2014, the number of exceedances is similar in all four seasons, rather than heavily weighted toward the off-peak seasons when most planned outages occur. Also in 2013 and 2014, there were exceedances that had durations that put them into Time Range 3 and Time Range 4, meaning that the duration of these exceedances was greater than 20 minutes; some were greater than 30 minutes. Taken together, it appears that in the Eastern Interconnection, exceedances are occurring for longer periods of time, and there was a notable increase in total occurrences, particularly in Time Range 1.

Also, the number of Time Range 1 exceedances increased significantly in 2014 compared to the other years for which data is provided. This may be explained by the fact that a new Energy Management System (EMS), which logs all defined IROL limit exceedance alarms, was installed in late 2013 at one of the RCs. All defined IROL exceedance limit alarms are also archived, allowing for sampling of the data for reporting purposes. The RC also implemented a new monitoring tool whereby the granularity of the monitoring has been decreased from 60 seconds to 10 seconds, which will inherently pick up more IROL exceedances. Therefore, the increase in the number of Time Range 1 events in 2014 is attributed to the new EMS system as well as the monitoring tool. It is anticipated that measurements for future years will also be impacted by the monitoring changes made for 2014. Based on this anticipated result, the parameters for reporting on Time Range 1 should be examined to ensure that the correct information is being captured.

[54] T_v is the maximum time that an IROL can be violated before the risk to the Interconnection or other RC Area(s) becomes greater than acceptable. Each IROL's T_v shall be less than or equal to 30 minutes.

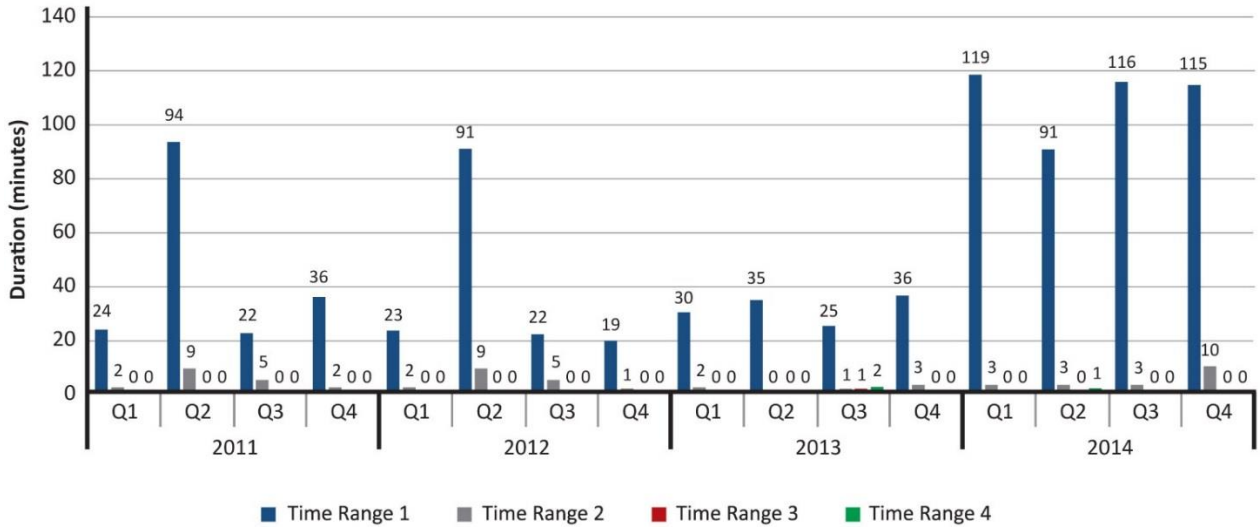

Figure 4.8: Eastern Interconnection IROL Exceedance

Western Interconnection

The year 2014 was the first time the RC in the Western Interconnection was able to report on IROL exceedances because of changes to allow the calculation of IROL limits. As a result, M-8 was reviewed and updated to reflect IROL reporting from the Western Interconnection. For the year 2014, reported IROL data does not show any IROL exceedances for the Western Interconnection. The Western Interconnection RC's definition of an IROL has additional criteria that may not exist in other RC areas.

ERCOT Interconnection

Figure 4.9 shows that the number of IROL exceedances was greatly reduced from 2011 through 2014. The drop in IROL exceedances between the fourth quarter of 2012 and the first quarter of 2013 is attributed to the completion of a major transmission expansion project. The result is that the IROL that contributed to most of the exceedances (the West-to-North (W-N) IROL) was retired in 2013. In the past, the W-N IROL limit was the sole source of IROL exceedances.

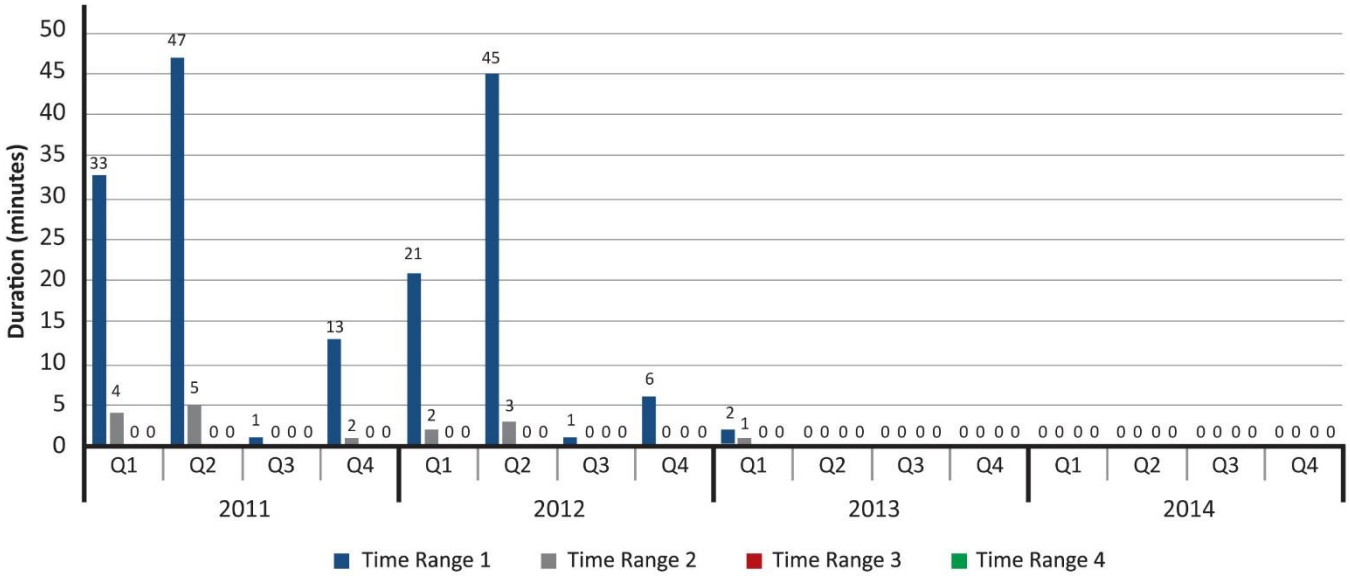

Figure 4.9: ERCOT Interconnection IROL Exceedances

M-9 (ALR4-1) Correct Protection System Operations

Background

In 2013, the metric was modified to focus on correct protection system operations, rather than focusing solely on misoperations. Therefore, in this report, the focus of this metric will include an analysis of correct operations and a discussion of misoperations.

Protection system misoperations were identified as an area that requires further analysis in past state of reliability reports. The improvements to the data collection process that the Protection System Misoperations Task Force (PSMTF) and System Protection Control Subcommittee (SPCS) proposed in 2013 were implemented and have improved the accuracy of misoperation reporting. The PSMTF and SPCS recommendation that misoperation analysis be continued on an annual basis by the respective protection system subcommittees within each Regional Entity began in early 2014.

Assessment

Figure 4.10 shows the correct operations rate for NERC during the reporting period. This information has not been included in prior state of reliability reports, but is included here for the time period that the data is available.

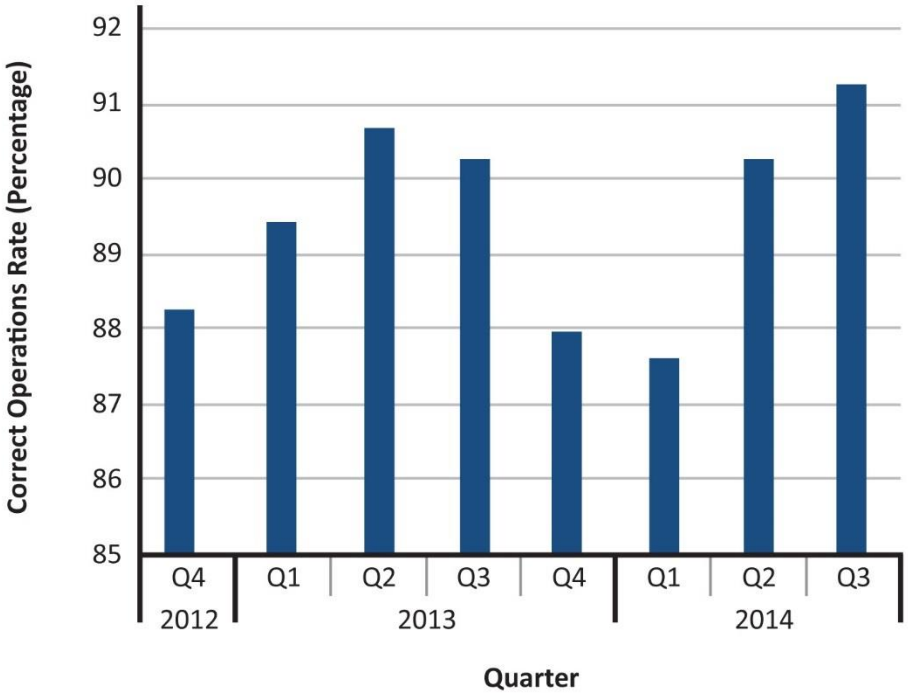

Figure 4.10: Correct Protection System Operations Rate

Figure 4.11 shows the misoperation rate by Region through the third quarter of 2014. The misoperation rate reflects the ratio of misoperations to total operations for the entire BES, 100 kV and above. This ratio provides a consistent way to trend the rate of misoperations as compared to a misoperation count alone, where weather and other factors can influence the count. Total protection system operations were first requested with the fourth quarter 2012 misoperation data.

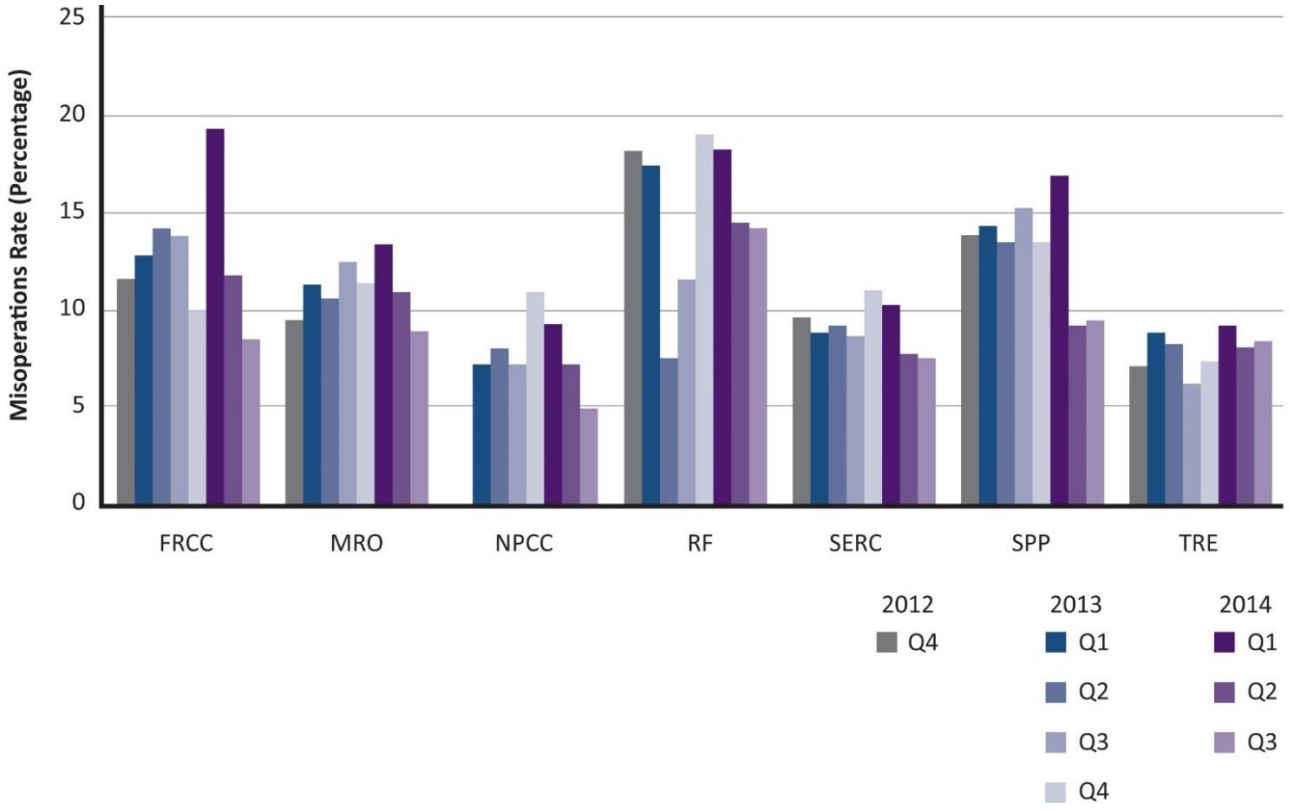

Figure 4.11: Protection System Misoperations by Region (2Q 2012–3Q 2014)

Figure 4.12 illustrates the top-three cause codes being assigned to misoperations by the TOs: incorrect setting, logic, or design error; relay failures/malfunctions; and communication failure. These three cause codes have consistently accounted for approximately 65 percent of all misoperations since data collection started in 2011.

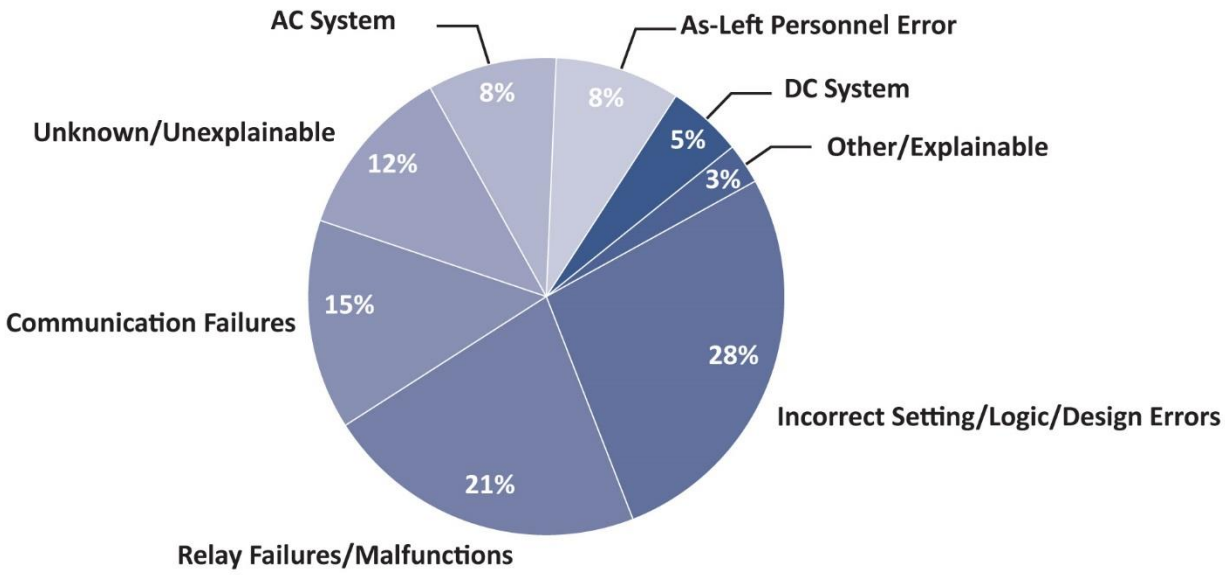

Figure 4.12: NERC Misoperations by Cause Code (2Q 2011–3Q 2014)[55]

Analysis of Data

Linkage between Reported Misoperations and Transmission-Related Qualified Events

An analysis of misoperation data and events in the Event Analysis Process provides two perspectives on misoperations. Out of approximately 2,000 total misoperations in 2014, approximately 2.5–3.0 percent were causal to or exacerbated the severity of reportable system disturbances. The other perspective is that more than 68 percent of transmission-related events have misoperations associated with them that either initiated the event or caused the event to be more severe. In 2014, there were 54 transmission-related system disturbances which resulted in a Qualified Event. Of those 54 events, 47 events, or about 87 percent, had associated misoperations. Of the 47 events, 37 of them (79 percent) experienced misoperations that were contributory to or exacerbated the severity of the event. In several cases, multiple misoperations occurred during a single disturbance.

Ground Instantaneous Overcurrent Settings

Additionally, 18 of the misoperations identified in Qualified Events were attributed to incorrect relay settings, with 11 of those 18 specifically attributed to incorrect ground overcurrent settings. The only Category 3 event in 2014 was directly related to an incorrect ground instantaneous overcurrent setting. Based on a review of misoperations in Qualified Events, there are two main causes of the incorrectly set ground instantaneous overcurrent elements. The first is an increase in the maximum value of ground fault short circuit current available over time, rendering the ground settings too sensitive. The second is setting the ground instantaneous overcurrent element without enough margin to accommodate short circuit modeling tolerances and other component anomalies. Entities were provided with information in 2014 to address these topics.

[55] Cause coded Misoperation data for 2014 4Q is not available at this point

Actions to Address Misoperations

NERC is in the process of revising a number of Reliability Standards that involve protection systems.[56] To increase awareness and transparency, NERC will continue to conduct industry webinars[57] on protection systems and document success stories on how GOs and TOs are achieving high levels of protection system performance. The quarterly protection system misoperation trending by NERC and the Regional Entities can be viewed on NERC's website.[58] In addition, NERC staff analyzed the top-three protection system misoperation cause codes reported on a quarterly basis by the Regions and NERC through compliance with Reliability Standard PRC-004-2.1a to identify Regional Entity trends and provide guidance to protection system owners that experience a high number of misoperations.[59] Incorrect setting/logic/design errors in microprocessor relays were found to be the largest source of misoperations in almost every Region. This further supports the idea that focus should be placed on setting/logic/design controls for microprocessor relays. Specific NERC and industry actions are identified in the report, with the expectation that the rate of misoperations due to these causes can be reduced by 25 percent by yearend 2017.

M-11 (ALR6-2) Energy Emergency Alerts

Background

This metric was enhanced in 2013 by expanding the data collection to include counts and duration of all EEA events of all levels, and unserved energy data for all EEA3 occurrences that result in load shedding. Going forward, this metric will account for the number and duration of all EEAs that are issued. All EEA1, EEA2, and EEA3 occurrences are now tracked to see whether there are any changes in frequency, duration, and load shed magnitudes associated with EEA occurrences over time.

As historical data is gathered on EEAs, trends provide a relative indication of performance measured at a Regional Entity or interconnection level. By definition, when an EEA3 alert is issued, firm load interruptions are imminent or in progress. An EEA3 indicates an issue with the real-time adequacy of the electric supply system. It may be due to a lack of fuel or dependence on transmission for imports into a constrained area, not simply a lack of available generation resources. The contributing factors for EEA3 events need to be considered.

The reporting of the duration and unserved energy of load shed events aids in determining the likelihood and duration of a load shed event following the issuance of an EEA3. EEA3 events are currently reported, collected, and maintained in NERC's Reliability Coordinator Information System (RCIS), as defined in Reliability Standard EOP-002-3.[60]

Assessment

Table 4.11 shows the number of EEA3 events from 2006 to 2014 at the Regional Entity level. Interactive quarterly trending is available on the Reliability Indicator's page.[61] In 2014, there were four EEA3 alerts issued with only one resulting in a loss of load event. The number of EEA3 events declared in 2014 is less than any other year for which data reporting exists.

[61] The EEA3 interactive presentation is available on the NERC website at: http://www.nerc.com/pa/RAPA/ri/Pages/EEA2andEEA3.aspx.

Table 4.11: Energy Emergency Alert 3									
Region	Number of Events								
	2006	2007	2008	2009	2010	2011	2012	2013	2014
NERC	**7**	**23**	**12**	**41**	**11**	**23**	**16**	**7**	**4**
FRCC	0	0	0	0	0	0	0	1	2
MRO	0	0	0	0	0	0	0	0	0
NPCC	0	0	1	1	0	0	0	0	1
RF	0	3	1	0	2	0	1	0	0
SERC	4	14	2	3	4	2	7	0	1
SPP	1	5	3	35	4	15	6	2	0
TRE	0	0	0	0	0	1	1	0	0
WECC	2	1	5	2	1	5	1	4	0

One EEA3 event that resulted in load shed involved the interruption of 100 MW of load for 3.33 hours, and an additional 200 MW of load for 2.5 hours, or unserved energy of 833 MWh. This event was due to conditions during the polar vortex that resulted in record-low temperatures and high demand.

The other three reported EEA3 alerts did not result in any loss of load events. These EEA3 events generally fell into the category of a local area with transmission limitations such that the local area could not make use of the reserves that existed within the Region. In these cases, all local generation resources were in use, and transmission limitations restricted the ability to get resources from the Region, which had reserves available.

Since 2013, EEA Level 1 and Level 2 events are also assessed as a part of this metric. Table 4.12 shows the number of EEA events at each of the levels by Regional Entity. More events occur at Level 1 and Level 2, as those represent situations in which capacity emergencies are developing.

Figure 4.13 displays the cumulative amount of time at each EEA alert level. This data for all the alerts was only collected for 2013 and 2014. This graph shows that the duration of EEA3 events for which no load was lost was lower in 2014 than in 2013. Except for the one EEA3 event for which load was lost, both the amount of load lost and the duration of the event were greater than in 2013.

Table 4.12: 2014 EEA Level by Region				
Region	EEA1	EEA2	EEA3	Total

M-12 (ALR6-11) Automatic AC Transmission Outages Initiated by Failed Protection System Equipment

Background

This metric was enhanced in 2014 to be consistent with the collection of BES data in TADS. Originally, this metric collected a "normalized count (on a per-circuit basis) of 200 kV and above ac Transmission Element outages (i.e., TADS momentary and sustained Automatic Outages) that were initiated by Failed Protection System Equipment." Since the definition of BES was changed to include equipment down to 100 kV in some circumstances, this metric was revised to include any BES ac Transmission element outages that were initiated by the TADS ICC of Failed Protection System Equipment. The new BES definition became applicable July 1, 2014. However, the addition of TADS reporting for voltage classes less than 100 kV (BES only) and 100 to 199 kV begins for calendar year 2015. Therefore, 2014 data presented below is only for ac transmission element outages 200 kV and above. Figure 4.14 presents the number of automatic outages per circuit for the time period 2010 to 2014, and Figure 4.15 presents the number of automatic outages per transformer for the time period 2010 to 2014.

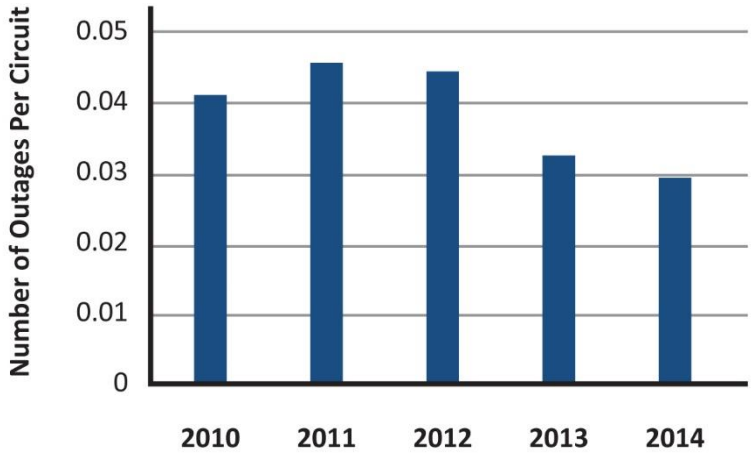

Figure 4.14: Automatic AC Circuit Outages Initiated by Failed Protection System Equipment

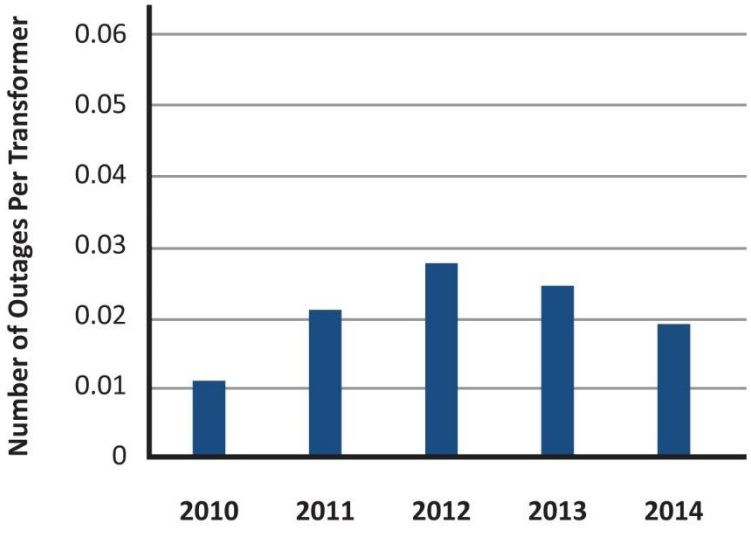

Figure 4.15: Automatic Transformer Outages Initiated by Failed Protection System Equipment

M-13 (ALR6-12) Automatic AC Transmission Outages Initiated by Human Error

Background

This metric was enhanced in 2014 to be consistent with the collection of BES data in TADS. Originally, the metric collected a "normalized count (on a per-circuit basis) of 200 kV and above ac Transmission Element outages (i.e., TADS momentary and sustained Automatic Outages) that were initiated by Human Error." Since the definition of BES was changed to include equipment down to 100 kV in some circumstances, this metric was revised to include any BES ac transmission element outages that were initiated by the TADS ICC of Human Error. Data for 2014, presented below, is only for ac transmission element outages 200 kV and above. Figure 4.16 presents the number of automatic outages per circuit for the time period 2010 to 2014, and Figure 4.17 presents the number of automatic outages per transformer for the time period 2010 to 2014.

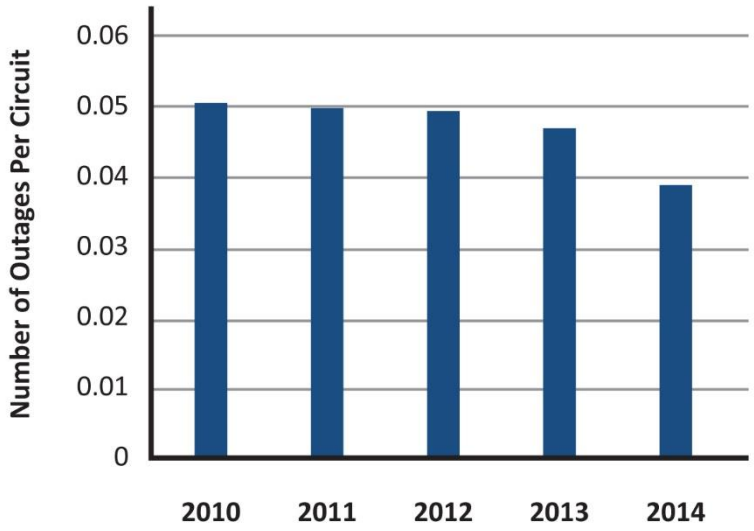

Figure 4.16: Automatic AC Circuit Outages Initiated by Human Error

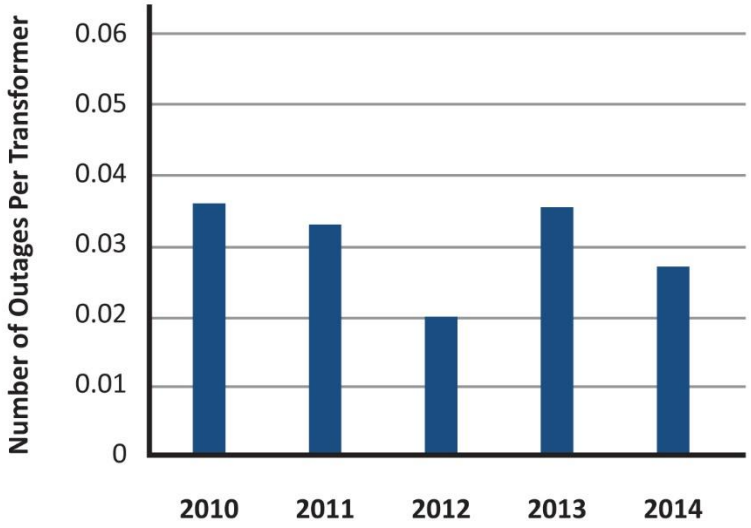

Figure 4.17: Automatic Transformer Outages Initiated by Human Error

M-14 (ALR6-13) Automatic AC Transmission Outages Initiated by Failed AC Substation Equipment

Background

This metric was enhanced in 2014 to be consistent with the collection of BES data in TADS. Originally, the metric collected a "normalized count (on a per-circuit basis) of 200 kV and above ac Transmission Element outages (i.e., TADS momentary and sustained Automatic Outages) that were initiated by Failed AC Substation Equipment." Since the definition of BES was changed to include equipment down to 100 kV in some circumstances, this metric was revised to include any BES ac transmission element outages that were initiated by the TADS ICC of Failed AC Substation Equipment. Data for 2014, presented below, is only for AC Transmission Element outages 200 kV and above. Figure 4.18 presents the number of automatic outages per circuit for the time period 2010 to 2014, and Figure 4.19 presents the number of automatic outages per transformer for the time period 2010 to 2014.

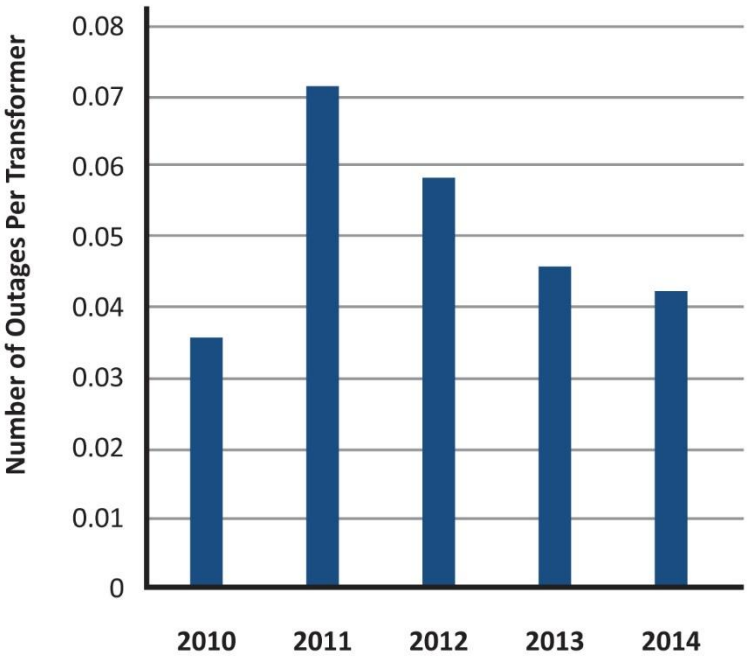

Figure 4.19: Automatic Transformer Outages Initiated by Failed AC Substation Equipment

M-15 (ALR6-14) Automatic AC Transmission Outages Initiated by Failed AC Circuit Equipment

Background

This metric was enhanced in 2014 to be consistent with the collection of BES data in TADS. Originally, the metric collected a "normalized count (on a per circuit basis) of 200 kV and above ac Transmission Element outages (i.e., TADS momentary and sustained Automatic Outages) that were initiated by Failed AC circuit equipment." Since the definition of BES was changed to include equipment down to 100 kV in some circumstances, this metric was revised to include any BES ac transmission element outages that were initiated by the TADS ICC of Failed AC Circuit Equipment. Data for 2014, presented below, is only for ac transmission element outages 200 kV and above. Figure 4.20 presents the number of automatic outages per circuit per 100 miles for the time period 2010 to 2014.

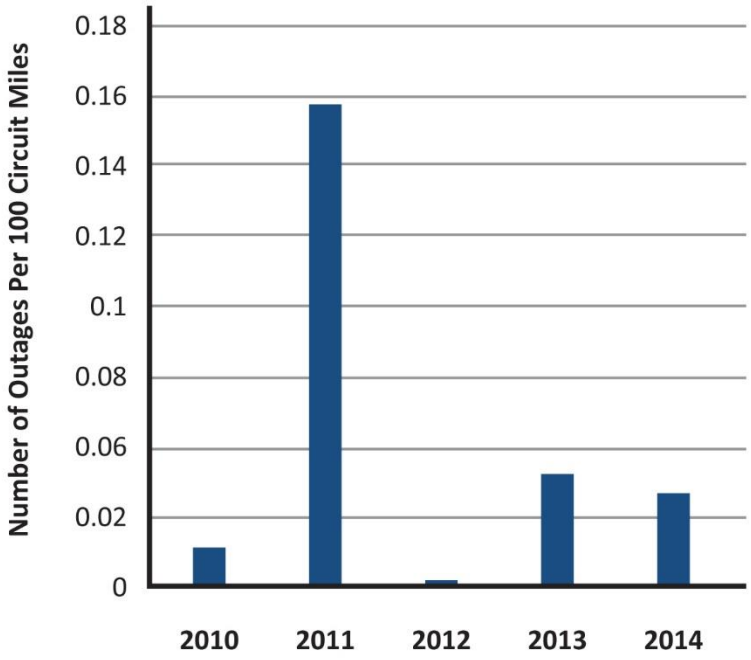

Figure 4.20: Automatic AC Circuit Outages Initiated by Failed AC Circuit Equipment per 100 Miles

M-16 (ALR6-15) Element Availability Percentage (APC) & Unavailability Percentage

Background

This metric was enhanced in 2013 to combine the Element Availability and Unavailability into one metric. Originally, there were two metrics: one to calculate availability and one to calculate unavailability. This metric continues to focus on availability of elements at 200 kV and above, because the components of the calculation include planned outages (which will no longer be collected in TADS beginning in 2015), unplanned outages (which are collected in TADS for all BES Elements), and operational outages (which are only collected in TADS for 200 kV and above). Therefore, the reporting voltage levels for this will not change. Figure 4.21 presents ac circuit availability as a percentage for the time period 2010 to 2014, and Figure 4.22 presents transformer availability as a percentage for the time period 2010 to 2014.

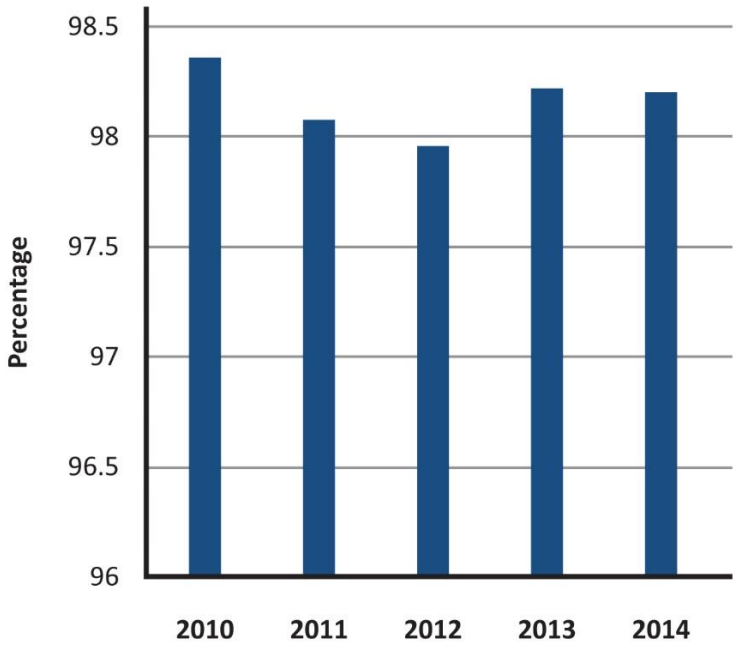

Figure 4.21: AC Circuit Availability

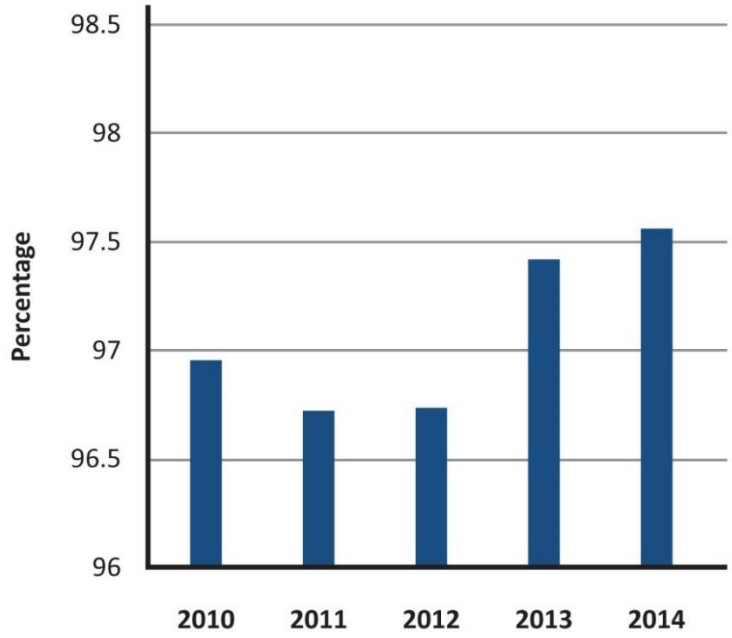

Figure 4.22: Transformer Availability

Chapter 5 – Development of Compliance Metrics

Background

NERC has continuously enhanced the Compliance Monitoring and Enforcement Program since 2008, providing more certainty on actions, outcomes, and reliability consequences. In August of 2010, the Reliability Metrics Working Group released its *Integrated Bulk Power System Risk Assessment Concepts*[62] paper introducing new concepts, such as the "universe of risk" of the BPS, which is illustrated in Figure 5.1. One of these concepts, the SRI, was developed as a way to assess the event-driven risk to the BPS. The ALR metrics were developed to assess the condition-driven risk. And the first attempt at a metric to track the impact of standard-driven risks of compliance violations was the Key Compliance Monitoring Index (KCMI).

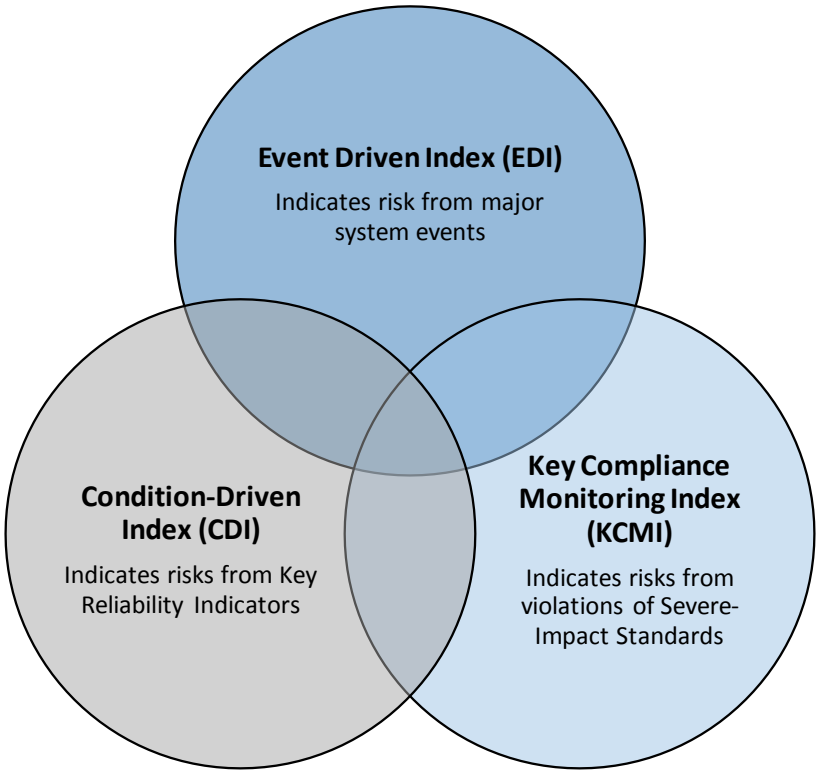

Figure 5.1: Conceptual Diagram of Risk Indices

The five-year assessment of the KCMI indicated that the risk to BPS reliability based on the number of violations of NERC Reliability Standards trended lower from 2008 to 2012. However, over the years, the Reliability Standards and language in the requirements underwent several modifications. New Reliability Standards and requirements were added, and others retired, but these changes were not reflected in the KCMI calculation. It proved difficult to maintain meaningful tracking of the data. Therefore, in late 2013, the OC and the PC acted to retire KCMI as a compliance metric and tasked the PAS with developing a replacement metric to allow for the meaningful collection of data concerning industry performance pertaining to compliance violations.

In June 2014, the RISC asked the CCC to identify ways compliance data can be used to create measures to reduce risk to the BPS. This request was based on a NERC Board request to the RISC in February 2013:

[62] http://www.nerc.com/comm/PC/Performance Analysis Subcommittee PAS DL/Archive/Integrated_Bulk_Power_System_Risk_Assessment_Concepts_Final.pdf.

FURTHER RESOLVED, the Board hereby directs NERC management to work with the RISC and, as appropriate, NERC committee leadership to consider how NERC should utilize a data-driven reliability strategy development process that integrates with budget development and overall ERO planning (e.g., Standing Committee planning, department and employee goal setting).

Separately tasked with determining methods and metrics to reflect the risk of noncompliance to the reliability of the BPS, the two groups formed a team to address the development of one or more compliance-based metrics that relate to the reliability of the BPS. The concepts presented in this chapter describe two metrics that the team has developed in response to the tasks presented by the RISC, the OC, and PC.

CP-1 Risk Metric

A New Concept for Evaluating Risk to the BES, CP-1

The CCC and PAS proposed a new metric that relies on the ERO Enforcement staff's determination of the risk of a potential violation. As a violation progresses through enforcement, it is assigned situation-specific risk based on the facts and circumstances of the case. The most egregious violations are deemed "Serious Risk." Specifically, the team recommended tracking violations in the quarter they occurred. This focused the new metric more on newly discovered and reported possible violations (PVs).

CP-2 Impact Metric

Description

Compliance Metric 2 (CP-2) is a quarterly count of the number of newly reported noncompliances with observed reliability impact.

While the CP-1 (Risk) metric is expected to provide value to the ERO Enterprise, it has two primary limitations:

- While feedback loops will improve the quality of the risk assessments, there still is some subjectivity in the assignment of risk.
- Serious-Risk violations are relatively rare events, so tracking them provides limited information.

Error! Reference source not found. Figure 5.2 depicts the risk breakdown of violations processed in 2013 and 2014. Consistent with trends observed from 2008–2012, very few violations were deemed Serious Risk. Since BES impact is a manifestation of risk, the determination of the actual reliability impact of a PV is another aspect that could provide significant benefit in trending. The team's proposed CP-2 provides a measure of the observable BES impact due to compliance violations.

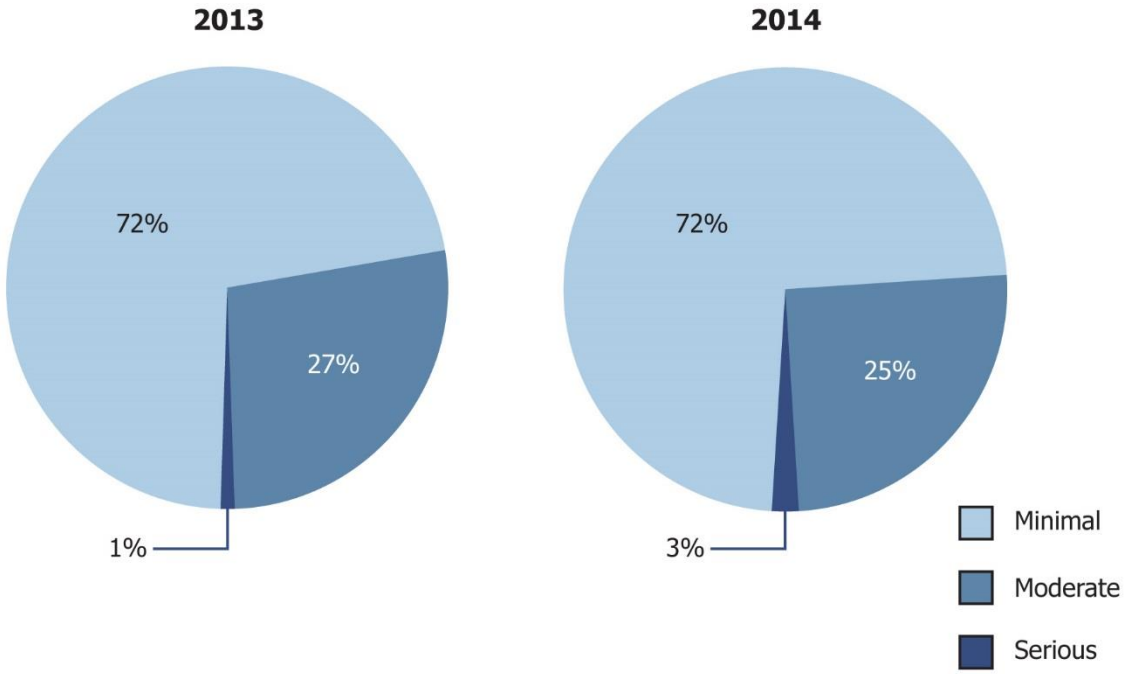

Figure 5.2 Final Risk Assessments (2013 and 2014)

The starting point for the metric is identification of a PV. For each PV reported, an assessment would be made as to whether there was an observable reliability impact from that violation. Unlike the assessment of risk, this metric focuses on the actual impact, not the potential impact of the violation.

To follow this approach to reduce the impact of standard violations on the BES, an assessment of the observable reliability impact needs to be made.

Figure 5.3 maps the four data tiers that define the impacts used for CP-2. This metric only requires capturing a small amount of data along with each Compliance Exception or PV. The observed impacts in the figure were used to advance the development of this report. The list is expected to evolve slightly over time based on experience.

It should be noted that Tier 2 and Tier 3 observations are relatively rare events. Of the approximately 1,200 violations processed in 2014, there were 25 Tier 3 violations and only a handful of Tier 2 cases. The value in the metric comes from verifying that the industry is looking for problems (Tier 0) and addressing the minor problems (Tier 1) before they can become large disturbances with more severe results.

The CCC approved the concepts and provided these concepts to the RISC in April of 2015. The PAS plans to recommend to the OC and PC the testing of these two compliance metrics: CP-1 (Risk Focus), and CP-2 (Impact Focus). These metrics should offer significant value in achieving the objectives above.

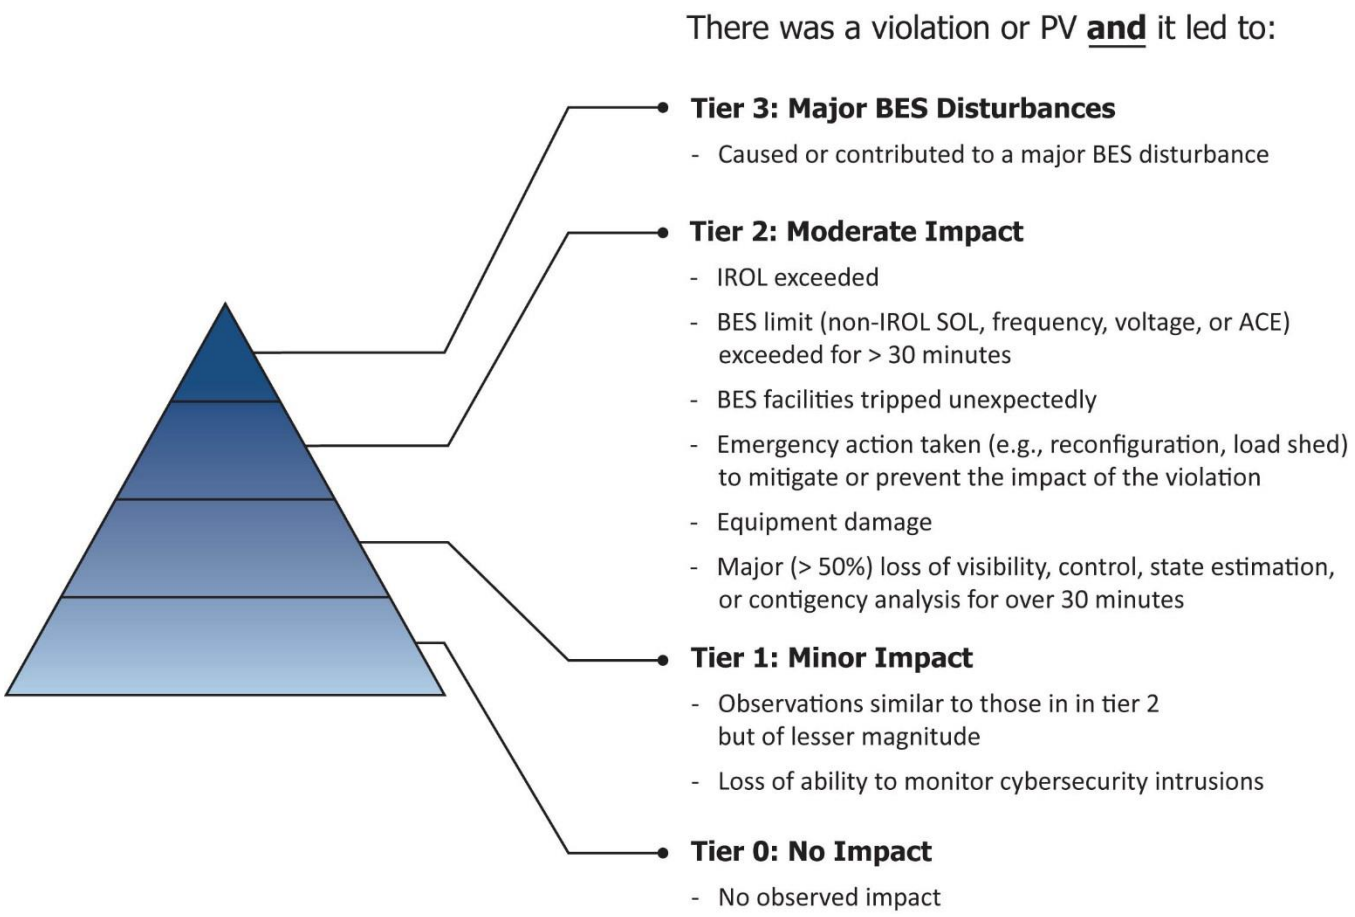

Figure 5.3: Impact Observations Mapped to the Impact Pyramid Tiers

Chapter 6 – Event Analysis

Background

The industry's voluntary ERO Event Analysis Process provides information to the ERO and industry to address potential reliability risks or vulnerabilities of the BPS. Since its initial implementation in October of 2010, the process has resulted in the collection of 569 Qualified Events and yielded 96 Lessons Learned, 19 of which were published in 2014.[63]

The first step in the ERO Event Analysis Process is Bulk Power System Awareness (BPSA), which monitors the BPS for reliability incidents that rise above a certain threshold of impact or risk. NERC's BPSA group and the eight Regional Entities monitor BPS conditions, significant occurrences, and emerging risks and threats across the 14 RC regions in North America. The 2014 information and products are provided in Figure 6.1, and a detailed description can be found in Appendix E.

Information	Products
Mandatory reports	252 daily reports
500 DOE OE-417 reports	33 special reports for significant occurrences
282 EOP-004-2 reports	4 security-related NERC Advisory (Level 1) Alerts for ES-ISAC
4 EOP-002-3 reports	1 reliability-related NERC Advisory (Level 1) Alert
Other information[64]	503 new Event Analysis database entries
1,741 Intelligent Alarms notifications	170 qualified Event Analysis Process events
2,356 FNet notifications and 602 FNet daily summaries	
6,172 WECCnet messages	
1,691 RCIS messages	
186 Space Weather Predictive Center Alerts	
1,789 assorted U.S. Government products	
3,588 assorted confidential, proprietary, or non-public products	
13,184 open source media reports	
1,257 Reliability Coordinator and ISO/RTO notifications	

Figure 6.1. Situational Awareness Inputs and Products in 2014

[64] Information sources listed in no particular order or priority, and not limited to these resources.

Analysis and Reporting of Events

Using the automated tools, mandatory reports, voluntary information sharing and third-party publicly available sources, disturbances on the grid are categorized by the severity of their impact on the BPS. Table 6.1 contains a consolidated chart of the reportable events since the program's inception (October 2010) and for 2014. For a more thorough review of the process, see: http://www.nerc.com/pa/rrm/ea/EA_Program_Document Library/Final_ERO_EA_Process_V2.1.pdf.

Table 6.1: Event Analysis Summary

Event Category	Count (Total)	Count (2014)	Comments
CAT 1	**412**	**144**	51 - Three or more BPS facilities lost (1a); 11 - Islanding (1b); 7 - BPS SPS/RAS Misoperation (1c); 1 - Voltage Reduction (1d) 10 - Control Room evacuations (1f); 2 - Generation lost (1g); 62 - Partial EMS (1h)
CAT 2	**137**	**24**	21 - EMS events (2b) 1 - Volt Excursion (2c) 1 - Unintended loss of load (2f) 1 - IROL (2g)
CAT 3	**15**	**1**	Loss of 2,103 MW generation (2 Nuclear units)
CAT 4	**3**	**0**	
CAT 5	**2**	**1**	Polar Vortex (2014)
Total CAT 1-5 Events	**569**	**170**	
Non-Qualified Occurrences Reported	**2050**	**333**	

Figure 6.2 is the control chart for the 569 Qualified Events through 2014. In October 2013, when Version 2 of the Event Analysis Process introduced the new category of events, collectively known as Category 1h (partial loss of EMS; see Appendix E for more information), occurrences that were not previously reported became reportable. The point in January 2014 where the number of reportable events exceeds the upper control limit[65] has been analyzed; results show an increase in the Category 1h events reported—out of an abundance of caution—when the mandatory reporting of EOP-004-2 went into effect.

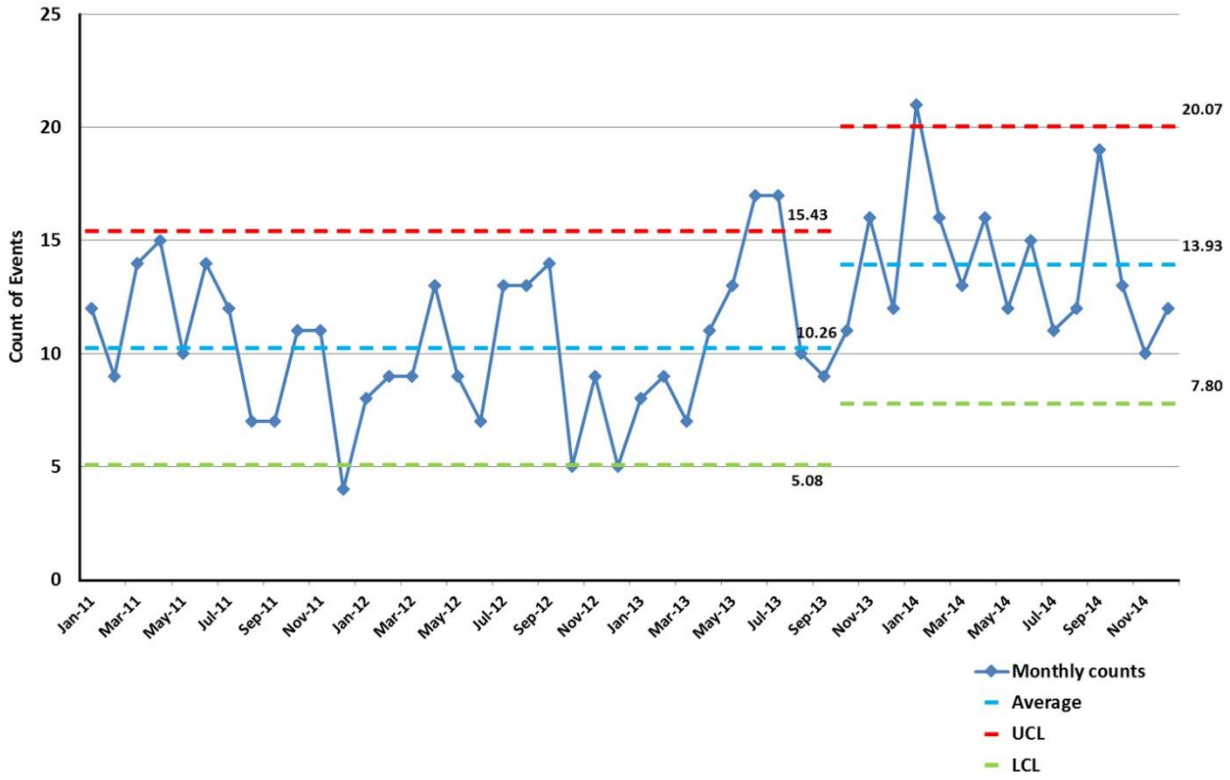

Figure 6.2. Control Chart – Number of Events (per Month) Over Time

A total of 342 contributing cause codes[66] were assigned to 401 events. The root cause of every event cannot be determined, though many of the contributing causes or failed defenses can be.

[65] The control limits are calculated using Statistical Process Control techniques as an Individuals-Moving Range (3-month moving average for the moving range) control chart.

[66] http://www.nerc.com/pa/rrm/ea/EA Program Document Library/CCAP_Manual_rev201503__Final_for_posting.pdf.

Figure 6.3 shows the overall trends for the contributing cause codes of events.

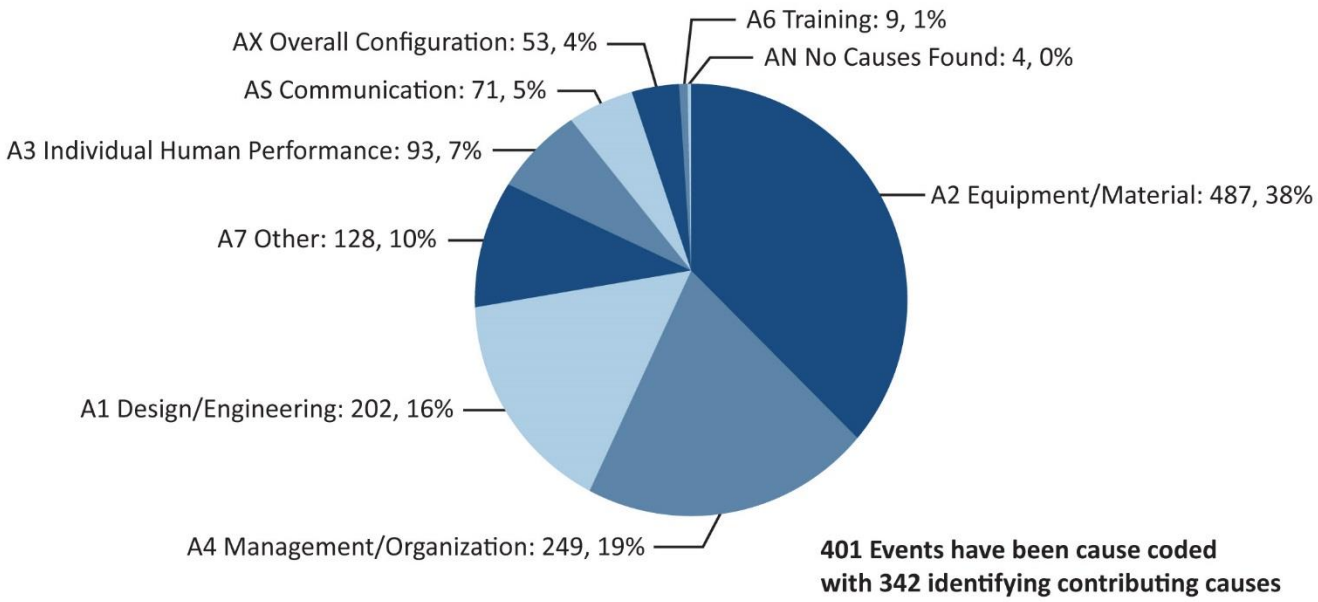

Figure 6.3. Percentage of Contributing Causes by Category

Identifying these large areas of concern makes it easier to prioritize and search for actionable threats to reliability. For example, analysis of the aggregate data identified different types of failed or damaged equipment. This information was turned over to the ACSETF for further investigation.

There was a single Category 3 event in 2014. The dominant issue in this event was the latent error of an incorrect setting of the directional ground instantaneous overcurrent (IOC) element on a numerical relay. NERC published a Lesson Learned in February 2015 titled *Consideration of the Effects of Mutual Coupling when Setting Ground Instantaneous Overcurrent Elements*. Similar issues have been seen in several smaller events.

Major Initiatives in Event Analysis

Human Performance

In Appendix A, human error is listed as a contributor to transmission outages. Event Analysis has identified workforce capability and human performance challenges as possible threats to reliability. Workforce capability and human performance is a broad topic and can most simply be divided into management, team, and individual levels. NERC held its third annual HP conference, Improving Human Performance on the Grid, in Atlanta in March 2014.

NERC continues to conduct cause analysis training with staff from the Regions and registered entities. As of December 2014, personnel from all eight Regions and approximately 1,000 people from 204 different registered entities have received cause analysis training (roughly 8,000 hours of training).

Polar Vortex Review

In 2014, NERC and the Regions engaged in an analysis of a major event that occurred across a significant footprint of North America. In early January of 2014, the Midwest, South Central, and East Coast regions of North America experienced a polar vortex, where extreme cold weather conditions occurred in lower latitudes than normal, resulting in temperatures 20 to 30° F below average. Some areas faced days that were 35° F or more below their

average temperatures. These temperatures resulted in record-high electrical demand for these areas on January 6 and again on January 7, 2014.

Considerable resources were used to evaluate conditions, including information gathered during operations and data collected in GADS. NERC's *Polar Vortex Review*[67] shows that BPS reliability was maintained despite sustained record-low temperatures occurring over a large geographic area in North America. Many areas experienced daytime high and overnight-low temperatures that were between 20 degrees and 30 degrees below normal, with 49 cities setting new record lows.

GOPs and TOPs in North America responded well to prevent major impacts to the BPS. As expected, key factors during the event included fuel deliverability issues, natural gas pipeline outages, gas service interruptions, frozen electricity and gas equipment, and other extreme cold weather operating challenges. During the event, grid operators employed techniques such as voltage reduction and demand-side management to ensure that BPS reliability was maintained.

Event Severity Risk Index (eSRI)

Event Analysis calculates an Event Severity Risk Index (eSRI) for all Qualified Events (as defined in the ERO Event Analysis Process). The eSRI calculation follows the methodology provided in Appendix E and considers the loss of transmission, the loss of generation, and the loss of firm load along with the duration of the load loss.

Every Qualified Event since October 2010 reported through the ERO Event Analysis Process has its eSRI calculated. For the purposes of trending, certain event groups are excluded. The total number of events was 568; of these, 29 were attributed to islanding events for an entity that plans and operates to island as a normal contingency, 14 were weather-driven, and five were Category 4-5 events (three of which are also weather driven). Only two Category 4-5 events were excluded as Category 4-5 events, while three of them were excluded as weather-driven events. For more details on the exclusions and the eSRI formula, see Appendix E. A total of 523 event eSRI calculations are used for trending, as shown in Figure 6.4 and Figure 6.5.

[67] http://www.nerc.com/pa/rrm/January 2014 Polar Vortex Review/Polar_Vortex_Review_29_Sept_2014_Final.pdf.

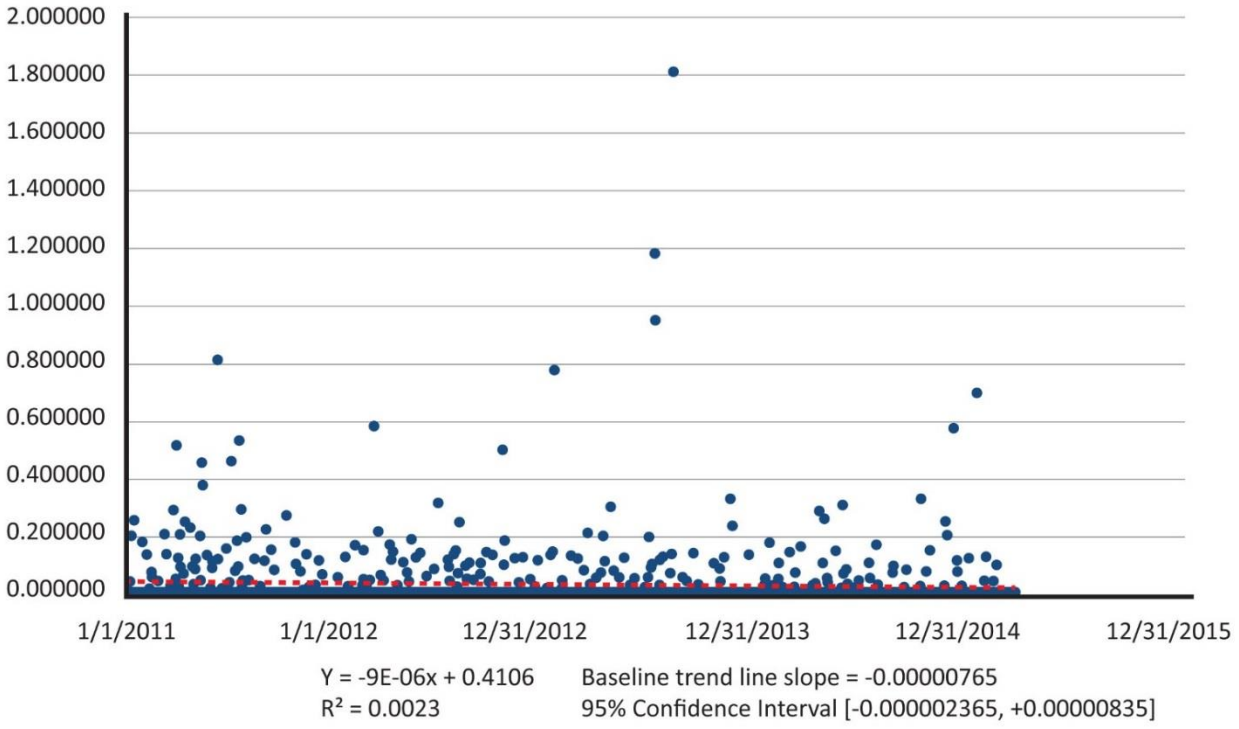

Figure 6.4: Trend Line of eSRI

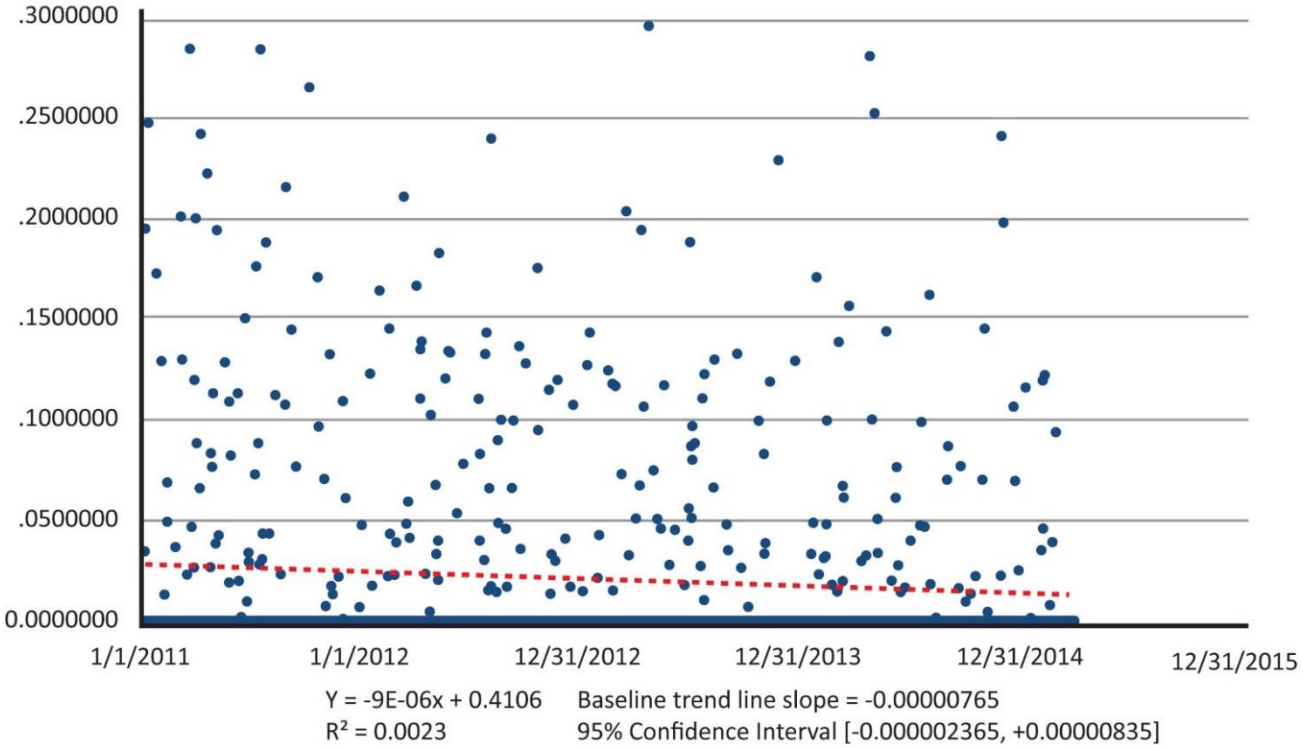

Figure 6.5: Expanded View of eSRI Trend Line Y Axis 0 to .3

As seen in the expanded view (included to address the scale limit visibility), the eSRI is approximately zero within the statistical confidence interval. Also, as indicated in Figures 6.4 and 6.5, the trend line is relatively flat.

Chapter 7 – Actions to Address Key Findings in Prior State of Reliability Reports

The state of reliability report contains key findings each year, many of which result in necessary actions for the PAS, NERC, and other subcommittees and working groups.[68] To track the actions that have been completed and those that are ongoing, a comprehensive table of action items identified in state of reliability reports from 2011 to 2014 is provided. In Table 7.1, the list of completed key actions is detailed and represents several years of response from industry to the items noted in previous state of reliability reports, while Table 7.2 shows those items that are still ongoing.

It is noteworthy that over these four years of reports, 22 items have been called out as actionable. During those same years, 18 of them have been completed. These have resulted in new processes, additional data and analysis, determination of risk, and modifications made to mitigate the risk. Four of them are still being addressed, but the expected resolution is on track for conclusion.

[68] Prior state of reliability reports can be found at the following locations:

Table 7.1: Completed Key Finding Actions

Item Reference	Finding Report Year	Key Finding Type	Key Finding Heading	Key Finding Reference	Key Finding Words	Key Finding Status	Actions Taken to Date
1	2011	Transmission Performance	Transmission Availability Performance	Page 3 Paragraph 2	*"Almost one-third of all sustained, automatic outages are dependent or common mode events. A joint team should be formed to analyze these outages."*	Complete	Further clarification of key finding made, with subsequent formation of an IEEE working group, which continues to study this issue. Results of analysis on common and dependent mode outages was provided to the PC in 2012.
2	2011	Metric Assessment	Reliability Metric Performance	Page 2 Paragraph 3	*"All metrics will be evaluated on a regular basis to determine each metric's contribution to quantitative reliability measurement."*	Complete	Incorporated into routine metric review process and PAS scope. Reviewed, retired, and augmented metrics, in addition to annual review of BPS performance.
3	2011	Metric Assessment	Disturbance Events	Page 3 Paragraph 4	*"This suggests more data and analysis into equipment failure many prove fruitful. However, with such a small dataset, no conclusions can be drawn."*	Complete	Created Event Analysis Subcommittee and ERO Event Analysis Process with ongoing assessment of Qualified Events; subsequently, the ACSETF was formed, which further explored and investigated equipment failures.
4	2012	Metric Assessment	Bulk Power System Reliability Remains Adequate	Page 5 Paragraph 3	*"Investigation into load-loss events is recommended, including post-event review. Further, load-loss reporting should be refined to distinguish differences between consequential and non-consequential load loss, and include identification of initiating events."*	Complete	Load-loss events are analyzed in several different ways, including modifications to ALR1-4 (in 2013), which captures load-loss events in excess of 50 MW, and the modified SRI calculation method, both of which were approved by OC and PC. Additionally, consequential and non-consequential are addressed by factors collected during the ERO Event Analysis Process, where an eSRI is also calculated.
5	2012	Transmission Performance	Equipment Failure Warrants Further Analysis	Page 10 Paragraph 2,3	*"Additional data is needed to investigate equipment failure. Small subject matter expert technical group could be formed to further investigate and provide solutions."*	Complete	Targeted data collection conducted. Collaboration between NATF and NERC undertaken to facilitate identification of reliability risks due to particular types and models of equipment. ACSETF was formed to further investigate equipment failure; specific recommendations were made to the PC at its March 2015 meeting.

Table 7.1: Completed Key Finding Actions							
Item Reference	**Finding Report Year**	**Key Finding Type**	**Key Finding Heading**	**Key Finding Reference**	**Key Finding Words**	**Key Finding Status**	**Actions Taken to Date**
6	2012	Metric Assessment	Frequency Response is Stable with No Deterioration	Page 5 Paragraph 5	*"More data is still needed to apply statistical significance tests and calculate a confidence interval to establish a trend. Also additional analysis on time of year, load levels, generation on-line, and response withdrawal should be considered when interpreting the trend."*	Complete	Frequency response statistics and performance levels have been developed (with regard to assessing stability as a function of time, loading, etc.).
7	2012	Transmission Performance	Protection System Misoperations are a Significant Reliability Issue	Page 9 Paragraph 1	*"Deeper investigation into the root causes of protection system misoperations is a high priority. As announced, a Protection System Misoperation Task Force has been formed to analyze misoperations."*	Complete	New reporting requirements were introduced, misoperation cause codes created; PSMTF assembled and evaluated performance. Augmented TADS analyses were subsequently performed and incorporated into the state of reliability reports.
8	2013	Metric Assessment	Bulk Power System Reliability Remains Adequate	Page 9 Paragraph 2	*"The top 10 most severe events in 2012 were all initiated by weather. There were only three high-stress days (SRI greater than 5.0) in 2012 compared to six days in 2011."*	Complete	Refined SRI to incorporate improved load-loss calculation method; modified SRI calculation, which was approved by OC and PC.
9	2013	Metric Assessment	Reduced Standards Violations Risks	Page 12 Paragraph 1	*"A five year assessment of the Key Compliance Monitoring Index indicated improvement…suggesting that this improved compliance trends indicates a reduced risk to BPS reliability."*	Complete	Subsequently, the KCMI was retired and a new metric was developed that evaluates the compliance risk to reliability.
10	2013	Transmission Performance	AC Substation Equipment Failures are a Second Significant Contributor to Disturbance Events and Automatic Outage Severity	Page 15 Paragraph 2	*"NERC recommends that a small subject matter expert technical group be formed to further validate findings [re circuit breaker failure equipment involvement] to understand the contributing factors to circuit breaker failures and provide risk control solutions."*	Complete	ACSETF formed, developed analysis, recommended improvements in the report. The OC and PC approved the report and task force disbanded.

Table 7.1: Completed Key Finding Actions							
Item Reference	**Finding Report Year**	**Key Finding Type**	**Key Finding Heading**	**Key Finding Reference**	**Key Finding Words**	**Key Finding Status**	**Actions Taken to Date**
11	2014		Sustained High Performance for Bulk Power System Reliability	Page 11 Paragraph 1	*"Based on the SRI_{bps} and 16 metrics that measure the characteristics of an ALR, BPS reliability is adequate and within the defined acceptable ALR performance objectives."*	Complete	No specific action is required for this finding.
12	2014	Frequency Response	Frequency Response remains Stable	Page 15 Paragraph 1	*"From 2009 to 2013, the Eastern Interconnection, ERCOT Interconnection, Quebec Interconnection and Western Interconnection have shown steady frequency response performance, trending above the recommended IFRO at all times during the study period. The Eastern Interconnection showed a slightly downward trend in frequency response; however, this trend is not statistically significant. Recommendation: NERC will examine and develop root causes for incidents in 2013 where frequency response was less than the IFRO. NERC will determine additional actions, beyond those currently being worked on in NERC Standards that should be taken to maintain and improve frequency response performance."*	Complete	Frequency event data has been studied further as recommended in the *Frequency Response Initiative Report.* This analysis process is annually conducted and results in a report filed with FERC. It is expected that this periodic analysis will continue to support the state of reliability reports.
13	2012	Frequency Response	More Data and Research is Needed	Page 12 Paragraph 3	*"Many datasets and performance analyses conducted in this report are still in an early stage. A number of metrics are limited to occurrence count values; no additional details, such as duration and/or intensity are available to provide a better observation of how each occurrence impacts bulk power system reliability."*	Complete	In subsequent state of reliability reports and in routine application of metrics, further dimensions to metrics have been created where appropriate. As metrics are reviewed and applied, they are further clarified and additional facets to their collection, calculation and application are addressed. This is evidenced by recent changes to metrics such as M2 (previously titled ALR1-4) as well as M11 (previously titled ALR 6-2).

Table 7.1: Completed Key Finding Actions							
Item Reference	Finding Report Year	Key Finding Type	Key Finding Heading	Key Finding Reference	Key Finding Words	Key Finding Status	Actions Taken to Date
14	2013	Frequency Response	Steady Frequency Response	Page 12 Paragraph 3	*"The expected frequency response for each interconnection has been higher than the recommended interconnection frequency response obligation."*	Complete	Frequency response continues to be monitored and reported upon annually, with assessment against statistical limits. Conclusions are drawn from these analyses which are reported in a variety of reports, including the state of reliability reports.
15	2013	Transmission Performance	Protection System Misoperations are a Significant Contributor to Disturbance Events and Automatic Transmission Outage Severity	Page 13 Paragraph 1	*"[P]rotection system misoperations are identified as the leading initiating cause to disturbance events."*	Complete	The PSMTF was established and collected data; additional outage cause codes were created to further distinguish types of clearing, to support better analysis, which will lead to improved operations and fewer misoperations. Misoperations reporting was enhanced.
16	2014	Transmission Performance	Protection System Misoperations Cause Transmission Events	Page 16 Paragraph 2	*"Misoperations analysis has developed three different datasets to understand their impact. Based on these datasets, however, the relationship between the Misoperations Initiating Cause Code and transmission risk, and the positive correlation between misoperations and transmission severity, understanding and reducing misoperations should remain a focus of NERC and industry participants. Recommendation: NERC will complete development of Reliability Standard PRC-004-3 — Protection System Misoperation Identification and Correction. NERC will develop a plan and catalyze industry action to address the three most common causes of protection system misoperations (settings/logic/design*	Complete	PRC 04-3 was approved in 2013. NERC staff analyzed misoperation data in 2014 and presented findings to the Planning Committee, which contained recommendations.

Table 7.1: Completed Key Finding Actions

					errors, communication failures, and relay failures)."		

Table 7.1: Completed Key Finding Actions							
Item Reference	Finding Report Year	Key Finding Type	Key Finding Heading	Key Finding Reference	Key Finding Words	Key Finding Status	Actions Taken to Date
17	2014	Transmission Performance	Substation Equipment Failures Impact Transmission Event Severity	Page 18 Paragraph 3	*"The AC Substation Equipment Task Force (ACSETF) was created to address high-priority reliability issues related to ac substation equipment. The failure data is currently being analyzed, and observations include; 1) circuit breaker failures have the highest percentage of failures; 2) top four subcomponents are interruptions, mechanism, trip coil and bushing; 3) inherent in circuit breaker failure is an increased probability that additional BPS elements will also be out of service; 4) inherent in transformer failure is an increased probability of longer outage duration; and 5) further data collection and analysis is needed, including maintenance strategies, bus configurations, and failure event SRI calculation. Recommendation: NERC will assess the implementation and effectiveness of the Level 1 NERC Advisory issued to address 345 kV SF6 puffer-type breaker failures. NERC will develop a plan with milestones to address the causes of substation equipment failures identified by the ACSETF. NERC will develop and facilitate data collection necessary to perform future analysis of substation equipment failures, as recommended by the ACSETF."*	Complete	For circuit breaker failures, Event Analysis is assessing the effectiveness of the alert. For all other items noted, the ACSETF presented a prioritized list of recommendations at the March 2015 Planning Committee meeting and a plan to address those recommendations will be developed in 2015, including necessary data collection. Actions recommended were assigned by the PC to the appropriate work groups. The ACSETF was disbanded.

Table 7.1: Completed Key Finding Actions							
Item Reference	**Finding Report Year**	**Key Finding Type**	**Key Finding Heading**	**Key Finding Reference**	**Key Finding Words**	**Key Finding Status**	**Actions Taken to Date**
18	2014	Metric Assessment	Use of Energy Emergency Alert Level 3 Declines	Page 19 Paragraph 4	*"In 2013 there were seven Energy Emergency Alert (EEA) Level 3 events declared, which is significantly lower than the number that occurred in prior years. Recommendation: NERC will analyze system events that resulted in firm load shedding to determine any common causes or trends that warrant action."*	Complete	This metric will continue to be monitored for the value in evaluating the reliability of the system. Modifications to the metric were made to ensure a comprehensive understanding of the use and occurrence of EEAs. Based upon continued analysis, there is an apparent improvement trend for this metric, as discussed in Chapters 2 and 4.

Table 7.2: Ongoing Key Finding Actions							
Item Reference	Finding Report Year	Key Finding Type	Key Finding Heading	Key Finding Reference	Key Finding Words	Key Finding Status	Actions Taken to Date
1	2012	Generation Performance	Resource Mix Changes Necessitate New Metrics	Page 11 Paragraph 1	"Resources such as wind generation and demand response are the non-traditional resources that perform differently than conventional generators. New metrics should be developed in order to determine what, if any, impact these differences have on reliability."	Ongoing	The wind data reporting instruction (Section 1600 Data Request for Wind Characteristics) will collect elementary performance data intended to enable the development of metrics. Demand response metrics have been developed but are being modified and aligned across all Regions so that consistent measurements can be calculated.
2	2013	Transmission Performance	Automatic Transmission Events with Unknown Cause Necessitate Analysis	Page 17 Paragraph 1	"Initiating [unknown] cause codes comprise 19 percent of all events with automatic outages. This may be an area where more analysis is needed."	Ongoing	Improvements have been made in unknown sustained cause codes by focused efforts by operators, Regional Entities and NERC. Work still remains for the TADSWG.
3		Metric Assessment	Severity Risk Index Assessment	Page 28 Paragraph 3	"Additionally, it appears that with the modified method of calculating SRI_{bps}, generation severity plays a substantial role in the daily summary values as measured by SRI_{bps}. Future state of reliability reports will contain information assembled and analyzed from GADS, which is likely to bring greater understanding to these facilities and their role assessing the reliability of the BPS. Further analysis of generation performance, particularly as it relates to daily bulk power system performance is appropriate; additional analysis will be incorporated into SOR reports in the future."	Ongoing	Generation loss was noted as a significant contributor to daily SRI. It will be subsequently reported within the annual state of reliability reports.
4	2011	Generation Performance	Generating Availability Performance	Page 3 Paragraph 3	"In the last three years, the Equivalent Forced Outage Rate - Demand (EFORd) increased, indicating a higher risk that a unit may not be available...Detailed analysis is needed to identify the root causes of increasing forced outage rate."	Ongoing	GADSWG analysis is underway and preliminary results are presented in this report. Work still remains for the GADSWG.

Chapter 8 – Spare Equipment Initiatives

Background

In June 2010, NERC issued a report titled *High-Impact, Low-Frequency Event Risk to the North American Bulk Power System*.[69] In a postulated high-impact low-frequency (HILF) event, such as a coordinated physical or cyber attack or a severe geomagnetic disturbance (GMD), long-lead-time[70] electric transmission system equipment may be damaged. This could adversely impact system reliability.

Following a HILF event, increased industry and government coordination will help maximize the use of available spare transmission equipment in restoring the grid, thereby increasing the resiliency of the system.

Following the aforementioned HILF report, the Spare Equipment Database Task Force (SEDTF) was created to update NERC's existing spare equipment database. The objective was provide an automated system with enhanced information security and usability for the industry to locate spare equipment in the event of an emergency or other non-routine failure. The SEDTF provided NERC staff with guidance on how the new system should operate and the NERC Spare Equipment Database (SED)[71] was developed. Following the development of the SED, the SEDTF became the Spare Equipment Database Working Group (SEDWG), with the purpose of conducting outreach and maintenance on the database.

In September 2014, the SEDWG's scope was updated to reflect the broader landscape of spare equipment and was renamed the Spare Equipment Working Group (SEWG).[72] The SEWG will continue to oversee the SED, but also assess the industry's posture on long-lead-time electric transmission equipment and act as a conduit for information exchange between the industry and government on the issue of spare equipment.

Spare Equipment and NERC Reliability Standards

Physical Security Standard CIP-014-1[73]

On November 20, 2014, FERC issued its final rule, largely approving CIP-014-1. CIP-014-1 focuses on critical facilities such as transmission stations or substations and their associated primary control centers that, if rendered inoperable or damaged, could have a critical impact on the operation of the interconnection through instability, uncontrolled separation, or cascading failures on the BPS. Requirement 5.5.1 of CIP-014-1 specifies an attribute for an entity's plan:

The physical security plan(s) shall include resiliency or security measures to deter, detect, delay, assess, communicate and respond to potential threats.

Having the ability to quickly locate available spare transformers is an important function of expanding BES resilience.

Transmission Planning Standard TPL-001-4[74]

The importance of spare transformers has also been identified in Requirement 2.1.5 of TPL-001-4, since they are a type of long-lead-time equipment:

---

[69] *High Impact, Low Frequency Event Risk to the North American Bulk Power System*, June 2010, http://www.nerc.com/pa/ci/resources/documents/hilf_report.pdf.

[70] "Long lead time" is defined as six months or more.

[73] Physical Security Standard, http://www.nerc.com/pa/Stand/Reliability Standards/CIP-014-1.pdf.

[74] TPL standard, http://www.nerc.com/files/TPL-001-4.pdf.

When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

Spare Equipment Working Group (SEWG)

Purpose of SEWG

The purpose of the Spare Equipment Working Group (SEWG) is to oversee the collection of information on long-lead-time electric transmission system equipment, assess the industry's posture on this equipment, and act as a conduit for information exchange between the industry and government on the issue of spare equipment.

SEWG Activities

In 2014, the primary focus of the SEWG was to increase participation. The SEWG worked with NERC and industry associations to host webinars and make presentations to explain the program to registered entities and to solicit new participants. In 2015, the SEWG will continue to increase SED awareness and participation, work on methods to gauge and assess the success and goals for the SED, and develop a white paper on the industry's posture on long-lead-time electric transmission equipment.

Spare Equipment Initiatives

NERC and industry are employing various initiatives with respect to spare equipment. Some of them are listed below.

Spare Equipment Database[75]

The NERC SED is able to support entities in search of spare power transformers available for purchase from other non-affiliated entities. If a HILF event such as a terrorist attack or natural disaster were to occur, the SED provides entities in need of multiple transformers the ability to connect with entities that have spare transformers available. Providing information to the database is voluntary and meant to complement existing transformer sharing and mutual assistance agreements. The database is populated and managed by participating organizations bound by a mutual confidentiality agreement.

SEWG reviewed various types of long-lead-time equipment. Following the review, it was determined that the initial focus should be large power transformers and generator step-up (GSU) transformers. In addition to long lead times, large power transformers also require substantial capital to secure. For these reasons, owners typically maintain an appropriate limited number of spares in the event of a failure. It may be beneficial in the future to expand the SED to include other types of long-lead-time equipment.

Confidentiality has been and continues to be an important aspect of the SED. Participating organizations voluntarily identify and report spare equipment that meets predefined criteria in the database. The data collected provides essential information to enable automated queries of available equipment. In addition, equipment owner information is required to facilitate communication following a HILF event.

SED utilizes a double-blind approach to preserve the anonymity of the registered SED participants, the requestor, and the owner of the equipment. To initiate the search, the requestor completes an online form and the program conducts a search. Upon completion, the requestor and the NERC SED administrator are notified of the success of the search. From there, the SED program initiates a double-blind search-response procedure. SED generates

[75] For further information related to the SED program, please visit: http://www.nerc.com/pa/RAPA/sed/Pages/Spare-Equipment-Database-(SED).aspx

messages to each unnamed TO identified by the search (without disclosing what equipment is needed, how many pieces of equipment are requested, or the name of the requestor).

Owners who wish to proceed with discussing a sale/lease/exchange can use the double-blind search process to respond to the unnamed requestor to open an active discussion. Any decision to provide additional information is the responsibility of the owners. The NERC SED administrator is informed of all communications conducted via the SED link. The requestor and owner may then work toward a settlement acceptable to both parties. A complete description of the SED search process and a special report on the SED can be found on NERC's website.[76]

Spare Transformer Equipment Program[77]

The Spare Transformer Equipment Program (STEP) was developed by industry through EEI in response to an industry-wide desire to cost-effectively increase reliability, particularly in the event of deliberate destruction of electrical transformers in connection with a terrorist event. The STEP program was designed to benefit the BPS by making certain that sufficient spare transformer capacity is available to allow an affected participating utility to restore its system following a triggering event to an N-0 reliability level. It does not, however, directly address routine failures or events that may cause specific, localized outages in distribution service to any particular facility. Although a triggering event is limited to an act of terrorism, the STEP program provides a ready mechanism for participating utilities to voluntarily share assets in the event of other catastrophic loss. There are currently 55 member utilities in the program.

SpareConnect[78]

SpareConnect is a mechanism for BPS asset owners and operators to network with other SpareConnect participants concerning the possible sharing of transmission and GSU transformers and related equipment, including bushings, fans, and auxiliary components. SpareConnect establishes a confidential, united platform for the entire electric industry to communicate equipment needs in the event of an emergency or other non-routine failure. SpareConnect complements existing programs, such as STEP and voluntary mutual assistance programs, by establishing an additional trusted network of participants who are uniquely capable of providing assistance concerning equipment availability and technical resources.

SpareConnect does not create or manage a central database of spare equipment. Instead, the program provides decentralized access to points of contact at electric industry companies so that, in the event of an emergency, SpareConnect participants are able to connect quickly with other participants in a selected voltage class.

SpareConnect does not impose any obligation on participants to provide any information or to make any particular piece of equipment available. Once connected, those SpareConnect participants who are interested in providing additional information or sharing equipment work directly and privately with each other on the specific terms and conditions of any potential equipment sale or other transaction.

[76] *Special Report: Spare Equipment Database System*, October 2011, http://www.nerc.com/docs/pc/sedtf/SEDTF_Special_Report_October_2011.pdf

Chapter 9 – BES Security Metrics

Background

The *State of Reliability 2014* report noted that the NERC PAS was collaborating with the BESSMWG to develop security performance metrics. During 2014, the BESSMWG developed an initial set of five metrics that have been approved by NERC's Critical Infrastructure Protection Committee (CIPC), with an additional two undergoing further development. This chapter introduces these new cyber and physical security metrics, provides results based on preliminary data collected during 2014, and proposes next steps to further refine these metrics, validate the results, and develop additional metrics.

Purpose

For some years now, NERC and the electricity industry have taken actions to address cyber and physical security risks to the BES as a result of potential and real threats, vulnerabilities, and events. CIPC established the BESSMWG to develop a comprehensive set of security performance metrics. These metrics would complement other NERC reliability performance metrics by defining lagging and leading indicators for security performance as they relate to reliable BES operation.

Methodology

The BESSMWG, composed of subject matter experts from NERC's Electricity Sector Information Sharing and Analysis Center (ES-ISAC) and experts from the electricity sector who have experience in physical security, cybersecurity, and power system operations, began their work by sharing how they measure and manage security performance within their own organizations. Members discussed the processes used to manage their security programs, as well as their own experiences with real security incidents and their potential impact on the BES. Through these discussions, members considered the available sources of data that might be helpful for improving security performance for the electricity sector as a whole. They also discussed the relative merits of lagging and leading indicators with the goal of developing metrics that address both attributes.

Lagging Indicators are results-oriented, measure historical events, and tend to be easier to measure.
Leading Indicators contribute to or precede events and tend to be more difficult to measure.

The BESSMWG identified the following challenges related to developing security performance metrics:

- **Limited Historical Data:** To date, there have been relatively few security incidents with the potential to affect the BES. Physical security incidents, such as vandalism and sabotage, have occurred infrequently for decades, typically with little or no impact on BES reliability. However, recent high-profile events have increased awareness regarding the potential for physical security incidents to significantly impact the BES. Risks associated with cybersecurity appear to be rapidly evolving as the nature of cyber intrusions becomes increasingly sophisticated.
- **Limited Ability to Normalize Available Data:** Ideally, metrics provide a proportional indication by statistically sampling a known fraction of the whole, instead of measuring all events. Security threats and vulnerabilities are constantly changing. Therefore, security performance metrics are limited to absolute numbers rather than statistically valid percentages of the whole. While absolute numbers may indicate trends, work must continue to normalize available data to further refine this metric.
- **Changing Threat Landscape:** The frequency of physical and cybersecurity threats, vulnerabilities, and incidents, while historically low, is changing rapidly. Adversaries are becoming increasingly sophisticated in using malware to pursue targets.

- **Sensitive Information:** Information that details security threats, vulnerabilities, and real incidents is highly sensitive. In the wrong hands, this information can expose existing vulnerabilities to new and sophisticated exploits, create additional vulnerabilities, and limit effective response.

NERC Reliability Principles

NERC's Reliability Principles were developed to help ensure NERC's Reliability Standards are developed in a consistent manner to support the reliability of the BES. While the development of security performance metrics is not limited to the scope of NERC's Reliability Standards, the eighth principle is relevant.

> *8. Bulk power systems shall be protected from malicious physical or cyber attacks.*

Assessing the Value of the Metrics

To assess the relative value of the security metrics being considered, the BESSMWG used the same SMART[79] rating criteria used for developing the reliability performance metrics. As the SMART criteria were developed specific to BES reliability, the BESSMWG found the criteria helped ensure that the impact of security on the reliability of the BES was kept foremost in mind. From that perspective, security metrics that did not have an apparent link to BES reliability received a lower SMART rating score, while those that have an apparent link received a higher score.

The BESSMWG considered several general categories related to security performance:

- **Actual Physical and Cyber Events:** NERC's Reliability Standards require entities to report cyber and physical security incidents or events according to certain criteria. The BESSMWG considered metrics that would summarize these historical events as lagging indicators of security performance. Of importance is not just the number and frequency of these events over time, but also the extent to which they may have resulted in a loss of load to customers.
- **Information Sharing:** The ability of entities to quickly and effectively share information with each other is an important capability when responding to new or rapidly evolving emergency situations. NERC's ES-ISAC provides a central clearing house to receive, analyze, and share information with member entities. The BESSMWG considered metrics that would provide leading indicators of the extent to which entities are actively engaged with the ES-ISAC on a macro level.
- **Global Cyber Vulnerabilities:** Cybersecurity is not a concern limited to the electricity sector. The BESSMWG considered publicly available metrics that describe how cyber vulnerabilities at the global level affecting all information technologies are changing over time. While these metrics do not provide a direct measure of the impact on the BES, they may provide leading indicators relevant to the electricity sector.

The BESSMWG considered an initial set of more than 20 security performance metrics. Detailed definitions have been developed for the top five of these metrics based on available data. An additional two are being considered for further development during 2015. All security performance metrics are reported on an aggregated basis at the North American level, as there is no evidence to suggest that details at the interconnection or Regional Entity levels would be meaningful.

[79] SMART: Specific/Simple, Measurable, Attainable, Relevant, and Tangible/Timely.

Security Performance Metrics and Preliminary Results

This section provides the five security performance metrics approved by CIPC for implementation.

BES Security Metric 1: Reportable Cyber Security Incidents

This metric reports the total number of Reportable Cyber Security Incidents[80] that occur over time and identifies how many of these incidents have resulted in a loss of load. It is important to note that any loss of load will be counted, regardless of direct cause. For example, if load was shed as a result of a loss of situation awareness caused by a cyber incident affecting an entity's energy management system, the incident would be counted even though the cyber incident did not directly cause the loss of load (e.g., through an unauthorized breaker operation). This metric will provide an indication of the number of Reportable Cyber Security Incidents and the resilience of the BES to operate reliably and continue to serve load.

This metric is based on data reported by entities, as required by Reliability Standard CIP-008-3, to NERC's ES-ISAC, where it is analyzed. Data for this metric is provided in Table 9.1. Given the current relatively low number of such incidents, it is anticipated that the data will be gathered and summarized quarterly. Analysis of this security performance metric data shows that no Reportable Cyber Security Incident resulted in loss of load on the BPS in 2014.

Preliminary Results Based on Data Collected During 2014

Table 9.1: Reportable Cyber Security Incidents

Metric	2014				2015				2016			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Total number of Reportable Cyber Security Incidents	3											
Total number of Reportable Cyber Security Incidents resulting in loss of load	0											

BES Security Metric 2: Reportable Physical Security Events

This metric reports the total number of physical security reportable events[81] that occur over time and identifies how many of these events have resulted in a loss of load. It is important to note that any loss of load will be counted, regardless of direct cause. For example, if load was shed as a result of safety concerns due to a break-in at a substation, the event would be counted even though no equipment was damaged to directly cause the loss of load. The metric will provide an indication of the number of physical security reportable events and the resilience of the BES to operate reliably and continue to serve load.

This metric is based on data reported by entities as required by Reliability Standard EOP-004-2to NERC's Bulk Power System Awareness group, which is then analyzed by NERC's ES-ISAC. Data for this metric is provided in Table 9.2. Given the current relatively low frequency of such incidents, it is anticipated that the data will be gathered and summarized quarterly. Analysis of this security performance metric data showed that no physical security reportable event resulted in loss of load on the BPS in 2014.

[80] Ref. NERC Glossary of Terms: "A Cyber Security Incident that has compromised or disrupted one or more reliability tasks of a functional entity."

[81] Reportable Events are defined in Reliability Standard EOP-004-2 Event Reporting, Attachment 1.

Preliminary Results Based on Data Collected During 2014

Table 9.2: Reportable Physical Security Events												
Metric	2014				2015				2016			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Total number of reportable events as a result of physical security threats to a Facility or BES control center	47											
Total number of reportable events that caused physical damage or destruction to a Facility	9											
Total number of reportable events as a result of physical security threats to a Facility or BES control center, or that caused physical damage or destruction to a Facility, that resulted in a loss of load	0											

BES Security Metric 3: ES-ISAC Membership

This metric reports the total number of electricity sector organizations and individuals registered as members of the ES-ISAC. ES-ISAC member organizations include NERC registered entities and others in the electricity sector. Given today's rapidly changing threat environment, it is important that electricity entities be able to quickly receive and share security-related information. This metric provides the number of organizations registered, as well as the number of individuals. Increasing ES-ISAC membership should serve to collectively increase awareness of security threats and vulnerabilities and enhance the sector's ability to respond quickly and effectively.

This metric is based on data available from the ES-ISAC. Data for this metric is provided in Table 9.3. It is anticipated that the data will be gathered and summarized quarterly. The data shows that registered membership of the ES-ISAC is increasing every quarter.

Preliminary Results Based on Data Collected During 2014

Table 9.3: ES-ISAC Membership												
Metric	2014				2015				2016			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Total number of electricity sector organizations registered as members of the ES-ISAC	496	557	578	827								
Total number of individuals in ES-ISAC member organizations who have ES-ISAC accounts	1514	1844	2010	2770								

BES Security Metric 4: Industry-Sourced Information Sharing

This metric reports the total number of Incident Bulletins published by the ES-ISAC based on information voluntarily submitted by ES-ISAC member organizations. ES-ISAC member organizations include NERC registered entities and others in the electricity sector. Incident Bulletins describe cyber and physical security incidents and provide timely, relevant, and actionable information of broad interest to the electricity sector. But given security issues, they do not represent the complete picture of physical and cyber information available to or distributed by the ES-ISAC.

This metric is based on data reported to and analyzed by the ES-ISAC. Data for this metric is provided in Table 9.4. Given the current relatively low frequency of such incidents, it is anticipated that the metric data will be gathered and summarized quarterly.

Preliminary Results Based on Data Collected During 2014

Table 9.4: Industry-Sourced Information Sharing

Metric	2014				2015				2016			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Total number of ES-ISAC Incident Bulletins based on information provided by the electricity sector	18	26	22	14								

BES Security Metric 5: Global Cyber Vulnerabilities

This metric reports the number of global cybersecurity vulnerabilities that are considered to be high severity. This metric is based on data published by the National Institute of Standards and Technology (NIST). NIST defines high-severity vulnerabilities as those with a common vulnerability scoring system[82] (CVSS) of seven or higher. As the term "global" implies, this metric is not limited to information technology typically used by electricity sector entities. As a result, this metric received a relatively low score using the SMART rating criteria. However, the BESSMWG recommends that this metric be adopted as it provides a leading indicator of the extent of constantly evolving cyber vulnerabilities and identifies trends beyond the electricity sector that may be relevant to the sector. Data for this metric is provided in Table 9.5. The data will be gathered and summarized quarterly.

Preliminary Results Based on Data Collected During 2014

Table 9.5: Global Cyber Vulnerabilities

Metric	2014				2015				2016			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Number of global cyber vulnerabilities considered to be high severity	446	499	418	557								

[82] Ref. NIST http://nvd.nist.gov/cvss.cfm.

Next Steps

The BESSMWG acknowledges that these five metrics represent only the first step in developing meaningful security performance metrics on behalf of the electricity industry. Through 2015, the BESSMWG will work with the ES-ISAC to help validate the data for these five metrics and continue to define additional metrics that can be developed with readily available data. In addition, the BESSMWG will develop a longer-term roadmap to explore other metrics that would be valuable, regardless of the extent to which the data is currently readily available.

Appendix A – Statistical Analysis for Risk Issue Identification and Transmission Outage Severity Analysis

Study Method

Defining BPS Impact from Transmission Risk

The SRI presented in Chapter 2 consists of several weighted risk impact components: generation, transmission, and load loss.[83] The transmission outage impact component of the SRI is defined as $w_T \times N_T$, where w_T is a weighting factor of 30 percent and N_T is the severity impact of a given day's transmission outages on the BPS based on TADS outages. Since transmission outages are a significant contributor to the overall SRI, this appendix provides an analysis of the individual TADS events based on TADS outage ICCs.

Equation A.1 is used to calculate the transmission outage severity component of a TADS event. The severity of a transmission outage is calculated based on its assumed contribution of power flow through transmission circuits. The average power flow MVA values, or Equivalent MVA Values, used in Equation A.1, are shown in Table A.1. These Equivalent MVA Values are also applied to the denominator of the transmission outage severity equation to normalize the function. The TADS event severity is then analyzed by ICC to investigate relative information between the ICCs.

For normalization, the total number of transmission circuits from the same year as the event is multiplied by each voltage class's Equivalent MVA value. For example, if an outage occurred in 2014, the normalization would use the total number of transmission circuits in 2014. This allows comparison of TADS events across years while taking into account the changing number of circuits within the BPS.

$$Transmission\ Severity\ (TADS\ event) = \left[\frac{\sum_{AC\ circuit\ Outages\ in\ Event}(Equivalent\ MVA)}{\sum_{AC\ circuit\ Inventory\ Counts}(Equivalent\ MVA)}\right] \cdot 1000$$

Equation A.1

Table A.1: Transmission Outage Severity Equivalent MVA Values

Voltage Class	Equivalent MVA Value
200–299 kV	700
300–399 kV	1300
400–599 kV	2000
600–799 kV	3000

In these studies, TADS events associated with automatic (forced) ac circuit outages that occurred from 2012 to 2014 are analyzed. Four data sets of TADS events studied separately are described further in Appendix A:

- All TADS events
- Common and Dependent Mode events
- Sustained events
- TADS events by Region

[83] http://www.nerc.com/docs/pc/rmwg/pas/index_team/sri_equation_refinement_may6_2011.pdf, pp. 2-3.

Determining Initiating Causes and Modification Method

TADS events are categorized by ICCs.[84] These ICCs facilitate the study of cause-effect relationships between each event's ICC and event severity. The procedure illustrated in Figure A.1 is used to determine a TADS event's ICC. The procedure that defines ICCs for a TADS event allows ICC assignment to a majority of transmission outage events recorded in TADS.

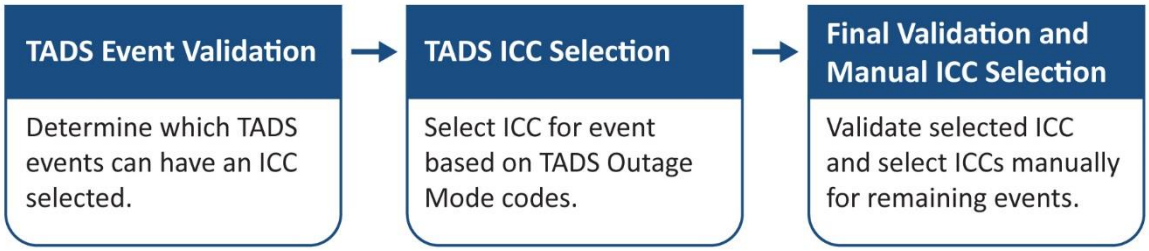

Figure A.1: TADS Event Initiating Cause Code Selection Procedure

Previous state of reliability reports have analyzed the TADS data set and its ICCs. The 2013 and 2014 *State of Reliability* reports also included analysis based on an augmented data set that defined changes in ICCs to further distinguish normal clearing events from abnormal clearing events. Two TADS ICCs are impacted: Human Error and Failed Protection System Equipment.

- TADS Human Error ICC is subdivided by type codes, which first became available in 2012. For the purpose of the state of reliability, data for two specific type codes related to protection system misoperation have been removed from the Human Error ICC and added to the Failed Protection System Equipment ICC. Those type codes are 61 dependability[85] (failure to operate) and 62 security[86] (unintended operation).

- TADS Failed Protection System Equipment ICC plus the Human Error type code 61 and 62 data are added together in a new or augmented ICC labeled "Misoperation" in each state of reliability report.

The 2013 and 2014 *State of Reliability* reports have revealed that analyzing data based on both data sets (TADS ICCs and TADS augmented ICCs to include the Misoperation cause code) has not provided additional information. Therefore, starting with this report, the data and analysis in this appendix will be based on the augmented ICC data set, which currently contains three years of data. In future years, the analysis will be based on the most recent five years of augmented ICC data.

In this report, references to ICC mean the augmented ICC as described above.

Event Statistics by Year

There are 10,748 TADS events with ICCs assigned, comprising 99.6 percent of the total number of TADS events for the years 2012 to 2014. These events contribute 99.1 percent of the total calculated transmission outage severity of the database. Table A.2 provides the corresponding event statistics by year.

---

[84] For detailed definitions of TADS cause codes, please refer to: http://www.nerc.com/pa/RAPA/tads/Transmission Availability Data System Working Group/TADS Definitions (Appendix 7).pdf, January 14, 2013, pp. 19-20.

[85] Event Type 61 Dependability (failure to operate): one or more automatic outages with delayed fault clearing due to failure of a single protection system (primary or secondary backup) under either of these conditions:
- Failure to initiate the isolation of a faulted power system Element as designed, or within its designed operating time, or
- In the absence of a fault, failure to operate as intended within its designed operating time.

[86] Event Type 62 Security (unintended operation): one or more automatic outages caused by improper operation (e.g., overtrip) of a protection system resulting in isolating one or more TADS elements it is not intended to isolate, either during a fault or in the absence of a fault.

Table A.2: TADS Outage Events Summary (2012–2014)				
Summary	**2012**	**2013**	**2014**	**2012–2014**
Number of TADS events	3,753	3,557	3,477	10787
Number of events with ICC assigned	3,724	3,557	3,467	10748
Percentage of events with ICC assigned	99.2%	100.0%	99.7%	99.6%
Transmission outage severity all TADS events	612.4	506.0	448.2	1566.6
Transmission outage severity of TADS events with ICC assigned	602.1	506.0	445.0	1553.1
Percentage of Transmission outage severity of events with TADS ICC assigned	98.3%	100.0%	99.3%	99.1%

In particular, the statistics in Table A.2 show that, on average, one transmission event occurs in North America every 2 hours and 26 minutes.

Events with Common ICC by Year and Estimates of Event Probability

Table A.3 lists annual counts and hourly event probability of TADS events by ICC. The ICCs with the largest number of events are weather (with and without lightning), Unknown, Misoperation, Failed AC Circuit Equipment, and Failed AC Substation Equipment. These groups together amount to 76 percent of TADS events for three years.

Almost all TADS ICC groups have sufficient data available to be used in a statistical analysis. Only three ICCs (Vegetation; Vandalism, Terrorism, or Malicious Acts; and Environmental) do not have enough observations for reliable statistical inferences. These are combined into a new group, named "Combined Smaller ICC Groups," that can be statistically compared to every other group and also studied with respect to annual changes of transmission outage severity.

With the development of the transmission outage severity measure and TADS event ICCs, it is possible to statistically analyze the most recent three years of TADS data (2012–2014). For TADS events initiated by a common cause, the probability[87] of observing the initiation of an event during a given hour is estimated using the corresponding historical event occurrences reported in TADS. Namely, the event occurrence probability is the total number of occurrences for a given type of event observed during the historical data period divided by the total number of hours in the same period. Therefore, the sum of the estimated probabilities for all events is equal to the estimated probability of any event during a given hour.

[87] Probability is estimated using event occurrence frequency of each ICC type without taking into account the event duration.

Table A.3: TADS Events and Hourly Event Probability by ICC (2012–2014)					
Initiating Cause Code	**2012**	**2013**	**2014**	**2012–2014**	**Event Initiation Probability/Hour**
Lightning	852	813	709	2374	0.090
Unknown	710	712	779	2201	0.084
Weather, excluding lightning	446	433	441	1320	0.050
Misoperation	321	281	314	916	0.035
Failed AC Circuit Equipment	261	248	224	733	0.028
Failed AC Substation Equipment	248	191	223	662	0.025
Foreign Interference	170	181	226	577	0.022
Human Error (w/o Type 61 OR Type 62)	212	191	149	552	0.021
Contamination	160	151	149	460	0.017
Fire	106	130	44	280	0.011
Power System Condition	77	109	83	269	0.010
Other	104	64	77	245	0.009
Combined Smaller ICC groups	57	53	49	159	0.006
Vegetation	43	36	39	118	0.004
Vandalism, Terrorism, or Malicious Acts	10	9	8	27	0.001
Environmental	4	8	2	14	0.001
All with ICC assigned	3724	3557	3467	10748	0.409
All TADS Events	3753	3557	3477	10787	0.410

Determining Relative Risk

The process of the statistical analysis performed to identify top causes to transmission risk is demonstrated in Figure A.2. After Step 1 (quantifying an event impact by transmission outage severity) and Step 2 (assigning initiating causes to TADS events), at Step 3, NERC staff determined the correlation between each ICC and transmission outage severity and detected statistically significant relationships between several initiating causes and transmission outage severity. Also, sample distributions were studied to determine any statistically significant pair-wise differences in expected transmission outage severity between ICCs, including a time trend analysis where applicable. Finally, at Step 4, the relative risk was calculated for each ICC group, and initiating causes were ranked by their risk to the transmission system.

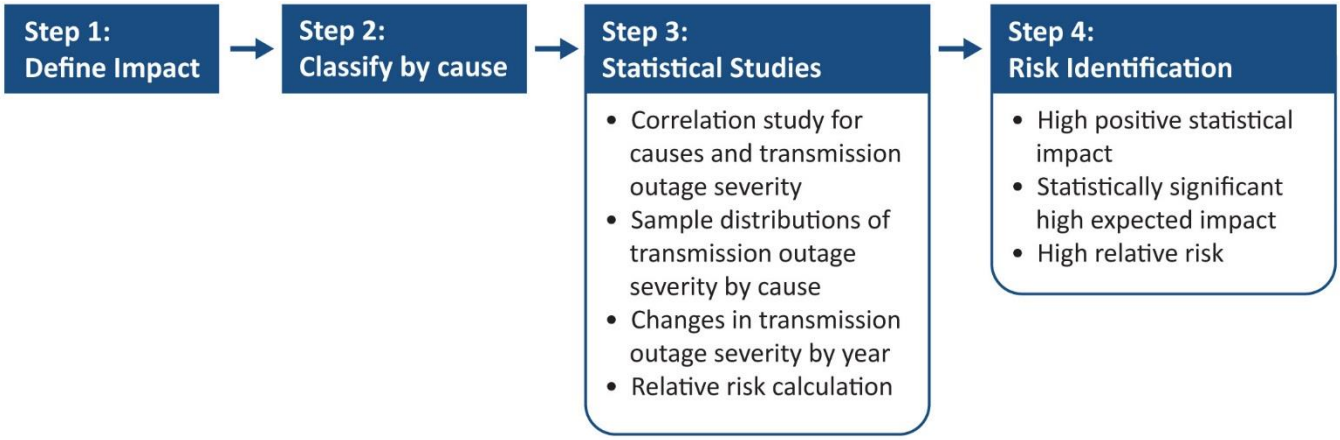

Figure A.2: Risk Identification Method

To study the relationship between ICCs and the transmission outage severity of TADS events, NERC investigated the statistical significance of the correlation between transmission outage severity and the indicator function[88] of a given ICC.[89] The test is able to determine a statistically significant positive or negative correlation between ICC and transmission outage severity.

Distributions of transmission outage severity for the entire dataset were examined separately for events with a given ICC. A series of t-tests[90] were performed to compare the expected transmission outage severity of a given ICC with the expected outage severity of the rest of the events at significance level of 0.05. Then, the Fisher's Least Square[91] difference method was applied to determine statistically significant[92] differences in the expected transmission outage severity for all pairs of ICCs.

Where applicable, the time trend analysis was performed. Statistically significant differences in the expected transmission outage severity for each ICC group were analyzed for each year of data. This showed if the average transmission outage severity for a given ICC group had changed over time.

[88] The indicator function of a given ICC assigns value 1 to an event with this ICC and value 0 to the rest of the events.

[89] For each ICC, a null statistical hypothesis on zero correlation at significance level 0.05 was tested. If the test resulted in rejection of the hypothesis, it is concluded that a statistically significant positive or negative correlation between an ICC and transmission severity exists; the failure to reject the null hypothesis indicates no significant correlation between ICC and transmission severity.

[90] For t-test, see D. C. Montgomery and G. C. Runger, Applied Statistics and Probability for Engineers. Fifth Edition. 2011. John Wiley & Sons. Pp. 361-369.

[91] For Fisher's Least Significance Difference (LSD) method or test, see D. C. Montgomery and G. C. Runger, Applied Statistics and Probability for Engineers. Fifth Edition. 2011. John Wiley & Sons. Pp. 524-526.

[92] At significance level of 0.05.

Finally, relative risk was calculated for each ICC group. The impact of an outage event was defined as the expected transmission outage severity associated with a particular ICC group. The probability that an event from a given group initiates during a given hour is estimated from the frequency of the events of each type without taking into account the event duration. The risk per hour of a given ICC was calculated as the product of the probability per hour and the expected severity (impact) of an event from this group. The relative risk was then defined as the percentage of the risk associated with each ICC out of the total (combined for all ICC events) risk per hour. Finally, risk profiles of TADS events initiated by common causes are visualized as bubble charts that summarize results of correlational, distributional, and risk ranking analyses.

Correlation between ICC and Transmission Outage Severity

To study a relationship between ICC and transmission outage severity of TADS events, the statistical significance of the correlation between transmission outage severity and the indicator function[93] of a given ICC was investigated.[94] A statistically significant positive or negative correlation between ICC and transmission outage severity could be determined by the statistical test. There were three key outcomes of all the tests. A statistically significant positive correlation of ICC to transmission outage severity indicates a greater likelihood that an event with this ICC would result in a higher transmission outage severity. A stark negative correlation indicates the contrary; in this case, a lower transmission outage severity would be likely. If no significant correlation is found, it indicates the absence of a linear relationship between ICC and the transmission outage severity, and that the events with this ICC have an expected transmission outage severity similar to all other events from the database.

Figure A.3 shows the correlations between calculated transmission outage severity and the given ICC. A red bar corresponds to an ICC with statistically significant positive correlation with transmission outage severity, a green bar corresponds to an ICC with statistically significant negative correlation, and a blue bar indicates no significant correlation. Thus, Misoperation, Failed AC Substation Equipment, and Power System Condition have statistically significant positive correlation with transmission outage severity. The expected severity of events with each of these ICCs is greater than the expected severity of other ICC events. Secondly, Weather Excluding Lightning, Foreign Interference, Unknown, and Combined Smaller ICC Groups have a statistically significant negative correlation with transmission outage severity. The expected severity of events initiated by these causes is less than the expected transmission outage severity of other TADS events. Finally, events with each of the ICCs with blue bars have the expected transmission outage severity similar to all other events in TADS.

[93] The indicator function of a given ICC assigns value 1 to an event with this ICC and value 0 to the rest of the events.

[94] For each ICC, a null statistical hypothesis on zero correlation at significance level 0.05 was tested. If the test resulted in rejection of the hypothesis, it is concluded that a statistically significant positive or negative correlation between an ICC and transmission outage severity exists; the failure to reject the null hypothesis indicates no significant correlation between ICC and transmission outage severity.

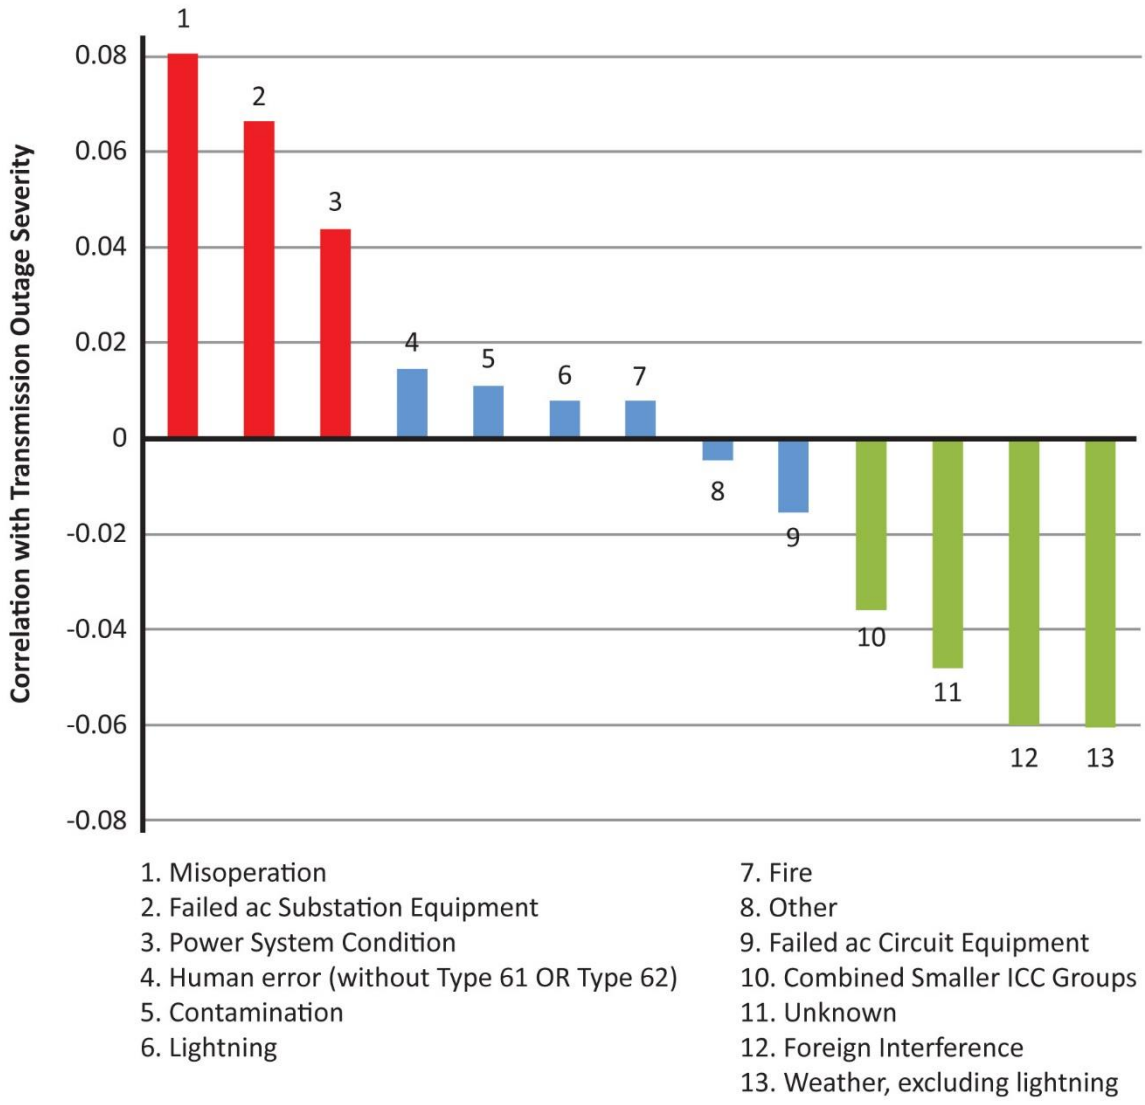

Figure A.3: Correlation between ICC and Transmission Outage Severity of TADS Events (2012–2014)

Distribution of Transmission Outage Severity by ICC

Next, the distribution of transmission outage severity for the dataset was studied separately for events with a given ICC and the complete dataset. The transmission outage severity of the 2012 to 2014 dataset has a sample mean of 0.15 and the sample standard deviation of 0.10. The sample statistics for transmission outage severity by ICC are listed in Table A.4, with the ICCs ordered from the largest average transmission outage severity to the smallest one.

A series of the Fisher's Least Square tests confirms that the groups of events initiated by Power System Condition, Misoperation, and Failed AC Substation Equipment have statistically[95] greater expected severity than other events, in accordance with the correlation analysis described above. It means that when an event initiated by one of these causes occurs, it has, on average, a greater impact and a higher risk to the transmission system. Moreover, the tests on homogeneity of variances point out to statistically greater variances (and the standard deviations) for

[95] At significance level 0.05

each of these groups as compared with other events. The greater variance is an additional risk factor since it implies more frequent occurrences of events with high transmission outage severity.

Table A.4 provides a column that lists ICCs that are statistically less than a given ICC referenced by the table's column 1 index. For example, Power System Condition, Misoperation, and Failed AC Substation Equipment initiate events with statistically larger transmission outage severity than any other ICC starting with Human Error. However, pairwise differences between three top groups are not significant, meaning that an individual impact of events from these groups is statistically less.

Table A.4: Distribution of Transmission Outage Severity by ICC (2012–2014)

#	Initiating Cause Code (ICC)	Average TS	Is Expected TS statistically significantly different than for other events?	ICC with statistically significantly smaller TS	Standard Deviation of TS
1	Power System Condition	0.1702	Larger	4,5,6,7,8,9,10,11,12,13	0.15
2	Misoperation	0.1693	Larger	4,5,6,7,8,9,10,11,12,13	0.14
3	Failed AC Substation Equipment	0.1689	Larger	4,5,6,7,8,9,10,11,12,13	0.12
4	Human Error (w/o Type 61 OR Type 62)	0.1527	No	9,10,11,12,13	0.10
5	Contamination	0.1493	No	10,11,12,13	0.08
6	Fire	0.1489	No	10,11,12,13	0.09
7	Lightning	0.1459	No	10,11,12,13	0.09
	All TADS events	**0.1452**	**N/A**	**N/A**	**0.10**
	All with ICC assigned	**0.1445**	**N/A**	**N/A**	**0.09**
8	Other	0.1417	No	12,13	0.10
9	Failed AC Circuit Equipment	0.1391	No	12,13	0.08
10	Unknown	0.1356	Smaller	12,13	0.07
11	Weather, excluding lightning	0.1334	Smaller	12,13	0.08
12	Foreign Interference	0.1207	Smaller	None	0.06
13	Combined Smaller ICC groups	0.1169	Smaller	None	0.06

Average Transmission Outage Severity by ICC: Annual Changes

Year-over-year changes in calculated transmission outage severity by ICC were reviewed next. Figure A.4 shows changes in the average transmission outage severity for each ICC for the 2012 to 2014 dataset. The groups of ICC events are listed from left to right by descending average transmission outage severity for the three years. The largest average transmission outage severity over the data period was observed for events initiated by Power System Condition.

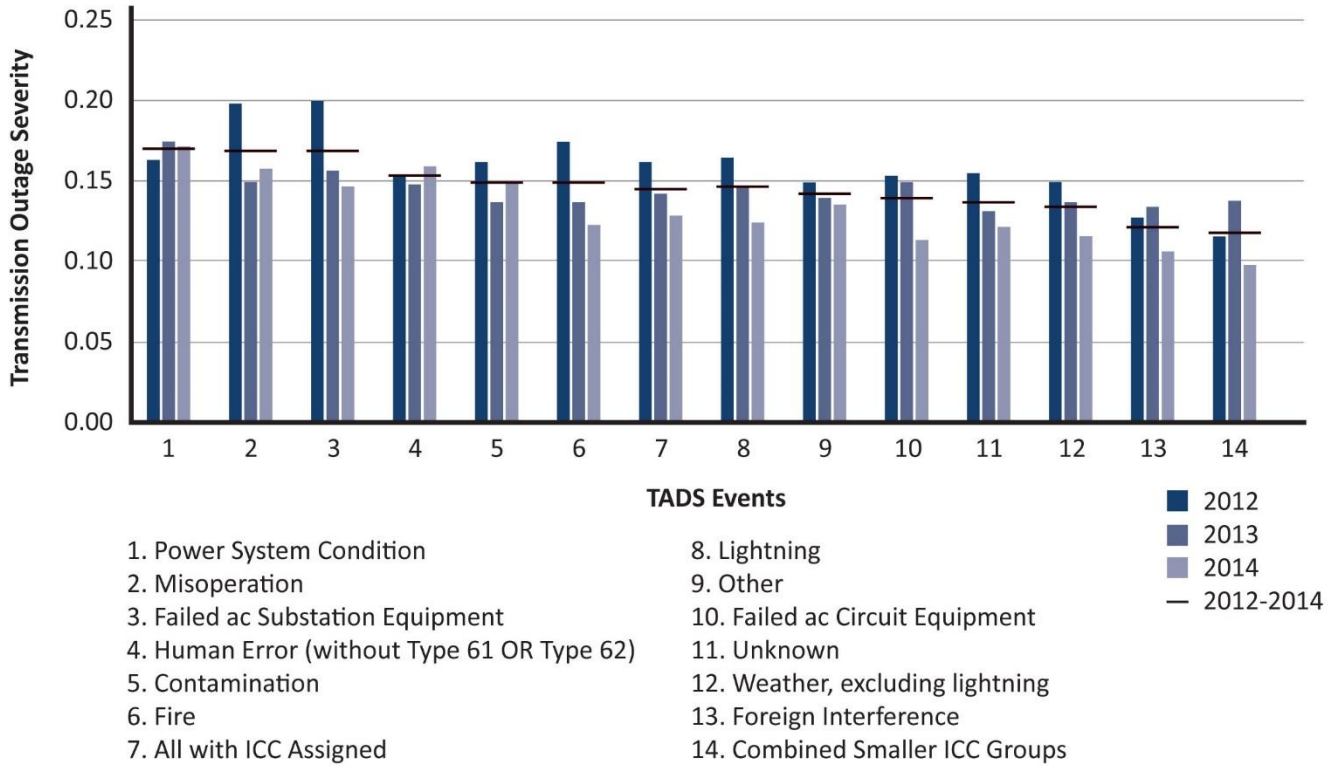

Figure A.4: Average Transmission Outage Severity of TADS Events by ICC (2012–2014)

It should be noted that Power System Condition ICC, which in the *State of Reliability 2014* report followed Failed AC Substation Equipment and Misoperations ICCs, moved to the top spot based on the three-year data. Power System Condition is defined as "Automatic Outages caused by power system conditions such as instability, overload trip, out-of-step, abnormal voltage, abnormal frequency, or unique system configurations (e.g., an abnormal terminal configuration due to existing condition with one breaker already out of service)." In Figure A.4, one can see that both Failed AC Substation Equipment and Misoperations ICCs have a large reduction in the average transmission outage severity from 2012 to 2013 and stayed essentially flat from 2013 to 2014. Statistical tests confirm that these decreases from 2012 to 2013 were statistically significant.[96] In contrast, the average transmission outage severity of events initiated by Power System Condition had no significant year-over-year changes over these three years.

Another important conclusion comes from the analysis of transmission outage severity of all TADS events with ICC assigned. Their average transmission outage severity significantly decreased from 2012 to 2013 and then again from 2013 to 2014. The same trend is observed for events with ICCs Lightning, Unknown, and Weather excluding Lightning—the three largest groups of TADS events.

[96] This summary only lists changes that are statistically significant at the 0.05 level.

Transmission Outage Severity Risk and Relative Risk of TADS Events by ICC

The risk of each ICC group can be defined as the total transmission outage severity associated with this group; its relative risk is equal to the percentage of the group transmission outage severity in the 2012 to 2014 database. Equivalently, the risk of a given ICC per hour can be defined as the product of the probability that an event with this ICC initiates during an hour and the expected severity (impact) of an event from this group. For any ICC group, the relative risk per hour is the same as the relative risk for a year (or any other time period) if estimated from the same dataset.

Relative risk of the 2012 to 2014 TADS events by ICC is listed in Table A.5. The probability that an event from a given group initiated during a given hour is estimated from the frequency of the events of each type without taking into account the event duration. Excluding weather-related events and events with Unknown ICC, events initiated by Misoperations and by Failed AC Substation Equipment had the largest shares in the total transmission outage severity and contributed 9.9 and 7.1 percent, respectively, to transmission outage severity relative risk.

Note that Power System Condition has a low rank despite having the largest average transmission outage severity of an individual event from this group. The reason is that there is a small number of events with this ICC and, therefore, rare occurrences of these events are reflected by their small probability.

Table A.5: Relative Risk by ICC (2012–2014)

Group of TADS events	Probability that an event from a group starts during a given hour	Expected Impact (expected transmission outage severity of an event)	Risk associated with a group per hour	Relative Risk by group
All TADS events	0.410	0.145	0.0596	**100.0%**
All with ICC assigned	0.409	0.144	0.0590	**99.1%**
Lightning	0.090	0.146	0.0132	**22.1%**
Unknown	0.084	0.136	0.0113	**19.1%**
Weather, excluding lightning	0.050	0.133	0.0067	**11.2%**
Misoperation	0.035	0.169	0.0059	**9.9%**
Failed AC Substation Equipment	0.025	0.169	0.0043	**7.1%**
Failed AC Circuit Equipment	0.028	0.139	0.0039	**6.5%**
Human Error (w/o Type 61 OR Type 62)	0.021	0.153	0.0032	**5.4%**
Foreign Interference	0.022	0.121	0.0026	**4.4%**
Contamination	0.017	0.149	0.0026	**4.4%**
Power System Condition	0.010	0.170	0.0017	**2.9%**
Fire	0.011	0.149	0.0016	**2.7%**
Other	0.009	0.142	0.0013	**2.2%**
Combined Smaller ICC groups	0.006	0.117	0.0007	**1.2%**

Figure A.5 shows year-over-year changes in the relative risk of TADS events by ICC. The groups of ICC events are listed from left to right by descending relative risk for the three years. The top-three contributors to transmission risk—Lightning, Unknown, and Weather excluding Lightning—had a statistically significant decrease in the expected outage severity, as described in the previous section. For ICC Lightning, the number of events in 2014 also decreased, and both decreases (in probability and an impact) resulted in a drop in the 2014 transmission risk. On the contrary, the number of events with ICC Unknown increased in 2014 and offset the expected severity decrease; thus, the transmission risk for ICC Unknown grew in 2014. Finally, for Weather excluding Lightning, increase in probability and decrease in expected severity compensated each other, and the transmission risk stayed flat.

For both Misoperation and Failed AC Substation Equipment ICCs, the number of events increased in 2014 and offset the statistically significant decrease in their expected transmission outage severity; this resulted in an increased transmission risk and increased relative risk for these two ICCs.

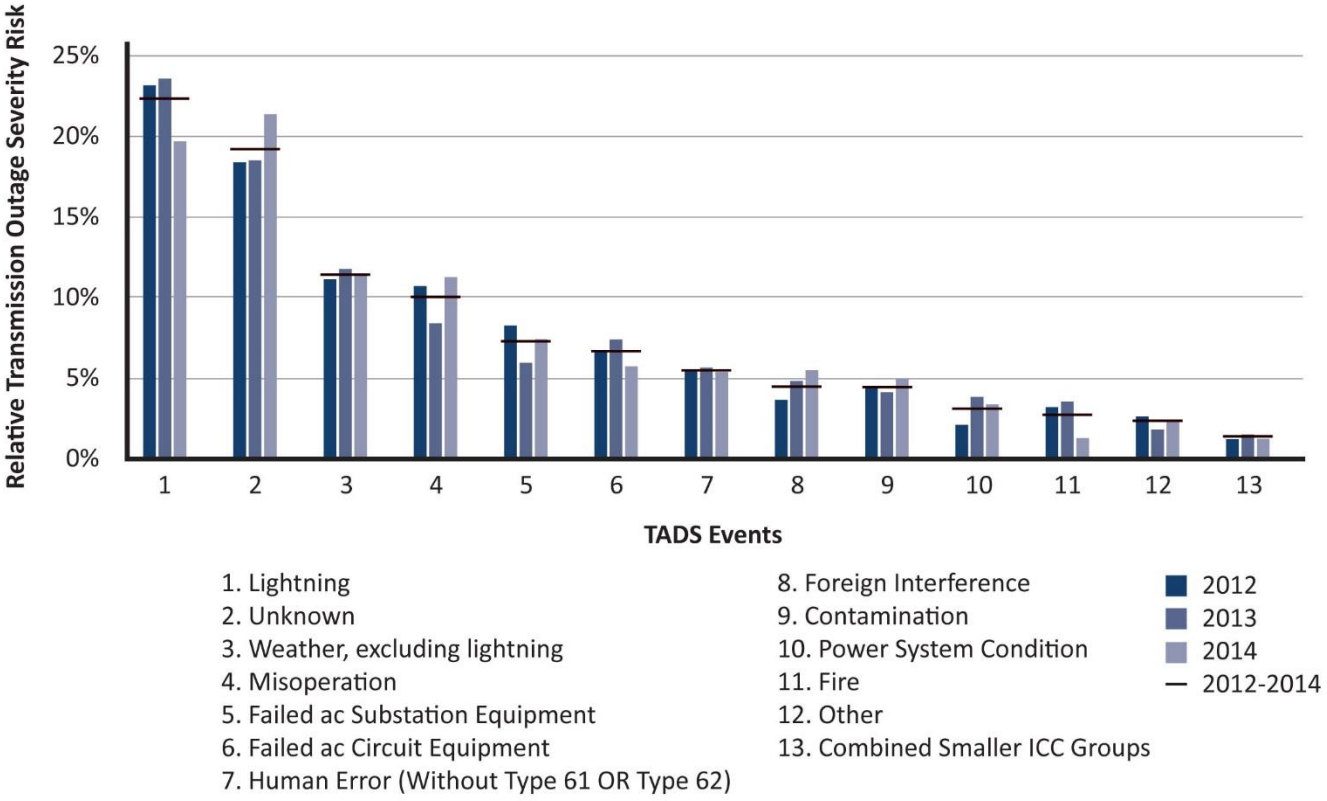

Figure A.5: Relative Transmission Outage Severity Risk by ICC and Year

Common/Dependent Mode Event ICC Study (2012–2014)

TADS also provides information to classify outages as single-mode or common or dependent mode (CDM) events that should be evaluated separately from single-mode events. CDM events result in multiple transmission element outages. It is important to monitor and understand CDM events due to their potential risk to system reliability. These TADS events have more transmission outage severity than TADS events with a Single Mode outage. A Single Mode event is defined as a TADS event with a single-element outage. A CDM TADS event is a TADS event where all outages have one of the modes (other than Single Mode) in Table A.6.

Based on this definition, every TADS event was categorized as either a Single Mode event or a CDM event. Some TADS events were entered as a combination of Single Mode outages and other outage modes. These events were manually examined to determine if the event was Single Mode or CDM. For some events, it was not possible to determine whether the event was Single Mode or CDM, nor was it possible to tell the ICC for the event. These events, approximately 0.3 percent of all TADS events, were removed from the study.

Table A.6: Outage Mode Codes

Outage Mode Code	Automatic Outage Description
Single Mode	A single-element outage that occurs independently of another automatic outage
Dependent Mode Initiating	A single-element outage that initiates at least one subsequent element automatic outage
Dependent Mode	An automatic outage of an element that occurred as a result of an initiating outage, whether the initiating outage was an element outage or a non-element outage
Common Mode	One of at least two automatic outages with the same initiating cause code where the outages are not consequences of each other and occur nearly simultaneously
Common Mode Initiating	A common-mode outage that initiates one or more subsequent automatic outages

Table A.7 lists CDM events by ICC in the 2012 to 2014 database and their percentages with respect to all TADS events with a given ICC. Note that the Misoperations ICC initiated the largest number of CDM events. CDM events initiated by Lightning comprise the second-largest group, followed by Failed AC Substation Equipment and Unknown. Overall, 1613 CDM events were defined. Out of these, 1576 are assigned to one of the 16 ICCs.

Table A.7: CDM Events and Hourly Event Probability by ICC (2012–2014)

Initiating Cause Code	ALL TADS events	CDM events	CDM as % of ALL	Event Initiation Probability/Hour
Misoperation	916	286	31.2%	0.0109
Lightning	2374	270	11.4%	0.0103
Failed AC Substation Equipment	662	225	34.0%	0.0086
Unknown	2201	137	6.2%	0.0052
Weather, excluding lightning	1320	123	9.3%	0.0047
Human Error (w/o Type 61 OR Type 62)	552	119	21.6%	0.0045
Power System Condition	269	118	43.9%	0.0045
Failed AC Circuit Equipment	733	99	13.5%	0.0038
Other	245	68	27.8%	0.0026
Foreign Interference	577	59	10.2%	0.0022
Fire	280	33	11.8%	0.0013
Contamination	460	23	5.0%	0.0009
Combined Smaller ICC groups	159	16	10.1%	0.0006
Vegetation	118	7	5.9%	0.0003
Environmental	14	6	42.9%	0.0002
Vandalism, Terrorism, or Malicious Acts	27	3	11.1%	0.0001
All with ICC assigned	10748	1576	14.7%	0.0599
All TADS events	10787	1613	15.0%	0.0613

CDM events are a subset of the previously evaluated TADS events; they comprise 15 percent of all TADS events from 2012 to 2014. Annual datasets of CDM events do not have enough observations to run statistical analyses and track statistically significant year-over-year changes in transmission outage severity. Even the three-year CDM dataset has too small of a sample size for reliable correlation analysis or for the statistical analysis of differences in transmission outage severity.

Upon combining the three smallest ICC group (Vegetation; Environmental; and Vandalism, Terrorism, or Malicious Acts) into a new group (Combined Smaller ICC groups), the transmission risk and relative risk by ICC were calculated and ranked. Table A.8 provides a breakdown of relative risk of CDM events by ICC.

Table A.8: Evaluation of CDM Event ICC Contribution to Transmission Outage Severity (2012–2014)

Group of TADS events	Probability that an event from a group starts during a given hour	Expected Impact (expected transmission outage severity of an event)	Risk associated with a group per hour	Relative Risk by group
All TADS events	0.410	0.145	0.060	**100.0%**
All CDM events	0.061	0.226	0.014	**23.3%**
All CDM with ICC assigned	0.060	0.224	0.013	**22.5%**
CDM Lightning	0.0103	0.2394	0.002	**4.1%**
CDM Misoperation	0.0109	0.2202	0.002	**4.0%**
CDM Failed AC Substation Equipment	0.0086	0.2270	0.002	**3.3%**
CDM Unknown	0.0052	0.2270	0.001	**2.0%**
CDM Weather, excluding lightning	0.0047	0.2221	0.001	**1.7%**
CDM Human Error (w/o Type 61 OR Type 62)	0.0045	0.2273	0.001	**1.7%**
CDM Power System Condition	0.0045	0.2152	0.001	**1.6%**
CDM Failed AC Circuit Equipment	0.0038	0.2378	0.001	**1.5%**
CDM Other	0.0026	0.1854	0.000	**0.8%**
CDM Foreign Interference	0.0022	0.1823	0.000	**0.7%**
CDM Fire	0.0013	0.2440	0.000	**0.5%**
CDM Contamination	0.0009	0.2530	0.000	**0.4%**
CDM Combined Smaller ICC groups	**0.0006**	**0.1467**	**0.000**	**0.1%**

Analysis of the TADS CDM events indicated that events with ICCs of Misoperation and Failed AC Substation Equipment are the two largest contributors to transmission outage severity with the exception of weather-related events. However, there is no significant correlation between any ICC and the transmission outage severity, which might be due to insufficient sample size of ICC groups and the whole CDM dataset for three years.

Sustained Event ICC Study (2012 to 2014)

TADS provides information to classify automatic outages as momentary or sustained.[97] A momentary outage is defined as an automatic outage with an outage duration less than one minute. If the circuit recloses and trips again within less than a minute of the initial outage, it is only considered one outage. The circuit would need to remain in service for longer than one minute between the breaker operations to be considered as two outages. A sustained outage[98] is defined as an automatic outage with an outage duration of a minute or greater. The definition of sustained outage has been extended to a TADS event with duration of a minute or greater. It is important to monitor and understand sustained outages and sustained events due to their potential risk to system reliability. Since outage duration is not included in the definition of transmission outage severity (Equation A.1), NERC staff studied the transmission outage severity of sustained events by ICC.

Table A.9 lists sustained events by ICC in the 2012 to 2014 database and their percentages with respect to all TADS events with a given ICC. Unlike all TADS events and CDM events, events with an Unknown ICC represented the largest number of sustained events. Sustained events initiated by Weather excluding Lightning ICC comprise the second largest group, followed by Lightning and Misoperation. Overall, 5908 sustained events were reported, representing 54.8 percent of all TADS events from 2012 to 2014. Out of these, 5878 are assigned to one of the 16 ICCs.

Almost all ICC groups of sustained events have sufficient data available to be used in a statistical analysis. Only two ICCs (Vandalism, Terrorism, or Malicious Acts; and Environmental) do not have enough observations for reliable statistical inferences based on the 2012 to 2014 data. These are combined into a new group, named "Combined Smaller ICC Groups," that can be statistically compared to every other group and used for reliable correlation analysis and for the statistical analysis of differences in transmission outage severity.

[97] http://www.nerc.com/pa/RAPA/tads/Pages/default.aspx.

[98] The TADS definition of Sustained Outage is different from the NERC *Glossary of Terms Used in Reliability Standards* definition of Sustained Outage that is presently only used in FAC-003-1. The glossary defines a Sustained Outage as follows: "The deenergized condition of a transmission line resulting from a fault or disturbance following an unsuccessful automatic reclosing sequence and/or unsuccessful manual reclosing procedure." The definition is inadequate for TADS reporting for two reasons. First, it has no time limit that would distinguish a sustained outage from a momentary outage. Second, for a circuit with no automatic reclosing, the outage would not be "counted" if the TO has a successful manual reclosing under the glossary definition.

Table A.9: Sustained Events and Hourly Event Probability by ICC (2012–2014)				
Initiating Cause Code	**ALL TADS events**	**Sustained events**	**Sustained as % of ALL**	**Sustained Event Initiation Probability/Hour**
Unknown	2201	864	39.3%	0.0328
Weather, excluding lightning	1320	836	63.3%	0.0318
Lightning	2374	702	29.6%	0.0267
Misoperation	916	697	76.1%	0.0265
Failed AC Circuit Equipment	733	572	78.0%	0.0217
Failed AC Substation Equipment	662	562	84.9%	0.0214
Human Error (w/o Type 61 OR Type 62)	552	475	86.1%	0.0181
Foreign Interference	577	298	51.6%	0.0113
Fire	280	209	74.6%	0.0079
Power System Condition	269	188	69.9%	0.0071
Other	245	181	73.9%	0.0069
Contamination	460	171	37.2%	0.0065
Vegetation	118	89	75.4%	0.0034
Combined Smaller ICC groups	41	34	82.9%	0.0013
Vandalism, Terrorism, or Malicious Acts	27	22	81.5%	0.0008
Environmental	14	12	85.7%	0.0005
All with ICC assigned	10748	5878	54.7%	0.2235
All TADS events	10787	5908	54.8%	0.2246

Figure A.6 shows the correlation between calculated transmission outage severity and each ICC in the same format as Figure A.3.

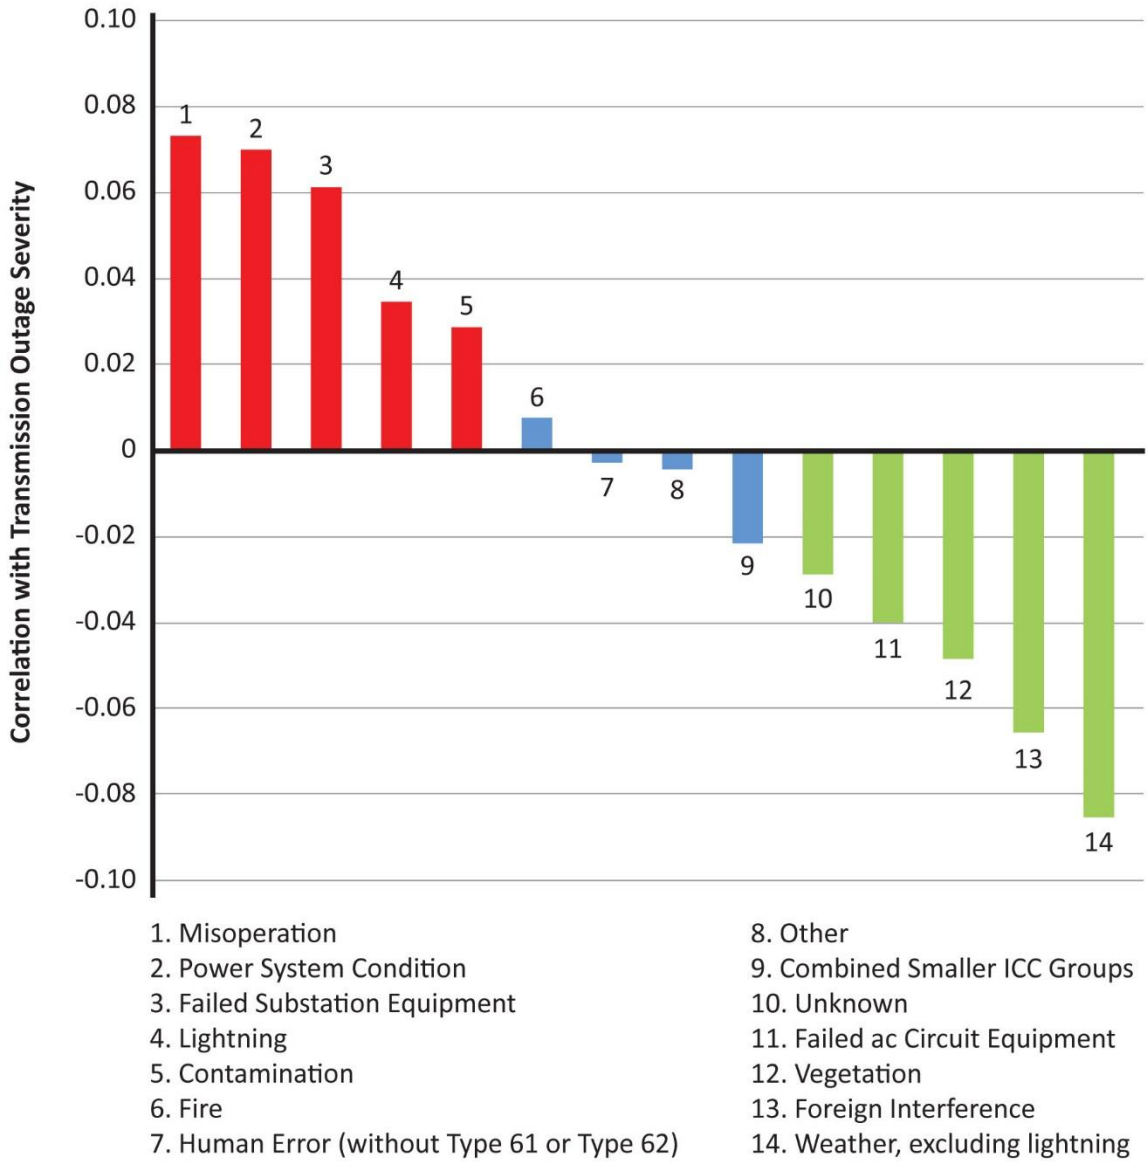

Figure A.6: Correlation between ICC and Transmission Outage Severity of Sustained Events (2012–2014)

Next, the distribution of transmission outage severity for the dataset was studied separately for sustained events with a given ICC. The sample statistics for transmission outage severity by ICC are listed in Table A.10 in the same format as Table A.4. Sustained events initiated by Power System Condition have the highest expected transmission outage severity, followed by events with ICCs Misoperation and Failed AC Substation Equipment. These groups not only have the statistically greater than expected outage severity than other sustained events, but also the greater variation, which means more frequent occurrences of events with these ICCs, which have very high transmission outage severity.

Table A.10: Distribution of Transmission Outage Severity of Sustained Events by ICC (2012–2014)

#	Initiating Cause Code (ICC)	Average TS	Is Expected TS statistically significantly different than for other sustained events?	ICC with statistically significantly smaller TS	Standard Deviation of TS
1	Power System Condition	0.196	Larger	2,3,4,5,6,7,8,9,10,11,12,13,14	0.18
2	Misoperation	0.175	Larger	5,6,7,8,9,10,11,12,13,14	0.15
3	Failed AC Substation Equipment	0.174	Larger	7,8,9,10,11,12,13,14	0.13
4	Contamination	0.171	Larger	9,10,11,12,13,14	0.10
5	Lightning	0.163	Larger	9,10,11,12,13,14	0.11
6	Fire	0.157	No	10,11,13,14	0.10
7	Human Error (w/o 61 OR Type 62)	0.155	No	10,11,13,14	0.11
	All Sustained Events	**0.154**	**N/A**	**N/A**	**0.11**
	Sustained with ICC	**0.153**	**N/A**	**N/A**	**0.11**
8	Other	0.150	No	11,13,14	0.12
9	Unknown	0.146	Smaller	11,13,14	0.09
10	Failed AC Circuit Equipment	0.140	Smaller	13,14	0.09
11	Weather, excluding lightning	0.132	Smaller	None	0.08
12	Combined Smaller ICC groups	0.123	Smaller	None	0.05
13	Foreign Interference	0.122	Smaller	None	0.07
14	Vegetation	0.110	Smaller	None	0.05

Finally, the transmission risk and relative risk by ICC were calculated and ranked. Table A.11 provides a breakdown of relative risk of CDM events by ICC.

Table A.11: Evaluation of Sustained Event ICC Contribution to Transmission Outage Severity (2012–2014)

Group of Sustained events	Probability that an event from a group starts during a given hour	Expected Impact (expected transmission outage severity of an event)	Risk associated with a group per hour	Relative Risk by group
All TADS events	0.410	0.145	0.0596	**100.0%**
All Sustained events	0.225	0.154	0.0346	**58.1%**
Sustained with ICC assigned	0.223	0.153	0.0342	**57.5%**
Unknown	0.033	0.146	0.0048	**8.0%**
Misoperation	0.026	0.175	0.0046	**7.8%**
Lightning	0.027	0.163	0.0044	**7.3%**
Weather, excluding lightning	0.032	0.132	0.0042	**7.0%**

Foreign Interference	0.011	0.122	0.0014	**2.3%**
Fire	0.008	0.157	0.0013	**2.1%**
Contamination	0.007	0.171	0.0011	**1.9%**
Other	0.007	0.150	0.0010	**1.7%**
Vegetation	0.003	0.110	0.0004	**0.6%**
Combined Smaller ICC groups	0.001	0.123	0.0002	**0.3%**

Analysis of the TADS sustained events indicated that the ICC Unknown has the greatest relative risk for sustained events from 2012 to 2014. Sustained events with ICCs of Misoperation and Failed AC Substation Equipment are the two largest contributors to transmission outage severity with the exception of weather-related events. Also, they have a significant positive correlation with transmission outage severity. The ICC with the highest expected severity, Power System Condition, ranks low in Table A.11; its relative risk is small due to rare occurrences of sustained events with this ICC.

Regional Entity Transmission Analysis

For the first time, NERC performed a study of the transmission outage severity of TADS events by Region. This analysis is based on the 2012–2014 TADS data and utilizes the general methodology described in the previous sections. Here, a summary of this analysis is introduced and similarities and differences in transmission risk profiles by Region are examined. Figure A.7 shows the breakdown of NERC-wide inventory and transmission outage severity risk by Region.

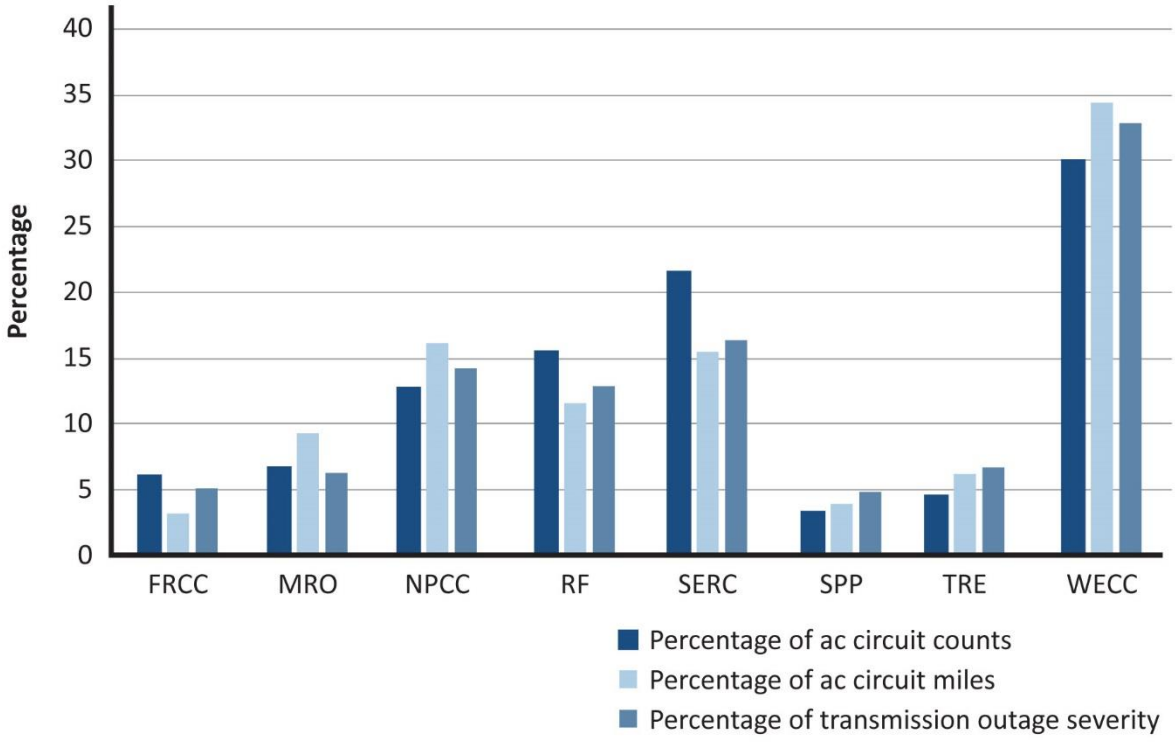

Figure A.7: NERC Inventory and Transmission Outage Severity Breakdown by Region (2012–2014)

Next, the transmission outage severity by initiating cause was studied for each Region. As for the entire NERC study described in the previous sections, three ICCs (Vegetation; Vandalism, Terrorism, or Malicious Acts; and Environmental) were grouped into a new group, named "Combined Smaller ICCs." A comparative analysis of Regional Entity relative risks by ICC is summarized in Figure A.8. Figure A.8 represents the breakdown by relative risk by Region and for NERC. Initiating causes are listed from left to right by decreasing relative risk for NERC data.

For the top NERC ICCs, the relative risks vary dramatically among Regions. Relative risk for Lightning ranges from 10 percent in FRCC to 32 percent for SPP. Events with ICC Unknown contribute between 9 percent for RFC and 30 percent in WECC. Weather excluding Lightning, as an outage cause code, initiates events comprising 9 percent transmission outage severity in NPCC and 24 percent in MRO.

Misoperation has the highest relative risk in NPCC (18 percent) and the lowest in FRCC (6 percent) with other Regions' numbers close to the NERC average of 10 percent. For MRO, AC Substation Equipment failures resulted in only 4 percent of the total transmission outage severity, while they contributed 13 percent in RFC.

FRCC has a very distinctive profile with unique risk breakdown. First, the top-three ICCs for North America (two weather-related and Unknown) comprise only 34 percent of the transmission outage severity in FRCC, versus 54 percent for NERC. Second, FRCC's top-risk ICC is Foreign Interference, which ranks very low for NERC and other

Regions. Note that NERC's top non-weather-related contributors, Misoperation and Failed AC Substation Equipment, together comprise only 13 percent of FRCC's transmission risk compared with 14 percent for Failed AC Circuit Equipment.

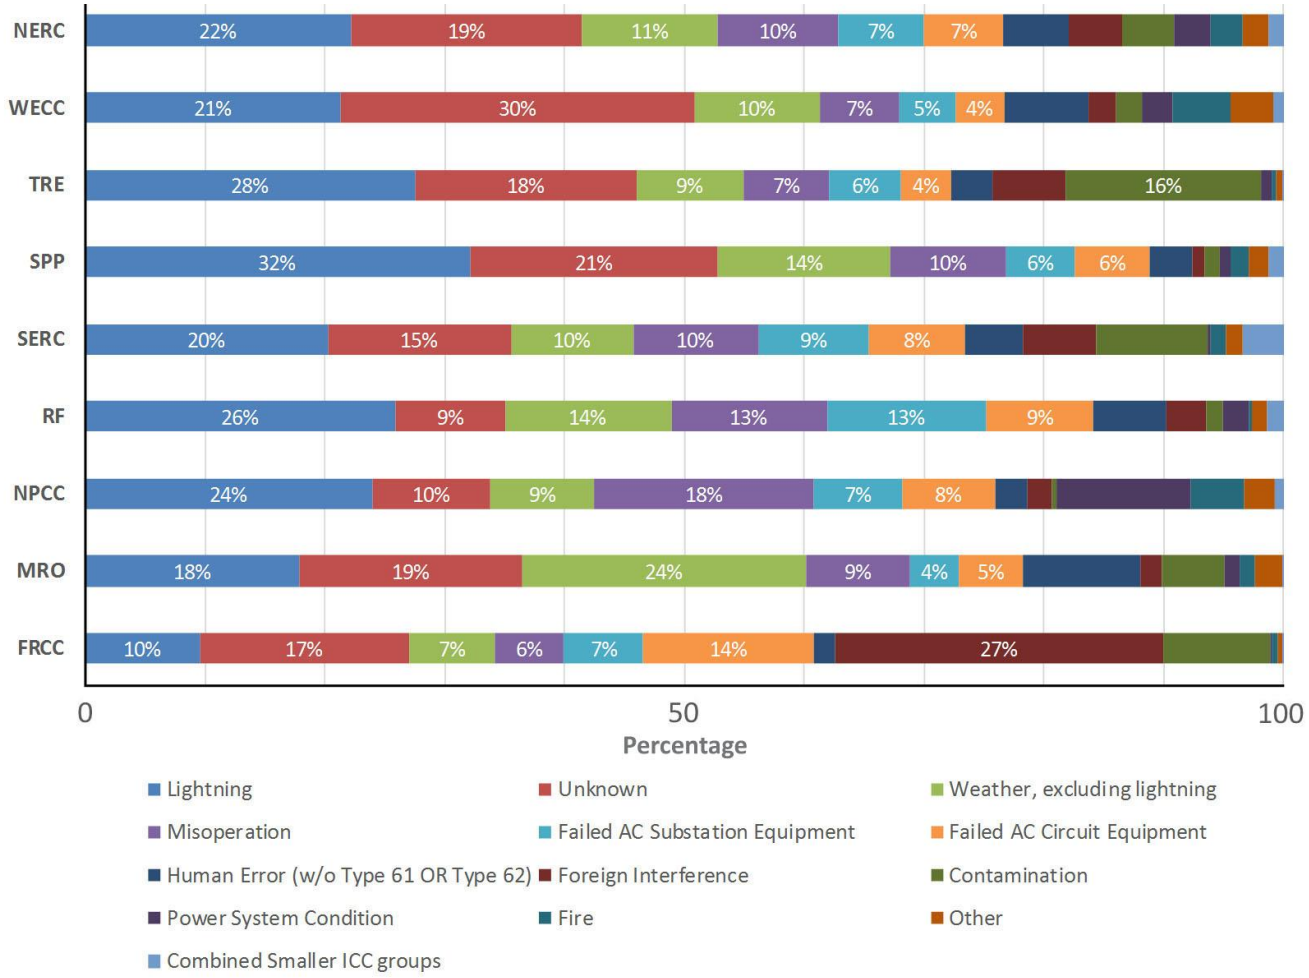

Figure A.8: Relative Transmission Risk by ICC and Region (2012–2014)

Summary of Analysis

The summary of the analysis of the risk profile of the 2012 to 2014 TADS events combined study is provided in Chapter 3. The Misoperation ICC (which represents TADS ICCs Failed Protection System Equipment and Human Error associated with Misoperations) and the Failed AC Substation Equipment ICC both show a statistically significant positive correlation with transmission outage severity and a higher relative transmission risk. Power System Condition ICC, while showing a positive correlation of transmission outage severity, has a lower relative transmission risk, based on the probability of this TADS outage event initiating in any hour and its expected transmission outage severity. On the other end of the risk spectrum, Lightning ICC shows a high relative transmission risk but has no significant correlation with transmission outage severity.

Figure A.9 represents an analysis of the risk profile of the 2012 to 2014 ICC study of sustained events. The x-axis is the magnitude of the correlation of a given ICC with transmission outage severity. The y-axis represents the expected transmission outage severity of an event when it occurs. The color of the marker indicates if there is a correlation of transmission outage severity with the given ICC (either positive – Red, negative – Green, or no significant correlation – Blue). The size of the marker indicates the probability of an event initiating in any hour

with a given ICC. Note that Failed AC Substation Equipment and Lightning both show a statistically significant positive correlation with transmission outage severity and show a higher relative transmission risk. On the other end of the risk spectrum, Weather excluding Lightning shows a high relative transmission risk but has no significant correlation with transmission outage severity.

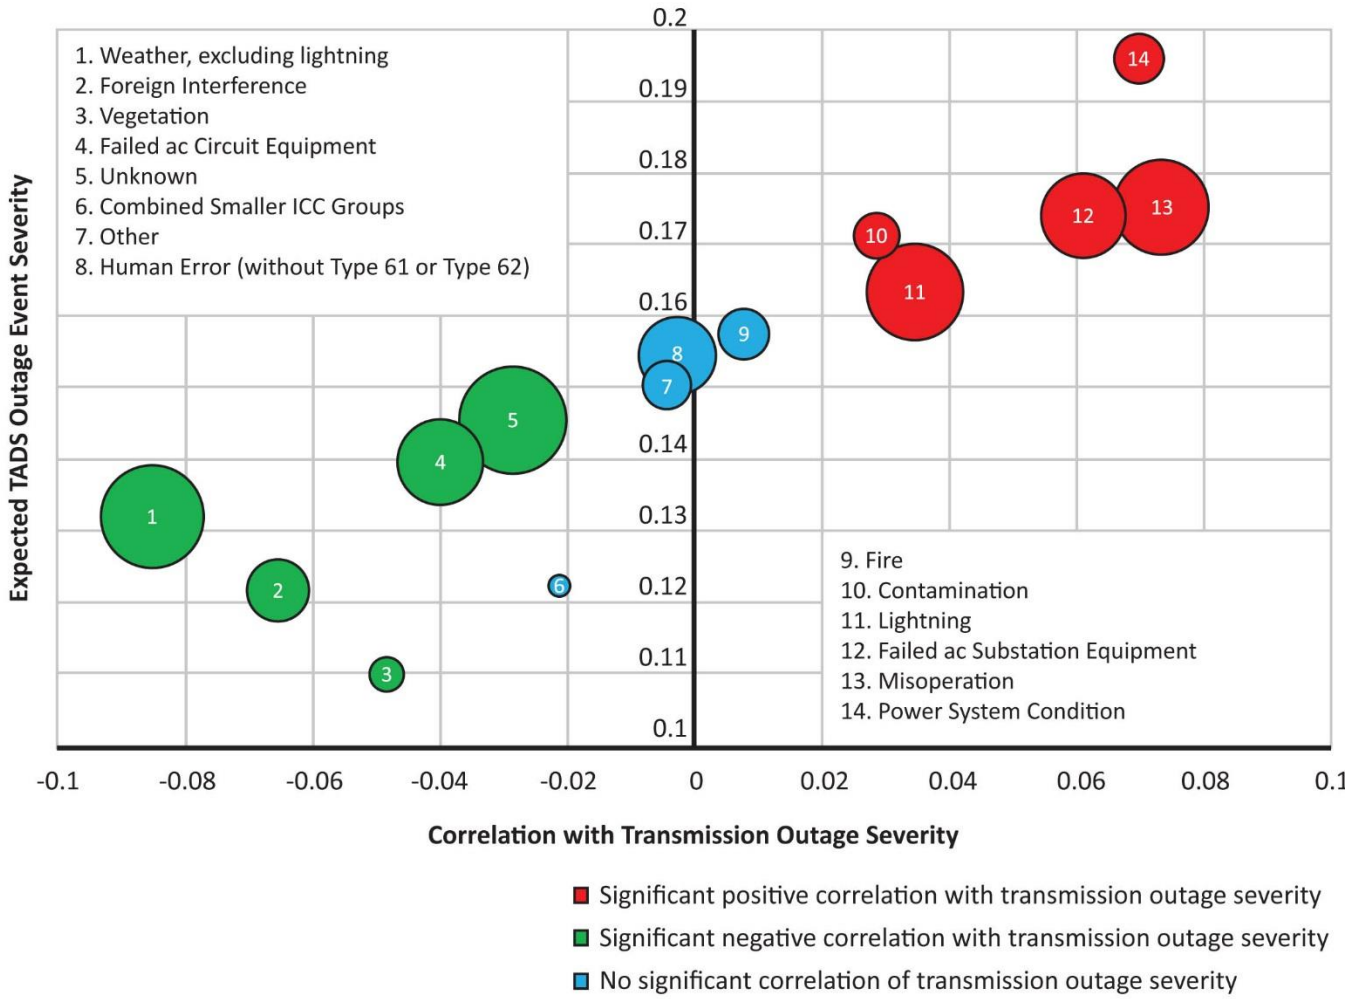

Figure A.9: Risk Profile of the 2012–2014 Sustained Events by ICC

The statistical analysis of the 2012 to 2014 TADS data on the transmission outage severity and initiating causes of TADS outage events yields the following observations:

- Excluding Weather-related and Unknown ICCs, Misoperations and Failed AC Substation Equipment ICCs remain the two largest contributors to transmission outage severity risk for all TADS events and all sustained TADS events.
- TADS outage events initiated by either of these ICCs have statistically significant greater expected outage severity than all other TADS outage events.
- Among other ICCs, only Power System Condition has a statistically significant positive correlation with transmission outage severity, but events initiated by this reported cause are less frequent and together contribute only 2.9 percent to the total transmission outage severity of the 2012–2014 TADS events.
- Statistical tests show that the average transmission outage severity of the events initiated by both Misoperations and Failed AC Substation Equipment ICC significantly decreased in 2014 versus 2012.

- Sustained TADS events with Unknown ICCs is an area that warrants further investigation by the TADSWG to determine:
    - The sustained outage events that have an Unknown ICC, and
    - The relative risk of events with both an initiating and sustained cause code of Unknown.
- The ICCs of TADS outage events are very different by Region.

Appendix B – Analysis of Generation Data

Introduction

The development of the Generating Availability Data System (GADS) began in 1982. GADS collects and stores unit operating information on a quarterly basis. By pooling individual unit information, overall generating unit availability performance is calculated. The information supports equipment reliability, availability analyses, and risk-informed decision making to industry. Finally, reports and information resulting from the data collected through GADS are used for benchmarking and analyzing electric power plants. Table B.1 shows some key characteristics of the population in the GADS database. The processing of 2014 GADS data is planned for completion by June 30, 2015.

Table B.1: Key Characteristics of the GADS Database

Metric/Year	2011	2012	2013
Number of Units > 20 MW	5,398	6,991	5,812
Average Age of the Fleet in Years	37.99	34.97	35.69
Average Age Fossil Units in Years	43.84	42.53	42.94

The age of the generating fleet is a particularly revealing statistic for GADS, since an aging fleet will potentially see increasing outages. Figure B.1 uses the GADS dataset to plot fleet capacity against age by fuel type. Figure B.1 shows two characteristics of the fleet reported to GADS: (1) there is an age bubble around 39–47 years, and that population is driven by coal and some gas units; (2) there is a significant age bubble around 11–13 years comprised almost exclusively of gas units. The data set shows a clear shift toward gas-fired unit additions, and the overall age of the fleet across North America is almost 10 years younger than the age of the coal-fired baseload plants that have been the backbone of power supply for many years. This trend is projected to continue given current forecasts around price and availability of natural gas as a power generation fuel, as well as regulatory impetus.

Generator Fleet Reliability

The GADS data set contains information that can be used to compute a number of reliability measures, including EFORd, a metric that measures the probability that a unit will not meet its demand periods for generating requirements because of forced outages or deratings.

Figure B.2 presents the monthly megawatt-weighted EFORd across the NERC footprint for the five-year period 2009–2013. The average outage rate over that period is 4.8 percent. EFORd has been fairly stable with only a few significant excursions, as indicated by the highlighted bars in the chart. In this case, significant excursions are at least one standard deviation higher.

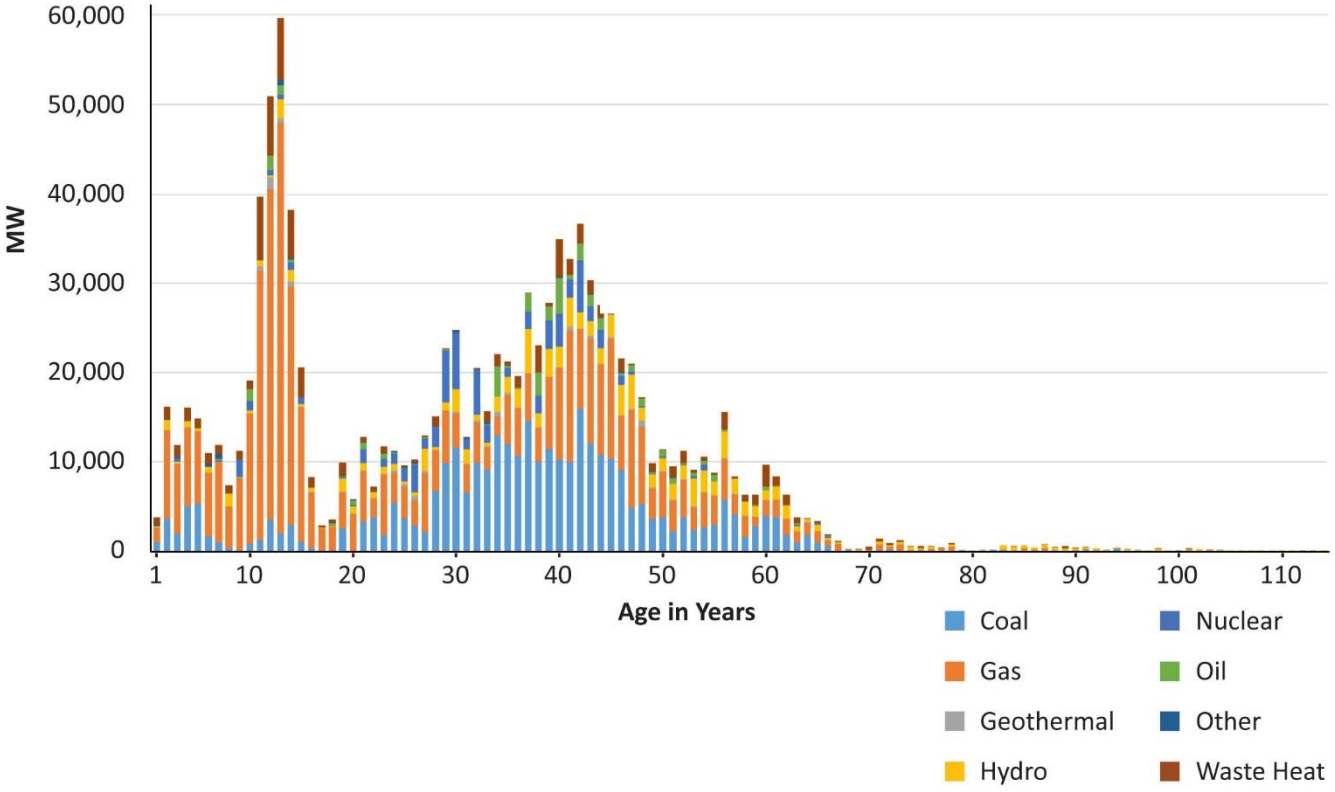

Figure B.2: Fleet Capacity against Age by Fuel Type

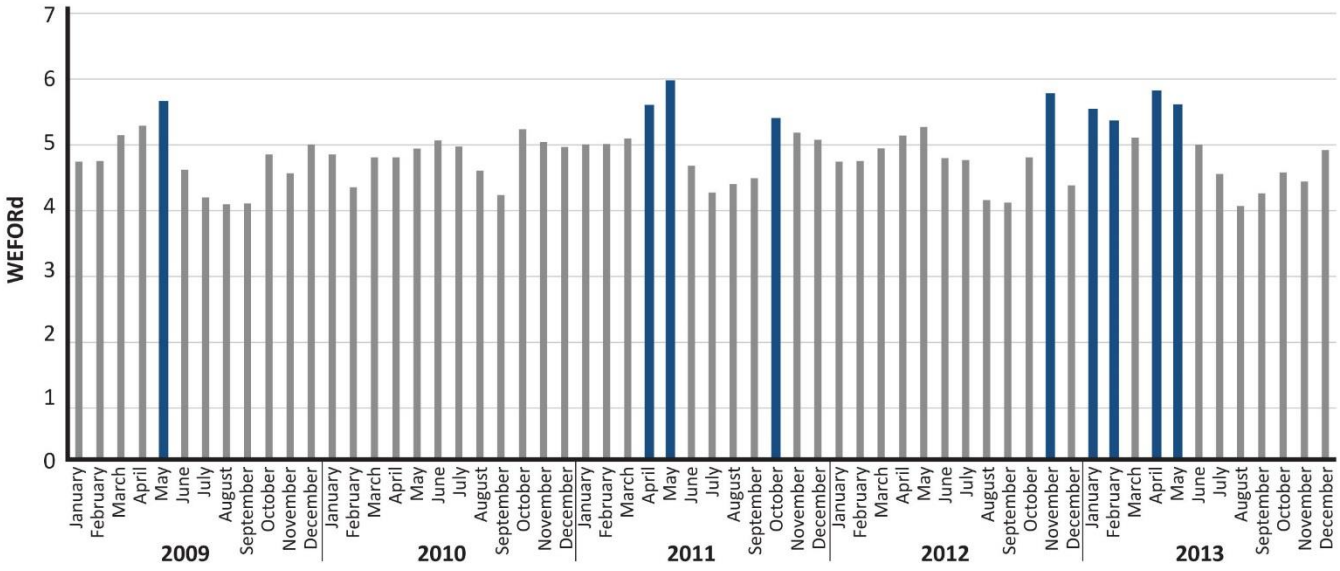

Figure B.2: Monthly Capacity Weighted EFORd 2009–2013

Top-10 Outage Causes

To better understand the cause of generator outages, the top-10 causes of unit outages for the summer and winter seasons were reviewed, as well as the annual causes, for the period 2012–2014. This analysis is focused on the top causes other than weather-related causes, measured in terms of lost megawatt hours, so it captures both the amount of capacity affected and the duration of the outages.

The level of outages reported into the GADS database is presented in Figure B.3, which shows the total duration of unit outages for the period 2012 to 2014 by season.

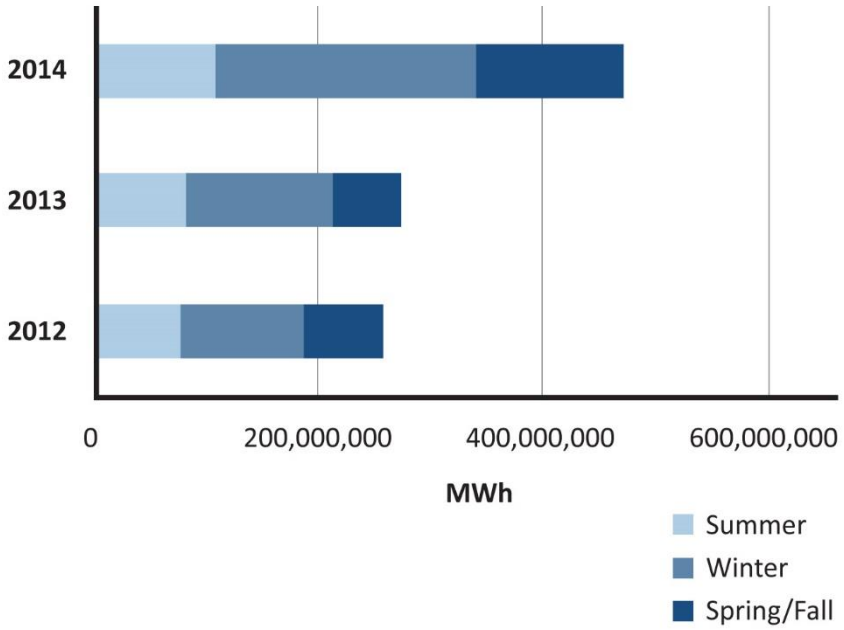

Figure B.3: Total Duration of Unit Outages 2012–2014

NERC	Annual MWh	Summer	Winter	Spring/Fall
2012	292,002,962	77,110,158	110,215,976	104,676,828
2013	306,500,709	82,522,997	131,075,905	92,901,806
2014	515,967,236	108,357,518	232,204,485	175,405,232

Based on the three years of available data, the following observations can be made:

- Summer lost megawatt hours have remained relatively consistent over the three-year period.
- Generally, lost megawatt hours in the winter season are greater than other periods of the year.
- The winter season lost megawatt hours show a significant excursion in 2014, driven in large part by outages related to the polar vortex.
- The sharp increase in the annual value of lost megawatt hours reported in 2014 is driven by the winter seasonal outages.

To provide insight into the drivers for the reported lost megawatt hours, the top-10 causes (exclusive of weather-related causes) have been examined to determine how much of a contribution is made by the top causes. Figure B.4 shows the contribution of the top-10 causes on a NERC-wide basis over the period 2012–2014. This is a three-year snapshot of the contributions by summer, winter, and annual impact.

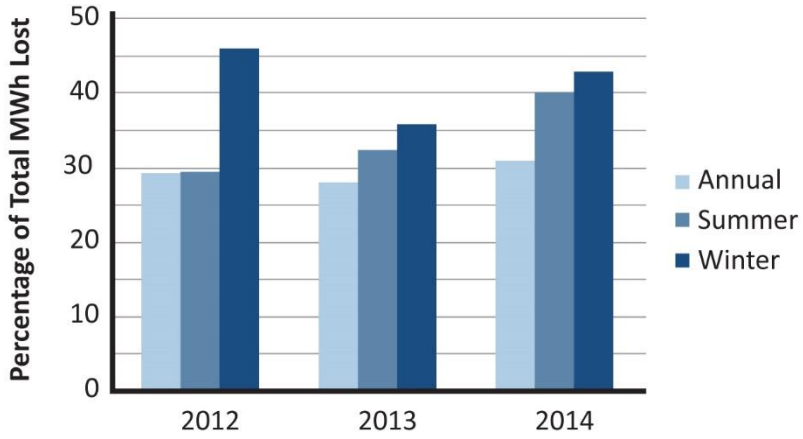

Figure B.4: Contribution of Top-10 Cause Codes 2012–2014

NERC	Annual	Summer	Winter
2012	0.2930	0.2957	0.4609
2013	0.2803	0.3237	0.3576
2014	0.3085	0.4027	0.4308

Based on this data set, the contribution from the top-10 causes to the total non-weather megawatt hours lost is about 30 percent; the remaining 70 percent of causes contribute less than 1 percent of the lost megawatt hours. It appears that in the 2014 data, the summer top-10 contributions have increased almost 10 percent compared to the results from 2012–2013. This change will be more fully analyzed as additional data becomes available. The contribution of the top-10 in the winter season is greater than the summer contribution and appears more variable.

The top-10 causes changes across the years and seasons, and the contribution from each of the top-10 causes to the total megawatt hours lost varies as well. Figure B.5 shows the contribution from each of the top-10 causes that accumulate to the total top-10 annual impacts shown in Figure B.4.

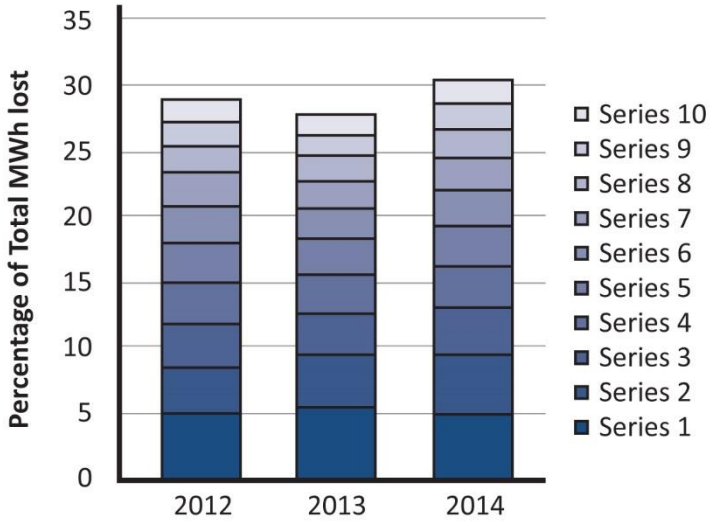

Figure B.5: Contribution of the Individual Top-10 Cause Codes to Top-10 Impacts

Table B.2 lists the top-10 causes on an annual basis; the list is ordered from the most impactful cause to the least within the top 10.

Table B.2: Top-10 Cause Codes on an Annual Basis

Series	2012	2013	2014
1	Waterwall (Furnace wall) A	Waterwall (Furnace wall) A	Boiler; miscellaneous
2	Transmission system problems	Main transformer	Waterwall (Furnace wall) A
3	Rotor; General	Rotor; General	Emergency generator trip devices
4	Steam generator tube leaks	Second superheater B	Lack of fuel (int supply of fuel)
5	Main transformer	Operator error	Main transformer
6	Steam generator tube inspections	Stator windings; bushings; terminals	Electrostatic precipitator fouling
7	Containment structure	Stator; General	Other low-pressure turbine problems
8	Second superheater B	Rotor windings	AC Conductors and buses
9	Generator output breaker	First reheater A	Stator windings; bushings; terminals
10	Other boiler I&C	First superheater B	Major turbine overhaul (720 hours or longer

Within the top-10 causes, there is some consistency and also some variability, although of limited sample size to draw long-term trends or conclusions. In addition to this type of annual view of the top-10 causes, seasonal variation in outage causes is summarized in Table B.3; this listing is organized around the top-5 annual outage causes and shows the seasonal ranking of these annual top 5 for the summer and winter periods.

Table B.3: Seasonal Ranking of the Top-5 Summer and Top-5 Winter Cause Codes

Year	Cause Code	Annual	Summer	Winter
2012	Waterwall (Furnace wall) A	1	1	6
	Transmission System Problems	2	3	3
	Rotor; General	3	8	
	Steam generator tube leaks	4		1
	Main transformer	5	5	7
2013	Waterwall (Furnace wall) A	1	1	
	Main transformer	2		1
	Rotor; General	3	2	
	Second superheater B	4	5	8
	Operator error	5		
2014	Boiler; miscellaneous	1		1
	Waterwall (Furnace wall) A	2	2	4
	Emergency generator trip devices	3		
	Lack of fuel (int supply of fuel)	4		2
	Main transformer	5	4	

Recommendations

- NERC, through the GADSWG, should continue to investigate seasonal performance trends for all types of reported generation. As the generation fleet continues to shift toward gas-fired units, and the overall age of the fleet reduces, new emerging trends must be examined to identify common outage concerns across fuel types.
- NERC, through the GADSWG, should trend forced outage rates to determine if there are immediate concerns with newly installed generation.
- NERC, through the GADSWG, should examine outage cause codes for specific equipment types (e.g., generator, boiler, turbine, etc.)
- NERC should investigate a shorter deadline for reporting annual data to facilitate better analysis in future state of reliability reports.

Appendix C – Analysis of Demand Response Data

Overview

Since 2012, the DADS Working Group (DADSWG) has continued to work to improve the detailed demand response data. Actions taken in the last year include revising the DADS glossary of definitions, streamlining event type reporting, implementing changes to the webDADS portal, and updating the historically reported event type to align with revised terms. While these efforts have begun to address the issues identified, more work is necessary, and the work will continue throughout 2015 and into 2016. The data represented here reflects the improved process and is an accurate portrayal of information.

Demand Response – Registered Programs

Demand Response Registered Program data provides important information about the individual programs that include product type, service type, relationships to other entities and programs, and monthly registered capacities.

The webDADS portal collects information about demand response programs based on product type and product service type. Current product types in webDADS include Energy, Capacity, and Reserves. Table C.1 shows the product service types related to reliability within each product type. When a reporting entity registers a demand response program in webDADS, it identifies the product type and product service type.

Table C.1: DADS Product Type Categories

Product Type	Product Service Type
Energy	Emergency
Capacity	Direct Control Load Management Interruptible Load Load as a Capacity Resource
Reserves	Spinning Non-Spinning

Due to the efforts undertaken in 2014, comparisons between registered program capacities in 2013 and 2014 by Regional Entities and service product types are available.

Registered Capacity by Region

Figure C.1 compares the registered capacity megawatts for all Product Service Types by Region for the month of August in 2013 and 2014. The August 2013 value was 44,285 MW, and the August 2014 value was 44,583 MW, an increase of less than 1 percent.

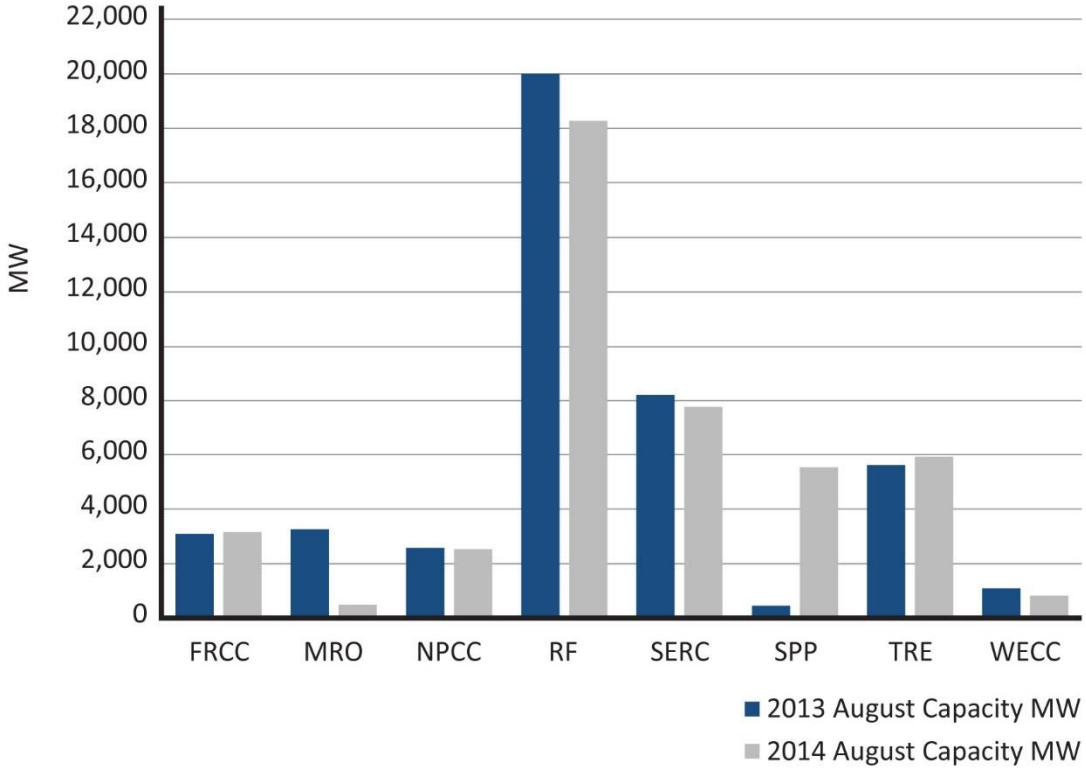

Figure C.3: Registered Capacity MW for all Product Service Types by Region – Aug. 2013 and 2014

Registered Capacity by Service Type

Figure C.2 shows a comparison of registered capacity megawatts by the product service type. In August, Load as a Capacity Resource appears to be the most common use of demand response resources for reliability (66 percent in 2013 and 58 percent in 2014), followed by Direct Control Load Management.

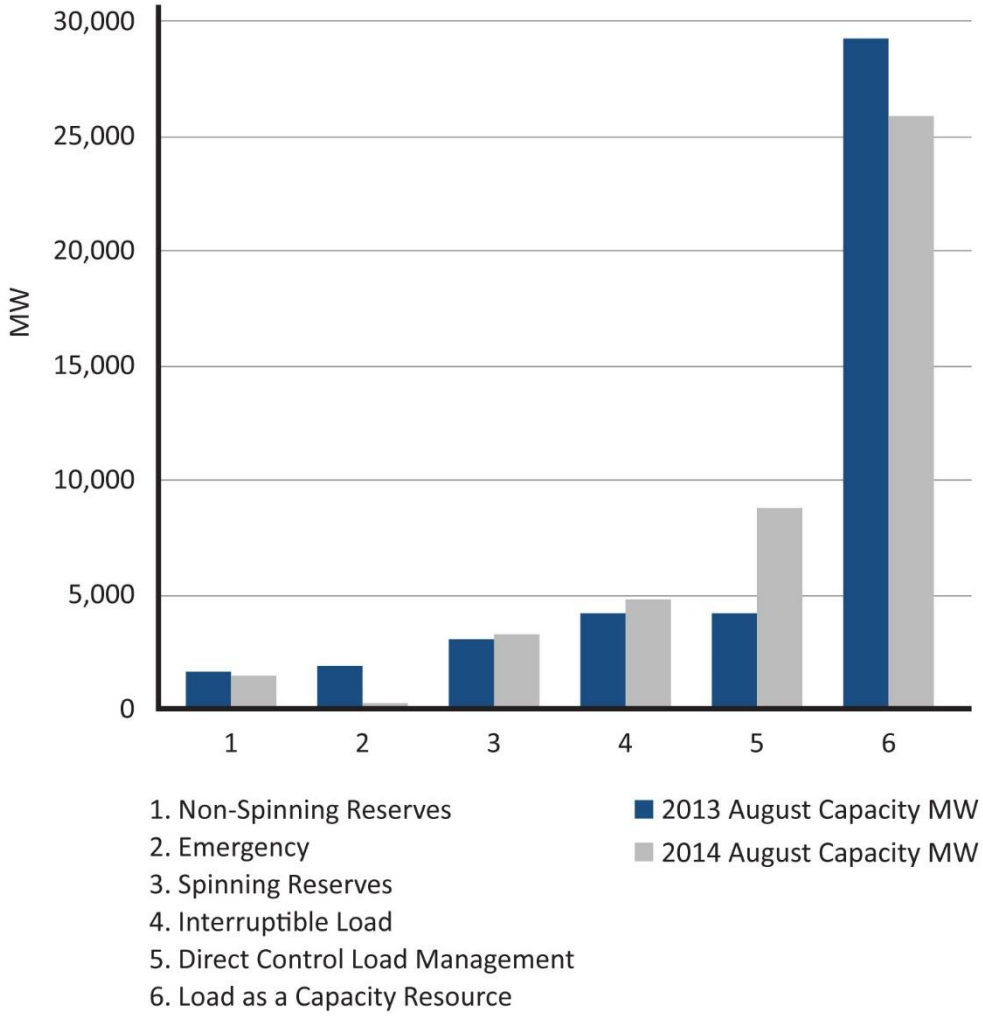

Figure C.4: Registered Capacity MW for all Regions by Service Type – Aug. 2013 and 2014

Demand Response – Reliability Events

When a demand response program is registered in webDADS, the entity selects a reporting type. The reporting type includes Reliability Events, Ancillary Services, or Market Participation. Figure C.3 represents all 2011–2014 reported Reliability Events as aggregated to the ISOs', RTOs', and BAs' webDADS hierarchy level.

Reliability Event reasons reported and summarized in webDADS are categorized as one of three types: Reliability Event, Frequency Control, and Forecast or Actual Reserve Shortage. Figure C.3 shows the number of days in each month, by Region, since demand response event reporting became mandatory in webDADS in April 2011. The black diamond shown on each column reflects the total number of days that a demand response event occurred in the month. When the column extends above the black diamond, it indicates that more than one Region used demand response on the same day. This view provides a perspective on how frequently demand response is used to resolve reliability issues.

For example, the summers of 2011 and 2012 were exceptionally hot, and the number of days demand response was dispatched in those summer months is much greater than in the other report years, even exceeding the number of days and regions where demand response was dispatched during the summer heat wave of 2013. The impact of the polar vortex is also evident in the number of days and regions that dispatched demand response in January 2014.

Figure C.3 illustrates that entities in the SERC and FRCC Regions use reliability demand response each month. The registered programs in these Regions are primarily Direct Control Load Management and Interruptible Load. The frequency of use of demand response in these programs may reflect a specific design characteristic of the program rather than an ongoing reliability issue.

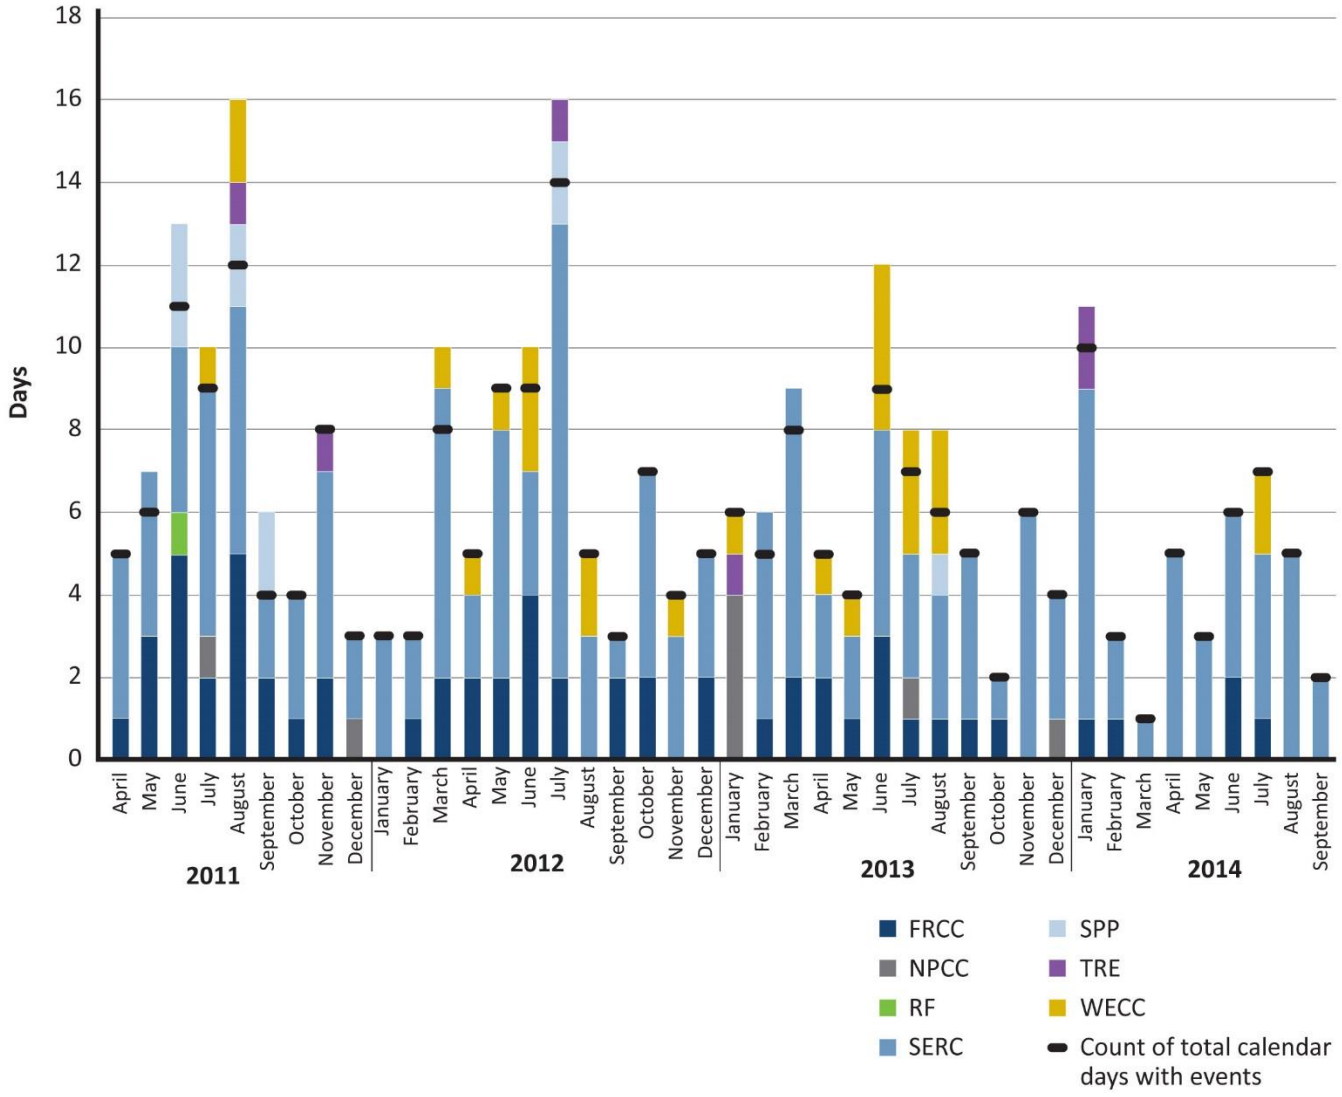

Figure C.5: Demand Response Events by Month and Region 2011–2014

Tables C.2–5 provide the data charted in Figure C.3. The tables provide the count of events by Region, the count of total calendar days with events, and the total dispatched megawatt value for all demand response events reported by month.

As a note of caution, the MW value shown for each month is an accumulation of all dispatched megawatts across all events in the month. The value is not an average or calculated value for the events and should not be proportioned to the count of events or days. Additionally, the number provided for the Calendar Days with Events is not the sum of event counts for the individual Regions.

Across North America, demand response is used an average of six times a month to respond to reliability events, dispatching an average of 500 MW each month. Additional analysis of the data collected using webDADS is needed; for example, it may be of interest to know if any of the days with demand response events experienced significant reliability problems.

The DADSWG will continue to work on data collection and reporting issues while monitoring and reporting on the availability and performance of demand response.

Appendix D – Statistical Analysis of Metrics

Interconnection Frequency Response: Time Trends

Eastern Interconnection

The time trend analysis uses the Eastern Interconnection frequency response (FR) datasets for 2012 to 2014. In this section, relationships between FR and the explanatory variable T (time = year, month, day, hour, minute, second) are studied. Figure D.1 shows the Eastern Interconnection FR scatter plot with a linear regression trend line, the 95 percent confidence interval for the data, and the 95 percent confidence interval for the slope of the time trend line.

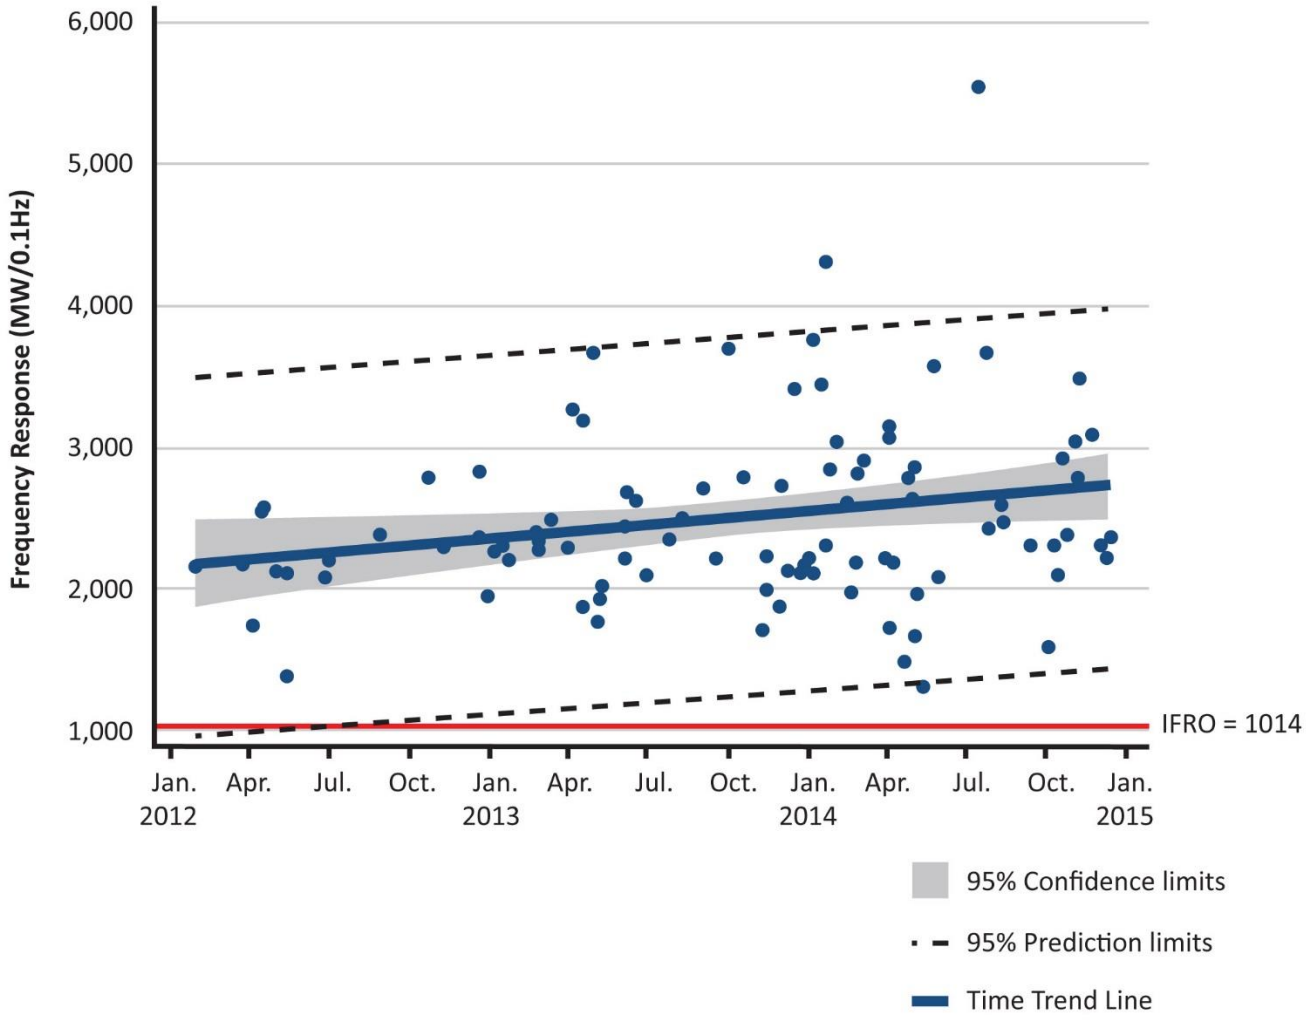

Figure D.1: Eastern Interconnection +FR Scatter Plot and Time Trend Line 2012–2014

There is a positive correlation of 0.22 between T and FR; further, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) results in a rejection of the null hypothesis about zero correlation (p-value of both tests was below 0.029). This proves that it was very unlikely that the observed positive correlation occurred simply by chance. Moreover, a linear trend line for the scatter plot connecting T and FR shown in Figure D.1 has a statistically significant positive slope (0.00000595), the linear regression is statistically significant, and on average, the Eastern Interconnection FR increased from 2012 through 2014 at the average rate of 15.0 MW/.1 Hz.

Western Interconnection

The time trend analysis uses the Western Interconnection FR data sets from 2012 through 2014. The FR values represent the observed values of the analysis (response) variable FR. In this section, the relationship is investigated between FR and the explanatory variable T, when an FR event happened. Figure D.2 shows the Western Interconnection frequency response scatter plot with a linear regression trend line, the 95 percent confidence interval for the data, and the 95 percent confidence interval for the slope of the time trend line.

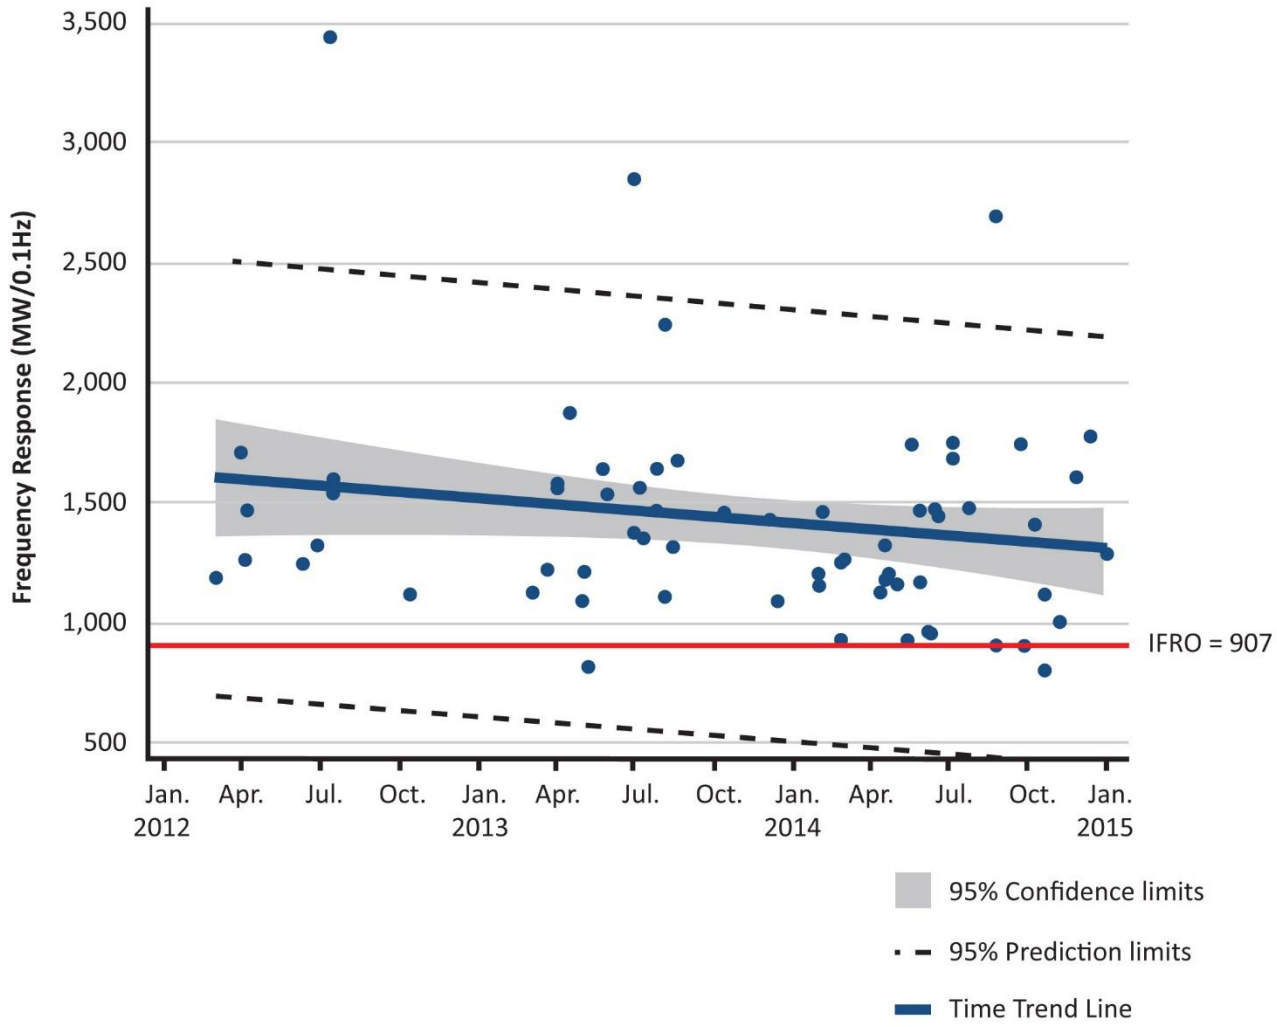

Figure D.2: Western Interconnection Frequency Response Scatter Plot and Time Trend Line 2012—2014

There is a negative correlation of -0.19 between T and FR; however, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) fails to reject the null hypothesis about zero correlation at a standard significance level (p value of both tests is 0.13). This result leads to the conclusion that the negative correlation could have occurred simply by chance. It implies that even though a linear trend line for the scatter plot connecting T and FR shown in Figure D.2 has a negative slope (-0.00000336), the linear regression is not statistically significant, and on average, the Western Interconnection FR has been stable from 2012 through 2014.

ERCOT Interconnection

The time trend analysis uses the ERCOT Interconnection FR datasets for 2012 to 2014. In this section, the relationship is investigated between FR and the explanatory variable T, when an FR event happened. Figure D.3 shows the ERCOT Interconnection FR scatter plot with a linear regression trend line, the 95 percent confidence interval for the data, and the 95 percent confidence interval for the slope of the time trend line.

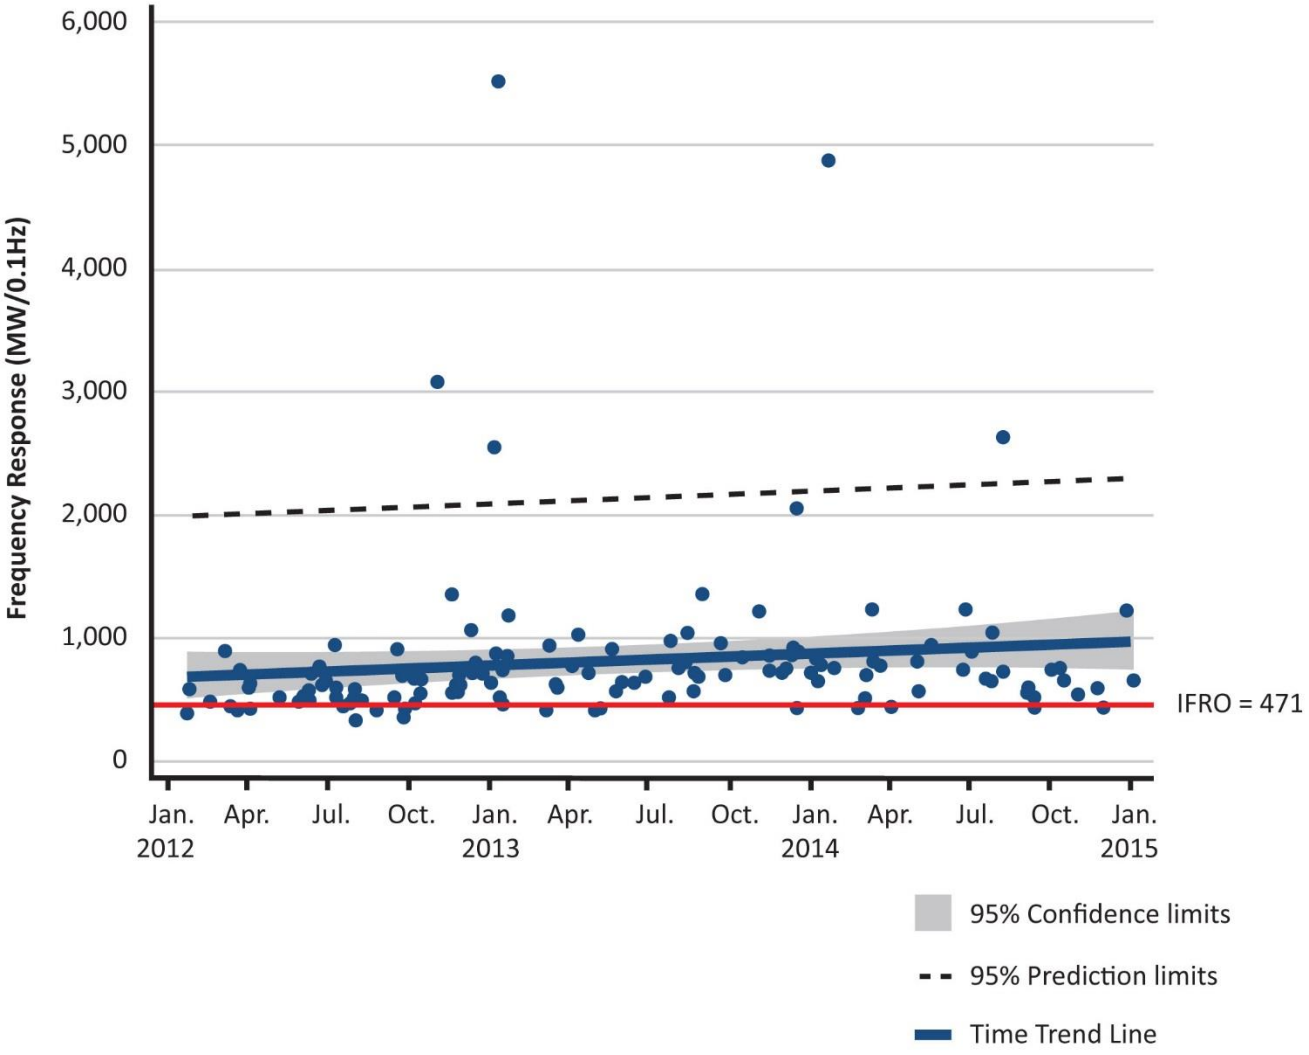

Figure D.3: ERCOT Interconnection Frequency Response Scatter Plot and Time Trend Line 2012—2014

There is a positive correlation of 0.12 between T and FR; however, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) fails to reject the null hypothesis about zero correlation at a standard significance level (p-value of both tests is 0.17). This result leads to the conclusion that with high probability the positive correlation could occur simply by chance. It implies that even though a linear trend line for the scatter plot connecting T and FR shown in Figure D.3 has a positive slope (0.00000304), the linear regression is not statistically significant, and on average, the ERCOT Interconnection FR has been stable from 2012 through 2014.

Québec Interconnection

The time trend analysis uses the Québec Interconnection FR datasets for 2012 to 2014. The FR values represent the observed values of the analysis (response) variable FR of the Québec Interconnection FR. In this section, the relationship is investigated between FR and the explanatory variable T, when an FR event happened. Figure D.4 shows the Québec Interconnection FR scatter plot with a linear regression trend line, the 95 percent confidence interval for the data, and the 95 percent confidence interval for the slope of the time trend line.

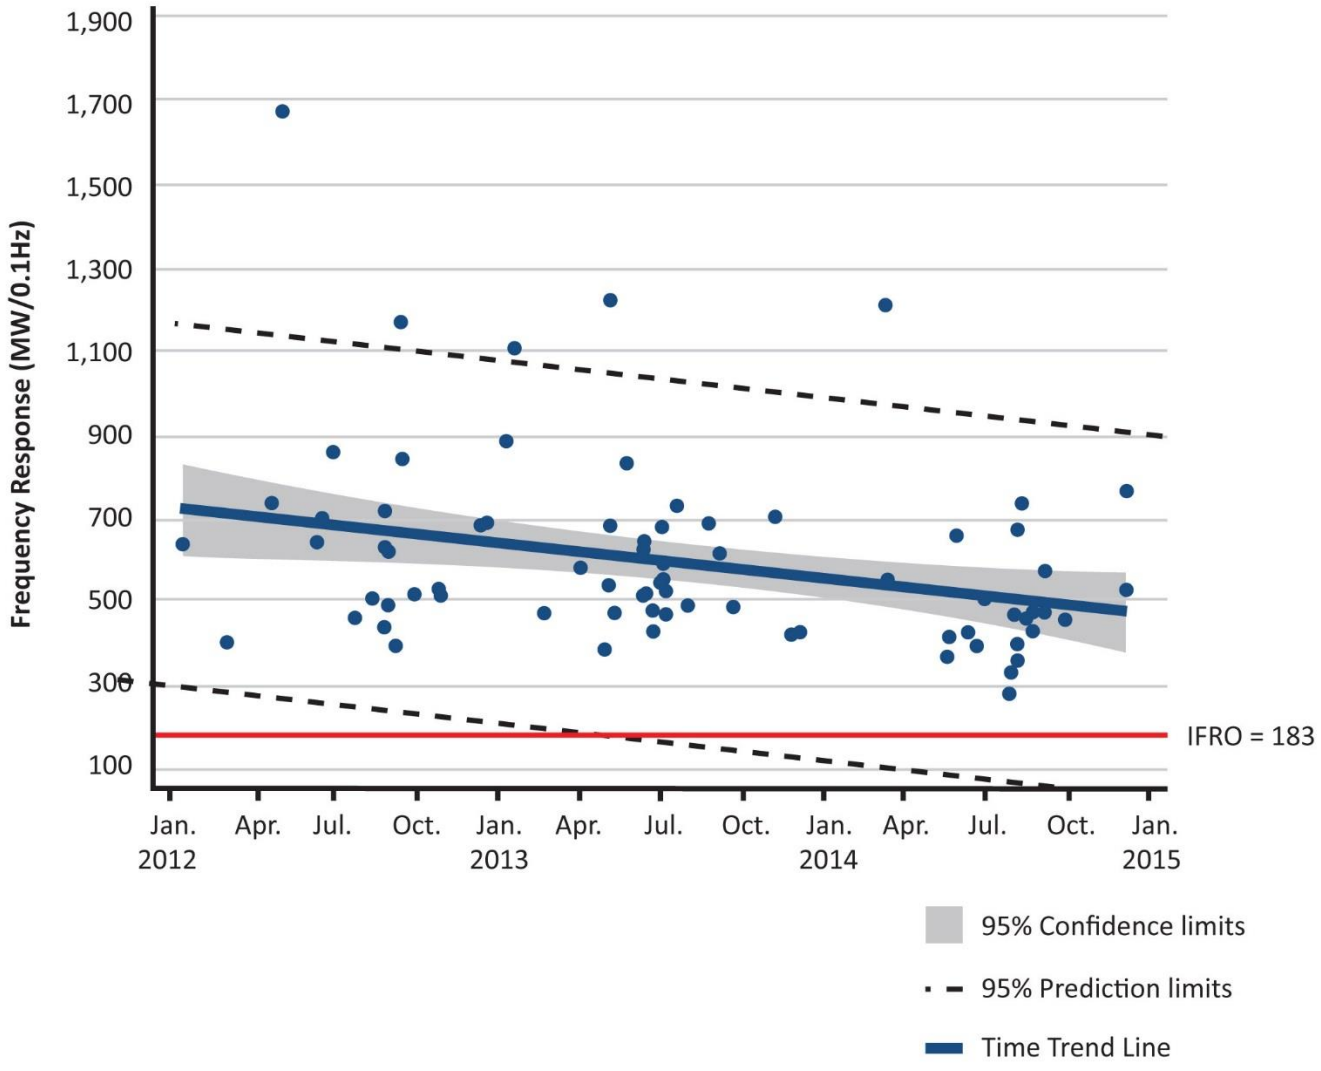

Figure D.4: Québec Interconnection Frequency Response Scatter Plot and Time Trend Line 2012—2014

There is a negative correlation of -0.31 between T and FR; further, the statistical test on the significance of the correlation (and the equivalent test of the significance of a linear regression) results in a rejection of the null hypothesis about zero correlation (p-value of both tests is below 0.007). This proves that it was very unlikely that the observed negative correlation occurred simply by chance. Moreover, a linear trend line for the scatter plot connecting T and FR shown in Figure D.4 has a statistically significant negative slope (-0.00000269), the linear regression is statistically significant, and on average, the Québec Interconnection FR decreased from 2012 through 2014 at the average rate of 6.8 MW/.1 Hz.

Interconnection Frequency Response: Year-to-Year Changes

Eastern Interconnection

The time trend analysis uses the Eastern Interconnection FR datasets from 2012 through 2014. The sample statistics by year are listed in Table D.1. The last column lists the number of FR events that fell below the absolute IFRO.[99]

Next, Fisher's Least Significant Difference test was used to analyze all pair-wise changes in FR. These tests result in the conclusion that there was a statistically significant increase of FR in 2014 compared with 2012, and there were no other statistically significant changes in the expected FR by year for the Eastern Interconnection.

Table D.1: Sample Statistics for Eastern Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 1014 MW/0.1 Hz
2012-2014	**97**	**2488.28**	**642.43**	**2307.43**	**1300.26**	**5552.36**	**0**
2012	16	2229.13	368.22	2187.47	1374.02	2824.55	0
2013	36	2415.84	500.78	2282.03	1707.03	3696.28	0
2014	45	2638.38	776.53	2469.33	1300.26	5552.36	0

[99] http://www.nerc.com/FilingsOrders/us/NERC Filings to FERC DL/Final_Info_Filing_Freq_Resp_Annual_Report_03202015.pdf

Figure D.5 shows the box plot of the annual distribution of the Eastern Interconnection FR. Each box encloses the interquartile range with the lower edge at the first quartile and the upper edge at the third quartile. A line is drawn through the box at the second quartile, which is the median. A diamond shows the mean. A lower (upper) whisker connects the box with the smallest (the largest) data point within 1.5 interquartile ranges from the first (the third) quartile. Data farther from the box than the whiskers, plotted as individual points, are outliers. Table D.1 and Figure D.5 illustrate year-to year increases in the average FR as well as in its variation. Statistical tests find the only statistically significant difference in the year-over-year changes—the expected FR in 2012 is significantly less than in 2014.

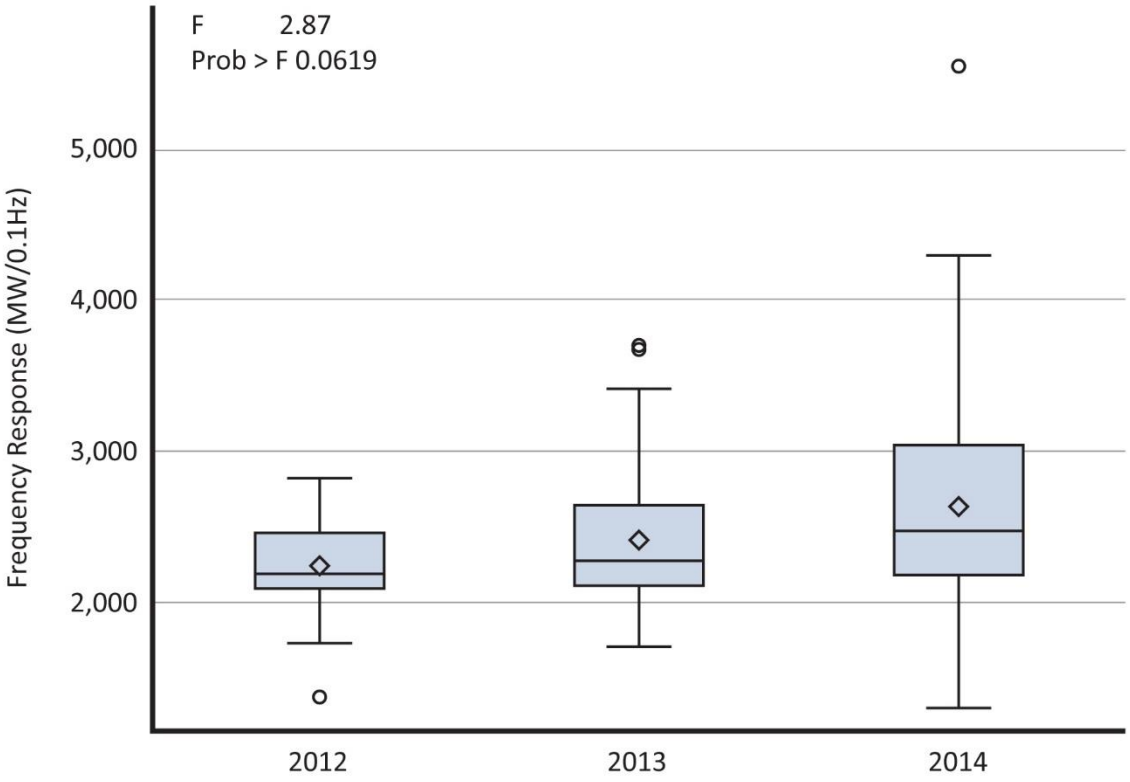

Figure D.5: Eastern Interconnection Frequency Response Distribution by Year 2012–2014

Western Interconnection

The time trend analysis uses the Western Interconnection FR datasets for 2012 through 2014. The sample statistics are listed by year in Table D.2. The last column lists the number of FR events that fell below the absolute IFRO.

Table D.2: Sample Statistics for Western Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 907 MW/0.1 Hz
2012-2014	**68**	**1419.06**	**444.92**	**1336.80**	**798.34**	**3439.70**	**4**
2012	10	1590.47	677.49	1396.43	1120.51	3439.70	0
2013	23	1489.99	421.93	1463.11	821.85	2850.99	1
2014	35	1323.47	363.24	1265.64	798.34	2695.58	3

Figure D.6 shows the box plot of the annual distribution of the Western Interconnection FR. There are no statistically significant differences in the expected FR by year. In particular, this is due to too small of a sample size for 2012.

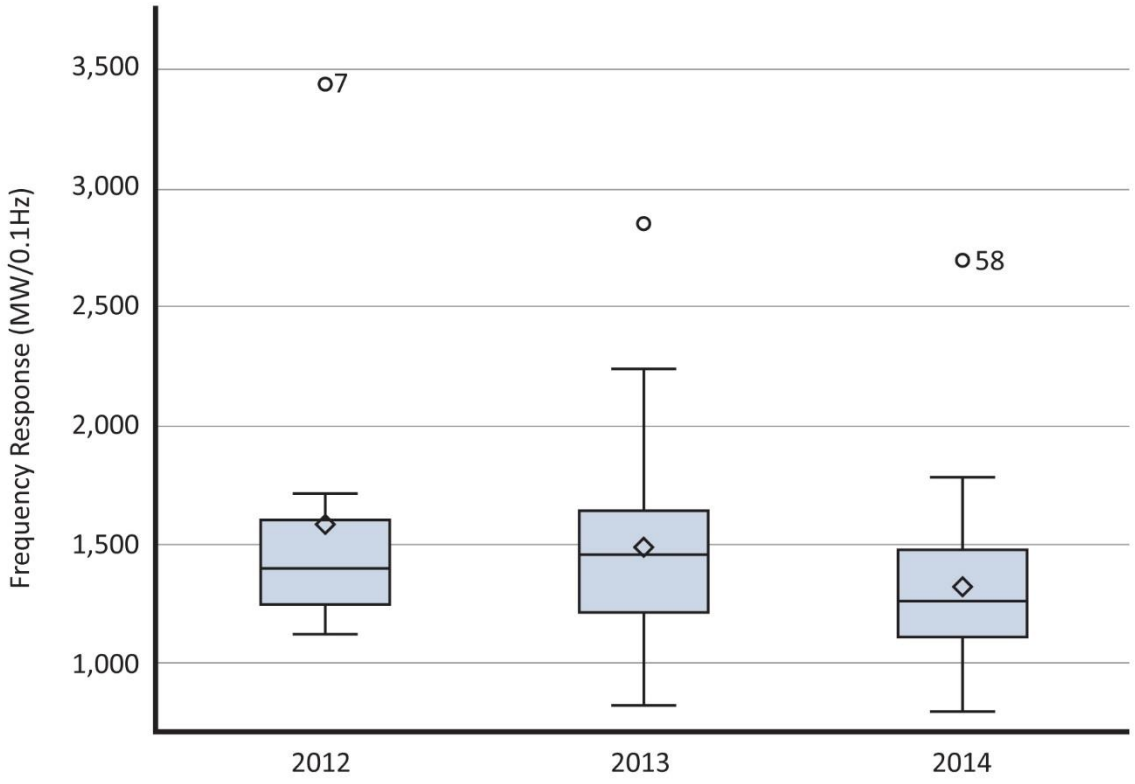

Figure D.6: Western Interconnection Frequency Response Distribution by Year 2012–2014

ERCOT Interconnection

The time trend analysis uses the ERCOT Interconnection FR datasets from 2012 through 2014. The sample statistics by year are listed in Table D.3. The last column lists the number of FR events that fell below the absolute IFRO.

Table D.3: Sample Statistics for ERCOT Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 471 MW/0.1 Hz
2012-2014	**138**	**809.70**	**661.67**	**663.83**	**336.77**	**5530.50**	**21**
2012	53	650.58	386.28	577.88	336.77	3082.64	12
2013	48	921.60	777.52	745.51	406.60	5530.50	5
2014	37	892.45	774.79	725.26	425.66	4879.72	4

Next, Fisher's Least Significant Difference test was used to analyze all pair-wise changes in FR. These tests result in the conclusion that there was a statistically significant increase of FR in 2013 compared with 2012, and there were no other statistically significant changes in the expected FR by year for the ERCOT Interconnection.

Figure D.7 shows the box plot of the annual distribution of the ERCOT FR. Statistical tests find the only statistically significant difference in the year-over-year changes—the expected frequency response in 2012 is significantly smaller than in 2013.

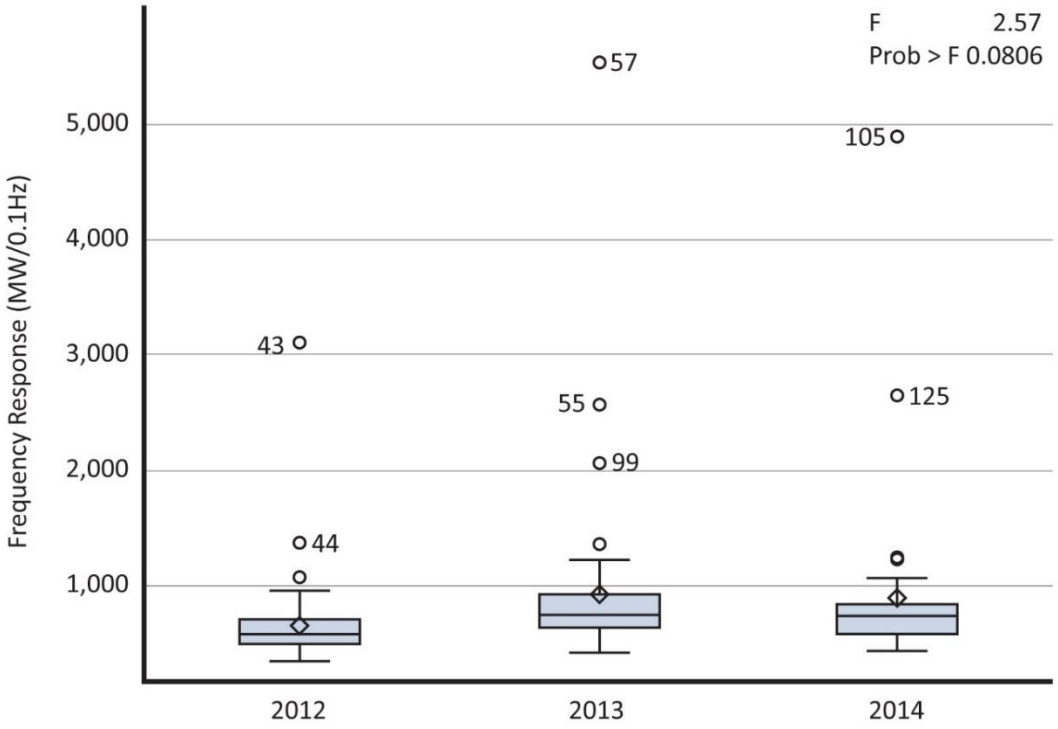

Figure D.7: ERCOT Frequency Response Distribution by Year 2012–2014

Several factors contributed to the FR performance in the ERCOT Interconnection during the years in which the FR did not meet the recommended IFRO (2011 and 2012).

- ERCOT has a small hydro fleet that suffered significantly due to the extreme drought of 2011. There was some relief in 2012, but not in the geographical area of these hydro facilities. Additionally, the owners of the facilities have changed the facilities' operation. Prior to the ERCOT nodal market implementation in December 2010, many of these facilities were operated as frequency responsive reserves. They were on-line in synchronous condenser mode and ramped to full output in about 20 seconds anytime frequency dropped to 59.900 Hz or below, providing 50 to 240 MW of primary FR (during the first 20 seconds of a disturbance). Since early 2011, this service has been discontinued.
- There was a drop in natural gas prices and a change in dispatch. The price change caused many of the large coal generators to shut down, and FR from these generators had been excellent. The combined-cycle facilities that replaced these units had difficulty getting FR to work consistently and correctly. Since the fall of 2012, FR from combined-cycle facilities has improved, due to TRE's efforts to work with these generators to improve their performance.
- Another contributing factor was the continued increase in wind generation in ERCOT that typically operates at maximum output. Without margin in the up direction, the Interconnection only benefits by curtailing wind generators during high-frequency excursions from these generators. When low-frequency excursions occur, the wind generators cannot provide additional output to increase Interconnection frequency.

Québec Interconnection

The time trend analysis uses the Québec Interconnection FR datasets for the years 2012 through 2014. The sample statistics by year are listed in Table D.4. The last column lists the number of FR events that fell below the absolute IFRO.

Table D.4: Sample Statistics for Quebec Interconnection

Year	Number of Values	Mean of Frequency Response	Standard Dev. of Frequency Response	Median	Minimum	Maximum	Number of events with FR below the IFRO of 183 MW/0.1 Hz
2012-2014	**74**	**591.8**	**220.6**	**526.9**	**288.3**	**1673.6**	**0**
2012	21	656.2	268.0	635.0	397.2	1673.6	0
2013	29	606.5	192.2	545.9	389.1	1227.8	0
2014	24	517.7	192.8	465.1	288.3	1212.4	0

Next, Fisher's Least Significant Difference test was applied to analyze all pair-wise changes in FR. Statistical tests find the only statistically significant difference in the year-over-year changes—the expected FR in 2012 is significantly greater than in 2014.

Figure D.8 shows the box plot of the annual distribution of the Québec Interconnection FR. Table D.4 and Figure D.8 illustrate year-to-year decreases in the average FR.

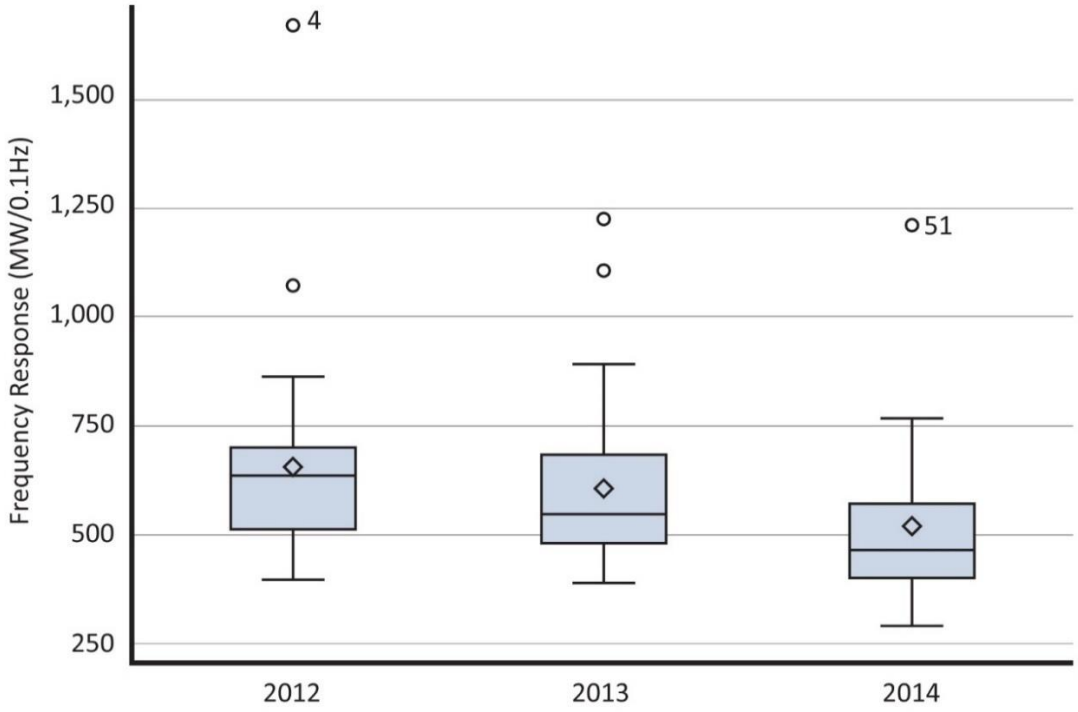

Figure D.8: Québec Interconnection Frequency Response Distribution by Year 2012–2014

Explanatory Variables for Frequency Response and Multiple Regression

Explanatory Variables

In the *2012 State of Reliability* report, Key Finding #2 proposed further work to see if specific indicators could be tied to severity of frequency deviation events. For each interconnection, the following set of six variables is included as explanatory variables (regressors) in the multiple regression models that describe the interconnection FR. These variables are not pair-wise uncorrelated, and some pairs are strongly correlated; however, all are included as candidates to avoid the loss of an important contributor to the FR variability. Model selection methods help ensure the removal of highly correlated regressors and run multicollinearity diagnostics (variance inflation diagnostics) for a multiple regression model selected.

Summer (Indicator Function) – Defined as 1 for FR events that occur from June through August, and 0 otherwise.
Winter (Indicator Function) – Defined as 1 for FR events that occur from December through February, and 0 otherwise.
High Pre-Disturbance Frequency (Indicator Function) – Defined as 1 for FR events with pre-disturbance frequency (point A) > 60 Hz, and 0 otherwise.
On-peak Hours (Indicator Function) – Defined as 1 for FR events that occurred during on-peak hours, and 0 otherwise. On-peak hours are designated as follows: Monday to Saturday from 0700 to 2200 (Central Time) excluding six holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day.
Time – A moment in time (year, month, day, hour, minute, second) when an FR event happened. Time is measured in seconds elapsed between midnight of January 1, 1960 (the time origin for the date format in SAS), and the time of a corresponding FR event. This is used to determine trends over the study period.
Interconnection Load Level – Measured in megawatts.

Data Sets – Since the Interconnection Load Level data are available for 2012 and 2013 only, the correlation study and multivariate analysis with the explanatory variables are performed for 2012 through 2013 FR data for each interconnection. The two-year data sets have insufficient sizes for a good explanatory and predictive model, which requires estimates of big number parameters. An adequate model for each interconnection can only come with an annual increase of the FR data sets.

Table D.5 lists the ranks of statistically significant variables of FR for each interconnection. Positive indicates a statistically significant positive correlation, negative indicates a statistically significant negative correlation, and a dash indicates no statistically significant linear relation. A high pre-disturbance frequency has a statistically significant impact to FR in three interconnections. Events with A > 60 Hz on average have smaller FR than the events with A ≤ 60 Hz. If the initial predisturbance frequency is higher than 60 Hz, it is more likely that governor actions will be delayed because of the time it takes for the frequency to drop to the upper dead-band setting.

Table D.5: Observation Summary

Explanatory Valuable	Western	Eastern	ERCOT	Québec
Summer	1 (positive)	-	-	-
Winter	-	-	1 (positive)	-
High Pre-disturbance	-	1 (negative)	3 (negative)	1 (negative)
On-Peak hours	3 (negative)	-	-	-
Time	-	-	2 (positive)	-
Load Level	2 (positive)	-	-	-

Eastern Interconnection: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the Eastern Interconnection FR are listed in Table D.6.

Table D.6: Descriptive Statistics

Variable	N	Mean	Standard Dev.	Minimum	Maximum
Time	52			1/1/2012	12/31/2014
Winter	52	0.29	0.46	0	1
Summer	52	0.21	0.41	0	1
A > 60	52	0.38	0.49	0	1
On-Peak Hours	52	0.54	0.50	0	1
Interconnection Load	52	344906	50831	238949	472683
Frequency Response	52	2358.4	468.6	1374.0	3696.3

The correlation and a single regression analysis result in the hierarchy of the explanatory variables for the Eastern Interconnection frequency response shown in Table D.7. The value of a coefficient of determination R^2 indicates the percentage in variability of frequency response that can be explained by variability of the corresponding explanatory variable.

Table D.7: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
A > 60	-0.35	Yes	12.1%
Time	0.20	No	N/A
On-Peak Hours	0.07	No	N/A
Interconnection Load	0.05	No	N/A
Summer	-0.03	No	N/A
Winter	0.02	No	N/A

Out of the six parameters, only the indicator of high pre-disturbance frequency has a statistically significant correlation with FR. High predisturbance frequency is negatively correlated with FR; thus, the events with A > 60 Hz have statistically significantly smaller expected FR than the events with A ≤ 60 Hz. The other five variables do not have a statistically significant[100] linear relationship with FR.

[100] At significance level 0.1

Both step-wise selection and backward elimination algorithms[101] result in a single regression model that connects the Eastern Interconnection FR with the indicator of high predisturbance frequency (the other five variables are not selected or were eliminated). The model's coefficients are listed in Table D.8.

Table D.8: Coefficients of Multiple Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	2485.83	78.45	31.69	<.0001	0.00
A> 60	1	-331.33	126.49	-2.62	0.01	1.00

The adjusted coefficient of the determination of the model is 10.3 percent; the model is statistically significant ($p < 0.01$). The random error has a zero mean and the sample deviation σ of 443.8 MW/.1 Hz. Since the multiple model for the Eastern Interconnection FR is reduced to a single model, no multicollinearity diagnostics are needed. The parameter estimate, or the coefficient for the high predisturbance frequency, indicates that on average, the Eastern Interconnection events with the predisturbance frequency A > 60 Hz have FR of 331 MW/.1 Hz smaller than events with A ≤ 60 Hz.

Frequency responses in the Eastern Interconnection are higher due to the large number of disturbances in the data set in which frequency changes were greater than the generator dead bands. Also, in earlier studies, the gross output of the unit trip was reported, rather than the net generation[102] megawatt loss to the interconnection.

[101] For step-wise regression algorithm and Backward Elimination algorithm see D. C. Montgomery and G. C. Runger. Applied Statistics and Probability for Engineers. Fifth Edition. 2011. John Wiley & Sons. Pp. 499-501.

[102] There could be a coincident loss of load also.

Western Interconnection: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the Western Interconnection FR are listed in Table D.9.

Table D.9: Descriptive Statistics

Variable	N	Mean	Standard Dev.	Minimum	Maximum
Time	33			1/1/2012	12/31/2014
Winter	33	0.09	0.29	0	1
Summer	33	0.48	0.51	0	1
A > 60	33	0.58	0.50	0	1
On-Peak Hours	33	0.45	0.51	0	1
Interconnection Load	33	91285.2	16015	38321	118936
Frequency Response	33	1520.4	503.7	821.9	3439.7

The correlation and a single regression analysis result in the hierarchy of the explanatory variables for the Western Interconnection FR shown in Table D.10. The value of a coefficient of determination R^2 indicates the percentage in variability of FR that can be explained by variability of the corresponding explanatory variable.

Table D.10: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
Summer	0.36	Yes	13.1%
Interconnection Load	0.36	Yes	0.127985063
On-Peak Hours	-0.31	Yes	0.097144422
Winter	-0.18	No	N/A
A > 60	-0.16	No	N/A
Time	-0.06	No	N/A

Out of the six parameters, the three on the top have a statistically significant correlation with FR. The indicators of summer and interconnection load have a positive correlation with FR (the summer events have a greater FR, and the higher interconnection load, the greater FR). The indicator of on-peak hours has a negative correlation with FR, which is: on-peak-hour events have, on average, a smaller response. The other three variables are not statistically significantly[103] correlated with FR.

[103] At significance level 0.1

Finally, both the step-wise selection algorithm and the backward elimination algorithm result in a single regression model that connects the Western Interconnection FR with one regressor, the indicator of summer (the other five variables are not selected or were eliminated).[104] The coefficients of the single model are listed in Table D.11.

Table D.11: Coefficients of Multiple Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1.00	1356.53	112.43	12.07	<.0001	0.00
Summer	1.00	360.6045300	166.765580	2.16	0.04	1.00

The adjusted coefficient of determination of the model is 10.3 percent; the model is statistically significant ($p = 0.04$). The random error has a zero mean and the sample deviation σ of 477.0 MW/.1 Hz. Since the multiple model for the Western Interconnection FR is reduced to a single model, no multicollinearity diagnostics are needed. The parameter estimate, or the coefficient for summer, indicates that on average, the summer events have FR 361 MW/.1 Hz greater than other events.

Note that although Table D.10 lists three explanatory variables for the Western Interconnection FR, Interconnection Load and On-Peak hours are eliminated from the final model due to their significant correlation with summer.

[104] Regressors in the final model have p-values not exceeding 0.1.

ERCOT: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the ERCOT Interconnection FR are listed in Table D.12.

Table D.12: Descriptive Statistics

Variable	N	Mean	Standard Dev.	Minimum	Maximum
Time	101			1/1/2012	12/31/2014
Winter	101	0.23	0.42	0	1
Summer	101	0.29	0.45	0	1
A > 60	101	0.42	0.50	0	1
On-Peak Hours	101	0.61	0.49	0	1
Interconnection Load	101	40532.4	9096	23252	64273
Frequency Response	101	779.4	616.6	336.8	5530.5

The correlation and a single-regression analysis result in the hierarchy of the explanatory variables for the ERCOT Interconnection FR shown in Table D.13. The value of a coefficient of determination R^2 indicates the percentage in variability of FR that can be explained by variability of the corresponding explanatory variable.

Table D.13: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
Winter	0.26	Yes	6.9%
Time	0.17	Yes	3.0%
A > 60	-0.17	Yes	2.8%
Interconnection Load	-0.13	No	N/A
Summer	-0.12	No	N/A
On-Peak Hours	0.04	No	N/A

Out of the six parameters, Winter and Time are statistically significantly positively correlated with FR (on average, frequency response increases in winter and grows with time). The indicator of high pre-disturbance frequency is statistically significantly negatively correlated with FR (the events with A > 60 Hz have smaller FR than the events with A ≤ 60 Hz). The other three variables do not have a statistically significant[105] linear relationship with FR.

[105] At significance level 0.1

Finally, both the step-wise selection algorithm and the backward elimination algorithm result in a single-regression model that connects the ERCOT Interconnection FR with the indicator of Winter (the other five variables are not selected or were eliminated)[106] as regressors. The coefficients of the multiple model (reduced to a single model) are listed in Table D.14.

Table D.14: Coefficients of Multiple Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	692	68	10	<.0001	0
Winter	1	384	142	3	0.0081	1

The adjusted coefficient of determination of the model is 5.9 percent; the model is statistically significant ($p = 0.008$). The random error has a zero mean and the sample deviation σ of 598.1 MW/.1 Hz. Since the multiple models for the ERCOT Interconnection FR are reduced to a single model, no multicollinearity diagnostics are needed. The parameter estimate, or the coefficient for the winter, indicates that on average, the ERCOT events in winter have FR of 384 MW/.1 Hz greater than other events.

[106] Regressors in the final model have p-values not exceeding 0.1.

Québec: Correlation Analysis and Multivariate Model

Descriptive statistics for the six explanatory variables and the Québec Interconnection FR are in Table D.15.

Table D.15: Descriptive Statistics

Variable	N	Mean	Standard Deviation	Minimum	Maximum
Time	50			1/1/2012	12/31/2014
Winter	50	0.14	0.35	0	1
Summer	50	0.50	0.51	0	1
A > 60	50	0.52	0.50	0	1
On-Peak Hours	50	0.92	0.27	0	1
Interconnection Load	50	23863	4980	15736	36142
Frequency Response	50	627.4	225.9	389.1	1673.6

The correlation and a single-regression analysis result in the hierarchy of the explanatory variables for the Québec Interconnection FR shown in Table D.16. The value of a coefficient of determination R^2 indicates the percentage in variability of FR that can be explained by variability of the corresponding explanatory variable.

Table D.16: Correlation and Regression Analysis

Explanatory Variable	Correlation with FR	Statistically Significant (Yes/No)	Coefficient of Determination of Single Regression (If SS)
A > 60	-0.28	Yes	7.6%
Time	-0.23	No	N/A
On-Peak Hours	-0.20	No	N/A
Summer	-0.19	No	N/A
Winter	0.14	No	N/A
Interconnection Load	0.01	No	N/A

Out of the six parameters, only one explanatory variable is statistically significantly[107] correlated with FR. The indicator of high predisturbance frequency is negatively correlated with FR (the events with A > 60 Hz have smaller FR than the events with A ≤ 60 Hz). The other five variables do not have a statistically significant linear relationship with FR.

[107] At significance level 0.1

Finally, both the step-wise selection algorithm and the backward elimination algorithm result in a multiple regression model that connects the Québec Interconnection FR with Time, Summer and high predisturbance frequency (the other three variables are not selected or were eliminated).[108] The coefficients of the multiple model are in Table D.17.

Table D.17: Coefficients of Multiple Model

Variable	DF	Parameter Estimate	Standard Error	t-value	p-value	Variance Inflation Value
Intercept	1	9316.77	3300.09	2.82	0.01	0.00
Time	1	0.0000	0.00	-2.60	0.01	1.11
Summer	1	-103	58.21	-1.78	0.08	1.03
A > 60	1	-190	61.35	-3.10	0.003	1.14

The model's adjusted coefficient of multiple determination is 19.2 percent (that is almost 20 percent of the Québec Interconnection FR variability and can be explained by the combined variability of these three parameters); the model is statistically significant ($p = 0.005$). The random error has a zero mean and the sample deviation σ of 203 MW/.1 Hz. Variance inflation factors for the regressors do not exceed 1.14, which confirms an acceptable level of multicollinearity that does not affect a general applicability of the model.

A parameter estimate for time indicates a rate of decrease of the FR per unit of time (a second). It translated to the monthly decrease rate of 6.8 MW/0.1Hz. Parameter estimate for summer means that for fixed values of other variables, the summer events on average have FR of 103 MW/0.1 Hz smaller than other events. The main reason summer events have a smaller FR is because winter is the peak usage season in the Québec Interconnection. More generator units are on-line; therefore, there is more inertia in the system, so it is more robust in responding to frequency changes in the winter. Parameter estimate for high predisturbance frequency means that for fixed values of other variables, events with the predisturbance frequency $A > 60$ Hz have, on average, FR of 190 MW/.1 Hz smaller than events with $A \leq 60$ Hz.

[108] Regressors in the final model have p-values not exceeding 0.1.

Misoperations Analysis

Misoperation Rate by Region and for NERC

Table D.18 lists the operation and misoperation counts and the corresponding misoperation rate by Region and for NERC for the eight quarters available.

Table D.18 Operations and Misoperations by Region from Q4 2012 to Q3 2014

Region	Operations	Misoperations	Misoperation Rate
RF	5839	790	13.53%
SPP	3328	432	12.98%
FRCC	1258	155	12.32%
MRO	2808	307	10.93%
SERC	8499	763	8.98%
TRE	3919	314	8.01%
NPCC	5375	413	7.68%
NERC	**31026**	**3174**	**10.23%**

Figure D.9 illustrates the misoperation rate ranking and summarizes results of the statistical tests on misoperation rate comparison.

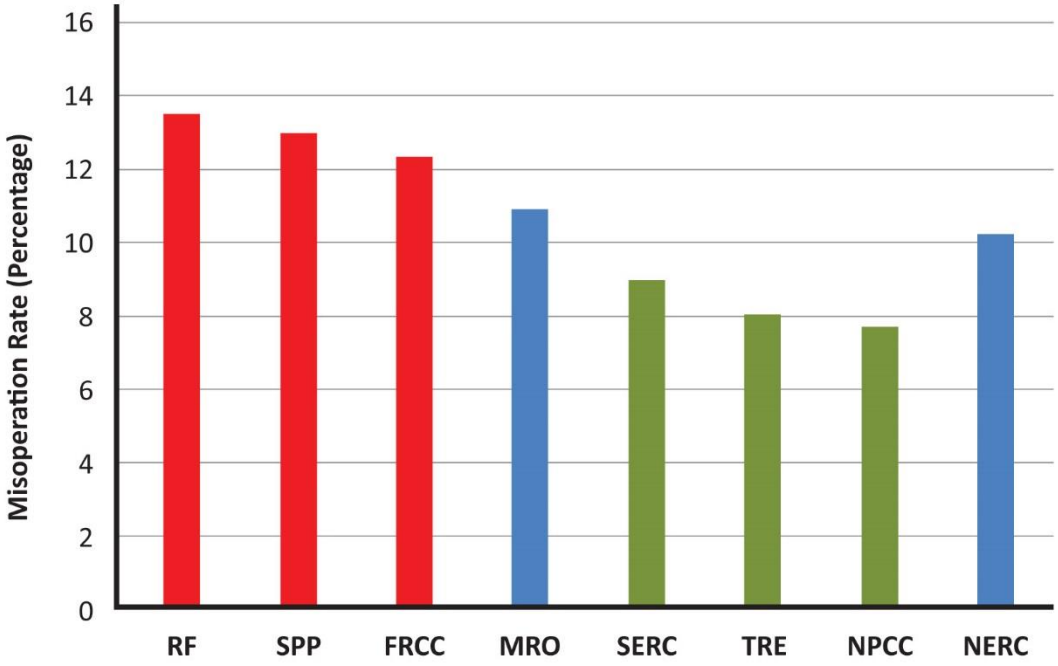

Figure D.9 Two-Year Misoperation Rate by Region (Q4 2012–Q3 2014)

In Figure D.9, red bars show the rates that are statistically significantly higher than NERC's rate, and green bars correspond to the rates significantly lower than NERC's rate. Finally, there is no significant difference between MRO and NERC misoperation rates for the two years.

Comparison of Regional Misoperation Rates

Next, Regional Entity misoperation data was analyzed to find statistically significant differences in misoperation rates between Regions. Table D.19 lists all the pairs of Regions with statistically significant differences in misoperation rate.

Table D.19: Regions with Misoperation Rate Statistically Significantly Different

	Higher	Lower
RFC	none	MRO, SERC, TRE, NPCC
SPP	none	MRO, SERC, TRE, NPCC
FRCC	none	SERC, TRE, NPCC
MRO	RFC, SPP	SERC, TRE, NPCC
SERC	RFC, SPP, FRCC, MRO	NPCC
TRE	RFC, SPP, FRCC, MRO	none
NPCC	RFC, SPP, FRCC, MRO, SERC	none

For example, Table D.19 and Figure D.9 show that the RFC misoperation rate is numerically greater than for any other Region presented. However, there is no significant difference with SPP and FRCC, so Table D.19 lists as statistically significant smaller only rates for MRO, SERC, TRE, and NPCC.

Year-Over-Year Changes by Region

Next, changes from the first four quarters (Q4 2012–Q3 2013, Year 1) to the second four quarters (Q4 2013–Q3 2014, Year 2) were studied to compare time periods with similar composition of seasons. The changes are shown in Figure D.10.

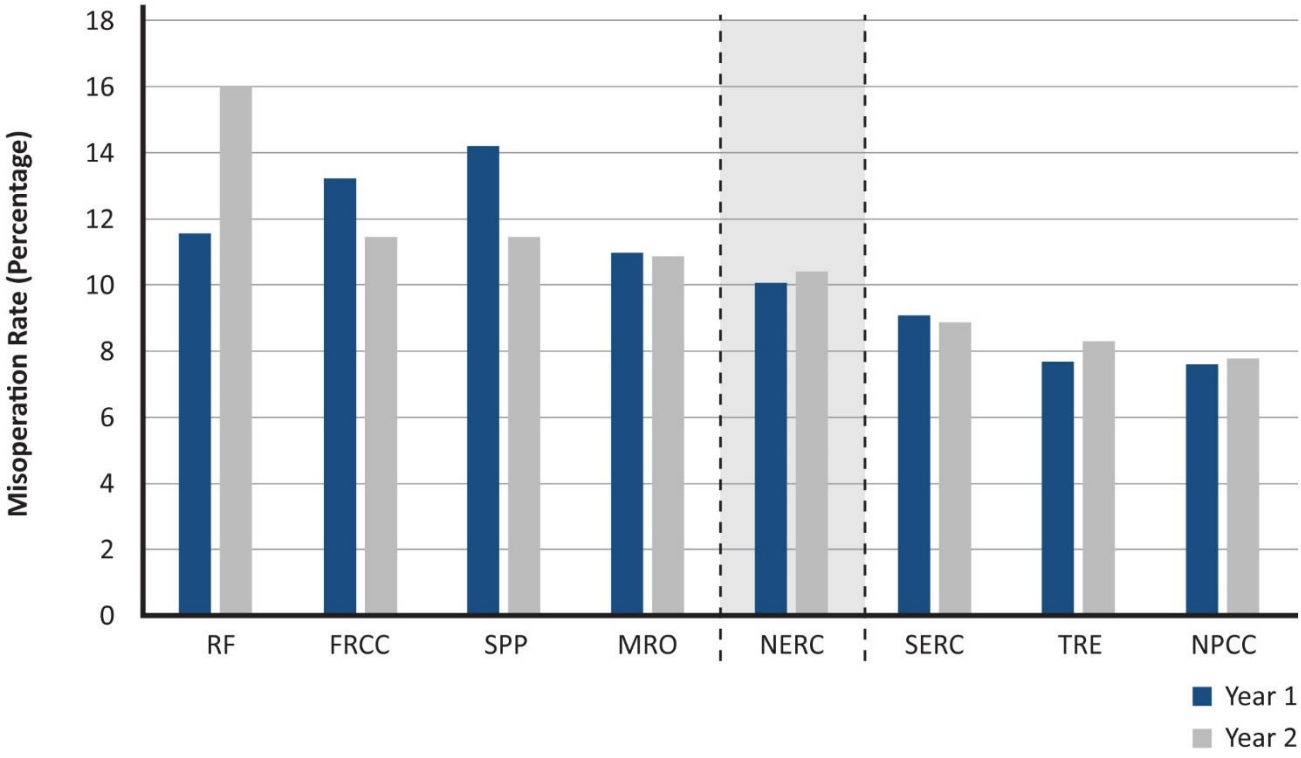

Figure D.10. Year-Over-Year Changes in Misoperation Rate by Region and NERC

By testing the hypotheses on the population proportion, there are only two statistically significant changes in misoperation rate between 2013 and 2014: an increase for the RFC misoperation rate and a decrease for the SPP misoperation rate.

The decrease of misoperations in SPP RE may be due in part to SPP RE's outreach efforts to increase successful protection system operations. SPP RE established a goal of a 92 percent successful operations rate and has made this goal part of the SPP RE staff's performance matrix. SPP RE has presented its misoperation analysis, findings, and conclusions in workshops, SPP RE Trustee meetings, and the monthly newsletter. SPP RE participates in the System Protection and Control Working Group (SPCWG), which completed a white paper on its analysis of Regional Entity relay misoperations caused by communication failures. Communication failures are the primary root cause of misoperations in SPP RE. The SPCWG is working on an additional white paper on misoperations[109] caused by Incorrect Setting/Logic/Design Errors, which is the second-highest root cause of Regional Entity misoperations.

Appendix E – Event Analysis Discussion

Background

The industry's voluntary Event Analysis Process continues to provide valuable information for the ERO and industry to address potential reliability risks or vulnerabilities of the BPS. Since its initial implementation in October of 2010, the process has reported 569 Qualified Events to the ERO and yielded 96 Lessons Learned, including 19 published in 2014.[110] NERC and the Regions assess every Qualified Event to identify causal factors and share with industry the possible risks to reliability. This year, the NERC Cause Code Assignment Process provided greater ability for historical trending and predictive analysis. Industry continued to actively participate in assigning cause codes for events, providing greater transparency on how the ERO analyzes and trends events. This active collaboration is a testament to the importance and effectiveness placed on this area by the industry, and also how important it is for the ERO and industry to truly understand the different contributors to events. The Event Analysis Subcommittee (EAS) has been essential in the maturation of this process and has facilitated the active dissemination of many of the products that have been delivered to date. This chapter highlights some of the significant products that have been produced from this active collaboration.

Bulk Power System Awareness

The first step in the ERO Event Analysis Process is to monitor BPS occurrences above a certain threshold of impact or risk. Bulk Power System Awareness (BPSA) is the process for understanding the potential threats or vulnerabilities to the reliability of the BPS. This starts with understanding occurrences and events in the context in which they occur. NERC's BPSA group and the eight Regional Entities monitor BPS conditions, significant occurrences, and emerging risks and threats across the 14 RCs in North America to maintain an understanding of conditions and situations that could impact the reliable operation of the BPS. The 2014 incoming information consisted of:

- Mandatory reports
  - 500 DOE OE-417 reports
  - 282 EOP-004-2 reports
  - 4 EOP-002-3 reports
- Other information (in no particular order or priority, and not limited to these resources)
  - 1,741 Intelligent Alarms notifications
  - 2,356 FNet notifications and 602 FNet daily summaries
  - 6,172 WECCnet messages
  - 1,691 RCIS messages
  - 186 Space Weather Predictive Center Alerts
  - 1,789 assorted U.S. Government products
  - 3,588 assorted confidential, proprietary or non-public products
  - 13,184 open source media reports
  - 1,257 RC and ISO/RTO notifications

[110] The link to the NERC Lessons Learned page: http://www.nerc.com/pa/rrm/ea/Pages/Lessons-Learned.aspx.

The information gathered allows the ERO to identify and conduct in-depth, critical self-analyses of Qualified Events to identify trends and provide experience-based insight to prevent repeat occurrences. The BPSA group also supports the development and publication of Industry Alerts and awareness products and facilitates information sharing among industry, Regions, and the government during crisis situations and major system disturbances.

- Products:
  - 252 daily reports
  - 33 special reports for significant occurrences
  - 4 security-related NERC Advisory (Level 1) Alerts for ES-ISAC
  - 1 reliability-related NERC Advisory (Level 1) Alert
  - 503 new Event Analysis database entries
  - 170 qualified Event Analysis Process events

Analysis and Reporting of Events

BPS conditions provide recognizable signatures through automated tools, mandatory reports, voluntary information sharing, and third-party publicly available sources. The significant majority of these signatures represent conditions and occurrences that have little or no reliability impact, either positive or adverse, on the BPS. However, being continually cognizant of the short-term condition of the BPS and the signatures associated with the entire range of reliability performance helps the ERO identify significant occurrences and events. Registered entities continue to share information and collaborate with the ERO well beyond what is required to maintain and improve the overall reliability of the grid. Only a small subset of the occurrences of which the BPSA group is made aware rise to the level of a reportable event. When a registered entity experiences an event, the registered entity will recommend an initial category for the event. The categories listed in the Categorization of Events section of the process do not cover all possible events.[111]

The quality, detailed analysis, and investigations that entities have performed have led to quality reports.[112] Good-quality event analysis reports allow for more accurate cause coding of events and has led to better trending. Better trending leads to timely identification of issues being communicated back to the industry.

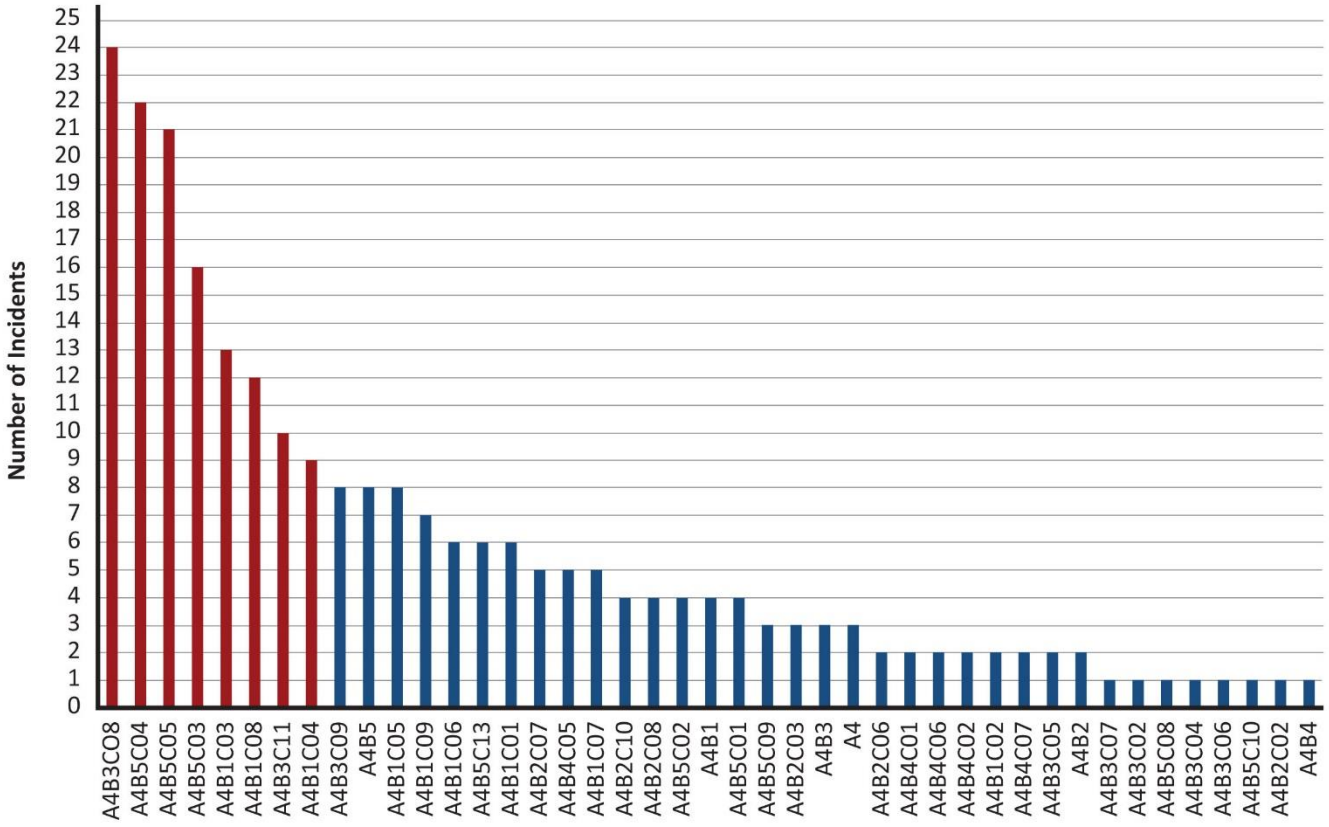
NERC Cause Code Assignment Process

Through the Event Analysis Process, NERC assesses every event report to identify and then share, industry-wide, the apparent threats to reliability that may be emerging. The NERC CCAP manual[113] was updated in March 2014. Cause coding has allowed for easier trending for all event causes. While the root cause of every event can not necessarily be determined, many of the contributing causes or failed defenses can be determined, analyzed, and trended to provide valuable information to the industry. Through the Event Analysis Process, cause codes were assigned to 401 events with 342 contributing cause codes.

A similar identification of trends can be observed in the large contribution of “less than adequate” or “needs improvement” cause factors in the area of Management and Organizational practices that contribute to events. Many of these threats can be identified and shared with the industry for awareness. For example, in Figure E.1 below, the identification of some of the particular challenges to organization and management effectiveness are

[111] For a more thorough review of the process, see: http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf.
[112] http://www.nerc.com/pa/rrm/ea/EA Program Document Library/NERC-Report-Quality.pdf
[113] http://www.nerc.com/files/NERC_Cause_Code_Assignment_Process_February_2013.pdf

identified. Management of complex systems and organizations is a challenge in every industry, and the percentage of events with these contributing factors is collectively found in other industries.



A4B3CO8 = Job scoping did not identify special circumstances and/or conditions
A4B5C04 = Risks/consequences associated with change not adequately reviewed
A4B5C05 = System interactions not considered
A4B5C03 = Inadequate vendor support of change
A4B1C03 = Management direction created insufficient awareness of impact of actions on safety/reliability
A4B1C08 = Corrective action responses to a known or repetitive problem was untimely
A4B3C11 = Inadequate work package preparation
A4B1C04 = Management follow-up or monitoring of activities did not identify problems

Figure E.1: Management or Organization Challenges Contributing to an Event

Many of the most frequently identified contributing causes for events seen in Figure E.1 were found in the severe cold weather events. NERC, in close collaboration with Regional Entity staff and industry, published a report titled *Assessment of Previous Severe Winter Weather Reports 1983-2011* to provide a review and comparison of previous winter weather events.[114] This review and a cold weather training package were provided to the industry to assist them with winter weather preparation.

Over 350 owners, users, and operators attended a webinar in October of 2014 that provided the industry reports and training material in preparation for the upcoming winter weather forecasts and entity cold weather preparedness. During the webinar, the impacts from both the February 2011 Southwest Cold Weather Event and previous cold weather events were discussed. The webinar encouraged Generator Owners and Operators to focus

[114] These reports can be found at http://www.nerc.com/pa/rrm/ea/Pages/February-2011-Southwest-Cold-Weather-Event.aspx .

on areas that were observed in past events, such as inspecting and maintaining heat trace equipment and thermal insulation, erecting adequate wind breaks and enclosures, and taking measures to protect instrument lines and equipment prior to the onset of winter weather.

The *Assessment of Previous Severe Winter Weather Reports 1983-2011* report was also reviewed during the webinar. This was to remind industry that generators experienced weather-related outages, and rolling blackouts in previous events and lessons learned from these events could have prevented outages in more recent winter events.

The Reliability Guideline *Generating Unit Winter Weather Readiness – Current Industry Practices* was also reviewed. This guideline provides a general framework for developing an effective winter weather readiness program for generating units throughout North America. Although the NERC *Winter Reliability Assessment 2014-15* was expected to be published later in November, attendees were given a preview of the draft. The NOAA winter outlook, resource adequacy, and seasonal reliability issues were also covered during the webinar. Attendees were introduced to a *Cold Weather Event Training Package* designed by NERC training staff to assist nontraditional cold weather registered entities with properly preparing for cold weather events. The materials were designed to be a guide to training sessions. These materials have been created as a foundation for training and remain in PowerPoint[115] format to allow for customization based on registered entity needs.

The Event Analysis Process continues to establish the appropriate balance of data reporting for analysis and use by the industry. NERC is investigating ways to sustain positive efforts and to improve the process.

Individual and Organizational Human Performance

Analysis of the event reports to date have identified possible workforce capability and human performance challenges that pose threats to reliability. Workforce capability and human performance is a broad topic and can most simply be divided into management, team, and individual levels. To provide more detailed information on the types of errors that were observed in BPS events since the inception of the NERC Event Analysis program, and specifically events that involved human error or potentially less-than-adequate training, the following summary is provided.

Generally, individual error is classified in the mode of performance in which the individual was operating when the error was committed. The NERC Cause Code Assignment Process uses a popular methodology as prescribed in one of the three modes, depending on the nature of the task and the level of experience with the particular situation. That is, when information is first perceived and interpreted in the processing system, that information is processed cognitively in either the skill-based, knowledge-based, or rule-based levels, depending on the individual's degree of experience with the particular situation.

Additionally, when contributing causes are considered, over half of the event reports to date indicate some management or organizational challenges. To support industry with these challenges, NERC held its third annual HP conference in Atlanta, Improving Human Performance on the Grid,[116] at the end of March 2014. The focus this year was not only on individual human performance, but the organizational and management challenges around human capital. The conference included industry and related industry professionals in the field, with over 200 attendees from all Regions. The conference and associated workshops were very well received. NERC supported WECC for a similar venue for industry in the fall. NERC provided industry support in this area to well over 250 registered entities across the eight Regions.

[115] This webinar presentation can be found at: http://www.nerc.com/pa/rrm/ea/Pages/February-2011-Southwest-Cold-Weather-Event.aspx.

[116] The full conference presentations for the past Human Performance Conference at NERC can be found at http://www.nerc.com/pa/rrm/hp/Pages/default.aspx.

Monitoring and Situation Awareness (Real-Time Tools)

Energy Management Systems (EMS), including SCADA, digital, or analog communications and real time tools, are vital for maintaining situational awareness and making operating decisions at both the individual and the organizational level. EMS systems are extremely reliable and are typically redundant. However, an outage of the EMS system increases the potential risk to the reliability of the BPS. The NERC Event Analysis program has received 111 Category 2b event reports, where a complete loss of SCADA, monitoring, or control has lasted for more than 30 minutes. NERC's commitment to active collaboration and sharing has allowed more information to be adequately reviewed and shared about these events in conjunction with the NERC Regions and the affected entities. In October 2013, the Event Analysis Process changed to add a new category of events.

Category 1h, for the partial loss of EMS, is defined as:

> *Loss of monitoring or control, at a control center, such that it significantly affects the entity's ability to make operating decisions for 30 continuous minutes or more.*

Examples include but are not limited to the following:

1. Loss of operator ability to remotely monitor, control BES Elements, or both
2. Loss of communications from SCADA RTUs
3. Unavailability of ICCP links reducing BES visibility
4. Loss of the ability to remotely monitor and control generating units via AGC
5. Unacceptable State Estimator or Contingency Analysis solutions

The EAS transitioned the Energy Management System Task Force (EMSTF) to a permanent working group to analyze the events and data that were being collected about EMS outages and challenges. Industry also recognized that many EMS outages were significantly less than the Category 2b, but impacted the decision-making activities for which the EMS is used. Category 1h was created to learn more about these type of events. This category allows the EMSWG to collect a greater number of the occurrences of EMS partial outages and share this information with the industry. With this modification of reporting EMS events, the number of Category 1h events reported by the industry has provided useful information and has decreased the number of Category 2b events. The active participation has led to even more detailed reporting and sharing of information, all helping the industry understand and mitigate the risk of these events.

From the Event Analysis reports and the work of the EAS, NERC published multiple lessons learned specifically about EMS outages and worked to build and support an industry-led EMSTF to support the EAS. The hard work and active sharing of this group has reduced some of the residual risk associated with this potential loss of situation awareness and monitoring capability associated with this type of event, and will continue to provide valuable information to the industry.

With the support of the EMSTF, NERC hosted its second *Monitoring and Situational Awareness Conference*, focused on improving Energy Management Systems reliability, September 23–24, 2014. The conference brought together more than 90 Operations and EMS experts from more than 55 registered entities, and a variety of vendors and consultants. The entities that attended came from across all of the Regions and Canada.

The feedback from participants has been extremely positive for the two conferences. Attendees liked the technical nature of the presentations and the takeaways they could use to improve the processes and procedures at their own companies. The openness with which the EMS issues and their corrective actions were shared was greatly appreciated by the attendees. Also appreciated was the platform that NERC provided to transparently share the events and learn from them. A third workshop was requested by industry for 2015. Industry has demonstrated

appropriate responses to EMS outages, and the ERO can now more accurately assess the residual risk to the BPS from EMS outages.[117] Industry has expressed continued strong interest and support for these information-sharing venues.

Event SRI (eSRI)

NERC Event Analysis staff calculates an Event Severity Risk Index (eSRI) for all qualified events (as defined in the Event Analysis Process).[118] This calculation is based on the methodology used by NERC for the standard Severity Risk Index (SRI) as described in Chapter 3, and considers the loss of transmission, the loss of generation, and the loss of firm load (along with load-loss duration).

Every event reported through the Event Analysis Process has its eSRI calculated, but for the purposes of trending, certain event groups are excluded. The excluded groups are:

1. Weather-driven events;
2. AESO-islanding events; and
3. Category 4-5 events.

The purpose of excluding Category 4–5 events is that they are monitored and tracked in a distinct manner, so counting them in this trending would be duplicative. As AESO designed islanding as an intentional act in their SPS schemes, these are also excluded. The purpose of excluding the weather-driven events is because they are outside of the control of the BES entities, thus not considered when studying impact over which there is control. A weather-driven event is an event whose root cause is determined to be weather (or other force of nature); examples would include the Hurricane Sandy event, an earthquake, or a string of tornadoes knocking down transmission towers, among others. There have been 14 of these events since October 2010, when the current Event Analysis Process was developed.

For the events reported since October 2010, the total number of events was 568; of these, 29 were AESO islanding, 14 were weather-driven, and five (three of which are also weather-driven) were Category 4–5 events. This means only two Category 4–5 events were excluded as Category 4–5 events, while three of them were excluded as weather-driven events. The total number of events for which eSRI will be included in any trending is 523 events (out of the total of 568).

The formula used is:

$eSRI = RPL * W_L * (MW_L) + W_T * (N_T) + W_G * (N_G)$, where

RPL = Load Restoration Promptness Level,
W_L = Weighting of load loss (60%),
MW_L = normalized weighting of load loss,
W_T = weighting of transmission lines lost (30%),
N_T = normalized number of transmission lines lost, in percent,
W_G = weighting of loss generation (10%),
N_G = normalized Net Dependable Capacity of generation lost.

The value of this calculation results in a number between zero (0) and one (1); thus, for easier use in analysis, this small number is multiplied by 1000.

[117] The full conference presentations for the past Monitoring and Situation Awareness conferences can be found at http://www.nerc.com/pa/rrm/Resources/Pages/Conferences-and-Workshops.aspx.

[118] http://www.nerc.com/pa/rrm/ea/EA Program Document Library/Final_ERO_EA_Process_V2.1.pdf

Once this number is calculated for each event and is plotted in chronological sequence, the slope of the trend line is calculated and plotted. In this way, the trend can be visually identified (as well as numerically calculated using statistical software). Every day has its eSRI calculated (meaning a day with no events has an eSRI = 0.000). For any days with multiple events, the eSRIs are additive.

Summary

The Event Analysis Process continues to provide valuable information for the industry to address potential threats or vulnerabilities to the reliability of the BPS. This continued active collaboration remains a testament to how much effort and resources are being expended in this area by the industry as well as how important it is for the ERO and industry to truly understand the different contributors to events. The continued cooperation and collaboration with the industry is the hallmark to this program's success.

The ability to identify specific pieces of equipment that are potential threats, as well as emerging trends that increase risk to the system, illustrates the value of the Event Analysis Process. These outcomes, coupled with the ability to actively share the information through Lessons Learned, webinars, technical conferences, and related venues, remain critical to the sustainment of high reliability.

Appendix F – Statistical Summary of SRI Assessment

The PAS has investigated the SRI performance for 2010 through 2014 as well as a year-by-year comparison and seasonal changes. A statistical test indicated statistically significant changes among annual SRI. ANOVA analysis showed that 2011 performance was the best SRI since 2010; moreover, the difference in all other years was statistically significant.[119] The 2014 SRI performance was statistically similar to 2010 and 2012 but worse than 2011 and 2013. The descriptive statistics of annual SRI are listed in Table F.1.

Table F.1: Descriptive Statistics of Annual SRI

Year	N	Mean	Standard Deviation	Minimum	Maximum	Median
2010	365	1.74	0.61	0.59	4.64	1.70
2011	365	1.50	1.04	0.48	13.97	1.34
2012	366	1.78	0.81	0.55	8.87	1.65
2013	365	1.67	0.60	0.46	4.06	1.57
2014	365	1.85	0.87	11.14	11.14	1.72

[119] ANOVA with Fisher's least significant difference test at the significant level 0.05.

The relative SRI performance by year is further visible in Figure F.1. The year 2011 was the best as measured by a median as well as a mean, in spite of the relatively large standard deviation (whose outliers included the September 8, 2011, load shed event, in addition to the February 2, 2011, cold weather load loss event).

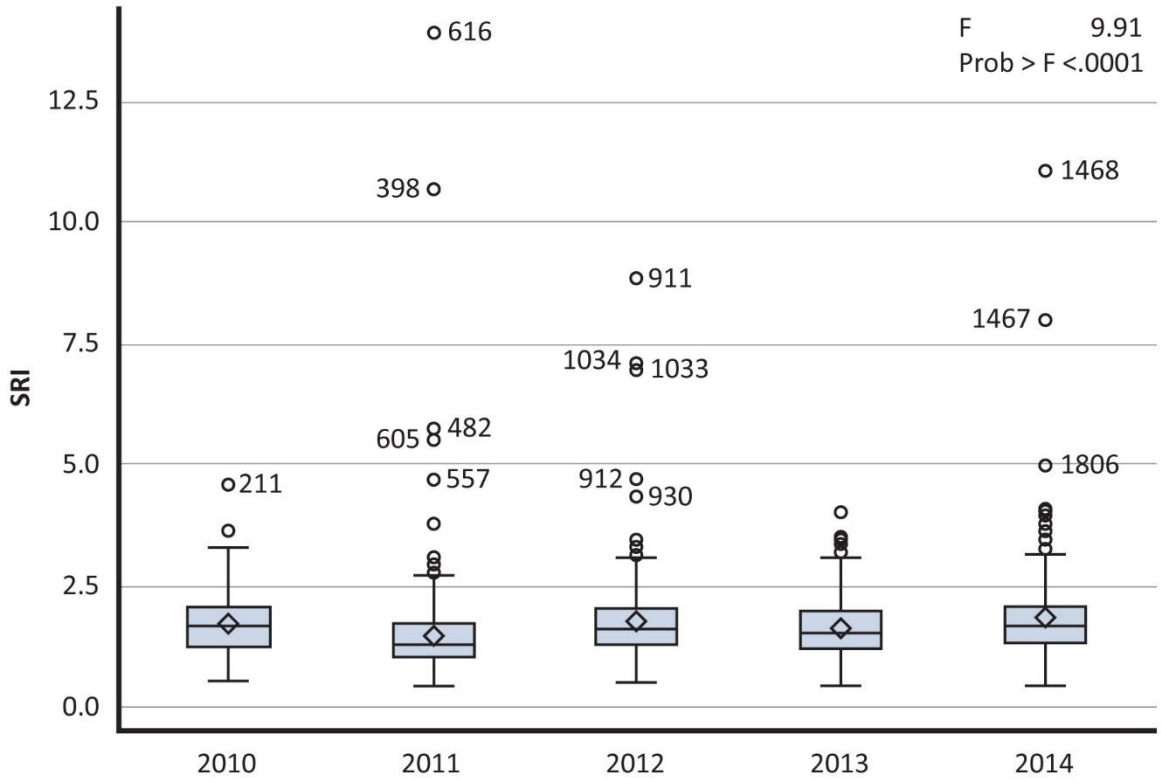


Figure F.1: Boxplot of Annual SRI

The performance of each year compared to every other year is depicted in Table F.2 below; if no reference to statistical significance is made within the table, it is assumed to be statistically significant.[120]

Table F.2: Pairwise Comparison of Annual SRI

	Compared to Year			
Base Year	**2011**	**2012**	**2013**	**2014**
2010	2011 Better	No Statistically Significant Difference	No Statistically Significant Difference	No Statistically Significant Difference
2011		2011 Better	2011 Better	2011 Better
2012			No Statistically Significant Difference	No Statistically Significant Difference
2013				2013 Better

[120] At significance level 0.05.

In Figure F.2, the trend of performance is shown over the five-year history along with a time trend line.

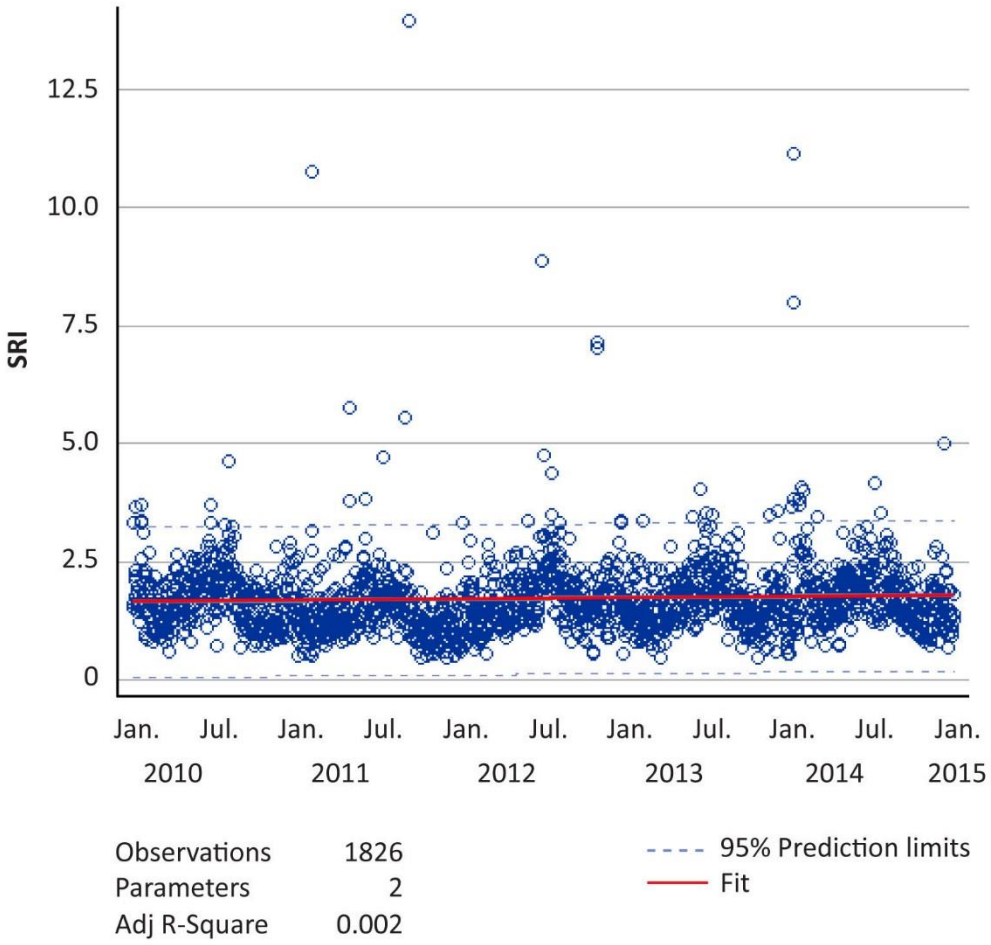

Figure F.2: Fit Plot for SRI 2010–2014

The time trend line has a statistically significant positive slope (p = 0.032). The same result can be drawn for the correlations analysis: on average, the trend line for SRI is increasing over time (i.e., the hypothesis on a stable performance SRI over 2010 to 2014 cannot be accepted at 0.05 significance level).

Finally, the statistical analysis of the seasonal performance was done. It revealed statistically significant differences in SRI by season. The fall SRI has the best performance, the summer SRI has the worst. Table F.3 shows the statistics by season based on the 2010 to 2014 data.

Table F.3: Descriptive Statistics of SRI by Season

Season	N	SRI	
		Mean	Standard Deviation
Winter	452	1.66	0.97
Spring	460	1.66	0.55
Summer	460	2.05	0.71
Fall	454	1.47	0.84

A statistical test[121] indicated that all differences in the seasonal expected SRI are statistically significant except those for winter and spring, which is also illustrated in Figure F.3.

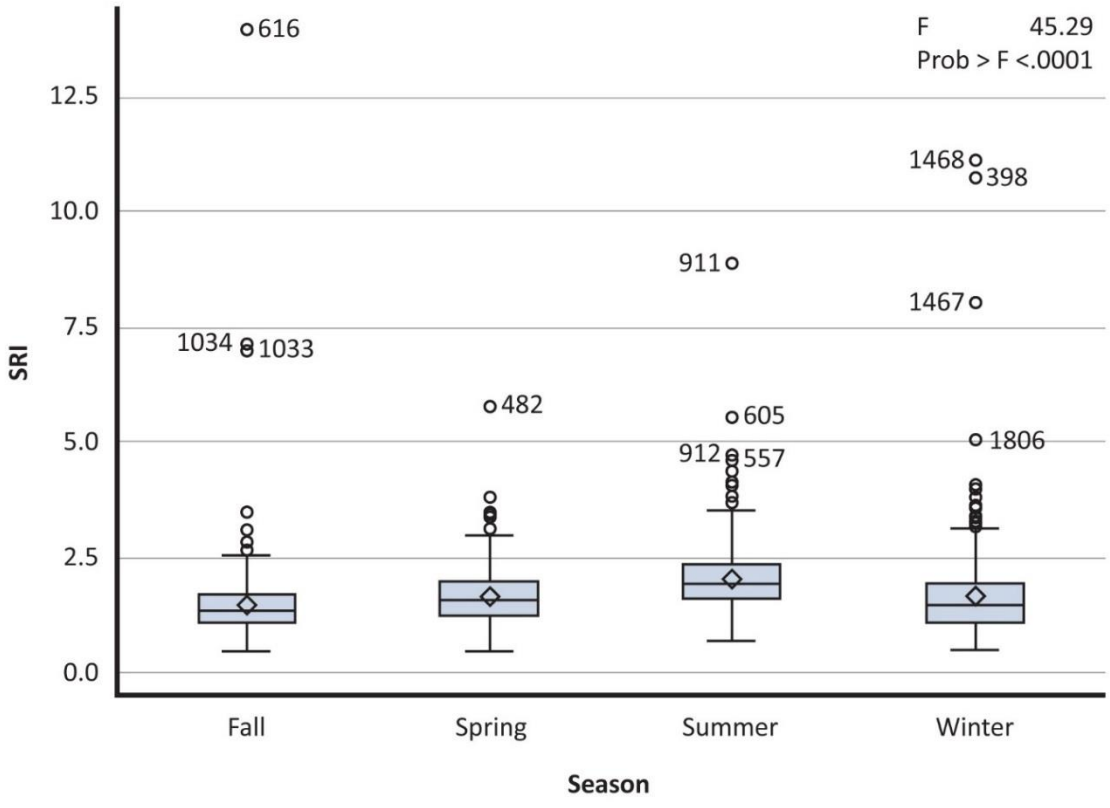

Figure F.3: Boxplot for SRI by Season 2010–2014

[121]ANOVA with Fisher's least significant difference test at the significant level 0.05.

Appendix G – Abbreviations Used in This Report

Acronym	Description
ALR	Adequate Level of Reliability
BES	Bulk Electric System
BPS	Bulk Power System
CDM	Common/Dependent Mode
EEA	Energy Emergency Alert
ERO	Electric Reliability Organization
ERCOT	Electric Reliability Council of Texas
FERC	Federal Energy Regulatory Commission
FRCC	Florida Reliability Coordinating Council
ICC	Initiating Cause Code
IROL	Interconnection Reliability Operating Limit
ISO	Independent System Operator
ISO-NE	ISO New England
KCMI	Key Compliance Monitoring Index
MRO	Midwest Reliability Organization
NERC	North American Electric Reliability Corporation
NPCC	Northeast Power Coordinating Council
NYISO	New York Independent Service Operator
PAS	Performance Analysis Subcommittee
PSMTF	Protection System Misoperation Task Force
RC	Reliability Coordinator
RE	Regional Entities
RF	ReliabilityFirst
RSG	Reserve-Sharing Group
SERC	SERC Reliability Corporation
SNL	Sandia National Laboratories
SOL	System Operating Limit
SPS	Special Protection Schemes
SPCS	System Protection and Control Subcommittee
SPP	Southwest Power Pool
SRI	Severity Risk Index
TADS	Transmission Availability Data System
TADSWG	Transmission Availability Data System Working Group
TO	Transmission Owner
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Appendix H – Contributions

Acknowledgements

NERC would like to express its appreciation to the many people who provided technical support and identified areas for improvement.

NERC Industry Groups

Table H.1 lists the NERC industry group contributors.

Media Release

Report Shows Strong Performance, Stable Frequency Response and Less Severe Transmission Outages

May 28, 2015

ATLANTA – The North American Electric Reliability Corporation completed an independent review of bulk power system trends to analyze the state of reliability and provide an integrated view of reliability performance in its annual *State of Reliability 2015*. The report's key findings show the bulk power system sustained high reliability performance, realized a reduction in unplanned transmission outages leading to load loss, maintained stable frequency response, and experienced no instances of load loss due to a cyber or physical security risk. Consistent with prior *State of Reliability* report findings, uncontrollable severe weather events continue to be the largest factor affecting the performance of the bulk power system.

The *State of Reliability 2015* report's findings and recommendations serve as input to NERC's risk assessment and reliability standards project prioritization of specific actions that can be taken to manage potential risks and enhance bulk power system reliability.

"The data collected and analyzed for this report shows a continuing trend of bulk power system equipment owners and operators achieving the desired reliability objectives," said Howard Gugel, NERC director of Performance Analysis. "While the performance of the bulk power system remains strong, NERC continues to work with industry to enhance reliability the grid."

NERC incorporated cyber and physical security metrics as key reliability indicators analyzed this year to set a baseline on critical infrastructure protection. Two of the metrics examined security incidents reported to NERC and the Department of Energy in 2014 and found that cyber and physical security protections effectively prevented loss of load due to these incidents.

Other key findings include:

- Severe weather events, which resulted in generator outages and deratings, remained a significant threat to reliability. Looking at the 10 most severe weather events in 2014, there were three days when periods of high stress

CONTACT:
Kimberly.Mielcarek@nerc.net

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

occurred on the bulk power system — two days during the January polar vortex event and another day during severe windstorms in California in December.

- Frequency response, which helps generators maintain reliability by adjusting output to meet system demand for electricity, remained above recommended interconnection obligation levels for the third consecutive year. NERC conducts annual tests to determine whether Interconnection Frequency Response Obligations are met in the Eastern Interconnection, the Western Interconnection, the Electric Reliability Council of Texas Interconnection and the Québec Interconnection.

- Unplanned transmission outages affecting on the bulk power system causing loss of load dropped from six in 2013 to three in 2014 — down from an average of 10 unplanned transmission outages between 2002 and 2011. While the total number of unplanned transmission outages impacting the bulk power system declined from 2013 to 2014, misoperations and equipment failure remained the greatest contributors to those outages, excluding weather.

- In 2014, there were four Energy Emergency Alert Level 3 events declared, which is less than any other year for which data was reported. Of the four events declared, only one resulted in load shedding. This event was due to conditions during the January polar vortex.

The *State of Reliability 2015* highlights key recommendations for stakeholders going forward that include:

- Developing metrics that provide insight into weather impacts on bulk power system performance, especially during load-loss events.
- Determining whether additional actions are required to maintain and improve frequency response performance.
- Evaluating the failure rate of circuit breakers and determine the impact of bus configuration on ac transmission circuit outages.
- Working with the Protection System Misoperations Task Force to develop a guideline on quality control to improve protective relay settings and developing an industry outreach program on reducing protection system misoperation.

###

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the bulk power system in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the bulk power system through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization for North America, subject to oversight by the Federal Energy Regulatory Commission and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the bulk power system, which serves more than 334 million people.

1702. Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023……100
1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509…...…102

SECTION 100 — APPLICABILITY OF RULES OF PROCEDURE

NERC and NERC Members shall comply with these Rules of Procedure. Each Regional Entity shall comply with these Rules of Procedure as applicable to functions delegated to the Regional Entity by NERC or as required by an Applicable Governmental Authority or as otherwise provided.

Each Bulk Power System owner, operator, and user shall comply with all Rules of Procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Any entity that is unable to comply or that is not in compliance with a NERC Rule of Procedure shall immediately notify NERC in writing, stating the Rule of Procedure of concern and the reason for not being able to comply with the Rule of Procedure.

NERC shall evaluate each case and inform the entity of the results of the evaluation. If NERC determines that a Rule of Procedure has been violated, or cannot practically be complied with, NERC shall notify the Applicable Governmental Authorities and take such other actions as NERC deems appropriate to address the situation.

NERC shall comply with each approved Reliability Standard that identifies NERC or the Electric Reliability Organization as a responsible entity. Regional Entities shall comply with each approved Reliability Standard that identifies Regional Entities as responsible entities. A violation by NERC or a Regional Entity of such a Reliability Standard shall constitute a violation of these Rules of Procedure.

SECTION 200 — DEFINITIONS OF TERMS

Definitions of terms used in the NERC Rules of Procedure are set forth in **Appendix 2**, *Definitions Used in the Rules of Procedure*.

SECTION 300 — RELIABILITY STANDARDS DEVELOPMENT

301. General

NERC shall develop and maintain Reliability Standards that apply to Bulk Power System owners, operators, and users and that enable NERC and Regional Entities to measure the reliability performance of Bulk Power System owners, operators, and users; and to hold them accountable for Reliable Operation of the Bulk Power Systems. The Reliability Standards shall be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.

302. Essential Attributes for Technically Excellent Reliability Standards

1. **Applicability** — Each Reliability Standard shall clearly identify the functional classes of entities responsible for complying with the Reliability Standard, with any specific additions or exceptions noted. Such functional classes[1] include: Reliability Coordinators, Balancing Authorities, Transmission Operators, Transmission Owners, Generator Operators, Generator Owners, Transmission Service Providers, market operators, Planning Authorities, Transmission Planners, Resource Planners, Load-Serving Entities, and Distribution Providers. Each Reliability Standard shall also identify the geographic applicability of the Reliability Standard, such as the entire North American Bulk Power System, an Interconnection, or within a Region. A Reliability Standard may also identify any limitations on the applicability of the Reliability Standard based on electric Facility characteristics.

2. **Reliability Objectives** — Each Reliability Standard shall have a clear statement of purpose that shall describe how the Reliability Standard contributes to the reliability of the Bulk Power System. The following general objectives for the Bulk Power System provide a foundation for determining the specific objective(s) of each Reliability Standard:

    2.1 **Reliability Planning and Operating Performance**— Bulk Power Systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

    2.2 **Frequency and Voltage Performance**— The frequency and voltage of Bulk Power Systems shall be controlled within defined limits through the balancing of Real and Reactive Power supply and demand.

[1] These functional classes of entities are derived from NERC's Reliability Functional Model. When a Reliability Standard identifies a class of entities to which it applies, that class must be defined in the Glossary of Terms Used in NERC Reliability Standards.

2.3 **Reliability Information** — Information necessary for the planning and operation of reliable Bulk Power Systems shall be made available to those entities responsible for planning and operating Bulk Power Systems.

2.4 **Emergency Preparation** — Plans for emergency operation and system restoration of Bulk Power Systems shall be developed, coordinated, maintained, and implemented.

2.5 **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of Bulk Power Systems.

2.6 **Personnel** — Personnel responsible for planning and operating Bulk Power Systems shall be trained and qualified, and shall have the responsibility and authority to implement actions.

2.7 **Wide-Area View** — The reliability of the Bulk Power Systems shall be assessed, monitored, and maintained on a Wide-Area basis.

2.8 **Security** —Bulk Power Systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome**— Each Reliability Standard shall state one or more performance Requirements, which if achieved by the applicable entities, will provide for a reliable Bulk Power System, consistent with good utility practices and the public interest. Each Requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for Bulk Power System reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance Requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that Requirement. Each performance Requirement shall have one or more associated measures used to objectively evaluate compliance with the Requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations**— Each Reliability Standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.

6. **Completeness** — Reliability Standards shall be complete and self-contained. The Reliability Standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for Penalties and sanctions, as well as other ERO and Regional Entity compliance documents, the consequences of violating a Reliability Standard are clearly presented to the entities responsible for complying with the Reliability Standards.

8. **Clear Language** — Each Reliability Standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

9. **Practicality** — Each Reliability Standard shall establish Requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, Reliability Standards shall use a set of standard terms and definitions that are approved through the NERC Reliability Standards development process.

303. Relationship between Reliability Standards and Competition

To ensure Reliability Standards are developed with due consideration of impacts on competition, to ensure Reliability Standards are not unduly discriminatory or preferential, and recognizing that reliability is an essential requirement of a robust North American economy, each Reliability Standard shall meet all of these market-related objectives:

1. **Competition** — A Reliability Standard shall not give any market participant an unfair competitive advantage.

2. **Market Structures** — A Reliability Standard shall neither mandate nor prohibit any specific market structure.

3. **Market Solutions** — A Reliability Standard shall not preclude market solutions to achieving compliance with that Reliability Standard.

4. **Commercially Sensitive Information** — A Reliability Standard shall not require the public disclosure of commercially sensitive information or other Confidential Information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with Reliability Standards.

5. **Adequacy** — NERC shall not set Reliability Standards defining an adequate amount of, or requiring expansion of, Bulk Power System resources or delivery capability.

304. Essential Principles for the Development of Reliability Standards

NERC shall develop Reliability Standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these Rules of Procedure as **Appendix 3A**. Appeals in connection with the development of a Reliability Standard shall also be conducted in accordance with the NERC *Standard Processes Manual*. Any amendments or revisions to the *Standard Processes Manual* shall be consistent with the following essential principles:

1. **Openness** — Participation shall be open to all Persons and who are directly and materially affected by the reliability of the North American Bulk Power System. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

2. **Transparency** — The process shall be transparent to the public.

3. **Consensus-building** —The process shall build and document consensus for each Reliability Standard, both with regard to the need and justification for the Reliability Standard and the content of the Reliability Standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any two Segments as defined in **Appendix 3D**, *Development of the Registered Ballot Body*, of these Rules of Procedure, and no single Segment, individual or organization shall be able to defeat a matter.

5. **Due Process** — Development of Reliability Standards shall provide reasonable notice and opportunity for any Person with a direct and material interest to express views on a proposed Reliability Standard and the basis for those views, and to have that position considered in the development of the Reliability Standards.

6. **Timeliness** — Development of Reliability Standards shall be timely and responsive to new and changing priorities for reliability of the Bulk Power System.

305. Registered Ballot Body

NERC Reliability Standards shall be approved by a Registered Ballot Body prior to submittal to the Board and then to Applicable Governmental Authorities for their approval, where authorized by applicable legislation or agreement. This Section 305 sets forth the rules pertaining to the composition of, and eligibility to participate in, the Registered Ballot Body.

1. **Eligibility to Vote on Reliability Standards** — Any person or entity may join the Registered Ballot Body to vote on Reliability Standards, whether or not such person or entity is a Member of NERC.

2. **Inclusive Participation** — The Segment qualification guidelines are inclusive; i.e., any entity with a legitimate interest in the reliability of the Bulk Power System that can meet any one of the eligibility criteria for a Segment is entitled to belong to and vote in each Segment for which it qualifies, subject to limitations defined in Sections 305.3 and 305.5.

3. **General Criteria for Registered Ballot Body Membership** — The general criteria for membership in the Segments are:

    3.1 **Multiple Segments** — A corporation or other organization with integrated operations or with affiliates that qualifies to belong to more than one Segment (e.g., Transmission Owners and Load-Serving Entities) may join once in each Segment for which it qualifies, provided that each Segment constitutes a separate membership and the organization is represented in each Segment by a different representative. Affiliated entities are collectively limited to one membership in each Segment for which they are qualified.

    3.2 **Withdrawing from a Segment or Changing Segments** — After its initial registration in a Segment, each registered participant may elect to withdraw from a Segment or apply to change Segments at any time.

    3.3 **Review of Segment Criteria** — The Board shall review the qualification guidelines and rules for joining Segments at least every three years to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

4. **Proxies for Voting on Reliability Standards** — Any registered participant may designate an agent or proxy to vote on its behalf. There are no limits on how many proxies an agent may hold. However, for the proxy to be valid, NERC must have in its possession written documentation signed by the representative of the registered participant that the voting right by proxy has been transferred from the registered participant to the agent.

5. **Segments** — The specific criteria for membership in each Registered Ballot Body Segment are defined in the *Development of the Registered Ballot Body* in **Appendix 3D.**

6. **Review of Segment Entries** — NERC shall review all applications for joining the Registered Ballot Body, and shall make a determination of whether the applicant's self-selection of a Segment satisfies at least one of the guidelines to

belong to that Segment. The entity shall then become eligible to participate as a voting member of that Segment. The Standards Committee shall resolve disputes regarding eligibility for membership in a Segment, with the applicant having the right of appeal to the Board.

306. Standards Committee

The Standards Committee shall provide oversight of the Reliability Standards development process to ensure stakeholder interests are fairly represented. The Standards Committee shall not under any circumstance change the substance of a draft or approved Reliability Standard.

1. **Membership** — The Standards Committee is a representative committee comprising representatives of two members of each of the Segments in the Registered Ballot Body and two officers elected to represent the interests of the industry as a whole.

2. **Elections** — Standards Committee members are elected for staggered (one per Segment per year) two-year terms by the respective Segments in accordance with the *Procedure for the Election of Members of the NERC Standards Committee*, which is incorporated into these Rules of Procedure as **Appendix 3B**. Segments may use their own election procedure if such a procedure is ratified by two-thirds of the members of a Segment and approved by the Board.

3. **Canadian Representation**

   The Standards Committee will include Canadian representation as provided in **Appendix 3B**, *Procedure for the Election of Members of the NERC Standards Committee*.

4. **Open Meetings** — All meetings of the Standards Committee shall be open and publicly noticed on the NERC website.

307. Standards Process Management

NERC shall assign a standards process manager to administer the development of continent-wide Reliability Standards and a regional standards manager to administer the development of Regional Reliability Standards. The standards process manager shall be responsible for ensuring that the development and revision of Reliability Standards are in accordance with the NERC *Standard Processes Manual*. The standards process manager and the regional standards manager shall work to achieve the highest degree of integrity and consistency of quality and completeness of the Reliability Standards. The regional standards manager shall coordinate with any Regional Entities that develop Regional Reliability Standards to ensure those Regional Reliability Standards are effectively integrated with the NERC Reliability Standards.

308. Steps in the Development of Reliability Standards

1. **Procedure** — NERC shall develop Reliability Standards through the process set forth in the NERC *Standard Processes Manual* (**Appendix 3A**). The *Standard Processes Manual* includes provisions for developing Reliability Standards that can be completed using expedited processes, including a process to develop Reliability Standards to address national security situations that involve confidential issues.

2. **Board Adoption** — Reliability Standards or revisions to Reliability Standards approved by the ballot pool in accordance with the *Standard Processes Manual* shall be submitted for adoption by the Board. No Reliability Standard or revision to a Reliability Standard shall be effective unless adopted by the Board.

3. **Governmental Approval** — After Board adoption, a Reliability Standard or revision to a Reliability Standard shall be submitted to all Applicable Governmental Authorities in accordance with Section 309. No Reliability Standard or revision to a Reliability Standard shall be effective within a geographic area over which an Applicable Governmental Authority has jurisdiction unless it is approved by such Applicable Governmental Authority or is otherwise made effective pursuant to the laws applicable to such Applicable Governmental Authority.

309. Filing of Reliability Standards for Approval by Applicable Governmental Authorities

1. **Filing of Reliability Standards for Approval** — Where authorized by applicable legislation or agreement, NERC shall file with the Applicable Governmental Authorities each Reliability Standard, modification to a Reliability Standard, or withdrawal of a Reliability Standard that is adopted by the Board. Each filing shall be in the format required by the Applicable Governmental Authority and shall include: a concise statement of the basis and purpose of the Reliability Standard; the text of the Reliability Standard; the implementation plan for the Reliability Standard; a demonstration that the Reliability Standard meets the essential attributes of Reliability Standards as stated in Section 302; the drafting team roster; the ballot pool and final ballot results; and a discussion of public comments received during the development of the Reliability Standard and the consideration of those comments.

2. **Remanded Reliability Standards and Directives to Develop Standards** — If an Applicable Governmental Authority remands a Reliability Standard to NERC or directs NERC to develop a Reliability Standard, NERC shall within five (5) business days notify all other Applicable Governmental Authorities, and shall within thirty (30) calendar days report to all Applicable Governmental Authorities

a plan and timetable for modification or development of the Reliability Standard. Reliability Standards that are remanded or directed by an Applicable Governmental Authority shall be modified or developed using the *Standard Processes Manual*. NERC shall, during the development of a modification for the remanded Reliability Standard or directed Reliability Standard, consult with other Applicable Governmental Authorities to coordinate any impacts of the proposed Reliability Standards in those other jurisdictions. The expedited standards development process may be applied if necessary to meet a timetable for action required by the Applicable Governmental Authorities, respecting to the extent possible the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interest in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply.

3. **Directives to Develop Reliability Standards under Extraordinary Circumstances** — An Applicable Governmental Authority may, on its own initiative, determine that extraordinary circumstances exist requiring expedited development of a Reliability Standard. In such a case, the Applicable Governmental Authority may direct the development of a Reliability Standard within a certain deadline. NERC staff shall prepare the Standards Authorization Request. The proposed Reliability Standard will then proceed through the Reliability Standards development process, using the expedited action process described in the *Standard Processes Manual* as necessary to meet the specified deadline. The timeline will be developed to respect, to the extent possible, the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply, with appropriate modification of the timeline.

310. Annual Reliability Standards Development Plan

NERC shall develop and provide an annual Reliability Standards Development Plan for development of Reliability Standards to the Applicable Governmental Authorities. NERC shall consider the comments and priorities of the Applicable Governmental Authorities in developing and updating the annual Reliability Standards Development Plan. Each annual Reliability Standards Development Plan shall include a progress report comparing results achieved to the prior year's Reliability Standards Development Plan.

311. Regional Entity Standards Development Procedures

1. **NERC Approval of Regional Entity Reliability Standards Development Procedure** — To enable a Regional Entity to develop Regional Reliability Standards that are to be recognized and made part of NERC Reliability Standards, a Regional Entity may request NERC to approve a Regional Reliability Standards development procedure.

2. **Public Notice and Comment on Regional Reliability Standards Development Procedure** — Upon receipt of such a request, NERC shall publicly notice and request comment on the proposed Regional Reliability Standards development procedure, allowing a minimum of 45 days for comment. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the Regional Reliability Standards development procedure and request another posting for comment, or submit the Regional Reliability Standards development procedure, along with its consideration of any objections received, for approval by NERC.

3. **Evaluation of Regional Reliability Standards Development Procedure** — NERC shall evaluate whether a Regional Reliability Standards development procedure meets the criteria listed below and shall consider stakeholder comments, any unresolved stakeholder objections, and the consideration of comments provided by the Regional Entity, in making that determination. If NERC determines the Regional Reliability Standards development procedure meets these requirements, the Regional Reliability Standards development procedure shall be submitted to the Board for approval. The Board shall consider the recommended action, stakeholder comments, any unresolved stakeholder comments, and the Regional Entity consideration of comments in determining whether to approve the Regional Reliability Standards development procedure.

   3.1 **Evaluation Criteria** — The Regional Reliability Standards development procedure shall be:

      3.1.1 **Open** — The Regional Reliability Standards development procedure shall provide that any person or entity who is directly and materially affected by the reliability of the Bulk Power Systems within the Regional Entity shall be able to participate in the development and approval of Reliability Standards. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in the Regional Entity, a Regional Entity or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

      3.1.2 **Inclusive** — The Regional Reliability Standards development procedure shall provide that any Person with a direct and material

interest has a right to participate by expressing an opinion and its basis, having that position considered, and appealing through an established appeals process if adversely affected.

3.1.3 **Balanced** — The Regional Reliability Standards development procedure shall have a balance of interests and shall not permit any two interest categories to dominate a matter or any single interest category to defeat a matter.

3.1.4 **Due Process** — The Regional Reliability Standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the Regional Reliability Standards development procedure shall include public notice of the intent to develop a Regional Reliability Standard, a public comment period on the proposed Regional Reliability Standard, due consideration of those public comments, and a ballot of interested stakeholders.

3.1.5 **Transparent** — All actions material to the development of Regional Reliability Standards shall be transparent. All Regional Reliability Standards development meetings shall be open and publicly noticed on the Regional Entity's website.

3.1.6 **Accreditation of Regional Standards Development Procedure** — A Regional Entity's Regional Reliability Standards development procedure that is accredited by the American National Standards Institute shall be deemed to meet the criteria listed in this Section 311.3.1, although such accreditation is not a prerequisite for approval by NERC.

3.1.7 **Use of NERC Procedure** — A Regional Entity may adopt the NERC *Standard Processes Manual* as the Regional Reliability Standards development procedure, in which case the Regional Entity's Regional Reliability Standards development procedure shall be deemed to meet the criteria listed in this Section 311.3.1.

4. **Revisions of Regional Reliability Standards Development Procedures** — Any revision to a Regional Reliability Standards development procedure shall be subject to the same approval requirements set forth in Sections 311.1 through 311.3.

5. **Duration of Regional Reliability Standards Development Procedures** — The Regional Reliability Standards development procedure shall remain in effect until such time as it is replaced with a new version approved by NERC or it is withdrawn by the Regional Entity. The Regional Entity may, at its discretion, withdraw its Regional Reliability Standards development procedure at any time.

312. Regional Reliability Standards

1. **Basis for Regional Reliability Standards** — Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard. Such Regional Reliability Standards shall in all cases be submitted to NERC for adoption and, if adopted, made part of the NERC Reliability Standards and shall be enforceable in accordance with the delegation agreement between NERC and the Regional Entity or other instrument granting authority over enforcement to the Regional Entity. No entities other than NERC and the Regional Entity shall be permitted to develop Regional Reliability Standards that are enforceable under statutory authority delegated to NERC and the Regional Entity.

2. **Regional Reliability Standards That are Directed by a NERC Reliability Standard** — Although it is the intent of NERC to promote uniform Reliability Standards across North America, in some cases it may not be feasible to achieve a reliability objective with a Reliability Standard that is uniformly applicable across North America. In such cases, NERC may direct Regional Entities to develop Regional Reliability Standards necessary to implement a NERC Reliability Standard. Such Regional Reliability Standards that are developed pursuant to a direction by NERC shall be made part of the NERC Reliability Standards.

3. **Procedure for Developing an Interconnection-wide Regional Standard** — A Regional Entity organized on an Interconnection-wide basis may propose a Regional Reliability Standard for approval as a NERC Reliability Standard to be made mandatory for all applicable Bulk Power System owners, operators, and users within that Interconnection.

    3.1 **Presumption of Validity** — An Interconnection-wide Regional Reliability Standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities, shall be adopted as a NERC Reliability Standard. NERC shall rebuttably presume that a Regional Reliability Standard developed, in accordance with a Regional Reliability Standards development process approved by NERC, by a Regional Entity organized on an Interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities.

    3.2 **Notice and Comment Procedure for Interconnection-wide Regional Reliability Standard** — NERC shall publicly notice and request comment on the proposed Interconnection-wide Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability

Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to comment on or withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

3.3 **Adoption of Interconnection-wide Regional Reliability Standard by NERC** — NERC shall evaluate and recommend whether a proposed Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections that could serve as a basis for rebutting the presumption of validity of the Regional Reliability Standard. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning the proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for adoption as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, NERC's recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to adopt the Regional Reliability Standard as a NERC Reliability Standard.

3.4 **Applicable Governmental Authority Approval** — An Interconnection-wide Regional Reliability Standard that has been adopted by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

3.5 **Enforcement of Interconnection-wide Regional Reliability Standard** — An Interconnection-wide Regional Reliability Standard that has been adopted by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

4. **Procedure for Developing Non-Interconnection-Wide Regional Reliability Standards** — Regional Entities that are not organized on an Interconnection-wide basis may propose Regional Reliability Standards to apply within their respective Regions. Such Regional Reliability Standards may be developed through the NERC Reliability Standards development procedure, or alternatively, through a Regional Reliability Standards development procedure that has been approved by NERC.

4.1 **No Presumption of Validity** — Regional Reliability Standards that are not proposed to be applied on an Interconnection-wide basis are not presumed to be valid but may be demonstrated by the proponent to be valid.

4.2 **Notice and Comment Procedure for Non-Interconnection-wide Regional Reliability Standards** — NERC shall publicly notice and request comment on the proposed Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to comment on or resolve any objections identified in the comments and may choose to withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for adoption by NERC.

4.3 **NERC Adoption of Non-Interconnection-wide Regional Reliability Standards** — NERC shall evaluate and recommend whether a proposed non-Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for adoption as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, the recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to adopt the Regional Reliability Standard as a NERC Reliability Standard.

4.4 **Applicable Governmental Authority Approval** — A non-Interconnection-wide Regional Reliability Standard that has been adopted by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

4.5 **Enforcement of Non-Interconnection-wide Regional Reliability Standards** — A non-Interconnection-wide Regional Reliability Standard that has been adopted by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory

within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

5. **Appeals** — A Regional Entity shall have the right to appeal NERC's decision not to adopt a proposed Regional Reliability Standard or Variance to the Commission or other Applicable Governmental Authority.

313. Other Regional Criteria, Guides, Procedures, Agreements, Etc.

1. **Regional Criteria** — Regional Entities may develop Regional Criteria that are necessary to implement, to augment, or to comply with NERC Reliability Standards, but which are not Reliability Standards. Regional Criteria may also address issues not within the scope of Reliability Standards, such as resource adequacy. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents used to enhance the reliability of the Bulk Power System in the Region. These documents typically provide benefits by promoting more consistent implementation of the NERC Reliability Standards within the Region. These documents are not NERC Reliability Standards, Regional Reliability Standards, or regional Variances, and therefore are not enforceable under authority delegated by NERC pursuant to delegation agreements and do not require NERC approval.

2. **Catalog of Regional Criteria** — NERC shall maintain a current catalog of Regional Criteria. Regional Entities shall provide a catalog listing of Regional Criteria to NERC and shall notify NERC of changes to the listing. Regional Entities shall provide any listed document to NERC upon written request.

314. Conflicts with Statutes, Regulations, and Orders

Notice of Potential Conflict — If a Bulk Power System owner, operator, or user determines that a NERC or Regional Reliability Standard may conflict with a function, rule, order, tariff, rate schedule, legislative requirement or agreement that has been accepted, approved, or ordered by a governmental authority affecting that entity, the entity shall expeditiously notify the governmental authority, NERC, and the relevant Regional Entity of the conflict.

1. **Determination of Conflict —** NERC, upon request of the governmental authority, may advise the governmental authority regarding the conflict and propose a resolution of the conflict, including revision of the Reliability Standard if appropriate.

2. **Regulatory Precedence** — Unless otherwise ordered by a governmental authority, the affected Bulk Power System owner, operator, or user shall continue to follow the function, rule, order, tariff, rate schedule, legislative requirement, or agreement accepted, approved, or ordered by the governmental authority until the

governmental authority finds that a conflict exists and orders a remedy and such remedy is affected.

315. Revisions to NERC Standard Processes Manual

Any person or entity may submit a written request to modify NERC *Standard Processes Manual*. Consideration of the request and development of the revision shall follow the process defined in the NERC *Standard Processes Manual*. Upon approval by the Board, the revision shall be submitted to the Applicable Governmental Authorities for approval. Changes shall become effective only upon approval by the Applicable Governmental Authorities or on a date designated by the Applicable Governmental Authorities or as otherwise applicable in a particular jurisdiction.

316. Accreditation

NERC shall seek and maintain accreditation of the NERC Reliability Standards development process by the American National Standards Institute.

317. Five-Year Review of Reliability Standards

NERC shall complete a review of each NERC Reliability Standard at least once every five years, or such longer period as is permitted by the American National Standards Institute, from the effective date of the Reliability Standard or the latest revision to the Reliability Standard, whichever is later. The review process shall be conducted in accordance with the NERC *Standard Processes Manual*. The standards process manager shall be responsible for administration of the five-year review of Reliability Standards. As a result of this review, the NERC Reliability Standard shall be reaffirmed, revised, or withdrawn. If the review indicates a need to revise or withdraw the Reliability Standard, a request for revision or withdrawal shall be prepared, submitted and addressed in accordance with the NERC *Standard Processes Manual*.

318. Coordination with the North American Energy Standards Board

NERC shall maintain a close working relationship with the North American Energy Standards Board and ISO/RTO Council to ensure effective coordination of wholesale electric business practice standards and market protocols with the NERC Reliability Standards.

319. Archived Standards Information

NERC shall maintain a historical record of Reliability Standards information that is no longer maintained on-line. For example, Reliability Standards that have been retired may be removed from the on-line system. Archived information shall be retained indefinitely

as practical, but in no case less than six years or one complete Reliability Standards review cycle from the date on which the Reliability Standard was no longer in effect. Archived records of Reliability Standards information shall be available electronically within 30 days following the receipt by the NERC standards information manager of a written request.

320. Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels

1. **Development of Violation Risk Factors and Violation Severity Levels** — NERC shall follow the process for developing Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) as set forth in the *Standard Processes Manual*, **Appendix 3A** to these Rules of Procedure.

2. **Remands of Directed Revision of VRFs and VSLs by Applicable Governmental Authorities** — If an Applicable Governmental Authority remands or directs a revision to a Board-approved VRF or VSL assignment, the NERC director of standards, after consulting with the standard drafting team, Standards Committee, and the NERC director of compliance operations, will recommend to the Board one of the following actions: (1) filing a request for clarification; (2) filing for rehearing or for review of the Applicable Governmental Authority decision; or (3) approval of the directed revisions to the VRF or VSL. If and to the extent time is available prior to the deadline for the Board's decision, an opportunity for interested parties to comment on the action taken will be provided.

3. **Alternative Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels** — In the event the Reliability Standards development process fails to produce Violation Risk Factors or Violation Severity Levels for a particular Reliability Standard in a timely manner, the Board of Trustees may approve Violation Risk Factors or Violation Severity Levels for that Reliability Standard after notice and opportunity for comment. In approving VRFs and VSLs, the Board shall consider the inputs of the Member Representatives Committee, affected stakeholders and NERC staff.

321. Special Rule to Address Certain Regulatory Directives

In circumstances where this Rule 321 applies, the Board of Trustees shall have the authority to take one or more of the actions set out below. The Board of Trustees shall have the authority to choose which one or more of the actions are appropriate to the circumstances and need not take these actions in sequential steps.

1. The Standards Committee shall have the responsibility to ensure that standards drafting teams address specific matters that are identified in directives issued by Applicable Governmental Authorities. If the Board of Trustees is presented with a proposed Reliability Standard that fails to address such directives, the Board of Trustees has the authority to remand, with instructions (including establishing a

timetable for action), the proposed Reliability Standard to the Standards Committee.

2. Upon a written finding by the Board of Trustees that a ballot pool has failed to approve a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to remand the proposed Reliability Standard to the Standards Committee, with instructions to (i) convene a public technical conference to discuss the issues surrounding the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with NERC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the proposed Reliability Standard one additional time, with such adjustments in the schedule as are necessary to meet the deadline contained in paragraph 2.1 of this Rule.

   2.1 Such a re-ballot shall be completed within forty-five (45) days of the remand. The Standards Committee memorandum shall be included in the materials made available to the ballot pool in connection with the re-ballot.

   2.2 In any such re-ballot, negative votes without comments related to the proposal shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the proposal shall be counted for purposes of determining the number of votes cast and whether the proposed Reliability Standard has been approved.

3. If the re-balloted proposed Reliability Standard achieves at least an affirmative two-thirds majority vote of the weighted Segment votes cast, with a quorum established, then the proposed Reliability Standard shall be deemed approved by the ballot pool and shall be considered by the Board of Trustees for approval.

4. If the re-balloted proposed Reliability Standard fails to achieve at least an affirmative two-thirds majority vote of the weighted Segment votes cast, but does achieve at least a sixty percent affirmative majority of the weighted Segment votes cast, with a quorum established, then the Board of Trustees has the authority to consider the proposed Reliability Standard for approval under the following procedures:

   4.1 The Board of Trustees shall issue notice of its intent to consider the proposed Reliability Standard and shall solicit written public comment particularly focused on the technical aspects of the provisions of the proposed Reliability Standard that address the specific matter identified in the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in

the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified.

4.2 The Board of Trustees may, in its discretion, convene a public technical conference to receive additional input on the matter.

4.3 After considering the developmental record, the comments received during balloting and the additional input received under paragraphs 4.1 and 4.2 of this Rule, the Board of Trustees has authority to act on the proposed Reliability Standard.

4.3.1 If the Board of Trustees finds that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to approve the proposed Reliability Standard and direct that it be filed with Applicable Governmental Authorities with a request that it be made effective.

4.3.2 If the Board of Trustees is unable to find that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to treat the proposed Reliability Standard as a draft Reliability Standard and direct that the draft Reliability Standard and complete developmental record, including the additional input received under paragraphs 4.1 and 4.2 of this Rule, be filed with the Applicable Governmental Authorities as a compliance filing in response to the order giving rise to the regulatory directive, along with a recommendation that the Reliability Standard not be made effective and an explanation of the basis for the recommendation.

5. Upon a written finding by the Board of Trustees that standard drafting team has failed to develop, or a ballot pool has failed to approve, a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to direct the Standards Committee (with the assistance of stakeholders and NERC staff) to prepare a draft Reliability Standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the Standards Committee fails to prepare such draft Reliability Standard, the Board of Trustees may direct NERC management to prepare such draft Reliability Standard.

5.1 The Board of Trustees may, in its discretion, convene a public technical conference to receive input on the matter. The draft Reliability Standard shall be posted for a 45-day public comment period.

5.2 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees finds that the draft Reliability Standard, with such modifications as the Board of Trustees determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to approve the draft Reliability Standard and direct that the proposed Reliability Standard be filed with Applicable Governmental Authorities with a request that the proposed Reliability Standard be made effective.

5.3 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees is unable to find that the draft Reliability Standard, even with modifications, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to direct that the draft Reliability Standard and complete developmental record be filed as a compliance filing in response to the regulatory directive with the Applicable Governmental Authority issuing the regulatory directive, with a recommendation that the draft Reliability Standard not be made effective.

5.4 The filing of the Reliability Standard under either paragraph 5.2 or paragraph 5.3 of this Rule shall include an explanation of the basis for the decision by the Board of Trustees.

5.5 A Reliability Standard approved under paragraph 5 of this Rule shall not be eligible for submission as an American National Standard.

6. NERC shall on or before March 31st of each year file a report with Applicable Governmental Authorities on the status and timetable for addressing each outstanding directive to address a specific matter received from an Applicable Governmental Authority.

SECTION 400 — COMPLIANCE ENFORCEMENT

401. Scope of the NERC Compliance Monitoring and Enforcement Program

1. **Components of the NERC Compliance Monitoring and Enforcement Program** — NERC shall develop and implement a NERC Compliance Monitoring and Enforcement Program to promote the reliability of the Bulk Power System by enforcing compliance with approved Reliability Standards in those regions of North American in which NERC and/or a Regional Entity (pursuant to a delegation agreement with NERC that has been approved by the Applicable Governmental Authority) has been given enforcement authority. There are four distinct parts of the NERC Compliance Monitoring and Enforcement Program: (1) NERC's oversight of the Regional Entity Compliance Monitoring and Enforcement Programs (Section 402), (2) the definition of the required Regional Entity Compliance Monitoring and Enforcement Program attributes (Section 403), (3) NERC's monitoring of Regional Entity compliance with Reliability Standards (Section 404), and (4) the monitoring of compliance with Reliability Standards that are applicable to NERC (Sections 405–406).

2. **Who Must Comply** — Where required by applicable legislation, regulation, rule or agreement, all Bulk Power System owners, operators, and users, Regional Entities, and NERC, are required to comply with all approved NERC Reliability Standards at all times. Regional Reliability Standards and Variances approved by NERC and the Applicable Governmental Authority shall be considered NERC Reliability Standards and shall apply to all Bulk Power System owners, operators, or users responsible for meeting those Reliability Standards within the Regional Entity boundaries, whether or not the Bulk Power System owner, operator, or user is a member of the Regional Entity.

3. **Data Access** — All Bulk Power System owners, operators, and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards. NERC and the applicable Regional Entity will define the data retention and reporting requirements in the Reliability Standards and compliance reporting procedures.

4. **Role of Regional Entities in the Compliance Monitoring and Enforcement Program** — Each Regional Entity that has been delegated authority through a delegation agreement or other legal instrument approved by the Applicable Governmental Authority shall, in accordance with the terms of the approved delegation agreement, administer a Regional Entity Compliance Monitoring and Enforcement program to meet the NERC Compliance Monitoring and Enforcement Program goals and the requirements in this Section 400.

5. **Program Continuity** — NERC will ensure continuity of compliance monitoring and enforcement within the geographic boundaries of a Regional Entity in the event that NERC does not have a delegation agreement, or the Regional Entity withdraws from the agreement or does not operate its Compliance Monitoring and Enforcement Program in accordance with the delegation agreement or other applicable requirements.

5.1 Should NERC not have a delegation agreement with a Regional Entity covering a geographic area, or a Regional Entity withdraws from an existing delegation agreement or the delegation agreement is otherwise terminated, NERC will directly administer the Compliance Monitoring and Enforcement Program applicable to owners, operators and users of the Bulk Power System within that geographic area.

1. This monitoring and enforcement will be accomplished by NERC and Compliance Staff from another approved Regional Entity.

2. If an existing delegation agreement with a Regional Entity is terminating, the Regional Entity shall promptly provide to NERC all relevant compliance information regarding Registered Entities, contacts, prior compliance information and actions, Mitigation Plans, and Remedial Action Directives for the period in which the Regional Entity was responsible for administering the Compliance Monitoring and Enforcement Program.

3. NERC will levy and collect all Penalties directly and will utilize any Penalty monies collected to offset the expenses of administering the Compliance Monitoring and Enforcement Program for the geographic area.

5.2 Should a Regional Entity seek to withdraw from its delegation agreement, NERC will seek agreement from another Regional Entity to amend its delegation agreement with NERC to extend that Regional Entity's boundaries for compliance monitoring and enforcement. In the event no Regional Entity is willing to accept this responsibility, NERC will administer the Compliance Monitoring and Enforcement Program within the geographical boundaries of the Regional Entity seeking to withdraw from the delegation agreement, in accordance with Section 401.5.1.

6. ~~**Actively Monitored Requirements**~~**Risk Elements** — NERC, with input from the Regional entities, stakeholders, and regulators, shall at least annually ~~select a subset of the~~identify risk elements to prioritize risks to the reliability of the Bulk Power System. These risk elements and related NERC Reliability Standards and Requirements are to be ~~actively monitored and audited~~considered for compliance oversight in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan. NERC identifies the risk elements using data including, but not limited to: compliance findings; event analysis experience; data analysis; and the expert judgment of NERC and Regional Entity staff, committees, and subcommittees. NERC uses these risk elements to identify and prioritize interconnection and continent-wide risks to the reliability of the Bulk Power System. These identified risks, as well as risks to the reliability of the Bulk Power System identified by Regional Entities for their footprint, represent the focus for monitoring activities in the upcoming year, and become inputs for developing oversight plans for individual Registered Entities. Compliance is required, and NERC and the Regional Entities have authority to monitor compliance, with all applicable NERC Reliability Standards whether or not they

are ~~included in the subset of Reliability Standards and Requirements designated~~identified as areas of focus to be ~~actively monitored and~~considered for compliance oversight ~~audited~~ in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan or are included in a Regional Entity's oversight plan for the Registered Entity.

7. **Penalties, Sanctions, and Remedial Action Directives** — NERC and Regional Entities will apply Penalties, sanctions, and Remedial Action Directives that bear a reasonable relation to the seriousness of a violation and take into consideration timely remedial efforts as defined in the NERC *Sanction Guidelines*, which is incorporated into these rules as **Appendix 4B**.

8. **Multiple Enforcement Actions** – A Registered Entity shall not be subject to an enforcement action by NERC and a Regional Entity, or by more than one Regional Entity (unless the Registered Entity is registered in more than one Region in which the violation occurred), for the same violation.

9. **Records** — NERC shall maintain a record of each compliance submission, including Self-Reported, Possible, Alleged, and Confirmed Violations of approved Reliability Standards; associated Penalties, sanctions, Remedial Action Directives and settlements; and the status of mitigation actions.

10. **Confidential Information** — NERC will treat all Possible and Alleged Violations of Reliability Standards and matters related to a Compliance Monitoring and Enforcement Program process, including the status of any Compliance Investigation or other Compliance Monitoring and Enforcement Program process, as confidential in accordance with Section 1500.

    The types of information that will be considered confidential and will not (subject to statutory and regulatory requirements) be disclosed in any public information reported by NERC are identified in Section 1500. Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident, will be identified and protected from public disclosure as Critical Energy Infrastructure Information in accordance with Section 1500.

    The Regional Entity and NERC shall give Bulk Power System owners, operators, and users a reasonable opportunity to demonstrate that information concerning a violation is confidential before such report is disclosed to the public.

11. **Public Posting** — When the affected Bulk Power System owner, operator, or user either agrees with a Possible or Alleged Violation(s) of a Reliability Standard(s) or a report of a Compliance Audit or Compliance Investigation, or enters into a settlement agreement concerning a Possible or Alleged Violation(s), or the time for submitting an appeal is passed, or all appeals processes are complete, NERC shall, subject to the confidentiality requirements of these Rules of Procedure, publicly post each Confirmed Violation, Penalty or sanction, settlement agreement, and final Compliance Audit or Compliance Investigation report, on its website.

11.1 Each Bulk Power System owner, operator, or user may provide NERC with a statement to accompany the Confirmed Violation or report to be posted publicly. The statement must be on company letterhead and include a signature, as well as the name and title of the person submitting the information.

11.2 In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information (*NERC Security Guidelines for the Electricity Sector — Protecting Potentially Sensitive Information* may be used as a guide) or other Confidential Information shall be redacted in accordance with Section 1500 and not be released publicly.

11.3 Subject to redaction of Critical Energy Infrastructure Information or other Confidential Information, for each Confirmed Violation or settlement relating to a Possible Violation or an Alleged Violation, the public posting shall include the name of any relevant entity, the nature, time period, and circumstances of such Possible, Alleged or Confirmed Violation, any Mitigation Plan or other Mitigating Activities to be implemented by the Registered Entity in connection with the Confirmed Violation or settlement, and sufficient facts to assist owners, operators and users of the Bulk Power System to evaluate whether they have engaged in or are engaging in similar activities.

12. **Violation Information Review** — NERC Compliance Staff shall periodically review and analyze all reports of Possible, Alleged and Confirmed Violations to identify trends and other pertinent reliability issues.

402. NERC Oversight of the Regional Entity Compliance Monitoring and Enforcement Programs

1. **NERC Monitoring Program** — NERC shall have a program to monitor the Compliance Monitoring and Enforcement Program of each Regional Entity that has been delegated authority. The objective of this monitoring program shall be to ensure that the Regional Entity carries out its Compliance Monitoring and Enforcement Program in accordance with these Rules of Procedure and the terms of the delegation agreement, and to ensure consistency and fairness of the Regional Entity's Compliance Monitoring and Enforcement Program. Oversight and monitoring by NERC shall be accomplished through an annual Compliance Monitoring and Enforcement Program review, program audits, and regular evaluations of Regional Entity Compliance Monitoring and Enforcement Program performance as described below.

1.1 **NERC Review of Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans** — NERC shall require each Regional Entity to submit for review and approval an annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan. NERC shall review each annual Regional Entity

Compliance Monitoring and Enforcement Program Implementation Plan and shall accept the plan if it meets NERC requirements and the requirements of the delegation agreement.

1.2 **Regional Entity Compliance Monitoring and Enforcement Program Evaluation** — NERC shall annually evaluate the goals, tools, and procedures of each Regional Entity Compliance Monitoring and Enforcement Program to determine the effectiveness of each Regional Entity Compliance Monitoring and Enforcement Program, using criteria developed by the NERC Compliance and Certification Committee.

1.3 **Regional Entity Compliance Monitoring and Enforcement Program Audit** — At least once every five years, NERC shall conduct an audit to evaluate how each Regional Entity Compliance Monitoring and Enforcement Program implements the NERC Compliance Monitoring and Enforcement Program. The evaluation shall be based on these Rules of Procedure, including Appendix 4C, the delegation agreement, directives in effect pursuant to the delegation agreement, approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans, required Compliance Monitoring and Enforcement Program attributes, and the NERC Compliance Monitoring and Enforcement Program procedures. These evaluations shall be provided to the Applicable Governmental Authorities to demonstrate the effectiveness of each Regional Entity. In addition, audits of Cross-Border Regional Entities shall cover applicable requirements imposed on the Regional Entity by statute, regulation, or order of, or agreement with, provincial governmental and/or regulatory authorities for which NERC has auditing responsibilities over the Regional Entity's compliance with such requirements within Canada or Mexico. Participation of a representative of an Applicable Governmental Authority shall be subject to the limitations of sections 3.1.6 and 8.0 of Appendix 4C of these Rules of Procedure regarding disclosures of non-public compliance information related to other jurisdictions. NERC shall maintain an audit procedure containing the requirements, steps, and timelines to conduct an audit of each Regional Entity Compliance Monitoring and Enforcement Program. The current procedure is contained in the NERC Audit of Regional Entity Compliance Programs, which is incorporated into these rules as **Appendix 4A**.

1.3.1. NERC shall establish a program to audit bulk power system owners, operators, and users operating within a regional entity to verify the findings of previous compliance audits conducted by the regional entity to evaluate how well the regional entity compliance enforcement program is meeting its delegated authority and responsibility.

1.4 Applicable Governmental Authorities will be allowed to participate as an observer in any audit conducted by NERC of a Regional Entity's

Compliance Monitoring and Enforcement Program. A representative of the Regional Entity being audited will be allowed to participate in the audit as an observer.

2. **Consistency Among Regional Compliance Monitoring and Enforcement Programs** — To provide for a consistent Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users required to comply with approved Reliability Standards, NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program, which is incorporated into these rules of procedure as **Appendix 4C**. Any differences in Regional Entity Compliance Monitoring and Enforcement Program methods, including determination of violations and Penalty assessment, shall be justified on a case-by-case basis and fully documented in each Regional Entity delegation agreement.

   2.1 NERC shall ensure that each of the Regional Entity Compliance Monitoring and Enforcement Programs meets these Rules of Procedure, including **Appendix 4C**, and follows the terms of the delegation agreement and the approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan.

   2.2 NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program in **Appendix 4C** containing the procedures to ensure the consistency and fairness of the processes used to determine Regional Entity Compliance Monitoring and Enforcement Program findings of compliance and noncompliance, and the application of Penalties and sanctions.

   2.3 NERC shall periodically conduct Regional Entity compliance manager forums. These forums shall use the results of Regional Entity Compliance Monitoring and Enforcement Program audits and findings of NERC Compliance Staff to identify and refine Regional Entity Compliance Monitoring and Enforcement Program differences into a set of best practices over time.

3. **Information Collection and Reporting** — NERC and the Regional Entities shall implement data management procedures that address data reporting requirements, data integrity, data retention, data security, and data confidentiality.

4. **Violation Disclosure** — NERC shall disclose all Confirmed Violations and maintain as confidential Possible Violations and Alleged Violations, according to the reporting and disclosure process in **Appendix 4C**.

5. **Authority to Determine Noncompliance, Levy Penalties and Sanctions, and Issue Remedial Action Directives** — NERC and Regional Entity Compliance Staff shall have the authority and responsibility to make initial determinations of compliance or noncompliance, and where authorized by the Applicable Governmental Authorities or where otherwise authorized, to determine Penalties

and sanctions for noncompliance with a Reliability Standard, and issue Remedial Action Directives. Regional Entity boards or a compliance panel reporting directly to the Regional Entity board will be vested with the authority for the overall Regional Entity Compliance Monitoring and Enforcement Program and have the authority to impose Penalties and sanctions on behalf of NERC, where authorized by applicable legislation or agreement. Remedial Action Directives may be issued by NERC or a Regional Entity that is aware of a Bulk Power System owner, operator, or user that is, or is about to engage in an act or practice that would result, in noncompliance with a Reliability Standard, where such Remedial Action Directive is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat. If, after receiving such a Remedial Action Directive, the Bulk Power System owner, operator, or user does not take appropriate action to avert a violation of a Reliability Standard, NERC may petition the Applicable Governmental Authority to issue a compliance order.

6. **Due Process** — NERC shall establish and maintain a fair, independent, and nondiscriminatory appeals process. The appeals process is set forth in Sections 408-410. The process shall allow Bulk Power System owners, operators, and users to appeal the Regional Entity's findings of noncompliance and to appeal Penalties, sanctions, and Remedial Action Directives that are levied by the Regional Entity. Appeals beyond the NERC process will be heard by the Applicable Governmental Authority.

   The appeals process will also allow for appeals to NERC of any findings of noncompliance issued by NERC to a Regional Entity for Reliability Standards and Requirements where the Regional Entity is monitored for compliance to a Reliability Standard. No monetary Penalties will be levied in these matters; however sanctions, remedial actions, and directives to comply may be applied by NERC.

7. **Conflict Disclosure** — NERC shall disclose to the appropriate governmental authorities any potential conflicts between a market rule and the enforcement of a Regional Reliability Standard.

8. **Confidentiality** — To maintain the integrity of the NERC Compliance Monitoring and Enforcement Program, NERC and Regional Entity staff, Compliance Audit team members, and committee members shall maintain the confidentiality of information obtained and shared during compliance monitoring and enforcement processes including Compliance Investigations, Compliance Audits, Spot Checks, drafting of reports, appeals, and closed meetings.

   8.1 NERC and the Regional Entity shall have in place appropriate codes of conduct and confidentiality agreements for staff and other Compliance Monitoring and Enforcement Program participants.

8.2 Individuals not bound by NERC or Regional Entity codes of conduct who serve on compliance-related committees or Compliance Audit teams shall sign a NERC confidentiality agreement prior to participating on the committee or Compliance Audit team.

8.3 Information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall not be distributed outside of a committee or team, nor released publicly. Other information subject to confidentiality is identified in Section 1500.

8.4 In the event that a staff, committee, or Compliance Audit team member violates any of the confidentiality rules set forth above, the staff, committee, or Compliance Audit team member and any member organization with which the individual is associated may be subject to appropriate action by the Regional Entity or NERC, including prohibiting participation in future Compliance Monitoring and Enforcement Program activities.

9. **Auditor Training** — NERC shall develop and provide training in auditing skills to all people who participate in NERC and Regional Entity Compliance Audits. Training for NERC and Regional Entity personnel and others who serve as Compliance Audit team leaders shall be more comprehensive than training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

403. Required Attributes of Regional Entity Compliance Monitoring and Enforcement Programs

Each Regional Entity Compliance Monitoring and Enforcement Program shall promote excellence in the enforcement of Reliability Standards. To accomplish this goal, each Regional Entity Compliance Monitoring and Enforcement Program shall (i) conform to and comply with the NERC uniform Compliance Monitoring and Enforcement Program, **Appendix 4C** to these Rules of Procedure, except to the extent of any deviations that are stated in the Regional Entity's delegation agreement, and (ii) meet all of the attributes set forth in this Section 403.

Program Structure

1. **Independence** — Each Regional Entity's governance of its Compliance Monitoring and Enforcement Program shall exhibit independence, meaning the Compliance Monitoring and Enforcement Program shall be organized so that its compliance monitoring and enforcement activities are carried out separately from other activities of the Regional Entity. The Compliance Monitoring and Enforcement Program shall not be unduly influenced by the Bulk Power System owners, operators, and users being monitored or other Regional Entity activities that are required to meet the Reliability Standards. Regional Entities must include rules providing that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

2. **Exercising Authority** — Each Regional Entity Compliance Monitoring and Enforcement Program shall exercise the responsibility and authority in carrying out the delegated functions of the NERC Compliance Monitoring and Enforcement Program in accordance with delegation agreements and **Appendix 4C**. These functions include but are not limited to: data gathering, data reporting, Compliance Investigations, Compliance Audit activities, evaluating compliance and noncompliance, imposing Penalties and sanctions, and approving and tracking mitigation actions.

3. **Delegation of Authority** — To maintain independence, fairness, and consistency in the NERC Compliance Monitoring and Enforcement Program, a Regional Entity shall not sub-delegate its Compliance Monitoring and Enforcement Program duties to entities or persons other than the Regional Entity Compliance Staff, unless (i) required by statute or regulation in the applicable jurisdiction, or (ii) by agreement with express approval of NERC and of FERC or other Applicable Governmental Authority, to another Regional Entity.

4. **Hearings of Contested Findings or Sanctions —** The Regional Entity board or compliance panel reporting directly to the Regional Entity board (with appropriate recusal procedures) will be vested with the authority for conducting compliance hearings in which any Bulk Power System owner, operator, or user provided a Notice of Alleged Violation may present facts and other information to contest a Notice of Alleged Violation or any proposed Penalty, sanction, any Remedial Action Directive, or any Mitigation Plan component. Compliance hearings shall be conducted in accordance with the Hearing Procedures set forth in Attachment 2 to **Appendix 4C**. If a stakeholder body serves as the Hearing Body, no two industry sectors may control any decision and no single segment may veto any matter related to compliance after recusals.

Program Resources

5. **Regional Entity Compliance Staff** — Each Regional Entity shall have sufficient resources to meet delegated compliance monitoring and enforcement responsibilities, including the necessary professional staff to manage and implement the Regional Entity Compliance Monitoring and Enforcement Program.

6. **Regional Entity Compliance Staff Independence** — The Regional Entity Compliance Staff shall be capable of and required to make all determinations of compliance and noncompliance and determine Penalties, sanctions, and Remedial Action Directives and to review and accept Mitigation Plans and other Mitigating Activities.

    6.1 Regional Entity Compliance Staff shall not have a conflict of interest, real or perceived, in the outcome of compliance monitoring and enforcement processes, reports, or sanctions. The Regional Entity shall have in effect a conflict of interest policy.

    6.2 Regional Entity Compliance Staff shall have the authority and responsibility to carry out compliance monitoring and enforcement

processes (with the input of industry subject matter experts), make determinations of compliance or noncompliance, and levy Penalties and sanctions without interference or undue influence from Regional Entity members and their representative or other industry entities.

6.3 Regional Entity Compliance Staff may call upon independent technical subject matter experts who have no conflict of interest in the outcome of the compliance monitoring and enforcement process to provide technical advice or recommendations in the determination of compliance or noncompliance.

6.4 Regional Entity Compliance Staff shall abide by the confidentiality requirements contained in Section 1500 and **Appendix 4C** of these Rules of Procedure, the NERC delegation agreement and other confidentiality agreements required by the NERC Compliance Monitoring and Enforcement Program.

6.5 Contracting with independent consultants or others working for the Regional Entity Compliance Monitoring and Enforcement Program shall be permitted provided the individual has not received compensation from a Bulk Power System owner, operator, or user being monitored for a period of at least the preceding six months and owns no financial interest in any Bulk Power System owner, operator, or user being monitored for compliance to the Reliability Standard, regardless of where the Bulk Power System owner, operator, or user operates. Any such individuals for the purpose of these Rules of Procedure shall be considered as augmenting Regional Entity Compliance Staff.

7. Use of Industry Subject Matter Experts and Regional Entity Members — Industry experts and Regional Entity members may be called upon to provide their technical expertise in Compliance Monitoring and Enforcement Program activities.

7.1 The Regional Entity shall have procedures defining the allowable involvement of industry subject matter experts and Regional Entity members. The procedures shall address applicable antitrust laws and conflicts of interest.

7.2 Industry subject matter experts and Regional Entity members shall have no conflict of interest or financial interests in the outcome of their activities.

7.3 Regional Entity members and industry subject matter experts, as part of teams or Regional Entity committees, may provide input to the Regional Entity Compliance Staff so long as the authority and responsibility for (i) evaluating and determining compliance or noncompliance and (ii) levying Penalties, sanctions, or Remedial Action Directives shall not be delegated to any person or entity other than the Compliance Staff of the Regional Entity. Industry subject matter experts, Regional Entity members, or

Regional Entity committees shall not make determinations of noncompliance or levy Penalties, sanctions, or Remedial Action Directives. Any committee involved shall be organized so that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

7.4 Industry subject matter experts and Regional Entity members shall sign a confidentiality agreement appropriate for the activity being performed.

7.5 All industry subject matter experts and Regional Entity members participating in Compliance Audits and Compliance Investigations shall successfully complete auditor training provided by NERC or the Regional Entity prior to performing these activities

Program Design

8. **Regional Entity Compliance Monitoring and Enforcement Program Content** — All approved Reliability Standards shall be included in the Regional Entity Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users within the defined boundaries of the Regional Entity. Compliance to approved Regional Reliability Standards is applicable only within the Region of the Regional Entity that submitted those particular Regional Reliability Standards for approval. NERC will identify the risk elements and related ~~minimum set of~~ Reliability Standards and Requirements to be ~~actively monitored~~considered by the Regional Entity in a given year in developing oversight plans for individual Registered Entities.

9. **Antitrust Provisions** — Each Regional Entity's Compliance Monitoring and Enforcement Program shall be structured and administered to abide by U.S. antitrust law and Canadian competition law.

10. **Information Submittal** — All Bulk Power System owners, operators, and users within the Regional Entity responsible for complying with Reliability Standards shall submit timely and accurate information when requested by the Regional Entity or NERC. NERC and the Regional Entities shall preserve any mark of confidentiality on information submitted pursuant to Section 1502.1.

10.1 Each Regional Entity has the authority to collect the necessary information to determine compliance and shall develop processes for gathering data from the Bulk Power System owners, operators, and users the Regional Entity monitors.

10.2 The Regional Entity or NERC has the authority to request information from Bulk Power System owners, operators, and users pursuant to Section 401.3 or this Section 403.10 without invoking a specific compliance monitoring and enforcement process in **Appendix 4C**, for purposes of determining whether to pursue one such process in a particular case and/or validating in the enforcement phase of a matter the conclusions reached through the compliance monitoring and enforcement process(es).

10.3 When required or requested, the Regional Entities shall report information to NERC promptly and in accordance with **Appendix 4C** and other NERC procedures.

10.4 Regional Entities shall notify NERC of all Possible, Alleged and Confirmed Violations of NERC Reliability Standards by Registered Entities over which the Regional Entity has compliance monitoring and enforcement authority, in accordance with **Appendix 4C**.

10.5 A Bulk Power System owner, operator, or user found in noncompliance with a Reliability Standard shall submit a Mitigation Plan with a timeline addressing how the noncompliance will be corrected, unless an enforcement process is used that does not require a Mitigation Plan. The Regional Entity Compliance Staff shall review and accept the Mitigation Plan in accordance with **Appendix 4C**.

10.6 An officer of a Bulk Power System owner, operator, or user shall certify as accurate all compliance data Self-Reported to the Regional Entity Compliance Monitoring and Enforcement Program.

10.7 Regional Entities shall develop and implement procedures to verify the compliance information submitted by Bulk Power System owners, operators, and users.

11. **Compliance Audits of Bulk Power System Owners, Operators, and Users** — Each Regional Entity will maintain and implement a program of proactive Compliance Audits of Bulk Power System owners, operators, and users responsible for complying with Reliability Standards, in accordance with **Appendix 4C**. A Compliance Audit is a process in which a detailed review of the activities of a Bulk Power System owner, operator, or user is performed to determine if that Bulk Power System owner, operator, or user is complying with approved Reliability Standards.

11.1 For an entity registered as a Balancing Authority, Reliability Coordinator, or Transmission Operator, the Compliance Audit will be performed at least once every three years. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, Compliance Audits shall be performed on a schedule established by NERC.

11.2 Compliance Audits of Balancing Authorities, Reliability Coordinators, and Transmission Operators will include a component at the audited entity's site. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, the Compliance Audit may be either an on-site Compliance Audit or based on review of documents, as determined to be necessary and appropriate by NERC or Regional Entity Compliance Staff.

11.3 Compliance Audits must include a detailed review of the activities of the Bulk Power System owner, operator, or user to determine if the Bulk Power System owner, operator, or user is complying with all approved Reliability Standards identified for audit by NERC. The Compliance Audit shall include a review of supporting documentation and evidence used by the Bulk Power System owner, operator or user to demonstrate compliance for an appropriate period prior to the Compliance Audit.

12. **Confidentiality of Compliance Monitoring and Enforcement Processes** — All compliance monitoring and enforcement processes, and information obtained from such processes, are to be non-public and treated as confidential in accordance with Section 1500 and **Appendix 4C** of these Rules of Procedure, unless NERC, the Regional Entity or FERC or another Applicable Governmental Authority with jurisdiction determines a need to conduct a Compliance Monitoring and Enforcement Program process on a public basis, provided, that NERC and the Regional Entities shall publish (i) schedules of Compliance Audits scheduled in each year, (ii) a public report of each Compliance Audit, and (iii) Notices of Penalty and settlement agreements. Advance authorization from the Applicable Governmental Authority is required to make public any compliance monitoring and enforcement process or any information relating to a compliance monitoring and enforcement process, or to permit interventions when determining whether to impose a Penalty. This prohibition on making public any compliance monitoring and enforcement process does not prohibit NERC or a Regional Entity from publicly disclosing (i) the initiation of or results from an analysis of a significant system event under Section 807 or of off-normal events or system performance under Section 808, or (ii) information of general applicability and usefulness to owners, operators, and users of the Bulk Power System concerning reliability and compliance matters, so long as specific allegations or conclusions regarding Possible or Alleged Violations of Reliability Standards are not included in such disclosures.

13. **Critical Energy Infrastructure Information** — Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident will be identified and protected from public disclosure as Critical Energy Infrastructure Information. In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall be redacted according to NERC procedures and shall not be released publicly.

14. **Penalties, Sanctions, and Remedial Action Directives** — Each Regional Entity will apply all Penalties, sanctions, and Remedial Action Directives in accordance with the approved *Sanction Guidelines*, **Appendix 4B** to these Rules of Procedure. Any changes to the *Sanction Guidelines* to be used by any Regional Entity must be approved by NERC and submitted to the Applicable Governmental Authority for approval. All Confirmed Violations, Penalties, and sanctions, including Confirmed Violations, Penalties and sanctions specified in a Regional Entity Hearing Body decision, will be provided to NERC for review and filing

with Applicable Governmental Authorities as a Notice of Penalty, in accordance with **Appendix 4C**.

15. **Regional Entity Hearing Process** — Each Regional Entity Compliance Monitoring and Enforcement Program shall establish and maintain a fair, independent, and nondiscriminatory process for hearing contested violations and any Penalties or sanctions levied, in conformance with Attachment 2 to **Appendix 4C** to these Rules of Procedure and any deviations therefrom that are set forth in the Regional Entity's delegation agreement. The hearing process shall allow Bulk Power System owners, operators, and users to contest findings of compliance violations, any Penalties and sanctions that are proposed to be levied, proposed Remedial Action Directives, and components of proposed Mitigation Plans. The Regional Entity hearing process shall be conducted before the Regional Entity board or a balanced committee established by and reporting to the Regional Entity board as the final adjudicator at the Regional Entity level, provided, that Canadian provincial regulators may act as the final adjudicator in their respective jurisdictions. The Regional Entity hearing process shall (i) include provisions for recusal of any members of the Hearing Body with a potential conflict of interest, real or perceived, from all compliance matters considered by the Hearing Body for which the potential conflict of interest exists and (ii) provide that no two industry sectors may control any decision and no single segment may veto any matter brought before the Hearing Body after recusals.

    Each Regional Entity will notify NERC of all hearings and NERC may observe any of the proceedings. Each Regional Entity will notify NERC of the outcome of all hearings.

    If a Bulk Power System owner, operator, or user or a Regional Entity has completed the Regional Entity hearing process and desires to appeal the outcome of the hearing, the Bulk Power System owner, operator, or user or the Regional Entity shall appeal to NERC in accordance with Section 409 of these Rules of Procedure, except that a determination of violation or Penalty that has been directly adjudicated by an Applicable Governmental Authority shall be appealed with that Applicable Governmental Authority.

16. **Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan** — Each Regional Entity shall annually develop and submit to NERC for approval a Regional Entity Compliance Monitoring and Enforcement Implementation Plan in accordance with **Appendix 4C** that, includes details on r~~R~~egional r~~R~~isk a~~A~~ssessment processes and results, Reliability Standards and Requirements associated with r~~R~~egional ~~R~~risk a~~A~~ssessment results, the methods to be used by the Regional Entity for reporting, monitoring, evaluati~~on~~ng, and assess~~ment of~~ ing performance criteria~~,~~ and the Regional Entity's Annual Audit Plan.~~identifies the Reliability Standards and Requirements to be actively monitored (both those required by NERC and any additional Reliability Standards the Regional Entity proposes to monitor), and how each NERC and Regional Entity identified Reliability Standard will be monitored,~~

~~evaluated, reported, sanctioned, and appealed.~~ These Regional Implementation Plans will be submitted to NERC on the schedule established by NERC, generally on or about October 1 of the preceding year. In conjunction with the annual Regional Implementation Plan, each Regional Entity must report to NERC regarding how it carried out its delegated compliance monitoring and enforcement authority in the previous year, the effectiveness of the Compliance Monitoring and Enforcement Program, and changes expected to correct any deficiencies identified. Each Regional Entity will provide its annual report on the schedule established by NERC, generally on or about February 15 of the following year.

404. NERC Monitoring of Compliance for Regional Entities or Bulk Power Owners, Operator, or Users

NERC shall monitor Regional Entity compliance with NERC Reliability Standards and, if no there is no delegation agreement in effect with a Regional Entity for the geographic area, shall monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards. Industry subject matter experts may be used as appropriate in Compliance Investigations, Compliance Audits, and other Compliance Monitoring and Enforcement Program activities, subject to confidentiality, antitrust, and conflict of interest provisions.

1. **NERC Obligations** — NERC Compliance Staff shall monitor the compliance of the Regional Entity with the Reliability Standards for which the Regional Entities are responsible, in accordance with **Appendix 4C**. NERC shall actively monitor in its annual Compliance Enforcement and Monitoring Program selected Reliability Standards that apply to the Regional Entities. NERC shall evaluate compliance and noncompliance with all of the Reliability Standards that apply to the Regional Entities and shall impose sanctions, Penalties, or Remedial Action Directives when there is a finding of noncompliance. NERC shall post all violations of Reliability Standards that apply to the Regional Entities as described in the reporting and disclosure process in **Appendix 4C**.

   In addition, NERC will directly monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards in any geographic area for which there is not a delegation agreement in effect with a Regional Entity, in accordance with **Appendix 4C**. In such cases, NERC will serve as the Compliance Enforcement Authority described in **Appendix 4C**. Compliance matters contested by Bulk Power System owners, operators, and users in such an event will be heard by the NERC Compliance and Certification Committee.

2. **Compliance Audit of the Regional Entity** — NERC shall perform a Compliance Audit of each Regional Entity responsible for complying with Reliability Standards at least once every three years. NERC shall make an evaluation of compliance based on the information obtained through the Compliance Audit. After due process is complete, the final Compliance Audit report shall be made public in accordance with the reporting and disclosure process in **Appendix 4C**.

3. **Appeals Process** —Any Regional Entity or Bulk Power System owner, operator or user found by NERC, as opposed to a Regional Entity, to be in noncompliance

with a Reliability Standard may appeal the findings of noncompliance with Reliability Standards and any sanctions or Remedial Action Directives that are issued by, or Mitigation Plan components imposed by, NERC, pursuant to the processes described in Sections 408 through 410.

405. Monitoring of Reliability Standards and Other Requirements Applicable to NERC

The NERC Compliance and Certification Committee shall establish and implement a process to monitor NERC's compliance with the Reliability Standards that apply to NERC. The process shall use independent monitors with no conflict of interest, real or perceived, in the outcomes of the process. All violations shall be made public according to the reporting and disclosure process in **Appendix 4C**. The Compliance and Certification Committee will also establish a procedure for monitoring NERC's compliance with its Rules of Procedure for the Standards Development, Compliance Monitoring and Enforcement, and Organization Registration and Certification Programs. Such procedures shall not be used to circumvent the appeals processes established for those programs.

406. Independent Audits of the NERC Compliance Monitoring and Enforcement Program

NERC shall provide for an independent audit of its Compliance Monitoring and Enforcement Program at least once every three years, or more frequently as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board. The independent audit shall meet the following minimum requirements and any other requirements established by the NERC Board.

1. **Effectiveness** — The audit shall evaluate the success and effectiveness of the NERC Compliance Monitoring and Enforcement Program in achieving its mission.

2. **Relationship** — The audit shall evaluate the relationship between NERC and the Regional Entity Compliance Monitoring and Enforcement Programs and the effectiveness of the programs in ensuring reliability.

3. **Final Report Posting** — The final report shall be posted by NERC for public viewing in accordance with **Appendix 4C**.

4. **Response to Recommendations** — If the audit report includes recommendations to improve the NERC Compliance Monitoring and Enforcement Program, the administrators of the NERC Compliance Monitoring and Enforcement Program shall provide a written response and plan to the Board within 30 days of the release of the final audit report.

407. Penalties, Sanctions, and Remedial Action Directives

1. **NERC Review of Regional Entity Penalties and Sanctions —** NERC shall review all Penalties, sanctions, and Remedial Action Directives imposed by each Regional Entity for violations of Reliability Standards, including Penalties, sanctions and Remedial Action Directives that are specified by a Regional Entity

Hearing Body final decision issued pursuant to Attachment 2 to **Appendix 4C**, to determine if the Regional Entity's determination is supported by a sufficient record compiled by the Regional Entity, is consistent with the *Sanction Guidelines* incorporated into these Rules of Procedure as **Appendix 4B** and with other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and is consistent with Penalties, sanctions and Remedial Action Directives imposed by the Regional Entity and by other Regional Entities for violations involving the same or similar facts and circumstances.

2. **Developing Penalties and Sanctions** — The Regional Entity Compliance Staff shall use the *Sanction Guidelines*, which are incorporated into these Rules of Procedure as **Appendix 4B**, to develop an appropriate Penalty, sanction, or Remedial Action Directive for a violation, and shall notify NERC of the Penalty, sanction or Remedial Action Directive.

3. **Effective Date of Penalty** — Where authorized by applicable legislation or agreement, no Penalty imposed for a violation of a Reliability Standard shall take effect until the thirty-first day after NERC files, with the Applicable Governmental Authority, a "Notice of Penalty" and the record of the proceedings in which the violation and Penalty were determined, or such other date as ordered by the Applicable Governmental Authority.

408. Review of NERC Decisions

1. **Scope of Review** — A Registered Entity or a Regional Entity wishing to challenge a finding of noncompliance and the imposition of a Penalty for a compliance measure directly administered by NERC, or a Regional Entity wishing to challenge a Regional Entity Compliance Monitoring and Enforcement Program audit finding, may do so by filing a notice of the challenge with NERC's director of enforcement no later than 21 days after issuance of the notice of finding of violation or audit finding. Appeals by Registered Entities or Regional Entities of decisions of Regional Entity Hearing Bodies shall be pursuant to Section 409.

2. **Contents of Notice** — The notice of challenge shall include the full text of the decision that is being challenged, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief.

3. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of challenge, the NERC director of enforcement may file with the Hearing Panel a response to the issues raised in the notice, with a copy to the Regional Entity.

4. **Hearing by Compliance and Certification Committee** — The NERC Compliance and Certification Committee shall provide representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program an opportunity to be heard and shall decide the matter

based upon the filings and presentations made, with a written explanation of its decision.

5. **Appeal** — The Regional Entity or Registered Entity may appeal the decision of the Compliance and Certification Committee by filing a notice of appeal with NERC's director of enforcement no later than 21 days after issuance of the written decision by the Compliance and Certification Committee. The notice of appeal shall include the full text of the written decision of the Compliance and Certification Committee that is being appealed, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not presented to the Compliance and Certification Committee.

6. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of appeal, the NERC Compliance Monitoring and Enforcement Program staff may file its response to the issues raised in the notice of appeal, with a copy to the entity filing the notice.

7. **Reply** — The entity filing the appeal may file a reply within 7 days.

8. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record, the response, and any reply. At its discretion, the Compliance Committee may invite representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program to appear before the Compliance Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

9. **Impartiality** — No member of the Compliance and Certification Committee or the Board of Trustees Compliance Committee having an actual or perceived conflict of interest in the matter may participate in any aspect of the challenge or appeal except as a party or witness.

10. **Expenses** — Each party in the challenge and appeals processes shall pay its own expenses for each step in the process.

11. **Non-Public Proceedings —** All challenges and appeals shall be closed to the public to protect Confidential Information.

409. Appeals from Final Decisions of Regional Entity Hearing Bodies

1. **Time for Appeal** — A Regional Entity acting as the Compliance Enforcement Authority, or an owner, operator or user of the Bulk Power System, shall be entitled to appeal from a final decision of a Regional Entity Hearing Body concerning an Alleged Violation of a Reliability Standard, a proposed Penalty or sanction for violation of a Reliability Standard, a proposed Mitigation Plan, or a proposed Remedial Action Directive, by filing a notice of appeal with NERC's

director of enforcement, with copies to the Regional Entity and any other Participants in the Regional Entity Hearing Body proceeding, no later than 21 days after issuance of the final decision of the Regional Entity Hearing Body.

2. **Contents** — The notice of appeal shall include the full text of the final decision of the Regional Entity Hearing Body that is being appealed, a concise statement of the error or errors contained in the final decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not first presented during the proceeding before the Regional Entity Hearing Body.

3. **Response to Notice of Appeal** — Within 21 days after the date the notice of appeal is filed, the Regional Entity shall file the entire record of the Regional Entity Hearing Body proceeding with NERC's director of enforcement, with a copy to the Participant filing the notice. Within 35 days after the date of the notice of appeal, all Participants in the proceeding before the Regional Entity Hearing Body, other than the Participant filing the notice of appeal, shall file their responses to the issues raised in the notice of appeal.

4. **Reply** — The Registered Entity filing the appeal may file a reply to the responses within 7 days.

5. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record of the proceeding before the Regional Entity Hearing Body, the responses, and any reply filed with NERC. At its discretion, the Compliance Committee may invite representatives of the entity making the appeal and the other Participants in the proceeding before the Regional Entity Hearing Body to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

6. **Expenses** — Each party in the appeals process shall pay its own expenses for each step in the process.

7. **Non-Public Proceedings** — All appeals shall be closed to the public to protect Confidential Information.

8. **Appeal of Hearing Body Decisions Granting or Denying Motions to Intervene** — This section is not applicable to an appeal of a decision of a Regional Entity Hearing Body granting or denying a motion to intervene in the Regional Entity Hearing Body proceeding. Appeals of decisions of Regional Entity Hearing Bodies granting or denying motions to intervene in Regional Entity Hearing Body proceedings shall be processed and decided pursuant to Section 414.

410. Hold Harmless

A condition of invoking the challenge or appeals processes under Section 408 or 409 is that the entity requesting the challenge or appeal agrees that neither NERC (defined to

include its Members, Board of Trustees, committees, subcommittees, staff and industry subject matter experts), any person assisting in the challenge or appeals processes, nor any company employing a person assisting in the challenge or appeals processes, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the challenge or appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

411. Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards

A Registered Entity that is subject to an Applicable Requirement of a NERC Critical Infrastructure Protection Standard for which Technical Feasibility Exceptions are permitted, may request a Technical Feasibility Exception to the Requirement, and the request will be reviewed, approved or disapproved, and if approved, implemented, in accordance with the NERC *Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standard*, Appendix 4D to these Rules of Procedure.

412. Certification of Questions from Regional Entity Hearing Bodies for Decision by the NERC Board of Trustees Compliance Committee

1. A Regional Entity Hearing Body that is conducting a hearing concerning a disputed compliance matter pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, may certify to the Board of Trustees, for decision, a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the hearing in whole or in part, and as to which there are other extraordinary circumstances that make prompt consideration of the question by the Compliance Committee appropriate, in accordance with Section 1.5.12 of the Hearing Procedures. All questions certified by a Regional Entity Hearing Body to the Board of Trustees shall be considered and disposed of by the Compliance Committee.

2. The Compliance Committee may accept or reject a certification of a question for decision. If the Compliance Committee rejects the certified question, it shall issue a written statement that the certification is rejected.

3. If the Compliance Committee accepts the certification of a question for decision, it shall establish a schedule by which the Participants in the hearing before the Regional Entity Hearing Body may file memoranda and reply memoranda stating their positions as to how the question certified for decision should be decided by the Compliance Committee. The Compliance Committee may also request, or provide an opportunity for, the NERC compliance operations department, the NERC compliance enforcement department, and/or the NERC general counsel to file memoranda stating their positions as to how the question certified for decision should be decided. After receiving such memoranda and reply memoranda as are filed in accordance with the schedule, the Compliance Committee shall issue a written decision on the certified question.

4. Upon receiving the Compliance Committee's written decision on the certified question, the Regional Entity Hearing Body shall proceed to complete the hearing in accordance with the Compliance Committee's decision.

5. The Compliance Committee's decision, if any, on the certified question shall only be applicable to the hearing from which the question was certified and to the Participants in that hearing.

413. Review and Processing of Regional Entity Hearing Body Final Decisions that Are Not Appealed

NERC shall review and process all final decisions of Regional Entity Hearing Bodies issued pursuant to Attachment 2 to Appendix 4C concerning an Alleged Violation, proposed Penalty or sanction, or proposed Mitigation Plan that are not appealed pursuant to Section 409, as though the determination had been made by the Regional Entity Compliance Monitoring and Enforcement Program. NERC shall review and process such final decisions, and may require that they be modified by the Regional Entity, in accordance with, as applicable to the particular decision, Sections 5.8, 5.9 and 6.5 of Appendix 4C.

414. Appeals of Decisions of Regional Entity Hearing Bodies Granting or Denying Motions to Intervene in Regional Entity Hearing Body Proceedings

1. **Time to Appeal** — An entity may appeal a decision of a Regional Entity Hearing Body under Section 1.4.4 of Attachment 2 of **Appendix C** denying the entity's motion to intervene in a Regional Entity Hearing Body proceeding, and the Regional Entity Compliance Staff or any other Participant in the Regional Entity Hearing Body proceeding may appeal a decision of the Regional Entity Hearing Body under Section 1.4.4 of Attachment 2 of **Appendix C** granting or denying a motion to intervene in the Regional Entity Hearing Body proceeding, in either case by filing a notice of appeal with the NERC director of enforcement, with copies to the Regional Entity Clerk, the Regional Entity Hearing body, the Hearing Officer, the Regional Entity Compliance Staff, and all other Participants in the Regional Entity Hearing Body proceeding, no later than seven (7) days following the date of the Regional Entity Hearing Body decision granting or denying the motion to intervene.

2. **Contents of Notice of Appeal** — The notice of appeal shall set forth information and argument to demonstrate that the decision of the Regional Entity Hearing Body granting or denying the motion to intervene was erroneous under the grounds for intervention specified in Section 1.4.4 of Attachment 2 of **Appendix 4C** and that the entity requesting intervention should be granted or denied intervention, as applicable. Facts alleged in, and any offers of proof made in, the notice of appeal shall be supported by affidavit or verification. The notice of appeal shall include a copy of the original motion to intervene and a copy of the decision of the Regional Entity Hearing Body granting or denying the motion to intervene.

3. **Responses to Notice of Appeal** — Within ten (10) days following the date the notice of appeal is filed, the Regional Entity Clerk shall transmit to the NERC director of enforcement copies of all pleadings filed in the Regional Entity Hearing Body proceeding on the motion to intervene. Within fourteen (14) days following the date the notice of appeal is filed, the Regional Entity Hearing Body, the Regional Entity Compliance Staff, and any other Participants in the Regional Entity Hearing Body proceeding, may each file a response to the notice of appeal with the NERC director of enforcement. Within seven (7) days following the last day for filing responses, the entity filing the notice of appeal, and any Participant in the Regional Entity Hearing Body proceeding that supports the appeal, may file replies to the responses with the NERC director of enforcement.

4. **Disposition of Appeal** — The appeal shall be considered and decided by the Compliance Committee. The NERC director of enforcement shall provide copies of the notice of appeal and any responses and replies to the Compliance Committee. The Compliance Committee shall issue a written decision on the appeal; provided, that if the Compliance Committee does not issue a written decision on the appeal within forty-five (45) days following the date of filing the notice of appeal, the appeal shall be deemed denied and the decision of the Regional Entity Hearing Body granting or denying the motion to intervene shall stand. The NERC director of enforcement shall transmit copies of the Compliance Committee's decision, or shall provide notice that the forty-five (45) day period has expired with no decision by the Compliance Committee, to the Regional Entity Clerk, the Regional Entity Hearing Body, the entity filing the notice of appeal, the Regional Entity Compliance Staff, and any other Participants in the Regional Entity Hearing Body proceeding that filed responses to the notice of appeal or replies to responses.

5. **Appeal of Compliance Committee Decision to FERC or Other Applicable Governmental Authority** — Any entity aggrieved by the decision of the Compliance Committee on an appeal of a Regional Entity Hearing Body decision granting or denying a motion to intervene in a Regional Entity Hearing Body proceeding (including a denial of such appeal by the expiration of the forty-five (45) day period as provided in Section 414.4) may appeal or petition for review of the decision of the Compliance Committee to FERC or to another Applicable Governmental Authority having jurisdiction over the matter, in accordance with the authorities, rules and procedures of FERC or such other Applicable Governmental Authority. Any such appeal or petition for review shall be filed within the time period, if any, and in the form and manner, specified by the applicable statutes, rules or regulations governing proceedings before FERC or the other Applicable Governmental Authority.

SECTION 500 — ORGANIZATION REGISTRATION AND CERTIFICATION

501. Scope of the Organization Registration and Organization Certification Programs

The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards. Registered Entities are not and do not become Members of NERC or a Regional Entity, by virtue of being listed on the NCR. Membership in NERC is governed by Article II of NERC's Bylaws; membership in a Regional Entity or regional reliability organization is governed by that entity's bylaws or rules.

The purpose of the Organization Certification Program is to ensure that the new entity (i.e., applicant to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures to demonstrate their ability to meet the Requirements/sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying thereby demonstrating the ability to become certified and then operational.

Organization Registration and Organization Certification may be delegated to Regional Entities in accordance with the procedures in this Section 500; the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into these Rules of Procedure as **Appendix 5A**; and, approved Regional Entity delegation agreements or other applicable agreements.

1. **NERC Compliance Registry** — NERC shall establish and maintain the NCR of the Bulk Power System owners, operators, and users that are subject to approved Reliability Standards.

   1.1 (a) The NCR shall set forth the identity and functions performed for each organization responsible for meeting Requirements/sub-Requirements of the Reliability Standards. Bulk Power System owners, operators, and users (i) shall provide to NERC and the applicable Regional Entity information necessary to complete the Registration, and (ii) shall provide NERC and the applicable Regional Entity with timely updates to information concerning the Registered Entity's ownership, operations, contact information, and other information that may affect the Registered Entity's Registration status or other information recorded in the Compliance Registry.

   (b) A generation or transmission cooperative, a joint-action agency or another organization may register as a Joint Registration Organization (JRO), in lieu of each of the JRO's members or related entities being registered individually for one or more functions. Refer to Section 507.

(c) Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function pursuant to a written agreement for the division of compliance responsibility. Refer to Section 508.

1.2 In the development of the NCR, NERC and the Regional Entities shall determine which organizations should be placed on the NCR based on the criteria provided in the NERC *Statement of Compliance Registry Criteria* which is incorporated into these Rules of Procedure as **Appendix 5B**.

1.3 NERC and the Regional Entities shall use the following rules for establishing and maintaining the NCR based on the Registration criteria as set forth in **Appendix 5B** *Statement of Compliance Registry Criteria*:

1.3.1 NERC shall notify each organization that it is on the NCR. The Registered Entity is responsible for compliance with all the Reliability Standards applicable to the functions for which it is registered from the time it receives the Registration notification from NERC.

1.3.2 Any organization receiving such a notice may challenge its placement on the NCR according to the process in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section V.

1.3.3 The Compliance Committee of the Board of Trustees shall promptly issue a written decision on the challenge, including the reasons for the decision.

1.3.4 The decision of the Compliance Committee of the Board of Trustees shall be final unless, within 21 days of the date of the Compliance Committee of the Board of Trustees decision, the organization appeals the decision to the Applicable Governmental Authority.

1.3.5 Each Registered Entity identified on the NCR shall notify its corresponding Regional Entity(s) of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the Registered Entity's responsibilities with respect to the Reliability Standards. Failure to notify will not relieve the Registered Entity from any responsibility to comply with the Reliability Standards or shield it from any Penalties or sanctions associated with failing to comply with the Reliability Standards applicable to its associated Registration.

1.4 For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall:

1.4.1 Ensure that all areas are under the oversight of one and only one Reliability Coordinator.

1.4.2 Ensure that all Balancing Authorities and Transmission Operator entities[2] are under the responsibility of one and only one Reliability Coordinator.

1.4.3 Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator.

1.4.4 Ensure that all Loads and generators are under the responsibility and control of one and only one Balancing Authority.

1.5 NERC shall maintain the NCR of organizations responsible for meeting the Requirements/sub-Requirements of the Reliability Standards currently in effect on its website and shall update the NCR monthly.

1.6 With respect to: (i) entities to be registered for the first time; (ii) currently-registered entities or (iii) previously-registered entities, for which registration status changes are sought, including availability and composition of a sub-set list of applicable Reliability Standards (which specifies the Reliability Standards and may specify Requirements/sub-Requirements), the registration process steps in Section III of **Appendix 5A** apply.

1.7 NERC shall establish a NERC-led, centralized review panel, comprised of a NERC lead with Regional Entity participants, in accordance with **Appendix 5A**, *Organization Registration and Organization Certification Manual*, Section III.D and **Appendix 5B**, *Statement of Compliance Registry Criteria*.

2. **Entity Certification** — NERC shall provide for Certification of all entities with primary reliability responsibilities requiring Certification. This includes those

[2] Some organizations perform the listed functions (e.g., Balancing Authority, Transmission Operator) over areas that transcend the Footprints of more than one Reliability Coordinator. Such organizations will have multiple Registrations, with each such Registration corresponding to that portion of the organization's overall area that is within the Footprint of a particular Reliability Coordinator.

entities that satisfy the criteria established in the NERC provisional Certification process. The NERC programs shall:

2.1 Evaluate and certify the competency of entities performing reliability functions. The entities presently expected to be certified include Reliability Coordinators, Transmission Operators, and Balancing Authorities.

2.2 Evaluate and certify each applicant's ability to meet the requirements for Certification.

2.3 Maintain process documentation.

2.4 Maintain records of currently certified entities.

2.5 Issue a Certification document to the applicant that successfully demonstrates its competency to perform the evaluated functions.

3. **Delegation and Oversight**

3.1 NERC may delegate responsibilities for Organization Registration and Organization Certification to Regional Entities in accordance with requirements established by NERC. Delegation will be via the delegation agreement between NERC and the Regional Entity or other applicable agreement. The Regional Entity shall administer Organization Registration and Organization Certification Programs in accordance with such delegations to meet NERC's programs goals and requirements subject to NERC oversight.

3.2 NERC shall develop and maintain a plan to ensure the continuity of Organization Registration and Organization Certification within the geographic or electrical boundaries of a Regional Entity in the event that no entity is functioning as a Regional Entity for that Region, or the Regional Entity withdraws as a Regional Entity, or does not operate its Organization Registration and Organization Certification Programs in accordance with delegation agreements.

3.3 NERC shall develop and maintain a program to monitor and oversee the NERC Organization Registration and Organization Certification Programs activities that are delegated to each Regional Entity through a delegation agreement or other applicable agreement.

3.3.1 This program shall monitor whether the Regional Entity carries out those delegated activities in accordance with NERC requirements, and whether there is consistency, fairness of administration, and comparability.

3.3.2 Monitoring and oversight shall be accomplished through direct participation in the Organization Registration and Organization Certification Programs with periodic reviews of documents and records of both programs.

502. Organization Registration and Organization Certification Program Requirements

1. NERC shall maintain the Organization Registration and Organization Certification Programs.

   1.1 The roles and authority of Regional Entities in the programs are delegated from NERC pursuant to the Rules of Procedure through regional delegation agreements or other applicable agreements.

   1.2 Processes for the programs shall be administered by NERC and the Regional Entities. Materials that each Regional Entity uses are subject to review and approval by NERC.

   1.3 The appeals process for the Organization Registration and Organization Certification Programs are identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Sections V and VI, respectively.

   1.4 The Certification Team membership is identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section IV.8.d.

2. To ensure consistency and fairness of the Organization Registration and Organization Certification Programs, NERC shall develop procedures to be used by all Regional Entities and NERC in accordance with the following criteria:

   2.1 NERC and the Regional Entities shall have data management processes and procedures that provide for confidentiality, integrity, and retention of data and information collected.

   2.2 Documentation used to substantiate the conclusions of the Regional Entity/ NERC related to Registration and/or Certification must be retained by the Regional Entity for (6) six years, unless a different retention period is otherwise identified, for the purposes of future audits of these programs.

   2.3 To maintain the integrity of the NERC Organization Registration and Organization Certification Programs, NERC, Regional Entities, Certification Team members, program audit team members (Section 506), and committee members shall maintain the confidentiality of information provided by an applicant or entities.

      2.2.1 NERC and the Regional Entities shall have appropriate codes of conduct and confidentiality agreements for staff, Certification

Team, Certification related committees, and Certification program audit team members.

2.2.2 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall maintain the confidentiality of any Registration or Certification-related discussions or documents designated as confidential (see Section 1500 for types of Confidential Information).

2.2.3 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall treat as confidential the individual comments expressed during evaluations, program audits and report-drafting sessions.

2.2.4 Copies of notes, draft reports, and other interim documents developed or used during an entity Certification evaluation or program audit shall be destroyed after the public posting of a final, uncontested report.

2.2.5 Information deemed by an applicant, entity, a Regional Entity, or NERC as confidential, including Critical Energy Infrastructure Information, shall not be released publicly or distributed outside of a committee or team.

2.2.6 In the event that an individual violates any of the confidentiality rules set forth above, that individual and any member organization with which the individual is associated will be subject to immediate dismissal from the audit team and may be prohibited from future participation in Compliance Monitoring and Enforcement Program activities by the Regional Entity or NERC.

2.2.7 NERC shall develop and provide training in auditing skills to all individuals prior to their participation in Certification evaluations. Training for Certification Team leaders shall be more comprehensive than the training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

2.4 An applicant that is determined to be competent to perform a function after completing all Certification requirements shall be deemed certified by NERC to perform that function for which it has demonstrated full competency.

2.4.1 All NERC certified entities shall be included on the NCR.

503. Regional Entity Implementation of Organization Registration and Organization Certification Program Requirements

1. **Delegation** — Recognizing the Regional Entity's knowledge of and experience with their members, NERC may delegate responsibility for Organization Registration and Organization Certification to the Regional Entity through a delegation agreement.

2. **Registration** — The following Organization Registration activities shall be managed by the Regional Entity per the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into the Rules of Procedure as Appendix 5A *Organization Registration and Organization Certification Manual*:

    2.1 Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4).

3. **Certification —** The following Organization Certification activities shall be managed by the Regional Entity in accordance with an approved delegation agreement or another applicable agreement:

    3.1 An entity seeking Certification to perform one of the functions requiring Certification shall contact the Regional Entity for the Region(s) in which it plans to operate to apply for Certification.

    3.2 An entity seeking Certification and other affected entities shall provide all information and data requested by NERC or the Regional Entity to conduct the Certification process.

    3.3 Regional Entities shall notify NERC of all Certification applicants.

    3.4 NERC and/or the Regional Entity shall evaluate the competency of entities requiring Certification to meet the NERC Certification requirements.

    3.5 NERC or the Regional Entity shall establish Certification procedures to include evaluation processes, schedules and deadlines, expectations of the applicants and all entities participating in the evaluation and Certification processes, and requirements for Certification Team members.

        3.5.1 The NERC / Regional Entity Certification procedures will include provisions for on-site visits to the applicant's facilities to review the data collected through questionnaires, interviewing the operations and management personnel, inspecting the facilities and equipment (including requesting a demonstration of all tools identified in the Certification process), reviewing all necessary documents and data (including all agreements, processes, and procedures identified in the Certification process), reviewing Certification documents and projected system operator work schedules, and reviewing any additional documentation needed to

support the completed questionnaire or inquiries arising during the site visit.

3.5.2 The NERC/ Regional Entity Certification procedures will provide for preparation of a written report by the Certification Team, detailing any deficiencies that must be resolved prior to granting Certification, along with any other recommendations for consideration by the applicant, the Regional Entity, or NERC.

504. Appeals

1. NERC shall maintain an appeals process to resolve any disputes related to Registration or Certification activities per the *Organization Registration and Organization Certification Manual,* which is incorporated in these Rules of Procedure as Appendix 5A.

2. The Regional Entity Certification appeals process shall culminate with the Regional Entity board or a committee established by and reporting to the Regional Entity board as the final adjudicator, provided that where applicable, Canadian provincial governmental authorities may act as the final adjudicator in their jurisdictions. NERC shall be notified of all appeals and may observe any proceedings **(Appendix 5A** *Organization Registration and Organization Certification Manual*).

505. Program Maintenance

NERC shall maintain its program materials, including such manuals or other documents as it deems necessary, of the governing policies and procedures of the Organization Registration and Organization Certification Programs.

506. Independent Audit of NERC Organization Registration and Organization Certification Program

1. NERC, through the Compliance and Certification Committee, shall provide for an independent audit of its Organization Registration and Organization Certification Programs at least once every three years, or more frequently, as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board.

2. The audit shall evaluate the success, effectiveness and consistency of the NERC Organization Registration and Organization Certification Programs.

3. The final report shall be posted by NERC for public viewing.

4. If the audit report includes recommendations to improve the program, the administrators of the program shall provide a written response to the Board within 30 days of the final report, detailing the disposition of each and every

recommendation, including an explanation of the reasons for rejecting a recommendation and an implementation plan for the recommendations accepted.

507. Provisions Relating to Joint Registration Organizations (JRO)

1. In addition to registering as the entity responsible for all functions that it performs itself, an entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Any entity seeking to register as a JRO must submit a written agreement with its members or related entities for all Requirements/sub-Requirements for the function(s) for which the entity is registering for and takes responsibility for, which would otherwise be the responsibility of one or more of its members or related entities. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the JRO Registration.

2. The JRO Registration data must include the same Registration information as a normal compliance Registration entry. The JRO is responsible for providing all of the information and data, including submitting reports, as needed by the Regional Entity for performing assessments of compliance.

3. The Regional Entity shall notify NERC of each JRO that the Regional Entity accepts. The notification will identify the point of contact and the functions(s) being registered for on behalf of its members or related entities.

4. For purposes of Compliance Audits, the Regional Entity shall keep a list of all JROs. This document shall contain a list of each JRO's members or related entities and the function(s) for which the JRO is registered for that member(s) or related entity(s). It is the responsibility of the JRO to provide the Regional Entity with this information as well as the applicable JRO agreement(s).

5. The Regional Entity may request clarification of any list submitted to it that identifies the members of the JRO and may request such additional information as the Regional Entity deems appropriate.

6. The Regional Entity's acceptance of a JRO shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the JRO will meet the Registration requirements of Section 501(1.4).

7. NERC shall maintain, and post on its website, a JRO registry listing all JRO Registrations that have been reviewed and accepted by the Regional Entity. The posting shall identify the JRO entity taking compliance responsibilities for itself and its members.

8. The JRO shall inform the Regional Entity of any changes to an existing JRO. The Regional Entity shall promptly notify NERC of each such revision.

9. Nothing in Section 507 shall preclude a member of a JRO, a related entity, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the member or other entity is registering. A JRO member or related entity that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the JRO of its Registration.

508. Provisions Relating to Coordinated Functional Registration (CFR) Entities

1. In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.

2. Each CFR or each individual entity within a CFR must identify a point of contact that is responsible for providing information and data, including submitting reports as needed by the Regional Entity related to the CFR Registration.

3. The Regional Entity shall notify NERC of each CFR that the Regional Entity accepts.

4. NERC or the Regional Entity may request clarification of any list submitted to it that identifies the compliance responsibilities of the CFR and may request such additional information as NERC or the Regional Entity deems appropriate.

5. The Regional Entity's acceptance of that CFR shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the CFR will meet the Registration requirements of Section 501(1.4).

6. NERC shall maintain, and post on its website, a CFR registry listing all CFR Registrations that have been accepted by NERC or by a Regional Entity. The posting shall clearly list all the Reliability Standards or Requirements/sub-Requirements thereof for which each entity of the CFR is responsible for under the CFR.

7. The point of contact shall inform the Regional Entity of any changes to an existing CFR. The Regional Entity shall promptly notify NERC of each such revision.

8. In the event of a violation of a Reliability Standard or of a Requirement/sub-Requirement of a Reliability Standard for which an entity of a CFR is registered, that entity shall be identified in the Notice of Alleged Violation and shall be assessed the sanction or Penalty in accordance with the NERC Sanctions Guidelines. In the event a Regional Entity is not able to determine which entity(ies) is responsible for a particular Reliability Standard, or Requirements/sub-Requirements thereof that has been violated, the Regional Entity shall investigate the noncompliance in accordance with the NERC Rules of Procedure Section 400, *Compliance Enforcement*, to determine the entity(ies) to which the Regional Entity shall to issue the sanction or Penalty for the violation.

9. Nothing in Section 508 shall preclude an entity registered in a CFR, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the entity is registering. An entity registered in a CFR that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the point of contact of its Registration.

509. Exceptions to the Definition of the Bulk Electric System

An Element is considered to be (or not be) part of the Bulk Electric System by applying the BES Definition to the Element (including the inclusions and exclusions set forth therein). Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of the Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside of the definition of the Bulk Electric System should be considered part of the Bulk Electric System.

SECTION 600 — PERSONNEL CERTIFICATION

601. Scope of Personnel Certification

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The Personnel Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System. The Personnel Certification awards system operator Certification Credentials to individuals who demonstrate that they have attained essential knowledge relating to NERC Reliability Standards as well as principles of Bulk Power System operations. NERC, as the ERO, will ensure skilled, trained, and qualified system operators through the Personnel Certification Program.

Except as necessary to obtain approval of the Rules of Procedure, the NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the policies, sets fees, and monitors the performance of the Personnel Certification Program for system operators.

602. Structure of ERO Personnel Certification Program

1. The NERC Personnel Certification Program shall be international in scope.
2. The PCGC shall (1) be able to independently exercise decision-making for all matters pertaining to Certification, (2) include individuals from the discipline being certified and whose composition addresses the needs of the users of the program (e.g., employers, regulators, etc.), and (3) have representation for each specialty or level within a discipline.
3. NERC shall maintain a nominating process for membership in the governing body. Nominations shall be open to all interested parties and self-nominations shall be accepted. The NERC Board of Trustees shall appoint members to the governing body from among those nominated. The members of the governing body shall serve at the pleasure of the Board.
4. The PCGC shall have control over the matters related to the Personnel Certification and re-Certification Programs listed below, without being subject to approval by any other body.

    4.1 Policies and procedures, including eligibility requirements and application processing.

    4.2 Requirements for personnel Certification, maintaining Certification, and re-Certification.

    4.3 Examination content, development, and administration.

    4.4 Examination cut score.

4.5 Grievance and disciplinary processes.

4.6 Governing body and subgroup(s)' meeting rules including agenda, frequency, and related procedures.

4.7 Subgroup(s) appointments and work assignments.

4.8 Publications about personnel Certification and re-Certification.

4.9 Setting fees for application, and all other services provided as a part of the personnel Certification and re-Certification activities.

4.10 Program funding, spending, and budget authority. Financial matters related to the operation of the program shall be segregated from other NERC activities.

5. The Personnel Certification Program shall utilize written procedures for the selection of members of the governing body that prohibit the governing body from selecting a majority of its successors.

6. The Personnel Certification Program shall be separate from the accreditation and education functions of NERC in related disciplines.

7. No member of the PCGC or staff member working with the Personnel Certification Program governing body shall have or exercise any authority or responsibility for compliance matters related to Reliability Standards concerning personnel Certification.

603. Examination and Maintenance of NERC System Operator Certification Credentials

1. System operators seeking to obtain a Credential must pass an examination to earn the Credential.

2. A certificate will be issued to successful candidates which is valid for three years.

3. A system operator must earn Continuing Education Hours (CE Hours) in NERC-Approved Learning Activities within the three-year period preceding the expiration date of his/her certificate as determined by the PCGC and posted in the NERC System Operator Program Manual. A system operator must request a renewal and submit the appropriate fee for Certification renewal evaluation.

4. The Credential of a certified system operator who does not accumulate the required number and balance of CE Hours within the three-year period will be Suspended. A system operator with a Suspended certificate cannot perform any task that requires an operator to be NERC-certified. The system operator with a Suspended Credential will have up to twelve months to acquire the necessary CE Hours.

4.1 During the time of suspension, the original anniversary date will be maintained. Therefore, should the system operator accumulate the required number of CE Hours within the twelve month suspension period, he/she will be issued a certificate that will be valid for three years from the previous expiration date.

4.2 At the end of the twelve-month suspension period, if the system operator has not accumulated the required number of CE Hours, the Credential will be Revoked and all CE Hours earned will be forfeited. After a Credential is Revoked, the system operator will be required to pass an examination to become certified.

5. Hardship: Due to unforeseen events and extenuating circumstances, a certified system operator may be unable to accumulate the necessary CE Hours in the time frame required by the Personnel Certification Program to maintain the Credential. In such an event, the individual must submit a written request containing a thorough explanation of the circumstances and supporting information to the NERC Personnel Certification Manager. The PCGC retains the right to invoke this hardship clause as it deems appropriate to address such events or circumstances.

604. Dispute Resolution Process

1. Any dispute arising under the NERC agreement establishing the *NERC Personnel Certification Program* or from the establishment of any NERC rules, policies, or procedures dealing with any segment of the Certification process shall be subject to the NERC System Operator Certification Dispute Resolution Process. The Dispute Resolution Process is for the use of persons who hold an operator Certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the Registration process.

2. Dispute Resolution Process consists of three steps.

2.1. Notify NERC Personnel Certification Program Staff: This first step can usually resolve the issues without further actions. It is expected that most disputes will be resolved at this step. If the issue(s) is not resolved to the satisfaction of the parties involved in the first step, the issue can be brought to the PCGC Dispute Resolution Task Force.

2.2. PCGC Dispute Resolution Task Force: If the NERC staff did not resolve the issue(s) to the satisfaction of the parties involved, a written request must be submitted to the chairman of the PCGC through NERC staff explaining the issue(s) and requesting further action. Upon receipt of the letter, the PCGC chairman will present the request to the PCGC Dispute Resolution Task Force for action. This task force consists of three current members of the PCGC. The PCGC Dispute Resolution Task Force will

investigate and consider the issue(s) presented and make a decision. This decision will then be communicated to the submitting party, the PCGC chairman, and the NERC staff within 45 calendar days of receipt of the request.

3. Personnel Certification Governance Committee: If the PCGC Dispute Resolution Task Force's decision did not resolve the issue(s) to the satisfaction of the parties involved, the final step in the process is for the issue(s) to be brought before the PCGC. Within 45 days of the date of the Task Force's decision, the disputing party shall submit a written request to the PCGC chairman through NERC staff requesting that the issue(s) be brought before the PCGC for resolution. The chairman shall see that the necessary documents and related data are provided to the PCGC members as soon as practicable. The PCGC will then meet or conference to discuss the issue(s) and make their decision within 60 calendar days of the chairman's receipt of the request. The decision will be provided to the person bringing the issue(s) and the NERC staff. The PCGC is the governing body of the Certification program and its decision is final.

4. Dispute Resolution Process Expenses: All individual expenses associated with the Dispute Resolution Process, including salaries, meetings, or consultant fees, shall be the responsibility of the individual parties incurring the expense.

5. Decision Process: Robert's Rules of Order shall be used as a standard of conduct for the Dispute Resolution Process. A majority vote of the members present will decide all issues. The vote will be taken in a closed session. No member of the PCGC may participate in the Dispute Resolution Process, other than as a party or witness, if he or she has an interest in the particular matter.

   5.1 A stipulation of invoking the Dispute Resolution Process is that the entity invoking the Dispute Resolution Process agrees that neither NERC (its members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the Dispute Resolution Process, nor any company employing a person assisting in the Dispute Resolution Process, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the Dispute Resolution Process. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

605. Disciplinary Action

1. Disciplinary action may be necessary to protect the integrity of the system operator Credential. The PCGC may initiate disciplinary action should an individual act in a manner that is inconsistent with expectations, including but not limited to:

1.1. Willful, gross, and/or repeated violation of the NERC Reliability Standards as determined by a NERC investigation.

1.2. Willful, gross, and/or repeated negligence in performing the duties of a certified system operator as determined by a NERC investigation.

1.3. Intentional misrepresentation of information provided on a NERC application for a system operator Certification exam or to maintain a system operator Credential using CE Hours.

1.4. Intentional misrepresentation of identification in the exam process, including a person identifying himself or herself as another person to obtain Certification for the other person.

1.5. Any form of cheating during a Certification exam, including, but not limited to, bringing unauthorized reference material in the form of notes, crib sheets, or other methods of cheating into the testing center.

1.6. A certified system operator's admission to or conviction of any felony or misdemeanor directly related to his/her duties as a system operator.

2. Hearing Process: Upon report to NERC of a candidate's or certified system operator's alleged misconduct, the NERC PCGC Credential Review Task Force will convene for the determination of facts. An individual, government agency, or other investigating authority can file a report. Unless the Task Force initially determines that the report of alleged misconduct is without merit, the candidate or certified system operator will be given the right to notice of the allegation. A hearing will be held and the charged candidate or certified system operator will be given an opportunity to be heard and present further relevant information. The Task Force may seek out information from other involved parties. The hearing will not be open to the public, but it will be open to the charged candidate or certified system operator and his or her representative. The Task Force will deliberate in a closed session, but the Task Force cannot receive any evidence during the closed session that was not developed during the course of the hearing.

3. Task Force's decision: The Task Force's decision will be unanimous and will be in writing with inclusion of the facts and reasons for the decision. The Task Force's written decision will be delivered to the PCGC and by certified post to the charged candidate or certified system operator. In the event that the Task Force is unable to reach a unanimous decision, the matter shall be brought to the full committee for a decision.

3.1. No Action: Allegation of misconduct was determined to be unsubstantiated or inconsequential to the Credential.

3.2. Probation: A letter will be sent from NERC to the offender specifying:

3.2.1. The length of time of the probationary period (to be determined by the PCGC).

3.2.2. Credential will remain valid during the probationary period.

3.2.3. The probationary period does not affect the expiration date of the current certificate.

3.2.4. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

3.3. Revoke for Cause: A letter will be sent from NERC to the offender specifying:

3.3.1. The length of time of the probationary period (to be determined by the PCGC).

3.3.2. Credential is no longer valid.

3.3.3. Successfully passing an exam will be required to become recertified.

3.3.4. An exam will not be authorized until the revocation period expires

3.4. Termination of Credential: A letter will be sent from NERC to the offender specifying permanent removal of Credential.

4. Credential Review Task Force: The Credential Review Task Force shall be comprised of three active members of the PCGC assigned by the Chairman of the PCGC on an ad hoc basis. No one on the Credential Review Task Force may have an interest in the particular matter. The Task Force will meet in a venue determined by the Task Force chairman.

5. Appeal Process: The decision of the Task Force may be appealed using the NERC System Operator Certification Dispute Resolution Process.

606. Candidate Testing Mechanisms

1. The Personnel Certification Program shall utilize reliable testing mechanisms to evaluate individual competence in a manner that is objective, fair to all candidates, job-related, and based on the knowledge and skill needed to function in the discipline.

2. The Personnel Certification Program shall implement a formal policy of periodic review of the testing mechanisms to ensure ongoing relevance of the mechanisms to knowledge and skill needed in the discipline.

3. The Personnel Certification Program shall utilize policies and procedures to ensure that all test administration and development materials are secure and demonstrate that these policies and procedures are consistently implemented.

4. The Personnel Certification Program shall establish pass/fail levels that protect the public with a method that is based on competence and generally accepted in the psychometric community as being fair and reasonable.

5. The Personnel Certification Program shall conduct ongoing studies to substantiate the reliability and validity of the testing mechanisms.

6. The Personnel Certification Program shall utilize policies and procedures that govern how long examination records are kept in their original format.

7. The Personnel Certification Program shall demonstrate that different forms of the testing mechanisms assess equivalent content and that candidates are not penalized for taking forms of varying difficulty.

607. Public Information About the Personnel Certification Program

1. The Personnel Certification Program shall maintain and publish publicly a System Operator Certification Program Manual describing the procedures used in examination construction and validation; all eligibility requirements and determination; fees; and examination administration documents, including: reporting of results, re-Certification requirements, and disciplinary and dispute resolution.

2. The Personnel Certification Program shall maintain and publish publicly a comprehensive summary or outline of the information, knowledge, or functions covered by each examination.

3. The Personnel Certification Program shall publish publicly and make available at least annually a summary of Certification activities for the program, including at least the following information: number of examinations delivered, the number passed, the number failed, and the number certified.

608. Responsibilities to Applicants for Certification or Re-Certification

The Personnel Certification Program:

1. Shall not discriminate among applicants as to age, gender, race, religion, national origin, disability, or marital status and shall include a statement of non-discrimination in announcements of the program.

2. Shall comply with all requirements of applicable federal and state/provincial laws with respect to all Certification and re-Certification activities, and shall require compliance of all contractors and/or providers of services.

3. Shall make available to all applicants copies of formalized procedures for application for, and attainment of, personnel Certification and re-Certification and shall uniformly follow and enforce such procedures for all applicants.

4. Shall implement a formal policy for the periodic review of eligibility criteria and application procedures to ensure that they are fair and equitable.

5. Shall provide competently proctored examination sites.

6. Shall uniformly report examination results to applicants in a timely manner.

7. Shall give applicants failing the examination information on general content areas of deficiency.

609. Responsibilities to the Public and to Employers of Certified Practitioners

The Personnel Certification Program:

1. Shall demonstrate that the testing mechanisms adequately measure the knowledge and skill required for entry, maintenance, and/or advancement in the profession for each position to be certified.

2. Shall award Certification and re-Certification only after the skill and knowledge of the individual have been evaluated and determined to be acceptable.

3. Shall maintain, in an electronic format, a current list of those persons certified in the programs and have policies and procedures that delineate what information about a Credential holder may be made public and under what circumstances.

4. Shall have formal policies and procedures for discipline of a Credential holder, including the revocation of the certificate, for conduct deemed harmful to the public or inappropriate to the discipline (e.g., incompetence, unethical behavior, physical or mental impairment affecting performance). These procedures shall incorporate due process.

5. Shall demonstrate that any title or Credential awarded accurately reflects or applies to the practitioner's daily occupational or professional duties and is not confusing to employers, consumers, regulators, related professions, and/or other interested parties.

SECTION 700 — RELIABILITY READINESS EVALUATION AND IMPROVEMENT AND FORMATION OF SECTOR FORUMS

701. Confidentiality Requirements for Readiness Evaluations and Evaluation Team Members

1. All information made available or created during the course of any reliability readiness evaluation including, but not limited to, data, Documents, observations and notes, shall be maintained as confidential by all evaluation team members, in accordance with the requirements of Section 1500.

2. Evaluation team members are obligated to destroy all confidential evaluation notes following the posting of the final report of the reliability readiness evaluation.

3. NERC will retain reliability readiness evaluation-related documentation, notes, and materials for a period of time as defined by NERC.

4. These confidentiality requirements shall survive the termination of the NERC Reliability Readiness Evaluation and Improvement Program.

702. Formation of Sector Forum

1. NERC will form a sector forum at the request of any five members of NERC that share a common interest in the safety and reliability of the Bulk Power System. The members of sector forum may invite such others of the members of NERC to join the sector forum as the sector forum deems appropriate.

2. The request to form a sector forum must include a proposed charter for the sector forum. The Board must approve the charter.

3. NERC will provide notification of the formation of a sector forum to its membership roster. Notices and agendas of meetings shall be posted on NERC's website.

4. A sector forum may make recommendations to any of the NERC committees and may submit a Standards Authorization Request to the NERC *Reliability Standards Development Procedure*.

SECTION 800 — RELIABILITY ASSESSMENT AND PERFORMANCE ANALYSIS

801. Objectives of the Reliability Assessment and Performance Analysis Program

The objectives of the NERC Reliability Assessment and Performance Analysis Program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American Bulk Power Systems, both as existing and as planned; (2) analyze off-normal events on the Bulk Power System; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the Board for publication to the electric industry and the general public.

802. Scope of the Reliability Assessment Program

1. The scope of the Reliability Assessment Program shall include:

   1.1 Review, assess, and report on the overall electric generation and transmission reliability (adequacy and operating reliability) of the interconnected Bulk Power Systems, both existing and as planned.

   1.2 Assess and report on the key issues, risks, and uncertainties that affect or have the potential to affect the reliability of existing and future electric supply and transmission.

   1.3 Review, analyze, and report on Regional Entity self-assessments of electric supply and bulk power transmission reliability, including reliability issues of specific regional concern.

   1.4 Identify, analyze, and project trends in electric customer demand, supply, and transmission and their impacts on Bulk Power System reliability.

   1.5 Investigate, assess, and report on the potential impacts of new and evolving electricity market practices, new or proposed regulatory procedures, and new or proposed legislation (e.g. environmental requirements) on the adequacy and operating reliability of the Bulk Power Systems.

2. The Reliability Assessment Program shall be performed in a manner consistent with the Reliability Standards of NERC including but not limited to those that specify reliability assessment Requirements.

803. Reliability Assessment Reports

The number and type of periodic assessments that are to be conducted shall be at the discretion of NERC. The results of the reliability assessments shall be documented in three reports: the long-term and the annual seasonal (summer) and the annual seasonal (winter) assessment reports. NERC shall also conduct special reliability assessments from time to time as circumstances warrant. The reliability assessment reports shall be reviewed and approved for publication by the Board. The three regular reports are described below.

1. **Long-Term Reliability Assessment Report** — The annual long-term report shall cover a ten-year planning horizon. The planning horizon of the long-term reliability assessment report shall be subject to change at the discretion of NERC. Detailed generation and transmission adequacy assessments shall be conducted for the first five years of the review period. For the second five years of the review period, the assessment shall focus on the identification, analysis, and projection of trends in peak demand, electric supply, and transmission adequacy, as well as other industry trends and developments that may impact future electric system reliability. Reliability issues of concern and their potential impacts shall be presented along with any mitigation plans or alternatives. The long-term reliability assessment reports will generally be published in the fall (September) of each year. NERC will also publish electricity supply and demand data associated with the long-term reliability assessment report.

2. **Summer Assessment Report** — The annual summer seasonal assessment report typically shall cover the four-month (June–September) summer period. It shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected summer peak demands. It shall also identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may include possible mitigation alternatives. The report will generally be published in mid-May for the upcoming summer period.

3. **Winter Assessment Report** — The annual winter seasonal assessment report shall cover the three-month (December–February) winter period. The report shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected winter peak demands. Similar to the summer assessment, the winter assessment shall identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may also include possible mitigation alternatives. The winter assessment report will generally be published in mid-November for the upcoming winter period.

4. **Special Reliability Assessment Reports** — In addition to the long-term and seasonal reliability assessment reports, NERC shall also conduct special reliability assessments on a regional, interregional, and Interconnection basis as conditions warrant, or as requested by the Board or governmental authorities. The teams of reliability and technical experts also may initiate special assessments of key

reliability issues and their impacts on the reliability of a regions, subregions, or Interconnection (or a portion thereof). Such special reliability assessments may include, among other things, operational reliability assessments, evaluations of emergency response preparedness, adequacy of fuel supply, hydro conditions, reliability impacts of new or proposed environmental rules and regulations, and reliability impacts of new or proposed legislation that affects or has the potential to affect the reliability of the interconnected Bulk Power Systems in North America.

804. Reliability Assessment Data and Information Requirements

To carry out the reviews and assessments of the overall reliability of the interconnected Bulk Power Systems, the Regional Entities and other entities shall provide sufficient data and other information requested by NERC in support of the annual long-term and seasonal assessments and any special reliability assessments.

Some of the data provided for these reviews and assessment may be considered confidential from a competitive marketing perspective, a Critical Energy Infrastructure Information perspective, or for other purposes. Such data shall be treated in accordance with the provisions of Section 1500 – Confidential Information.

While the major sources of data and information for this program are the Regional Entities, a team of reliability and technical experts is responsible for developing and formulating its own independent conclusions about the near-term and long-term reliability of the Bulk Power Systems.

In connection with the reliability assessment reports, requests shall be submitted to each of the Regional Entities for required reliability assessment data and other information, and for each Regional Entity's self-assessment report. The timing of the requests will be governed by the schedule for the preparation of the assessment reports.

The Regional Entity self-assessments are to be conducted in compliance with NERC Reliability Standards and the respective regional planning criteria. The team(s) of reliability and technical experts shall also conduct interviews with the Regional Entities as needed. The summary of the Regional Entity self-assessments that are to be included in the assessment reports shall follow the general outline identified in NERC's request. This outline may change from time to time as key reliability issues change.

In general, the Regional Entity reliability self-assessments shall address, among other areas, the following topics: demand and Net Energy for Load; assessment of projected resource adequacy; any transmission constraints that may impact bulk transmission adequacy and plans to alleviate those constraints; any unusual operating conditions that could impact reliability for the assessment period; fuel supply adequacy; the deliverability of generation (both internal and external) to Load; and any other reliability issues in the Region and their potential impacts on the reliability of the Bulk Power Systems.

805. Reliability Assessment Process

Based on their expertise, the review of the collected data, the review of the Regional Entity self-assessment reports, and interviews with the Regional Entities, as appropriate, the teams of reliability and technical experts shall perform an independent review and assessment of the generation and transmission adequacy of each Region's existing and planned Bulk Power System. The results of the review teams shall form the basis of NERC's long-term and seasonal reliability assessment reports. The review and assessment process is briefly summarized below.

1. **Resource Adequacy Assessment** — The teams shall evaluate the regional demand and resource capacity data for completeness in the context of the overall resource capacity needs of the Region. The team shall independently evaluate the ability of the Regional Entity members to serve their obligations given the demand growth projections, the amount of existing and planned capacity, including committed and uncommitted capacity, contracted capacity, or capacity outside of the Region. If the Region relies on capacity from outside of the Region to meet its resource objectives, the ability to deliver that capacity shall be factored into the assessment. The demand and resource capacity information shall be compared to the resource adequacy requirements of the Regional Entity for the year(s) or season(s) being assessed. The assessment shall determine if the resource information submitted represents a reasonable and attainable plan for the Regional Entity and its members. For cases of inadequate capacity or reserve margin, the Regional Entity will be requested to analyze and explain any resource capacity inadequacies and its plans to mitigate the reliability impact of the potential inadequacies. The analysis may be expanded to include surrounding areas. If the expanded analysis indicates further inadequacies, then an interregional problem may exist and will be explored with the applicable Regions. The results of these analyses shall be described in the assessment report.

2. **Transmission Adequacy and Operating Reliability Assessment** — The teams shall evaluate transmission system information that relates to the adequacy and operating reliability of the regional transmission system. That information shall include: regional planning study reports, interregional planning study reports, and/or regional operational study reports. If additional information is required, another data request shall be sent to the Regional Entity. The assessment shall provide a judgment on the ability of the regional transmission system to operate reliably under the expected range of operating conditions over the assessment period as required by NERC Reliability Standards. If sub-areas of the regional system are especially critical to the Reliable Operation of the regional bulk transmission system, these Facilities or sub-areas shall be reviewed and addressed in the assessment. Any areas of concern related to the adequacy or operating reliability of the system shall be identified and reported in the assessment.

3. **Seasonal Operating Reliability Assessment** — The team(s) shall evaluate the overall operating reliability of the regional bulk transmission systems. In areas with potential resource adequacy or system operating reliability problems, operational readiness of the affected Regional Entities for the upcoming season

shall be reviewed and analyzed. The assessment may consider unusual but possible operating scenarios and how the system is expected to perform. Operating reliability shall take into account a wide range of activities, all of which should reinforce the Regional Entity's ability to deal with the situations that might occur during the upcoming season. Typical activities in the assessment may include: facility modifications and additions, new or modified operating procedures, emergency procedures enhancement, and planning and operating studies. The teams shall report the overall seasonal operating reliability of the regional transmission systems in the annual summer and winter assessment reports.

4. **Reporting of Reliability Assessment Results** — The teams of reliability and technical experts shall provide an independent assessment of the reliability of the Regional Entities and the North American interconnected Bulk Power System for the period of the assessment. While the Regional Entities are relied upon to provide the information to perform such assessments, the review team is not required to accept the conclusions provided by the Regional Entities. Instead, the review team is expected, based on their expertise, to reach their own independent conclusions about the status of the adequacy of the generation and bulk power transmission systems of North America.

   The review team also shall strive to achieve consensus in their assessments. The assessments that are made are based on the best information available at the time. However, since judgment is applied to this information, legitimate differences of opinion can develop. Despite these differences, the review team shall work to achieve consensus on their findings.

   In addition to providing long-term and seasonal assessments in connection with the Reliability Assessment Program, the review team of experts shall also be responsible for recommending new and revised Reliability Standards related to the reliability assessments and the reliability of the Bulk Power Systems. These proposals for new or revised Reliability Standards shall be entered into NERC's Reliability Standards development process.

   Upon completion of the assessment, the team shall share the results with the Regional Entities. The Regional Entities shall be given the opportunity to review and comment on the conclusions in the assessment and to provide additional information as appropriate. The reliability assessments and their conclusions are the responsibility of NERC's technical review team and NERC.

   The preparation and approval of NERC's reliability assessment reports shall follow a prescribed schedule including review, comment, and possible approval by appropriate NERC committees. The long-term and seasonal (summer and winter) reliability assessment reports shall be further reviewed for approval by the Board for publication to the electric industry.

806. Scope of the Reliability Performance and Analysis Program

The components of the program will include analysis of large-scale outages, disturbances, and near misses to determine root causes and lessons learned; identification and continuous monitoring of performance indices to detect emerging trends and signs of a decline in reliability performance; and communications of performance results, trends, recommendations, and initiatives to those responsible to take actions; followed with confirmation of actions to correct any deficiencies identified. Within NERC, the reliability performance program will provide performance results to the Reliability Standards Development and Compliance Monitoring and Enforcement Programs to make the necessary adjustments to preserve reliability based on a risk-based approach.

807. Analysis of Major Events

Responding to major events affecting the Bulk Power System such as significant losses of Load or generation, significant Bulk Power System disturbances, or other emergencies on the Bulk Power System, can be divided into four phases: situational assessment and communications; situation tracking and communications; data collection, investigation, analysis, and reporting; and follow-up on recommendations.

1. NERC's role following a major event is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the major event. Working closely with the Regional Entities and Reliability Coordinators, and other appropriate Registered Entities, NERC will coordinate and facilitate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

2. When responding to any major event where physical or cyber security is suspected as a cause or contributing factor to the major event, NERC will immediately notify appropriate government agencies and coordinate its activities with them.

3. To the extent that a Reliability Standard sets forth specific criteria and procedures for reporting the Bulk Power System disturbances and events described in that Reliability Standard, all Registered Entities that are subject to the Requirements of that Reliability Standard must report the information required by that Reliability Standard within the time periods specified. In addition to reporting information as required by applicable Reliability Standards, each user, owner, and operator of the Bulk Power System shall also provide NERC and the applicable Regional Entities with such additional information requested by NERC or the applicable Regional Entity as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

4. During the conduct of NERC analyses, assistance may be needed from government agencies. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; investigations related to possible criminal or terrorist involvement in the major event; resources for initial data gathering immediately after the major

event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies.

5. NERC shall work with all other participants to establish a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the investigation and reporting of findings, conclusions, and recommendations related to major events with the objective of avoiding, to the extent possible, multiple investigations of the same major event. If the major event is confined to a single Regional Entity, NERC representatives will participate as members of the Regional Entity analysis team. NERC will establish, maintain, and revise from time to time as appropriate based on experience, a manual setting forth procedures and protocols for communications and sharing and exchange of information between and among NERC, the affected Regional Entity or Entities, and relevant governmental authorities, industry organizations and Bulk Power System user, owners, and operators concerning the investigation and analysis of major events.

6. NERC and applicable entity(s) will apply, as appropriate to the circumstances of the major event, the NERC *Blackout and Disturbance Response Procedures*, which are incorporated into these Rules of Procedure as **Appendix 8**. These procedures provide a framework to guide NERC's response to major events that may have multiregional, national, or international implications. Experienced industry leadership shall be applied to tailor the response to the specific circumstances of the major event. In accordance with those procedures, the NERC president will determine whether the major event warrants analysis at the NERC level. A Regional Entity may request that NERC elevate any analysis of a major event to the NERC level.

7. NERC will screen and analyze the findings and recommendations from the analysis, and those with generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with Section 810.

808. Analysis of Off-Normal Occurrences, Bulk Power System Performance, and Bulk Power System Vulnerabilities

1. NERC and Regional Entities will analyze Bulk Power System and equipment performance occurrences that do not rise to the level of a major event, as described in Section 807. NERC and Regional Entities will also analyze potential vulnerabilities in the Bulk Power System that they discover or that are brought to their attention by other sources including government agencies. The purpose of these analyses is to identify the root causes of occurrences or conditions that may be precursors of major events or other potentially more serious occurrences, or that have the potential to cause major events or other more serious occurrences, to assess past reliability performance for lessons learned, and to develop reliability performance benchmarks and trends.

2. NERC and Regional Entities will screen and analyze off-normal occurrences, Bulk Power System performance, and potential Bulk Power System vulnerabilities for significance, and information from those indicated as having generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with Section 810.

3. To the extent that a Reliability Standard sets forth specific criteria and procedures for reporting the Bulk Power System disturbances and events described in that Reliability Standard, all Registered Entities that are subject to the Requirements of that Reliability Standard must report the information required by that Reliability Standard within the time periods specified. In addition to reporting information as required by applicable Reliability Standards, each user, owner, and operator, of the Bulk Power System shall provide NERC and the applicable Regional Entities with such additional information requested by NERC or the applicable Regional Entities as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

809. Reliability Benchmarking

NERC shall identify and track key reliability indicators as a means of benchmarking reliability performance and measuring reliability improvements. This program will include assessing available metrics, developing guidelines for acceptable metrics, maintaining a performance metrics "dashboard" on the NERC website, and developing appropriate reliability performance benchmarks.

810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions

1. Members of NERC and Bulk Power System owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.

2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the Reliability Assessment Program.

3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:

3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the Bulk Power System of findings and lessons learned;

3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of

owners, operators, and users of the Bulk Power System according to each entity's facts and circumstances;

3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the Bulk Power System to take to ensure the reliability of the Bulk Power System. Such Essential Actions require NERC Board approval before issuance.

4. The Bulk Power System owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such Bulk Power System owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.

5. NERC will advise the Commission and other Applicable Governmental Authorities of its intent to issue all Level 1 (Advisories), Level 2 (Recommendations), and Level 3 (Essential Actions) at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other Applicable Governmental Authorities no later than thirty (30) days following the date by which NERC has requested the Bulk Power System owners, operators, and users to which a Level 2 (Recommendation) or Level 3 (Essential Action) issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other Applicable Governmental Authorities will describe the actions taken by the relevant owners, operators, and users of the Bulk Power System and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for Confidential Information or Critical Energy Infrastructure Information.

811. Equipment Performance Data

Through its Generating Availability Data System (GADS), NERC shall collect operating information about the performance of electric generating equipment; provide assistance to those researching information on power plant outages stored in its database; and support equipment reliability as well as availability analyses and other decision-making processes developed by GADS subscribers. GADS data is also used in conducting assessments of generation resource adequacy.

SECTION 900 — TRAINING AND EDUCATION

901. Scope of the Training and Education Program

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires informed and trained personnel. The training and education program will provide the education and training necessary for Bulk Power System personnel and regulators to obtain the essential knowledge necessary to understand and operate the Bulk Electric System.

NERC shall develop and maintain training and education programs for the purpose of establishing training requirements, developing materials, and developing training activities. The target audience of the training and education programs shall be Bulk Power System operating personnel including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, training personnel, and other personnel directly responsible for complying with NERC Reliability Standards who, through their actions or inactions, may impact the real-time, or day-ahead reliability of the Bulk Power System.

NERC shall also develop and provide appropriate training and education for industry participants and regulators affected by new or changed Reliability Standards or compliance Requirements.

To accomplish those objectives:

1. NERC shall periodically conduct job task analyses for targeted Bulk Power System personnel to ensure that the training program content is properly aligned to the job tasks performed by those personnel.

2. NERC shall develop and maintain personnel training program curriculum requirements based on valid job-task analysis.

3. NERC shall periodically conduct performance surveys to determine the effectiveness of the training program and identify areas for further training development and improvement.

4. NERC shall develop training and education materials and activities to assist Bulk Power System entities implementing new or revised Reliability Standard Requirements or other NERC-related changes.

5. NERC shall develop and provide training to people who participate in NERC and Regional Entity evaluations, audits, and investigations for the Compliance Monitoring and Enforcement Program, Organization Certification Program, and the continuing education program.

902. Continuing Education Program

NERC shall develop and maintain a continuing education program to foster the improvement of training and to promote quality in the training programs used by and

implemented by Bulk Power System entities. The program shall approve or accredit those activities and entities meeting NERC continuing education requirements.

1. NERC shall develop and implement continuing education program requirements that promote excellence in training programs and advance improved performance for Bulk Power System personnel identified in Section 901.

2. NERC shall develop and maintain a process to approve or accredit continuing education Providers and activities seeking approval or accreditation and meeting NERC-approved continuing education requirements.

3. NERC shall perform periodic audits on continuing education Providers and training activities to ensure that the approved or accredited Providers and training activities satisfy NERC continuing education requirements.

4. NERC shall develop and maintain an appeals process for disputed application reviews, interpretations of guidelines and standards, probation or suspension of NERC-approved Provider status, or Continuing Education Hour disputes.

SECTION 1000 — SITUATION AWARENESS AND INFRASTRUCTURE SECURITY

1001. Situation Awareness

NERC shall through the use of Reliability Coordinators and available tools, monitor present conditions on the Bulk Power System and provide leadership coordination, technical expertise, and assistance to the industry in responding to events as necessary. To accomplish these goals, NERC will:

1. Maintain real-time situation awareness of conditions on the Bulk Power System;

2. Notify the industry of significant Bulk Power System events that have occurred in one area, and which have the potential to impact reliability in other areas;

3. Maintain and strengthen high-level communication, coordination, and cooperation with governments and government agencies regarding real-time conditions; and

4. Enable the Reliable Operation of interconnected Bulk Power Systems by facilitating information exchange and coordination among reliability service organizations.

1002. Reliability Support Services

NERC may assist in the development of tools and other support services for the benefit of Reliability Coordinators and other system operators to enhance reliability, operations and planning. NERC will work with the industry to identify new tools, collaboratively develop requirements, support development, provide an incubation period, and at the end of that period, transition the tool or service to another group or owner for long term operation of the tool or provision of the service. To accomplish this goal, NERC will:

1. Collaborate with industry to determine the necessity of new tools or services to enhance reliability;

2. For those tools that the collaborative process determines should proceed to a development phase, provide a start-up mechanism and development system;

3. Implement the tool either on its own or through an appropriate group or organization; and

4. Where NERC conducts the implementation phase of a new tool or service, develop a transition plan to turn maintenance and provision of the tool or service over to an organization identified in the development stage.

In addition to tools developed as a result of a collaborative process with industry, NERC may develop reliability tools on its own, but will consult with industry concerning the need for the tool prior to proceeding to development.

Tools and services being maintained by NERC as of January 1, 2012, will be reviewed and, as warranted, transitioned to an appropriate industry group or organization. NERC will develop and maintain a strategic reliability tools plan that will list the tools and services being maintained by NERC, and, where applicable, the plans for transition to an appropriate industry group or organization.

1003. Infrastructure Security Program

NERC shall coordinate electric industry activities to promote Critical Infrastructure protection of the Bulk Power System in North America by taking a leadership role in Critical Infrastructure protection of the electricity sector so as to reduce vulnerability and improve mitigation and protection of the electricity sector's Critical Infrastructure. To accomplish these goals, NERC shall perform the following functions.

1. Electric Sector Information Sharing and Analysis Center (ESISAC)

    1.1 NERC shall serve as the electricity sector's sector coordinator and operate its Information Sharing and Analysis Center to gather information and communicate security-related threats and incidents within the sector, with United States and Canadian government agencies, and with other Critical Infrastructure sectors.

    1.2 NERC shall improve the capability of the ESISAC to analyze security threats and incident information and provide situational assessments for the electricity sector and governments.

    1.3 NERC shall work closely with the United States Department of Homeland Security, Department of Energy, Natural Resources Canada, and Public Safety and Emergency Preparedness Canada.

    1.4 NERC shall strengthen and expand these functions and working relationships with the electricity sector, other Critical Infrastructure industries, governments, and government agencies throughout North America to ensure the protection of the infrastructure of the Bulk Power System.

    1.5 NERC shall fill the role of the Electricity Sector Coordinating Council and coordinate with the Government Coordinating Council.

    1.6 NERC shall coordinate with other Critical Infrastructure sectors through active participation with the other Sector Coordinating Councils, the other ISACs, and the National Infrastructure Advisory Committee.

    1.7 NERC shall encourage and participate in coordinated Critical Infrastructure protection exercises, including interdependencies with other Critical Infrastructure sectors.

2. Security Planning

2.1 NERC shall take a risk management approach to Critical Infrastructure protection, considering probability and severity, and recognizing that mitigation and recovery can be practical alternatives to prevention.

2.2 NERC shall keep abreast of the changing threat environment through collaboration with government agencies.

2.3 NERC shall develop criteria to identify critical physical assets and Critical Cyber Assets, assess security threats, identify risk assessment methodologies, and assess effectiveness of physical and cyber protection measures.

2.4 NERC shall enhance and maintain the Bulk Power System critical spare transformer program, encourage increased participation by asset owners, and continue to assess the need to expand this program to include other critical Bulk Power System equipment.

2.5 NERC shall support implementation of the Critical Infrastructure Protection Standards through education and outreach.

2.6 NERC shall review and improve existing security guidelines, develop new security guidelines to meet the needs of the electricity sector, and consider whether any guidelines should be developed into Reliability Standards.

2.7 NERC shall conduct education and outreach initiatives to increase awareness and respond to the needs of the electricity sector.

2.8 NERC shall strengthen relationships with federal, state, and provincial government agencies on Critical Infrastructure protection matters.

2.9 NERC shall maintain and improve mechanisms for the sharing of sensitive or classified information with federal, state, and provincial government agencies on Critical Infrastructure protection matters; work with DOE and DHS to implement the National Infrastructure Protection Plan, as applicable to the electricity sector; and coordinate this work with PSEPC.

2.10 NERC shall improve methods to better assess the impact of a possible physical attack on the Bulk Power System and means to deter, mitigate, and respond following an attack.

2.11 NERC shall assess the results of vulnerability assessments and enhance the security of system control and data acquisition (SCADA) and process control systems by developing methods to detect an emerging cyber attack and the means to mitigate impacts on the Bulk Power Systems.

2.12 NERC shall work with the National SCADA Test Bed and the Process Control Systems Forum to accelerate the development of technology that

will enhance the security, safety, and reliability of process control and SCADA systems.

SECTION 1100 — ANNUAL NERC BUSINESS PLANS AND BUDGETS

1101. Scope of Business Plans and Budgets

The Board shall determine the content of the budgets to be submitted to the Applicable Governmental Authorities with consultation from the members of the Member Representatives Committee, Regional Entities, and others in accordance with the Bylaws. The Board shall identify any activities outside the scope of NERC's statutory reliability functions, if any, and the appropriate funding mechanisms for those activities.

1102. NERC Funding and Cost Allocation

1. In order that NERC's costs shall be fairly allocated among Interconnections and among Regional Entities, the NERC funding mechanism for all statutory functions shall be based on Net Energy for Load (NEL).

2. NERC's costs shall be allocated so that all Load (or, in the case of costs for an Interconnection or Regional Entity, all Load within that Interconnection or Regional Entity) bears an equitable share of such costs based on NEL.

3. Costs shall be equitably allocated between countries or Regional Entities thereof for which NERC has been designated or recognized as the Electric Reliability Organization.

4. Costs incurred to accomplish the statutory functions for one Interconnection, Regional Entity, or group of entities will be directly assigned to that Interconnection, Regional Entity, or group of entities provided that such costs are allocated equitably to end-users based on Net Energy for Load.

1103. NERC Budget Development

1. The NERC annual budget process shall be scheduled and conducted for each calendar year so as to allow a sufficient amount of time for NERC to receive Member inputs, develop the budget, and receive Board and, where authorized by applicable legislation or agreement, Applicable Governmental Authority approval of the NERC budget for the following fiscal year, including timely submission of the proposed budget to FERC for approval in accordance with FERC regulations.

2. The NERC budget submittal to Applicable Governmental Authorities shall include provisions for all ERO functions, all Regional Entity delegated functions as specified in delegation agreements and reasonable reserves and contingencies.

3. The NERC annual budget submittal to Applicable Governmental Authorities shall include description and explanation of NERC's proposed ERO program activities for the year; budget component justification based on statutory or other authorities; explanation of how each budgeted activity lends itself to the accomplishment of the statutory or other authorities; sufficiency of resources

provided for in the budget to carry out the ERO program responsibilities; explanation of the calculations and budget estimates; identification and explanation of changes in budget components from the previous year's budget; information on staffing and organization charts; and such other information as is required by FERC and other Applicable Governmental Authorities having authority to approve the proposed budget.

4. NERC shall develop, in consultation with the Regional Entities, a reasonable and consistent system of accounts, to allow a meaningful comparison of actual results at the NERC and Regional Entity level by the Applicable Governmental Authorities.

1104. Submittal of Regional Entity Budgets to NERC

1. Each Regional Entity shall submit its proposed annual budget for carrying out its delegated authority functions as well as all other activities and funding to NERC in accordance with a schedule developed by NERC and the Regional Entities, which shall provide for the Regional Entity to submit its final budget that has been approved by its board of directors or other governing body no later than July 1 of the prior year, in order to provide sufficient time for NERC's review and comment on the proposed budget and approval of the Regional Entity budget by the NERC Board of Trustees in time for the NERC and Regional Entity budgets to be submitted to FERC and other Applicable Governmental Authorities for approval in accordance with their regulations. The Regional Entity's budget shall include supporting materials in accordance with the budget and reporting format developed by NERC and the Regional Entities, including the Regional Entity's complete business plan and organization chart, explaining the proposed collection of all dues, fees, and charges and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

2. NERC shall review and approve each Regional Entity's budget for meeting the requirements of its delegated authority. Concurrent with approving the NERC budget, NERC shall review and approve, or reject, each Regional Entity budget for filing.

3. NERC shall also have the right to review from time to time, in reasonable intervals but no less frequently than every three years, the financial books and records of each Regional Entity having delegated authority in order to ensure that the documentation fairly represents in all material aspects appropriate funding of delegated functions.

1105. Submittal of NERC and Regional Entity Budgets to Governmental Authorities for Approval

1. NERC shall file for approval by the Applicable Governmental Authorities at least 130 days in advance of the start of each fiscal year. The filing shall include: (1) the complete NERC and Regional Entity budgets including the business plans and organizational charts approved by the Board, (2) NERC's annual funding requirement (including Regional Entity costs for delegated functions), and (3) the

mechanism for assessing charges to recover that annual funding requirement, together with supporting materials in sufficient detail to support the requested funding requirement.

2. NERC shall seek approval from each Applicable Governmental Authority requiring such approval for the funding requirements necessary to perform ERO activities within their jurisdictions.

1106. NERC and Regional Entity Billing and Collections

1. NERC shall request the Regional Entities to identify all Load-Serving Entities[3] within each Regional Entity and the NEL assigned to each Load-Serving Entity, and the Regional Entities shall supply the requested information. The assignment of a funding requirement to an entity shall not be the basis for determining that the entity must be registered in the Compliance Registry.

2. NERC shall accumulate the NEL by Load-Serving Entities for each Applicable Governmental Authority and submit the proportional share of NERC funding requirements to each Applicable Governmental Authority for approval together with supporting materials in sufficient detail to support the requested funding requirement.

3. NEL reported by Balancing Authorities within a Region shall be used to rationalize and validate amounts allocated for collection through Regional Entity processes.

4. The billing and collection processes shall provide:

   4.1 A clear validation of billing and application of payments.

   4.2 A minimum of data requests to those being billed.

   4.3 Adequate controls to ensure integrity in the billing determinants including identification of entities responsible for funding NERC's activities.

   4.4 Consistent billing and collection terms.

5. NERC will bill and collect all budget requirements approved by Applicable Governmental Authorities (including the funds required to support those functions assigned to the Regional Entities through the delegation agreements) directly from the Load-Serving Entities or their designees or as directed by particular Applicable Governmental Authorities, except where the Regional Entity is required to collect the budget requirements for NERC, in which case the Regional Entity will collect directly from the Load-Serving Entities or as otherwise

[3] A Regional Entity may allocate funding obligations using an alternative method approved by NERC and by FERC and other Applicable Governmental Authorities, as provided for in the regional delegation agreement.

provided by agreement and submit funds to NERC. Alternatively, a load-serving entity may pay its allocated ERO costs through a Regional Entity managed collection mechanism.

6. NERC shall set a minimum threshold limit on the billing of small LSEs to minimize the administrative burden of collection.

7. NERC shall pursue any non-payments and shall request assistance from Applicable Governmental Authorities as necessary to secure collection.

8. In the case where a Regional Entity performs the collection for ERO, the Regional Entity will not be responsible for non-payment in the event that a user, owner or operator of the Bulk Power System does not pay its share of dues, fees and charges in a timely manner, provided that such a Regional Entity shall use reasonably diligent efforts to collect dues, fees, and other charges from all entities obligated to pay them. However, any revenues not paid shall be recovered from others within the same Region to avoid cross-subsidization between Regions.

9. Both NERC and the Regional Entities also may bill members or others for functions and services not within statutory requirements or otherwise authorized by the Applicable Governmental Authorities. Costs and revenues associated with these functions and services shall be separately identified and not commingled with billings associated with the funding of NERC or of the Regional Entities for delegated activities.

1107. Penalty Applications

1. Where NERC or a Regional Entity initiates a compliance monitoring and enforcement process that leads to imposition of a Penalty, the entity that initiated the process shall receive any Penalty monies imposed and collected as a result of that process, unless a different disposition of the Penalty monies is provided for in the delegation agreement, or in a contract or a disposition of the violation that is approved by NERC and FERC.

2. All funds from financial Penalties assessed in the United States received by the entity initiating the compliance monitoring and enforcement process shall be applied as a general offset to the entity's budget requirements for the subsequent fiscal year, if received by July 1, or for the second subsequent fiscal year, if received on or after July 1. Funds from financial Penalties shall not be directly applied to any program maintained by the entity conducting the compliance monitoring and enforcement process. Funds from financial Penalties assessed against a Canadian entity shall be applied as specified by legislation or agreement.

3. In the event that a compliance monitoring and enforcement process is conducted jointly by NERC and a Regional Entity, the Regional Entity shall receive the Penalty monies and offset the Regional Entity's budget requirements for the subsequent fiscal year.

4. Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC or any other Applicable Governmental Authority.

1108. Special Assessments

On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next funding cycle, NERC shall file with the Applicable Governmental Authorities, where authorized by applicable legislation or agreement, for authorization for an amended or supplemental budget for NERC or a Regional Entity and, if necessary under the amended or supplemental budget, to collect a special or additional assessment for statutory functions of NERC or the Regional Entity. Such filing shall include supporting materials to justify the requested funding, including any departure from the approved funding formula or method.

SECTION 1200 — REGIONAL DELEGATION AGREEMENTS

1201. Pro Forma Regional Delegation Agreement

NERC shall develop and maintain a pro forma Regional Entity delegation agreement, which shall serve as the basis for negotiation of consistent agreements for the delegation of ERO functions to Regional Entities.

1202. Regional Entity Essential Requirements

NERC shall establish the essential requirements for an entity to become qualified and maintain good standing as a Regional Entity.

1203. Negotiation of Regional Delegation Agreements

NERC shall, for all areas of North America that have provided NERC with the appropriate authority, negotiate regional delegation agreements for the purpose of ensuring all areas of the North American Bulk Power Systems are within a Regional Entity Region. In the event NERC is unable to reach agreement with Regional Entities for all areas, NERC shall provide alternative means and resources for implementing NERC functions within those areas. No delegation agreement shall take effect until it has been approved by the Applicable Governmental Authority.

1204. Conformance to Rules and Terms of Regional Delegation Agreements

NERC and each Regional Entity shall comply with all applicable ERO Rules of Procedure and the obligations stated in the regional delegation agreement.

1205. Sub-delegation

The Regional Entity shall not sub-delegate any responsibilities and authorities delegated to it by its regional delegation agreement with NERC except with the approval of NERC and FERC and other Applicable Governmental Authorities. Responsibilities and authorities may only be sub-delegated to another Regional Entity. Regional Entities may share resources with one another so long as such arrangements do not result in cross-subsidization or in any sub-delegation of authorities.

1206. Nonconformance to Rules or Terms of Regional Delegation Agreement

If a Regional Entity is unable to comply or is not in compliance with an ERO Rule of Procedure or the terms of the regional delegation agreement, the Regional Entity shall immediately notify NERC in writing, describing the area of nonconformance and the reason for not being able to conform to the Rule of Procedure. NERC shall evaluate each case and inform the affected Regional Entity of the results of the evaluation. If NERC determines that a Rule of Procedure or term of the regional delegation agreement has been violated by a Regional Entity or cannot practically be implemented by a Regional Entity, NERC shall notify the Applicable Governmental Authorities and take any actions necessary to address the situation.

1207. Regional Entity Audits

Approximately every five years and more frequently if necessary for cause, NERC shall audit each Regional Entity to verify that the Regional Entity continues to comply with NERC Rules of Procedure and the obligations of NERC delegation agreement. Audits of Regional Entities shall be conducted, to the extent practical, based on professional auditing standards recognized in the U.S., including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, and if applicable to the coverage of the audit, may be based on Canadian or other international standards. The audits required by this Section 1207 shall not duplicate the audits of Regional Entity Compliance Monitoring and Enforcement Programs provided for in **Appendix 4A**, Audit of Regional Compliance Programs, to these Rules of Procedure.

1208. Process for Considering Registered Entity Requests to Transfer to Another Regional Entity

1. A Registered Entity that is registered in the Region of one Regional Entity and believes its registration should be transferred to a different Regional Entity may submit a written request to both Regional Entities requesting that they process the proposed transfer in accordance with this section. The Registered Entity's written request shall set forth the reasons the Registered Entity believes justify the proposed transfer and shall describe any impacts of the proposed transfer on other Bulk Power System owners, operators, and users.

2. After receiving the Registered Entity's written request, the two Regional Entities shall consult with each other as to whether they agree or disagree that the requested transfer is appropriate. The Regional Entities may also consult with affected Reliability Coordinators, Balancing Authorities and Transmission Operators as appropriate. Each Regional Entity shall post the request on its website for public comment period of 21 days. In evaluating the proposed transfer, the Regional Entities shall consider the location of the Registered Entity's Bulk Power System facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators; and users, the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments to other Load-Serving Entities of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity would be transitioned from the current Regional Entity to the transferee Regional Entity; along with any other reasons for the proposed transfer stated by the Registered Entity and any other reasons either Regional Entity considers relevant. The Regional Entities may

request that the Registered Entity provide additional data and information concerning the proposed transfer for the Regional Entities' use in their evaluation. The Registered Entity's current Regional Entity shall notify the Registered Entity in writing as to whether (i) the two Regional Entities agree that the requested transfer is appropriate, (ii) the two Regional Entities agree that the requested transfer is not appropriate and should not be processed further, or (iii) the two Regional Entities disagree as to whether the proposed transfer is appropriate.

3. If the two Regional Entities agree that the requested transfer is appropriate, they shall submit a joint written request to NERC requesting that the proposed transfer be approved and that the delegation agreement between NERC and each of the Regional Entities be amended accordingly. The Regional Entities' joint written submission to NERC shall describe the reasons for the proposed transfer; the location of the Registered Entity's Bulk Power System Facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators, and users; the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity will be transitioned from the current Regional Entity to the transferee Regional Entity. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

4. If the two Regional Entities do not agree with each other that the proposed transfer is appropriate, the Regional Entity supporting the proposed transfer shall, if requested by the Registered Entity, submit a written request to NERC to approve the transfer and the related delegation agreement amendments. The Regional Entity's written request shall include the information specified in Section 1208.3. The Regional Entity that does not believe the proposed transfer is appropriate will be allowed to submit a written statement to NERC explaining why the Regional Entity believes the transfer is not appropriate and should not be approved. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional

information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

5. Prior to action by the NERC Board of Trustees on a proposed transfer of registration under Section 1208.3 or 1208.4, NERC shall post information concerning the proposed transfer, including the submissions from the Regional Entities, on its website for at least twenty-one (21) days for the purpose of receiving public comment.

6. If the NERC Board of Trustees disapproves a proposed transfer presented to it pursuant to either Section 1208.3 or 1208.4, the Regional Entity or Regional Entities that believe the transfer is appropriate may, if requested to do so by the Registered Entity, file a petition with FERC pursuant to 18 C.F.R. section 39.8(f) and (g) requesting that FERC order amendments to the delegation agreements of the two Regional Entities to effectuate the proposed transfer.

7. No transfer of a Registered Entity from one Regional Entity to another Regional Entity shall be effective (i) unless approved by FERC, and (ii) any earlier than the first day of January of the second calendar year following approval by FERC, unless an earlier effective date is agreed to by both Regional Entities and NERC and approved by FERC.

SECTION 1300 — COMMITTEES

1301. Establishing Standing Committees

The Board may from time to time create standing committees. In doing so, the Board shall approve the charter of each committee and assign specific authority to each committee necessary to conduct business within that charter. Each standing committee shall work within its Board-approved charter and shall be accountable to the Board for performance of its Board-assigned responsibilities. A NERC standing committee may not delegate its assigned work to a member forum, but, in its deliberations, may request the opinions of and consider the recommendations of a member forum.

1302. Committee Membership

Each committee shall have a defined membership composition that is explained in its charter. Committee membership may be unique to each committee, and can provide for balanced decision-making by providing for representatives from each Sector or, where Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area. Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate Net Energy for Load. All committees and other subgroups (except for those organized on other than a Sector basis because Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area) must ensure that no two stakeholder Sectors are able to control the vote on any matter, and no single Sector is able to defeat a matter. With regard to committees and subgroups pertaining to development of, interpretation of, or compliance with Reliability Standards, NERC shall provide a reasonable opportunity for membership from Sectors desiring to participate. Committees and subgroups organized on other than a Sector basis shall be reported to the NERC Board and the Member Representatives Committee, along with the reasons for constituting the committee or subgroup in the manner chosen. In such cases and subject to reasonable restrictions necessary to accomplish the mission of such committee or subgroup, NERC shall provide a reasonable opportunity for additional participation, as members or official observers, for Sectors not represented on the committee or subgroup.

1303. Procedures for Appointing Committee Members

Committee members shall be nominated and selected in a manner that is open, inclusive, and fair. Unless otherwise stated in these Rules of Procedure or approved by the Board, all committee member appointments shall be approved by the board, and committee officers shall be appointed by the Chairman of the Board.

1304. Procedures for Conduct of Committee Business

1. Notice to the public of the dates, places, and times of meetings of all committees, and all nonconfidential material provided to committee members, shall be posted

on NERC's website at approximately the same time that notice is given to committee members. Meetings of all standing committees shall be open to the public, subject to reasonable limitations due to the availability and size of meeting facilities; provided that the meeting may be held in or adjourn to closed session to discuss matters of a confidential nature, including but not limited to personnel matters, compliance enforcement matters, litigation, or commercially sensitive or Critical Energy Infrastructure Information of any entity.

2. NERC shall maintain a set of procedures, approved by the Board, to guide the conduct of business by standing committees.

1305. Committee Subgroups

Standing committees may appoint subgroups using the same principles as in Section 1302.

SECTION 1400 — AMENDMENTS TO THE NERC RULES OF PROCEDURE

1401. Proposals for Amendment or Repeal of Rules of Procedure

In accordance with the Bylaws of NERC, requests to amend or repeal the Rules of Procedure may be submitted by (1) any fifty Members of NERC, which number shall include Members from at least three membership Sectors, (2) the Member Representatives Committee, (3) a committee of NERC to whose function and purpose the Rule of Procedure pertains, or (4) an officer of NERC.

1402. Approval of Amendment or Repeal of Rules of Procedure

Amendment to or repeal of Rules of Procedure shall be approved by the Board after public notice and opportunity for comment in accordance with the Bylaws of NERC. In approving changes to the Rules of Procedure, the Board shall consider the inputs of the Member Representatives Committee, other ERO committees affected by the particular changes to the Rules of Procedure, and other stakeholders as appropriate. After Board approval, the amendment or repeal shall be submitted to the Applicable Governmental Authorities for approval, where authorized by legislation or agreement. No amendment to or repeal of the Rules of Procedure shall be effective until it has been approved by the Applicable Governmental Authorities.

SECTION 1500 — CONFIDENTIAL INFORMATION

1501. Definitions

1. **Confidential Information** means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition.

2. **Confidential Business and Market Information** means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

3. **Critical Energy Infrastructure Information** means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

4. **Critical Infrastructure** means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

5. **Cyber Security Incident Information** means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

1502. Protection of Confidential Information

1. **Identification of Confidential Information** — An owner, operator, or user of the Bulk Power System and any other party (the "Submitting Entity") shall mark as confidential any information that it submits to NERC or a Regional Entity (the "Receiving Entity") that it reasonably believes contains Confidential Information as defined by these Rules of Procedure, indicating the category or categories defined in Section 1501 in which the information falls. If the information is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the Submitting Entity shall so indicate and provide supporting references and details.

2. **Confidentiality** — Except as provided herein, a Receiving Entity shall keep in confidence and not copy, disclose, or distribute any Confidential Information or

any part thereof without the permission of the Submitting Entity, except as otherwise legally required.

3. **Information no longer Confidential –** If a Submitting Entity concludes that information for which it had sought confidential treatment no longer qualifies for that treatment, the Submitting Entity shall promptly so notify NERC or the relevant Regional Entity.

1503. Requests for Information

1. **Limitation** — A Receiving Entity shall make information available only to one with a demonstrated need for access to the information from the Receiving Entity.

2. **Form of Request** — A person with such a need may request access to information by using the following procedure:

   2.1 The request must be in writing and clearly marked "Request for Information."

   2.2 The request must identify the individual or entity that will use the information, explain the requester's need for access to the information, explain how the requester will use the information in furtherance of that need, and state whether the information is publicly available or available from another source or through another means. If the requester seeks access to information that is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the requester shall describe how it qualifies to receive such information.

   2.3 The request must stipulate that, if the requester does not seek public disclosure, the requester will maintain as confidential any information received for which a Submitting Party has made a claim of confidentiality in accordance with NERC's rules. As a condition to gaining access to such information, a requester shall execute a non-disclosure agreement in a form approved by NERC's Board of Trustees.

3. **Notice and Opportunity for Comment** — Prior to any decision to disclose information marked as confidential, the Receiving Entity shall provide written notice to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed. Failure to provide such comments or otherwise respond is not deemed waiver of the claim of confidentiality.

4. **Determination by ERO or Regional Entity** — Based on the information provided by the requester under Rule 1503.2, any comments provided by the Submitting Entity, and any other relevant available information, the chief

executive officer or his or her designee of the Receiving Entity shall determine whether to disclose such information.

5. **Appeal** — A person whose request for information is denied in whole or part may appeal that determination to the President of NERC (or the President's designee) within 30 days of the determination. Appeals filed pursuant to this Section must be in writing, addressed to the President of NERC (or the President's designee), and clearly marked "Appeal of Information Request Denial."

   NERC will provide written notice of such appeal to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed; provided that any such comments must be received within 30 days of the notice and any failure to provide such comments or otherwise respond is not deemed a waiver of the claim of confidentiality.

   The President of NERC (or the President's designee) will make a determination with respect to any appeal within 30 days. In unusual circumstances, this time limit may be extended by the President of NERC (or the President's designee), who will send written notice to the requester setting forth the reasons for the extension and the date on which a determination on the appeal is expected.

6. **Disclosure of Information** — In the event the Receiving Entity, after following the procedures herein, determines to disclose information designated as Confidential Information, it shall provide the Submitting Entity no fewer than 21 days' written notice prior to releasing the Confidential Information in order to enable such Submitting Entity to (a) seek an appropriate protective order or other remedy, (b) consult with the Receiving Entity with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Section. Should a Receiving Entity be required to disclose Confidential Information, or should the Submitting Entity waive objection to disclosure, the Receiving Entity shall furnish only that portion of the Confidential Information which the Receiving Entity's counsel advises is legally required.

7. **Posting of Determinations on Requests for Disclosure of Confidential Information** — Upon making its determination on a request for disclosure of Confidential Information, NERC or the Regional Entity, as applicable, shall (i) notify the requester that the request for disclosure is granted or denied, (ii) publicly post any determination to deny the request to disclose Confidential Information, including in such posting an explanation of the reasons for the denial (but without in such explanation disclosing the Confidential Information), and (iii) publicly post any determination that information claimed by the Submitting Entity to be Confidential Information is not Confidential Information (but without in such posting disclosing any information that has been determined to be Confidential Information).

1504. Employees, Contractors and Agents

A Receiving Entity shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom Confidential Information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

1505. Provision of Information to FERC and Other Governmental Authorities

1. **Request** — A request from FERC for reliability information with respect to owners, operators, and users of the Bulk Power System within the United States is authorized by Section 215 of the Federal Power Act. Other Applicable Governmental Authorities may have similar authorizing legislation that grants a right of access to such information. Unless otherwise directed by FERC or its staff or the other Applicable Governmental Authority requesting the information, upon receiving such a request, a Receiving Entity shall provide contemporaneous notice to the applicable Submitting Entity. In its response to such a request, a Receiving Entity shall preserve any mark of confidentiality and shall notify FERC or other Applicable Governmental Authorities that the Submitting Entity has marked the information as confidential.

2. **Continued Confidentiality** — Each Receiving Entity shall continue to treat as confidential all Confidential Information that it has submitted to NERC or to FERC or another Applicable Governmental Authority, until such time as FERC or the other Applicable Governmental Authority authorizes disclosure of such information.

1506. Permitted Disclosures

1. **Confirmed Violations** — Nothing in this Section 1500 shall prohibit the disclosure of a violation at the point when the matter is filed with an Applicable Governmental Authority as a Notice of Penalty, the "violator" admits to the violation, or the alleged violator and NERC or the Regional Entity reach a settlement regarding the violation.

2. **Compliance Information** — NERC and the Regional Entities are authorized to exchange Confidential Information related to evaluations, Compliance Audits, and Compliance Investigations in furtherance of the Compliance Monitoring and Enforcement Program, on condition they continue to maintain the confidentiality of such information.

1507. Remedies for Improper Disclosure

Any person engaged in NERC or Regional Entity activity under Section 215 of the Federal Power Act or the equivalent laws of other Applicable Governmental Authorities who improperly discloses information determined to be confidential may lose access to Confidential Information on a temporary or permanent basis and may be subject to adverse personnel action, including suspension or termination. Nothing in Section 1500

precludes an entity whose information was improperly disclosed from seeking a remedy in an appropriate court.

SECTION 1600 — REQUESTS FOR DATA OR INFORMATION

1601. Scope of a NERC or Regional Entity Request for Data or Information

Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these Rules of Procedure and as may be granted by Applicable Governmental Authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to Requirements contained in any Reliability Standard to provide data or information; the Requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.

1602. Procedure for Authorizing a NERC Request for Data or Information

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in Section 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with Section 1602.2 or issuing the request or modification to Reporting Entities following approval by the Board of Trustees.

2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.

    2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "Confidential Information," "Critical Energy Infrastructure Information," "aggregating" or "identity masking"); and (vi) an estimate of the relative burden

imposed on the Reporting Entities to accommodate the data or information request.

2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the Reporting Entities to accommodate the modified data or information request, and (iii) any other items from Section 1602.2.1 that require updating as a result of the modifications.

3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.

4. In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.

5. NERC may make minor changes to an authorized request for data or information without Board approval. However, if a Reporting Entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.

6. Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the Applicable Governmental Authority.

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the Bulk Power System registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a Reporting Entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the Reporting Entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1604. Requests by Regional Entity for Data or Information

1. A Regional Entity may request that NERC seek authorization for a request for data or information to be applicable within the Region of the Regional Entity, either as a freestanding request or as part of a proposed NERC request for data or information. Any such request must be consistent with this Section 1600.

2. A Regional Entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural

elements as are included in this Section 1600. Any such Regional Entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other Applicable Governmental Authorities applicable to the Regional Entity. The Regional Entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other Applicable Governmental Authority.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the Bulk Power System, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.

4. The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the Applicable Governmental Authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's website.

SECTION 1700 — CHALLENGES TO DETERMINATIONS

1701. Scope of Authority

Section 1702 sets forth the procedures to be followed for Registered Entities to challenge determinations made by Planning Coordinators under Reliability Standard PRC-023. Section 1703 sets forth the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

1702. Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023

1. This Section 1702 establishes the procedures to be followed when a Registered Entity wishes to challenge a determination by a Planning Coordinator of the sub-200 kV circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers (defined as "Registered Entities" for purposes of this Section 1702) must comply with the requirements of Reliability Standard PRC-023.

2. Planning Coordinator Procedures

   2.1 Each Planning Coordinator shall establish a procedure for a Registered Entity to submit a written request for an explanation of a determination made by the Planning Coordinator under PRC-023.

   2.2 A Registered Entity shall follow the procedure established by the Planning Coordinator for submitting the request for explanation and must submit any such request within 60 days of receiving the determination under PRC-023 from the Planning Coordinator.

   2.3 Within 30 days of receiving a written request from a Registered Entity, the Planning Coordinator shall provide the Registered Entity with a written explanation of the basis for its determination under PRC-023, unless the Planning Coordinator provided a written explanation of the basis for its determination when it initially informed the Registered Entity of its determination.

3. A Registered Entity may challenge the determination of the Planning Coordinator by filing with the appropriate Regional Entity, with a copy to the Planning Coordinator, within 60 days of receiving the written explanation from the Planning Coordinator. The challenge shall include the following: (a) an explanation of the technical reasons for its disagreement with the Planning Coordinator's determination, along with any supporting documentation, and (b) a copy of the Planning Coordinator's written explanation. Within 30 days of receipt of a challenge, the Planning Coordinator may file a response to the Regional Entity, with a copy to the Registered Entity.

4. The filing of a challenge in good faith shall toll the time period for compliance with PRC-023 with respect to the subject facility until such time as the challenge is withdrawn, settled or resolved.

5. The Regional Entity shall issue its written decision setting forth the basis of its determination within 90 days after it receives the challenge and send copies of the decision to the Registered Entity and the Planning Coordinator. The Regional Entity may convene a meeting of the involved entities and may request additional information. The Regional Entity shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

6. A Planning Coordinator or Registered Entity affected by the decision of the Regional Entity may, within 30 days of the decision, file an appeal with NERC, with copies to the Regional Entity and the Planning Coordinator or Registered Entity. The appeal shall state the basis of the objection to the decision of the Regional Entity and shall include the Regional Entity decision, the written explanation of the Planning Coordinator's determination under PRC-023, and the documents and reasoning filed by the Registered Entity with the Regional Entity in support of its objection. The Regional Entity, Planning Coordinator or Registered Entity may file a response to the appeal within 30 days of the appeal.

7. The Board of Trustees shall appoint a panel to decide appeals from Regional Entity decisions under Section 1702.5. The panel, which may contain alternates, shall consist of at least three appointees, one of whom must be a member of the NERC staff, who are knowledgeable about PRC-023 and transmission planning and do not have a direct financial or business interest in the outcome of the appeal. The panel shall decide the appeal within 90 days of receiving the appeal from the decision of the Regional Entity and shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

8. The Planning Coordinator or Registered Entity affected by the decision of the panel may request that the Board of Trustees review the decision by filing its request for review and a statement of reasons with NERC's Chief Reliability Officer within 30 days of the panel decision. The Board of Trustees may, in its discretion, decline to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. Within 90 days of the request for review under this Section 1702.8, the Board of Trustees may either (a) issue a decision on the merits, which shall be the final NERC decision, or (b) issue a notice declining to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. If no written decision or notice declining review is issued within 90 calendar days, the appeal shall be deemed to have been denied by the Board of Trustees and this will have the same effect as a notice declining review.

9. The Registered Entity or Planning Coordinator may appeal the final NERC decision to the Applicable Governmental Authority within 30 days of receipt of

the Board of Trustees' final decision or notice declining review, or expiration of the 90-day review period without any action by NERC.

10. The Planning Coordinator and Registered Entity are encouraged, but not required, to meet to resolve any dispute, including use of mutually agreed to alternative dispute resolution procedures, at any time during the course of the matter. In the event resolution occurs after the filing of a challenge, the Registered Entity and Planning Coordinator shall jointly provide to the applicable Regional Entity a written acknowledgement of withdrawal of the challenge or appeal, including a statement that all outstanding issues have been resolved.

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509

1. This Section 1703 establishes the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

2. A Submitting Entity (or Owner if different) aggrieved by the decision of NERC to approve or disapprove an Exception Request or to terminate an Exception with respect to any Element may, within 30 days following the date of the decision, file a written challenge to the decision with the NERC director of compliance operations, with copies to the Regional Entity and the Submitting Entity or Owner if different. The challenge shall state the basis of the objection to the decision of NERC. The Regional Entity, and the Submitting Entity or Owner if different, may file a response to the challenge within 30 days following the date the challenge is filed with NERC.

3. The challenge shall be decided by the Board of Trustees Compliance Committee. Within 90 days of the date of submission of the challenge, the Board of Trustees Compliance Committee shall issue its decision on the challenge. The decision of the Board of Trustees Compliance Committee shall be the final NERC decision; provided, that the Board of Trustees Compliance Committee may extend the deadline date for its decision to a date more than 90 days following submission of the challenge, by issuing a notice to the Submitting Entity, the Owner (if different) and the Regional Entity stating the revised deadline date and the reason for the extension.

4. The Submitting Entity, or Owner if different, may appeal the final NERC decision to, or seek review of the final NERC decision by, the Applicable Governmental Authority(ies), in accordance with the legal authority and rules and procedures of the Applicable Governmental Authority(ies). Any such appeal shall be filed within thirty (30) days following the date of the decision of the Board of Trustees Compliance Committee, or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509…...…102

SECTION 100 — APPLICABILITY OF RULES OF PROCEDURE

NERC and NERC Members shall comply with these Rules of Procedure. Each Regional Entity shall comply with these Rules of Procedure as applicable to functions delegated to the Regional Entity by NERC or as required by an Applicable Governmental Authority or as otherwise provided.

Each Bulk Power System owner, operator, and user shall comply with all Rules of Procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Any entity that is unable to comply or that is not in compliance with a NERC Rule of Procedure shall immediately notify NERC in writing, stating the Rule of Procedure of concern and the reason for not being able to comply with the Rule of Procedure.

NERC shall evaluate each case and inform the entity of the results of the evaluation. If NERC determines that a Rule of Procedure has been violated, or cannot practically be complied with, NERC shall notify the Applicable Governmental Authorities and take such other actions as NERC deems appropriate to address the situation.

NERC shall comply with each approved Reliability Standard that identifies NERC or the Electric Reliability Organization as a responsible entity. Regional Entities shall comply with each approved Reliability Standard that identifies Regional Entities as responsible entities. A violation by NERC or a Regional Entity of such a Reliability Standard shall constitute a violation of these Rules of Procedure.

SECTION 200 — DEFINITIONS OF TERMS

Definitions of terms used in the NERC Rules of Procedure are set forth in **Appendix 2**, *Definitions Used in the Rules of Procedure*.

SECTION 300 — RELIABILITY STANDARDS DEVELOPMENT

301. General

NERC shall develop and maintain Reliability Standards that apply to Bulk Power System owners, operators, and users and that enable NERC and Regional Entities to measure the reliability performance of Bulk Power System owners, operators, and users; and to hold them accountable for Reliable Operation of the Bulk Power Systems. The Reliability Standards shall be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.

302. Essential Attributes for Technically Excellent Reliability Standards

1. **Applicability** — Each Reliability Standard shall clearly identify the functional classes of entities responsible for complying with the Reliability Standard, with any specific additions or exceptions noted. Such functional classes[1] include: Reliability Coordinators, Balancing Authorities, Transmission Operators, Transmission Owners, Generator Operators, Generator Owners, Transmission Service Providers, market operators, Planning Authorities, Transmission Planners, Resource Planners, Load-Serving Entities, and Distribution Providers. Each Reliability Standard shall also identify the geographic applicability of the Reliability Standard, such as the entire North American Bulk Power System, an Interconnection, or within a Region. A Reliability Standard may also identify any limitations on the applicability of the Reliability Standard based on electric Facility characteristics.

2. **Reliability Objectives** — Each Reliability Standard shall have a clear statement of purpose that shall describe how the Reliability Standard contributes to the reliability of the Bulk Power System. The following general objectives for the Bulk Power System provide a foundation for determining the specific objective(s) of each Reliability Standard:

    2.1 **Reliability Planning and Operating Performance**— Bulk Power Systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

    2.2 **Frequency and Voltage Performance**— The frequency and voltage of Bulk Power Systems shall be controlled within defined limits through the balancing of Real and Reactive Power supply and demand.

[1] These functional classes of entities are derived from NERC's Reliability Functional Model. When a Reliability Standard identifies a class of entities to which it applies, that class must be defined in the Glossary of Terms Used in NERC Reliability Standards.

2.3 **Reliability Information** — Information necessary for the planning and operation of reliable Bulk Power Systems shall be made available to those entities responsible for planning and operating Bulk Power Systems.

2.4 **Emergency Preparation** — Plans for emergency operation and system restoration of Bulk Power Systems shall be developed, coordinated, maintained, and implemented.

2.5 **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of Bulk Power Systems.

2.6 **Personnel** — Personnel responsible for planning and operating Bulk Power Systems shall be trained and qualified, and shall have the responsibility and authority to implement actions.

2.7 **Wide-Area View** — The reliability of the Bulk Power Systems shall be assessed, monitored, and maintained on a Wide-Area basis.

2.8 **Security** —Bulk Power Systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome**— Each Reliability Standard shall state one or more performance Requirements, which if achieved by the applicable entities, will provide for a reliable Bulk Power System, consistent with good utility practices and the public interest. Each Requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for Bulk Power System reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance Requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that Requirement. Each performance Requirement shall have one or more associated measures used to objectively evaluate compliance with the Requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations**— Each Reliability Standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.

6. **Completeness** — Reliability Standards shall be complete and self-contained. The Reliability Standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for Penalties and sanctions, as well as other ERO and Regional Entity compliance documents, the consequences of violating a Reliability Standard are clearly presented to the entities responsible for complying with the Reliability Standards.

8. **Clear Language** — Each Reliability Standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

9. **Practicality** — Each Reliability Standard shall establish Requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, Reliability Standards shall use a set of standard terms and definitions that are approved through the NERC Reliability Standards development process.

303. Relationship between Reliability Standards and Competition

To ensure Reliability Standards are developed with due consideration of impacts on competition, to ensure Reliability Standards are not unduly discriminatory or preferential, and recognizing that reliability is an essential requirement of a robust North American economy, each Reliability Standard shall meet all of these market-related objectives:

1. **Competition** — A Reliability Standard shall not give any market participant an unfair competitive advantage.

2. **Market Structures** — A Reliability Standard shall neither mandate nor prohibit any specific market structure.

3. **Market Solutions** — A Reliability Standard shall not preclude market solutions to achieving compliance with that Reliability Standard.

4. **Commercially Sensitive Information** — A Reliability Standard shall not require the public disclosure of commercially sensitive information or other Confidential Information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with Reliability Standards.

5. **Adequacy** — NERC shall not set Reliability Standards defining an adequate amount of, or requiring expansion of, Bulk Power System resources or delivery capability.

304. Essential Principles for the Development of Reliability Standards

NERC shall develop Reliability Standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these Rules of Procedure as **Appendix 3A**. Appeals in connection with the development of a Reliability Standard shall also be conducted in accordance with the NERC *Standard Processes Manual*. Any amendments or revisions to the *Standard Processes Manual* shall be consistent with the following essential principles:

1. **Openness** — Participation shall be open to all Persons and who are directly and materially affected by the reliability of the North American Bulk Power System. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

2. **Transparency** — The process shall be transparent to the public.

3. **Consensus-building** —The process shall build and document consensus for each Reliability Standard, both with regard to the need and justification for the Reliability Standard and the content of the Reliability Standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any two Segments as defined in **Appendix 3D**, *Development of the Registered Ballot Body*, of these Rules of Procedure, and no single Segment, individual or organization shall be able to defeat a matter.

5. **Due Process** — Development of Reliability Standards shall provide reasonable notice and opportunity for any Person with a direct and material interest to express views on a proposed Reliability Standard and the basis for those views, and to have that position considered in the development of the Reliability Standards.

6. **Timeliness** — Development of Reliability Standards shall be timely and responsive to new and changing priorities for reliability of the Bulk Power System.

305. Registered Ballot Body

NERC Reliability Standards shall be approved by a Registered Ballot Body prior to submittal to the Board and then to Applicable Governmental Authorities for their approval, where authorized by applicable legislation or agreement. This Section 305 sets forth the rules pertaining to the composition of, and eligibility to participate in, the Registered Ballot Body.

1. **Eligibility to Vote on Reliability Standards** — Any person or entity may join the Registered Ballot Body to vote on Reliability Standards, whether or not such person or entity is a Member of NERC.

2. **Inclusive Participation** — The Segment qualification guidelines are inclusive; i.e., any entity with a legitimate interest in the reliability of the Bulk Power System that can meet any one of the eligibility criteria for a Segment is entitled to belong to and vote in each Segment for which it qualifies, subject to limitations defined in Sections 305.3 and 305.5.

3. **General Criteria for Registered Ballot Body Membership** — The general criteria for membership in the Segments are:

   3.1 **Multiple Segments** — A corporation or other organization with integrated operations or with affiliates that qualifies to belong to more than one Segment (e.g., Transmission Owners and Load-Serving Entities) may join once in each Segment for which it qualifies, provided that each Segment constitutes a separate membership and the organization is represented in each Segment by a different representative. Affiliated entities are collectively limited to one membership in each Segment for which they are qualified.

   3.2 **Withdrawing from a Segment or Changing Segments** — After its initial registration in a Segment, each registered participant may elect to withdraw from a Segment or apply to change Segments at any time.

   3.3 **Review of Segment Criteria** — The Board shall review the qualification guidelines and rules for joining Segments at least every three years to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

4. **Proxies for Voting on Reliability Standards** — Any registered participant may designate an agent or proxy to vote on its behalf. There are no limits on how many proxies an agent may hold. However, for the proxy to be valid, NERC must have in its possession written documentation signed by the representative of the registered participant that the voting right by proxy has been transferred from the registered participant to the agent.

5. **Segments** — The specific criteria for membership in each Registered Ballot Body Segment are defined in the *Development of the Registered Ballot Body* in **Appendix 3D.**

6. **Review of Segment Entries** — NERC shall review all applications for joining the Registered Ballot Body, and shall make a determination of whether the applicant's self-selection of a Segment satisfies at least one of the guidelines to

belong to that Segment. The entity shall then become eligible to participate as a voting member of that Segment. The Standards Committee shall resolve disputes regarding eligibility for membership in a Segment, with the applicant having the right of appeal to the Board.

306. Standards Committee

The Standards Committee shall provide oversight of the Reliability Standards development process to ensure stakeholder interests are fairly represented. The Standards Committee shall not under any circumstance change the substance of a draft or approved Reliability Standard.

1. **Membership** — The Standards Committee is a representative committee comprising representatives of two members of each of the Segments in the Registered Ballot Body and two officers elected to represent the interests of the industry as a whole.

2. **Elections** — Standards Committee members are elected for staggered (one per Segment per year) two-year terms by the respective Segments in accordance with the *Procedure for the Election of Members of the NERC Standards Committee*, which is incorporated into these Rules of Procedure as **Appendix 3B**. Segments may use their own election procedure if such a procedure is ratified by two-thirds of the members of a Segment and approved by the Board.

3. **Canadian Representation**

   The Standards Committee will include Canadian representation as provided in **Appendix 3B**, *Procedure for the Election of Members of the NERC Standards Committee*.

4. **Open Meetings** — All meetings of the Standards Committee shall be open and publicly noticed on the NERC website.

307. Standards Process Management

NERC shall assign a standards process manager to administer the development of continent-wide Reliability Standards and a regional standards manager to administer the development of Regional Reliability Standards. The standards process manager shall be responsible for ensuring that the development and revision of Reliability Standards are in accordance with the NERC *Standard Processes Manual*. The standards process manager and the regional standards manager shall work to achieve the highest degree of integrity and consistency of quality and completeness of the Reliability Standards. The regional standards manager shall coordinate with any Regional Entities that develop Regional Reliability Standards to ensure those Regional Reliability Standards are effectively integrated with the NERC Reliability Standards.

308. Steps in the Development of Reliability Standards

1. **Procedure** — NERC shall develop Reliability Standards through the process set forth in the NERC *Standard Processes Manual* (**Appendix 3A**). The *Standard Processes Manual* includes provisions for developing Reliability Standards that can be completed using expedited processes, including a process to develop Reliability Standards to address national security situations that involve confidential issues.

2. **Board Adoption** — Reliability Standards or revisions to Reliability Standards approved by the ballot pool in accordance with the *Standard Processes Manual* shall be submitted for adoption by the Board. No Reliability Standard or revision to a Reliability Standard shall be effective unless adopted by the Board.

3. **Governmental Approval** — After Board adoption, a Reliability Standard or revision to a Reliability Standard shall be submitted to all Applicable Governmental Authorities in accordance with Section 309. No Reliability Standard or revision to a Reliability Standard shall be effective within a geographic area over which an Applicable Governmental Authority has jurisdiction unless it is approved by such Applicable Governmental Authority or is otherwise made effective pursuant to the laws applicable to such Applicable Governmental Authority.

309. Filing of Reliability Standards for Approval by Applicable Governmental Authorities

1. **Filing of Reliability Standards for Approval** — Where authorized by applicable legislation or agreement, NERC shall file with the Applicable Governmental Authorities each Reliability Standard, modification to a Reliability Standard, or withdrawal of a Reliability Standard that is adopted by the Board. Each filing shall be in the format required by the Applicable Governmental Authority and shall include: a concise statement of the basis and purpose of the Reliability Standard; the text of the Reliability Standard; the implementation plan for the Reliability Standard; a demonstration that the Reliability Standard meets the essential attributes of Reliability Standards as stated in Section 302; the drafting team roster; the ballot pool and final ballot results; and a discussion of public comments received during the development of the Reliability Standard and the consideration of those comments.

2. **Remanded Reliability Standards and Directives to Develop Standards** — If an Applicable Governmental Authority remands a Reliability Standard to NERC or directs NERC to develop a Reliability Standard, NERC shall within five (5) business days notify all other Applicable Governmental Authorities, and shall within thirty (30) calendar days report to all Applicable Governmental Authorities

a plan and timetable for modification or development of the Reliability Standard. Reliability Standards that are remanded or directed by an Applicable Governmental Authority shall be modified or developed using the *Standard Processes Manual*. NERC shall, during the development of a modification for the remanded Reliability Standard or directed Reliability Standard, consult with other Applicable Governmental Authorities to coordinate any impacts of the proposed Reliability Standards in those other jurisdictions. The expedited standards development process may be applied if necessary to meet a timetable for action required by the Applicable Governmental Authorities, respecting to the extent possible the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interest in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply.

3. **Directives to Develop Reliability Standards under Extraordinary Circumstances** — An Applicable Governmental Authority may, on its own initiative, determine that extraordinary circumstances exist requiring expedited development of a Reliability Standard. In such a case, the Applicable Governmental Authority may direct the development of a Reliability Standard within a certain deadline. NERC staff shall prepare the Standards Authorization Request. The proposed Reliability Standard will then proceed through the Reliability Standards development process, using the expedited action process described in the *Standard Processes Manual* as necessary to meet the specified deadline. The timeline will be developed to respect, to the extent possible, the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply, with appropriate modification of the timeline.

310. Annual Reliability Standards Development Plan

NERC shall develop and provide an annual Reliability Standards Development Plan for development of Reliability Standards to the Applicable Governmental Authorities. NERC shall consider the comments and priorities of the Applicable Governmental Authorities in developing and updating the annual Reliability Standards Development Plan. Each annual Reliability Standards Development Plan shall include a progress report comparing results achieved to the prior year's Reliability Standards Development Plan.

311. Regional Entity Standards Development Procedures

1. **NERC Approval of Regional Entity Reliability Standards Development Procedure** — To enable a Regional Entity to develop Regional Reliability Standards that are to be recognized and made part of NERC Reliability Standards, a Regional Entity may request NERC to approve a Regional Reliability Standards development procedure.

2. **Public Notice and Comment on Regional Reliability Standards Development Procedure** — Upon receipt of such a request, NERC shall publicly notice and request comment on the proposed Regional Reliability Standards development procedure, allowing a minimum of 45 days for comment. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the Regional Reliability Standards development procedure and request another posting for comment, or submit the Regional Reliability Standards development procedure, along with its consideration of any objections received, for approval by NERC.

3. **Evaluation of Regional Reliability Standards Development Procedure** — NERC shall evaluate whether a Regional Reliability Standards development procedure meets the criteria listed below and shall consider stakeholder comments, any unresolved stakeholder objections, and the consideration of comments provided by the Regional Entity, in making that determination. If NERC determines the Regional Reliability Standards development procedure meets these requirements, the Regional Reliability Standards development procedure shall be submitted to the Board for approval. The Board shall consider the recommended action, stakeholder comments, any unresolved stakeholder comments, and the Regional Entity consideration of comments in determining whether to approve the Regional Reliability Standards development procedure.

   3.1 **Evaluation Criteria** — The Regional Reliability Standards development procedure shall be:

      3.1.1 **Open** — The Regional Reliability Standards development procedure shall provide that any person or entity who is directly and materially affected by the reliability of the Bulk Power Systems within the Regional Entity shall be able to participate in the development and approval of Reliability Standards. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in the Regional Entity, a Regional Entity or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

      3.1.2 **Inclusive** — The Regional Reliability Standards development procedure shall provide that any Person with a direct and material

interest has a right to participate by expressing an opinion and its basis, having that position considered, and appealing through an established appeals process if adversely affected.

3.1.3 **Balanced** — The Regional Reliability Standards development procedure shall have a balance of interests and shall not permit any two interest categories to dominate a matter or any single interest category to defeat a matter.

3.1.4 **Due Process** — The Regional Reliability Standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the Regional Reliability Standards development procedure shall include public notice of the intent to develop a Regional Reliability Standard, a public comment period on the proposed Regional Reliability Standard, due consideration of those public comments, and a ballot of interested stakeholders.

3.1.5 **Transparent** — All actions material to the development of Regional Reliability Standards shall be transparent. All Regional Reliability Standards development meetings shall be open and publicly noticed on the Regional Entity's website.

3.1.6 **Accreditation of Regional Standards Development Procedure** — A Regional Entity's Regional Reliability Standards development procedure that is accredited by the American National Standards Institute shall be deemed to meet the criteria listed in this Section 311.3.1, although such accreditation is not a prerequisite for approval by NERC.

3.1.7 **Use of NERC Procedure** — A Regional Entity may adopt the NERC *Standard Processes Manual* as the Regional Reliability Standards development procedure, in which case the Regional Entity's Regional Reliability Standards development procedure shall be deemed to meet the criteria listed in this Section 311.3.1.

4. **Revisions of Regional Reliability Standards Development Procedures** — Any revision to a Regional Reliability Standards development procedure shall be subject to the same approval requirements set forth in Sections 311.1 through 311.3.

5. **Duration of Regional Reliability Standards Development Procedures** — The Regional Reliability Standards development procedure shall remain in effect until such time as it is replaced with a new version approved by NERC or it is withdrawn by the Regional Entity. The Regional Entity may, at its discretion, withdraw its Regional Reliability Standards development procedure at any time.

312. Regional Reliability Standards

1. **Basis for Regional Reliability Standards** — Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard. Such Regional Reliability Standards shall in all cases be submitted to NERC for adoption and, if adopted, made part of the NERC Reliability Standards and shall be enforceable in accordance with the delegation agreement between NERC and the Regional Entity or other instrument granting authority over enforcement to the Regional Entity. No entities other than NERC and the Regional Entity shall be permitted to develop Regional Reliability Standards that are enforceable under statutory authority delegated to NERC and the Regional Entity.

2. **Regional Reliability Standards That are Directed by a NERC Reliability Standard** — Although it is the intent of NERC to promote uniform Reliability Standards across North America, in some cases it may not be feasible to achieve a reliability objective with a Reliability Standard that is uniformly applicable across North America. In such cases, NERC may direct Regional Entities to develop Regional Reliability Standards necessary to implement a NERC Reliability Standard. Such Regional Reliability Standards that are developed pursuant to a direction by NERC shall be made part of the NERC Reliability Standards.

3. **Procedure for Developing an Interconnection-wide Regional Standard** — A Regional Entity organized on an Interconnection-wide basis may propose a Regional Reliability Standard for approval as a NERC Reliability Standard to be made mandatory for all applicable Bulk Power System owners, operators, and users within that Interconnection.

    3.1 **Presumption of Validity** — An Interconnection-wide Regional Reliability Standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities, shall be adopted as a NERC Reliability Standard. NERC shall rebuttably presume that a Regional Reliability Standard developed, in accordance with a Regional Reliability Standards development process approved by NERC, by a Regional Entity organized on an Interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities.

    3.2 **Notice and Comment Procedure for Interconnection-wide Regional Reliability Standard** — NERC shall publicly notice and request comment on the proposed Interconnection-wide Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability

Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to comment on or withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

3.3 **Adoption of Interconnection-wide Regional Reliability Standard by NERC** — NERC shall evaluate and recommend whether a proposed Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections that could serve as a basis for rebutting the presumption of validity of the Regional Reliability Standard. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning the proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for adoption as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, NERC's recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to adopt the Regional Reliability Standard as a NERC Reliability Standard.

3.4 **Applicable Governmental Authority Approval** — An Interconnection-wide Regional Reliability Standard that has been adopted by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

3.5 **Enforcement of Interconnection-wide Regional Reliability Standard** — An Interconnection-wide Regional Reliability Standard that has been adopted by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

4. **Procedure for Developing Non-Interconnection-Wide Regional Reliability Standards** — Regional Entities that are not organized on an Interconnection-wide basis may propose Regional Reliability Standards to apply within their respective Regions. Such Regional Reliability Standards may be developed through the NERC Reliability Standards development procedure, or alternatively, through a Regional Reliability Standards development procedure that has been approved by NERC.

4.1 **No Presumption of Validity** — Regional Reliability Standards that are not proposed to be applied on an Interconnection-wide basis are not presumed to be valid but may be demonstrated by the proponent to be valid.

4.2 **Notice and Comment Procedure for Non-Interconnection-wide Regional Reliability Standards** — NERC shall publicly notice and request comment on the proposed Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to comment on or resolve any objections identified in the comments and may choose to withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for adoption by NERC.

4.3 **NERC Adoption of Non-Interconnection-wide Regional Reliability Standards** — NERC shall evaluate and recommend whether a proposed non-Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for adoption as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, the recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to adopt the Regional Reliability Standard as a NERC Reliability Standard.

4.4 **Applicable Governmental Authority Approval** — A non-Interconnection-wide Regional Reliability Standard that has been adopted by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

4.5 **Enforcement of Non-Interconnection-wide Regional Reliability Standards** — A non-Interconnection-wide Regional Reliability Standard that has been adopted by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory

within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

5. **Appeals** — A Regional Entity shall have the right to appeal NERC's decision not to adopt a proposed Regional Reliability Standard or Variance to the Commission or other Applicable Governmental Authority.

313. Other Regional Criteria, Guides, Procedures, Agreements, Etc.

1. **Regional Criteria** — Regional Entities may develop Regional Criteria that are necessary to implement, to augment, or to comply with NERC Reliability Standards, but which are not Reliability Standards. Regional Criteria may also address issues not within the scope of Reliability Standards, such as resource adequacy. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents used to enhance the reliability of the Bulk Power System in the Region. These documents typically provide benefits by promoting more consistent implementation of the NERC Reliability Standards within the Region. These documents are not NERC Reliability Standards, Regional Reliability Standards, or regional Variances, and therefore are not enforceable under authority delegated by NERC pursuant to delegation agreements and do not require NERC approval.

2. **Catalog of Regional Criteria** — NERC shall maintain a current catalog of Regional Criteria. Regional Entities shall provide a catalog listing of Regional Criteria to NERC and shall notify NERC of changes to the listing. Regional Entities shall provide any listed document to NERC upon written request.

314. Conflicts with Statutes, Regulations, and Orders

Notice of Potential Conflict — If a Bulk Power System owner, operator, or user determines that a NERC or Regional Reliability Standard may conflict with a function, rule, order, tariff, rate schedule, legislative requirement or agreement that has been accepted, approved, or ordered by a governmental authority affecting that entity, the entity shall expeditiously notify the governmental authority, NERC, and the relevant Regional Entity of the conflict.

1. **Determination of Conflict —** NERC, upon request of the governmental authority, may advise the governmental authority regarding the conflict and propose a resolution of the conflict, including revision of the Reliability Standard if appropriate.

2. **Regulatory Precedence** — Unless otherwise ordered by a governmental authority, the affected Bulk Power System owner, operator, or user shall continue to follow the function, rule, order, tariff, rate schedule, legislative requirement, or agreement accepted, approved, or ordered by the governmental authority until the

governmental authority finds that a conflict exists and orders a remedy and such remedy is affected.

315. Revisions to NERC Standard Processes Manual

Any person or entity may submit a written request to modify NERC *Standard Processes Manual*. Consideration of the request and development of the revision shall follow the process defined in the NERC *Standard Processes Manual*. Upon approval by the Board, the revision shall be submitted to the Applicable Governmental Authorities for approval. Changes shall become effective only upon approval by the Applicable Governmental Authorities or on a date designated by the Applicable Governmental Authorities or as otherwise applicable in a particular jurisdiction.

316. Accreditation

NERC shall seek and maintain accreditation of the NERC Reliability Standards development process by the American National Standards Institute.

317. Five-Year Review of Reliability Standards

NERC shall complete a review of each NERC Reliability Standard at least once every five years, or such longer period as is permitted by the American National Standards Institute, from the effective date of the Reliability Standard or the latest revision to the Reliability Standard, whichever is later. The review process shall be conducted in accordance with the NERC *Standard Processes Manual*. The standards process manager shall be responsible for administration of the five-year review of Reliability Standards. As a result of this review, the NERC Reliability Standard shall be reaffirmed, revised, or withdrawn. If the review indicates a need to revise or withdraw the Reliability Standard, a request for revision or withdrawal shall be prepared, submitted and addressed in accordance with the NERC *Standard Processes Manual*.

318. Coordination with the North American Energy Standards Board

NERC shall maintain a close working relationship with the North American Energy Standards Board and ISO/RTO Council to ensure effective coordination of wholesale electric business practice standards and market protocols with the NERC Reliability Standards.

319. Archived Standards Information

NERC shall maintain a historical record of Reliability Standards information that is no longer maintained on-line. For example, Reliability Standards that have been retired may be removed from the on-line system. Archived information shall be retained indefinitely

as practical, but in no case less than six years or one complete Reliability Standards review cycle from the date on which the Reliability Standard was no longer in effect. Archived records of Reliability Standards information shall be available electronically within 30 days following the receipt by the NERC standards information manager of a written request.

320. Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels

1. **Development of Violation Risk Factors and Violation Severity Levels** — NERC shall follow the process for developing Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) as set forth in the *Standard Processes Manual*, **Appendix 3A** to these Rules of Procedure.

2. **Remands of Directed Revision of VRFs and VSLs by Applicable Governmental Authorities** — If an Applicable Governmental Authority remands or directs a revision to a Board-approved VRF or VSL assignment, the NERC director of standards, after consulting with the standard drafting team, Standards Committee, and the NERC director of compliance operations, will recommend to the Board one of the following actions: (1) filing a request for clarification; (2) filing for rehearing or for review of the Applicable Governmental Authority decision; or (3) approval of the directed revisions to the VRF or VSL. If and to the extent time is available prior to the deadline for the Board's decision, an opportunity for interested parties to comment on the action taken will be provided.

3. **Alternative Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels** — In the event the Reliability Standards development process fails to produce Violation Risk Factors or Violation Severity Levels for a particular Reliability Standard in a timely manner, the Board of Trustees may approve Violation Risk Factors or Violation Severity Levels for that Reliability Standard after notice and opportunity for comment. In approving VRFs and VSLs, the Board shall consider the inputs of the Member Representatives Committee, affected stakeholders and NERC staff.

321. Special Rule to Address Certain Regulatory Directives

In circumstances where this Rule 321 applies, the Board of Trustees shall have the authority to take one or more of the actions set out below. The Board of Trustees shall have the authority to choose which one or more of the actions are appropriate to the circumstances and need not take these actions in sequential steps.

1. The Standards Committee shall have the responsibility to ensure that standards drafting teams address specific matters that are identified in directives issued by Applicable Governmental Authorities. If the Board of Trustees is presented with a proposed Reliability Standard that fails to address such directives, the Board of Trustees has the authority to remand, with instructions (including establishing a

timetable for action), the proposed Reliability Standard to the Standards Committee.

2. Upon a written finding by the Board of Trustees that a ballot pool has failed to approve a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to remand the proposed Reliability Standard to the Standards Committee, with instructions to (i) convene a public technical conference to discuss the issues surrounding the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with NERC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the proposed Reliability Standard one additional time, with such adjustments in the schedule as are necessary to meet the deadline contained in paragraph 2.1 of this Rule.

   2.1 Such a re-ballot shall be completed within forty-five (45) days of the remand. The Standards Committee memorandum shall be included in the materials made available to the ballot pool in connection with the re-ballot.

   2.2 In any such re-ballot, negative votes without comments related to the proposal shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the proposal shall be counted for purposes of determining the number of votes cast and whether the proposed Reliability Standard has been approved.

3. If the re-balloted proposed Reliability Standard achieves at least an affirmative two-thirds majority vote of the weighted Segment votes cast, with a quorum established, then the proposed Reliability Standard shall be deemed approved by the ballot pool and shall be considered by the Board of Trustees for approval.

4. If the re-balloted proposed Reliability Standard fails to achieve at least an affirmative two-thirds majority vote of the weighted Segment votes cast, but does achieve at least a sixty percent affirmative majority of the weighted Segment votes cast, with a quorum established, then the Board of Trustees has the authority to consider the proposed Reliability Standard for approval under the following procedures:

   4.1 The Board of Trustees shall issue notice of its intent to consider the proposed Reliability Standard and shall solicit written public comment particularly focused on the technical aspects of the provisions of the proposed Reliability Standard that address the specific matter identified in the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in

the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified.

4.2 The Board of Trustees may, in its discretion, convene a public technical conference to receive additional input on the matter.

4.3 After considering the developmental record, the comments received during balloting and the additional input received under paragraphs 4.1 and 4.2 of this Rule, the Board of Trustees has authority to act on the proposed Reliability Standard.

4.3.1 If the Board of Trustees finds that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to approve the proposed Reliability Standard and direct that it be filed with Applicable Governmental Authorities with a request that it be made effective.

4.3.2 If the Board of Trustees is unable to find that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to treat the proposed Reliability Standard as a draft Reliability Standard and direct that the draft Reliability Standard and complete developmental record, including the additional input received under paragraphs 4.1 and 4.2 of this Rule, be filed with the Applicable Governmental Authorities as a compliance filing in response to the order giving rise to the regulatory directive, along with a recommendation that the Reliability Standard not be made effective and an explanation of the basis for the recommendation.

5. Upon a written finding by the Board of Trustees that standard drafting team has failed to develop, or a ballot pool has failed to approve, a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to direct the Standards Committee (with the assistance of stakeholders and NERC staff) to prepare a draft Reliability Standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the Standards Committee fails to prepare such draft Reliability Standard, the Board of Trustees may direct NERC management to prepare such draft Reliability Standard.

5.1 The Board of Trustees may, in its discretion, convene a public technical conference to receive input on the matter. The draft Reliability Standard shall be posted for a 45-day public comment period.

5.2 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees finds that the draft Reliability Standard, with such modifications as the Board of Trustees determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to approve the draft Reliability Standard and direct that the proposed Reliability Standard be filed with Applicable Governmental Authorities with a request that the proposed Reliability Standard be made effective.

5.3 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees is unable to find that the draft Reliability Standard, even with modifications, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to direct that the draft Reliability Standard and complete developmental record be filed as a compliance filing in response to the regulatory directive with the Applicable Governmental Authority issuing the regulatory directive, with a recommendation that the draft Reliability Standard not be made effective.

5.4 The filing of the Reliability Standard under either paragraph 5.2 or paragraph 5.3 of this Rule shall include an explanation of the basis for the decision by the Board of Trustees.

5.5 A Reliability Standard approved under paragraph 5 of this Rule shall not be eligible for submission as an American National Standard.

6. NERC shall on or before March 31st of each year file a report with Applicable Governmental Authorities on the status and timetable for addressing each outstanding directive to address a specific matter received from an Applicable Governmental Authority.

SECTION 400 — COMPLIANCE ENFORCEMENT

401. Scope of the NERC Compliance Monitoring and Enforcement Program

1. **Components of the NERC Compliance Monitoring and Enforcement Program** — NERC shall develop and implement a NERC Compliance Monitoring and Enforcement Program to promote the reliability of the Bulk Power System by enforcing compliance with approved Reliability Standards in those regions of North American in which NERC and/or a Regional Entity (pursuant to a delegation agreement with NERC that has been approved by the Applicable Governmental Authority) has been given enforcement authority. There are four distinct parts of the NERC Compliance Monitoring and Enforcement Program: (1) NERC's oversight of the Regional Entity Compliance Monitoring and Enforcement Programs (Section 402), (2) the definition of the required Regional Entity Compliance Monitoring and Enforcement Program attributes (Section 403), (3) NERC's monitoring of Regional Entity compliance with Reliability Standards (Section 404), and (4) the monitoring of compliance with Reliability Standards that are applicable to NERC (Sections 405–406).

2. **Who Must Comply** — Where required by applicable legislation, regulation, rule or agreement, all Bulk Power System owners, operators, and users, Regional Entities, and NERC, are required to comply with all approved NERC Reliability Standards at all times. Regional Reliability Standards and Variances approved by NERC and the Applicable Governmental Authority shall be considered NERC Reliability Standards and shall apply to all Bulk Power System owners, operators, or users responsible for meeting those Reliability Standards within the Regional Entity boundaries, whether or not the Bulk Power System owner, operator, or user is a member of the Regional Entity.

3. **Data Access** — All Bulk Power System owners, operators, and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards. NERC and the applicable Regional Entity will define the data retention and reporting requirements in the Reliability Standards and compliance reporting procedures.

4. **Role of Regional Entities in the Compliance Monitoring and Enforcement Program** — Each Regional Entity that has been delegated authority through a delegation agreement or other legal instrument approved by the Applicable Governmental Authority shall, in accordance with the terms of the approved delegation agreement, administer a Regional Entity Compliance Monitoring and Enforcement program to meet the NERC Compliance Monitoring and Enforcement Program goals and the requirements in this Section 400.

5. **Program Continuity** — NERC will ensure continuity of compliance monitoring and enforcement within the geographic boundaries of a Regional Entity in the event that NERC does not have a delegation agreement, or the Regional Entity withdraws from the agreement or does not operate its Compliance Monitoring and Enforcement Program in accordance with the delegation agreement or other applicable requirements.

5.1 Should NERC not have a delegation agreement with a Regional Entity covering a geographic area, or a Regional Entity withdraws from an existing delegation agreement or the delegation agreement is otherwise terminated, NERC will directly administer the Compliance Monitoring and Enforcement Program applicable to owners, operators and users of the Bulk Power System within that geographic area.

1. This monitoring and enforcement will be accomplished by NERC and Compliance Staff from another approved Regional Entity.

2. If an existing delegation agreement with a Regional Entity is terminating, the Regional Entity shall promptly provide to NERC all relevant compliance information regarding Registered Entities, contacts, prior compliance information and actions, Mitigation Plans, and Remedial Action Directives for the period in which the Regional Entity was responsible for administering the Compliance Monitoring and Enforcement Program.

3. NERC will levy and collect all Penalties directly and will utilize any Penalty monies collected to offset the expenses of administering the Compliance Monitoring and Enforcement Program for the geographic area.

5.2 Should a Regional Entity seek to withdraw from its delegation agreement, NERC will seek agreement from another Regional Entity to amend its delegation agreement with NERC to extend that Regional Entity's boundaries for compliance monitoring and enforcement. In the event no Regional Entity is willing to accept this responsibility, NERC will administer the Compliance Monitoring and Enforcement Program within the geographical boundaries of the Regional Entity seeking to withdraw from the delegation agreement, in accordance with Section 401.5.1.

6. ~~**Actively Monitored Requirements**~~**Risk Elements** — NERC, with input from the Regional entities, stakeholders, and regulators, shall at least annually ~~select a subset of the~~identify risk elements to prioritize risks to the reliability of the Bulk Power System. These risk elements and related NERC Reliability Standards and Requirements are to be ~~actively monitored and audited~~considered for compliance oversight in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan. NERC identifies the risk elements using data including, but not limited to: compliance findings; event analysis experience; data analysis; and the expert judgment of NERC and Regional Entity staff, committees, and subcommittees. NERC uses these risk elements to identify and prioritize interconnection and continent-wide risks to the reliability of the Bulk Power System. These identified risks, as well as risks to the reliability of the Bulk Power System identified by Regional Entities for their footprint, represent the focus for monitoring activities in the upcoming year, and become inputs for developing oversight plans for individual Registered Entities. Compliance is required, and NERC and the Regional Entities have authority to monitor compliance, with all applicable NERC Reliability Standards whether or not they

are ~~included in the subset of Reliability Standards and Requirements designated~~identified as areas of focus to be ~~actively monitored and~~considered for compliance oversight ~~audited~~ in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan or are included in a Regional Entity's oversight plan for the Registered Entity.

7. **Penalties, Sanctions, and Remedial Action Directives** — NERC and Regional Entities will apply Penalties, sanctions, and Remedial Action Directives that bear a reasonable relation to the seriousness of a violation and take into consideration timely remedial efforts as defined in the NERC *Sanction Guidelines*, which is incorporated into these rules as **Appendix 4B**.

8. **Multiple Enforcement Actions** – A Registered Entity shall not be subject to an enforcement action by NERC and a Regional Entity, or by more than one Regional Entity (unless the Registered Entity is registered in more than one Region in which the violation occurred), for the same violation.

9. **Records** — NERC shall maintain a record of each compliance submission, including Self-Reported, Possible, Alleged, and Confirmed Violations of approved Reliability Standards; associated Penalties, sanctions, Remedial Action Directives and settlements; and the status of mitigation actions.

10. **Confidential Information** — NERC will treat all Possible and Alleged Violations of Reliability Standards and matters related to a Compliance Monitoring and Enforcement Program process, including the status of any Compliance Investigation or other Compliance Monitoring and Enforcement Program process, as confidential in accordance with Section 1500.

    The types of information that will be considered confidential and will not (subject to statutory and regulatory requirements) be disclosed in any public information reported by NERC are identified in Section 1500. Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident, will be identified and protected from public disclosure as Critical Energy Infrastructure Information in accordance with Section 1500.

    The Regional Entity and NERC shall give Bulk Power System owners, operators, and users a reasonable opportunity to demonstrate that information concerning a violation is confidential before such report is disclosed to the public.

11. **Public Posting** — When the affected Bulk Power System owner, operator, or user either agrees with a Possible or Alleged Violation(s) of a Reliability Standard(s) or a report of a Compliance Audit or Compliance Investigation, or enters into a settlement agreement concerning a Possible or Alleged Violation(s), or the time for submitting an appeal is passed, or all appeals processes are complete, NERC shall, subject to the confidentiality requirements of these Rules of Procedure, publicly post each Confirmed Violation, Penalty or sanction, settlement agreement, and final Compliance Audit or Compliance Investigation report, on its website.

11.1 Each Bulk Power System owner, operator, or user may provide NERC with a statement to accompany the Confirmed Violation or report to be posted publicly. The statement must be on company letterhead and include a signature, as well as the name and title of the person submitting the information.

11.2 In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information (*NERC Security Guidelines for the Electricity Sector — Protecting Potentially Sensitive Information* may be used as a guide) or other Confidential Information shall be redacted in accordance with Section 1500 and not be released publicly.

11.3 Subject to redaction of Critical Energy Infrastructure Information or other Confidential Information, for each Confirmed Violation or settlement relating to a Possible Violation or an Alleged Violation, the public posting shall include the name of any relevant entity, the nature, time period, and circumstances of such Possible, Alleged or Confirmed Violation, any Mitigation Plan or other Mitigating Activities to be implemented by the Registered Entity in connection with the Confirmed Violation or settlement, and sufficient facts to assist owners, operators and users of the Bulk Power System to evaluate whether they have engaged in or are engaging in similar activities.

12. **Violation Information Review** — NERC Compliance Staff shall periodically review and analyze all reports of Possible, Alleged and Confirmed Violations to identify trends and other pertinent reliability issues.

402. NERC Oversight of the Regional Entity Compliance Monitoring and Enforcement Programs

1. **NERC Monitoring Program** — NERC shall have a program to monitor the Compliance Monitoring and Enforcement Program of each Regional Entity that has been delegated authority. The objective of this monitoring program shall be to ensure that the Regional Entity carries out its Compliance Monitoring and Enforcement Program in accordance with these Rules of Procedure and the terms of the delegation agreement, and to ensure consistency and fairness of the Regional Entity's Compliance Monitoring and Enforcement Program. Oversight and monitoring by NERC shall be accomplished through an annual Compliance Monitoring and Enforcement Program review, program audits, and regular evaluations of Regional Entity Compliance Monitoring and Enforcement Program performance as described below.

1.1 **NERC Review of Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans** — NERC shall require each Regional Entity to submit for review and approval an annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan. NERC shall review each annual Regional Entity

Compliance Monitoring and Enforcement Program Implementation Plan and shall accept the plan if it meets NERC requirements and the requirements of the delegation agreement.

1.2 **Regional Entity Compliance Monitoring and Enforcement Program Evaluation** — NERC shall annually evaluate the goals, tools, and procedures of each Regional Entity Compliance Monitoring and Enforcement Program to determine the effectiveness of each Regional Entity Compliance Monitoring and Enforcement Program, using criteria developed by the NERC Compliance and Certification Committee.

1.3 **Regional Entity Compliance Monitoring and Enforcement Program Audit** — At least once every five years, NERC shall conduct an audit to evaluate how each Regional Entity Compliance Monitoring and Enforcement Program implements the NERC Compliance Monitoring and Enforcement Program. The evaluation shall be based on these Rules of Procedure, including Appendix 4C, the delegation agreement, directives in effect pursuant to the delegation agreement, approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans, required Compliance Monitoring and Enforcement Program attributes, and the NERC Compliance Monitoring and Enforcement Program procedures. These evaluations shall be provided to the Applicable Governmental Authorities to demonstrate the effectiveness of each Regional Entity. In addition, audits of Cross-Border Regional Entities shall cover applicable requirements imposed on the Regional Entity by statute, regulation, or order of, or agreement with, provincial governmental and/or regulatory authorities for which NERC has auditing responsibilities over the Regional Entity's compliance with such requirements within Canada or Mexico. Participation of a representative of an Applicable Governmental Authority shall be subject to the limitations of sections 3.1.6 and 8.0 of Appendix 4C of these Rules of Procedure regarding disclosures of non-public compliance information related to other jurisdictions. NERC shall maintain an audit procedure containing the requirements, steps, and timelines to conduct an audit of each Regional Entity Compliance Monitoring and Enforcement Program. The current procedure is contained in the NERC Audit of Regional Entity Compliance Programs, which is incorporated into these rules as **Appendix 4A**.

1.3.1. NERC shall establish a program to audit bulk power system owners, operators, and users operating within a regional entity to verify the findings of previous compliance audits conducted by the regional entity to evaluate how well the regional entity compliance enforcement program is meeting its delegated authority and responsibility.

1.4 Applicable Governmental Authorities will be allowed to participate as an observer in any audit conducted by NERC of a Regional Entity's

Compliance Monitoring and Enforcement Program. A representative of the Regional Entity being audited will be allowed to participate in the audit as an observer.

2. **Consistency Among Regional Compliance Monitoring and Enforcement Programs** — To provide for a consistent Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users required to comply with approved Reliability Standards, NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program, which is incorporated into these rules of procedure as **Appendix 4C**. Any differences in Regional Entity Compliance Monitoring and Enforcement Program methods, including determination of violations and Penalty assessment, shall be justified on a case-by-case basis and fully documented in each Regional Entity delegation agreement.

   2.1 NERC shall ensure that each of the Regional Entity Compliance Monitoring and Enforcement Programs meets these Rules of Procedure, including **Appendix 4C**, and follows the terms of the delegation agreement and the approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan.

   2.2 NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program in **Appendix 4C** containing the procedures to ensure the consistency and fairness of the processes used to determine Regional Entity Compliance Monitoring and Enforcement Program findings of compliance and noncompliance, and the application of Penalties and sanctions.

   2.3 NERC shall periodically conduct Regional Entity compliance manager forums. These forums shall use the results of Regional Entity Compliance Monitoring and Enforcement Program audits and findings of NERC Compliance Staff to identify and refine Regional Entity Compliance Monitoring and Enforcement Program differences into a set of best practices over time.

3. **Information Collection and Reporting** — NERC and the Regional Entities shall implement data management procedures that address data reporting requirements, data integrity, data retention, data security, and data confidentiality.

4. **Violation Disclosure** — NERC shall disclose all Confirmed Violations and maintain as confidential Possible Violations and Alleged Violations, according to the reporting and disclosure process in **Appendix 4C**.

5. **Authority to Determine Noncompliance, Levy Penalties and Sanctions, and Issue Remedial Action Directives** — NERC and Regional Entity Compliance Staff shall have the authority and responsibility to make initial determinations of compliance or noncompliance, and where authorized by the Applicable Governmental Authorities or where otherwise authorized, to determine Penalties

and sanctions for noncompliance with a Reliability Standard, and issue Remedial Action Directives. Regional Entity boards or a compliance panel reporting directly to the Regional Entity board will be vested with the authority for the overall Regional Entity Compliance Monitoring and Enforcement Program and have the authority to impose Penalties and sanctions on behalf of NERC, where authorized by applicable legislation or agreement. Remedial Action Directives may be issued by NERC or a Regional Entity that is aware of a Bulk Power System owner, operator, or user that is, or is about to engage in an act or practice that would result, in noncompliance with a Reliability Standard, where such Remedial Action Directive is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat. If, after receiving such a Remedial Action Directive, the Bulk Power System owner, operator, or user does not take appropriate action to avert a violation of a Reliability Standard, NERC may petition the Applicable Governmental Authority to issue a compliance order.

6. **Due Process** — NERC shall establish and maintain a fair, independent, and nondiscriminatory appeals process. The appeals process is set forth in Sections 408-410. The process shall allow Bulk Power System owners, operators, and users to appeal the Regional Entity's findings of noncompliance and to appeal Penalties, sanctions, and Remedial Action Directives that are levied by the Regional Entity. Appeals beyond the NERC process will be heard by the Applicable Governmental Authority.

   The appeals process will also allow for appeals to NERC of any findings of noncompliance issued by NERC to a Regional Entity for Reliability Standards and Requirements where the Regional Entity is monitored for compliance to a Reliability Standard. No monetary Penalties will be levied in these matters; however sanctions, remedial actions, and directives to comply may be applied by NERC.

7. **Conflict Disclosure** — NERC shall disclose to the appropriate governmental authorities any potential conflicts between a market rule and the enforcement of a Regional Reliability Standard.

8. **Confidentiality** — To maintain the integrity of the NERC Compliance Monitoring and Enforcement Program, NERC and Regional Entity staff, Compliance Audit team members, and committee members shall maintain the confidentiality of information obtained and shared during compliance monitoring and enforcement processes including Compliance Investigations, Compliance Audits, Spot Checks, drafting of reports, appeals, and closed meetings.

   8.1 NERC and the Regional Entity shall have in place appropriate codes of conduct and confidentiality agreements for staff and other Compliance Monitoring and Enforcement Program participants.

8.2 Individuals not bound by NERC or Regional Entity codes of conduct who serve on compliance-related committees or Compliance Audit teams shall sign a NERC confidentiality agreement prior to participating on the committee or Compliance Audit team.

8.3 Information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall not be distributed outside of a committee or team, nor released publicly. Other information subject to confidentiality is identified in Section 1500.

8.4 In the event that a staff, committee, or Compliance Audit team member violates any of the confidentiality rules set forth above, the staff, committee, or Compliance Audit team member and any member organization with which the individual is associated may be subject to appropriate action by the Regional Entity or NERC, including prohibiting participation in future Compliance Monitoring and Enforcement Program activities.

9. **Auditor Training** — NERC shall develop and provide training in auditing skills to all people who participate in NERC and Regional Entity Compliance Audits. Training for NERC and Regional Entity personnel and others who serve as Compliance Audit team leaders shall be more comprehensive than training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

403. Required Attributes of Regional Entity Compliance Monitoring and Enforcement Programs

Each Regional Entity Compliance Monitoring and Enforcement Program shall promote excellence in the enforcement of Reliability Standards. To accomplish this goal, each Regional Entity Compliance Monitoring and Enforcement Program shall (i) conform to and comply with the NERC uniform Compliance Monitoring and Enforcement Program, **Appendix 4C** to these Rules of Procedure, except to the extent of any deviations that are stated in the Regional Entity's delegation agreement, and (ii) meet all of the attributes set forth in this Section 403.

Program Structure

1. **Independence** — Each Regional Entity's governance of its Compliance Monitoring and Enforcement Program shall exhibit independence, meaning the Compliance Monitoring and Enforcement Program shall be organized so that its compliance monitoring and enforcement activities are carried out separately from other activities of the Regional Entity. The Compliance Monitoring and Enforcement Program shall not be unduly influenced by the Bulk Power System owners, operators, and users being monitored or other Regional Entity activities that are required to meet the Reliability Standards. Regional Entities must include rules providing that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

2. **Exercising Authority** — Each Regional Entity Compliance Monitoring and Enforcement Program shall exercise the responsibility and authority in carrying out the delegated functions of the NERC Compliance Monitoring and Enforcement Program in accordance with delegation agreements and **Appendix 4C**. These functions include but are not limited to: data gathering, data reporting, Compliance Investigations, Compliance Audit activities, evaluating compliance and noncompliance, imposing Penalties and sanctions, and approving and tracking mitigation actions.

3. **Delegation of Authority** — To maintain independence, fairness, and consistency in the NERC Compliance Monitoring and Enforcement Program, a Regional Entity shall not sub-delegate its Compliance Monitoring and Enforcement Program duties to entities or persons other than the Regional Entity Compliance Staff, unless (i) required by statute or regulation in the applicable jurisdiction, or (ii) by agreement with express approval of NERC and of FERC or other Applicable Governmental Authority, to another Regional Entity.

4. **Hearings of Contested Findings or Sanctions —** The Regional Entity board or compliance panel reporting directly to the Regional Entity board (with appropriate recusal procedures) will be vested with the authority for conducting compliance hearings in which any Bulk Power System owner, operator, or user provided a Notice of Alleged Violation may present facts and other information to contest a Notice of Alleged Violation or any proposed Penalty, sanction, any Remedial Action Directive, or any Mitigation Plan component. Compliance hearings shall be conducted in accordance with the Hearing Procedures set forth in Attachment 2 to **Appendix 4C**. If a stakeholder body serves as the Hearing Body, no two industry sectors may control any decision and no single segment may veto any matter related to compliance after recusals.

Program Resources

5. **Regional Entity Compliance Staff** — Each Regional Entity shall have sufficient resources to meet delegated compliance monitoring and enforcement responsibilities, including the necessary professional staff to manage and implement the Regional Entity Compliance Monitoring and Enforcement Program.

6. **Regional Entity Compliance Staff Independence** — The Regional Entity Compliance Staff shall be capable of and required to make all determinations of compliance and noncompliance and determine Penalties, sanctions, and Remedial Action Directives and to review and accept Mitigation Plans and other Mitigating Activities.

    6.1 Regional Entity Compliance Staff shall not have a conflict of interest, real or perceived, in the outcome of compliance monitoring and enforcement processes, reports, or sanctions. The Regional Entity shall have in effect a conflict of interest policy.

    6.2 Regional Entity Compliance Staff shall have the authority and responsibility to carry out compliance monitoring and enforcement

processes (with the input of industry subject matter experts), make determinations of compliance or noncompliance, and levy Penalties and sanctions without interference or undue influence from Regional Entity members and their representative or other industry entities.

6.3 Regional Entity Compliance Staff may call upon independent technical subject matter experts who have no conflict of interest in the outcome of the compliance monitoring and enforcement process to provide technical advice or recommendations in the determination of compliance or noncompliance.

6.4 Regional Entity Compliance Staff shall abide by the confidentiality requirements contained in Section 1500 and **Appendix 4C** of these Rules of Procedure, the NERC delegation agreement and other confidentiality agreements required by the NERC Compliance Monitoring and Enforcement Program.

6.5 Contracting with independent consultants or others working for the Regional Entity Compliance Monitoring and Enforcement Program shall be permitted provided the individual has not received compensation from a Bulk Power System owner, operator, or user being monitored for a period of at least the preceding six months and owns no financial interest in any Bulk Power System owner, operator, or user being monitored for compliance to the Reliability Standard, regardless of where the Bulk Power System owner, operator, or user operates. Any such individuals for the purpose of these Rules of Procedure shall be considered as augmenting Regional Entity Compliance Staff.

7. Use of Industry Subject Matter Experts and Regional Entity Members — Industry experts and Regional Entity members may be called upon to provide their technical expertise in Compliance Monitoring and Enforcement Program activities.

7.1 The Regional Entity shall have procedures defining the allowable involvement of industry subject matter experts and Regional Entity members. The procedures shall address applicable antitrust laws and conflicts of interest.

7.2 Industry subject matter experts and Regional Entity members shall have no conflict of interest or financial interests in the outcome of their activities.

7.3 Regional Entity members and industry subject matter experts, as part of teams or Regional Entity committees, may provide input to the Regional Entity Compliance Staff so long as the authority and responsibility for (i) evaluating and determining compliance or noncompliance and (ii) levying Penalties, sanctions, or Remedial Action Directives shall not be delegated to any person or entity other than the Compliance Staff of the Regional Entity. Industry subject matter experts, Regional Entity members, or

Regional Entity committees shall not make determinations of noncompliance or levy Penalties, sanctions, or Remedial Action Directives. Any committee involved shall be organized so that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

7.4 Industry subject matter experts and Regional Entity members shall sign a confidentiality agreement appropriate for the activity being performed.

7.5 All industry subject matter experts and Regional Entity members participating in Compliance Audits and Compliance Investigations shall successfully complete auditor training provided by NERC or the Regional Entity prior to performing these activities

Program Design

8. **Regional Entity Compliance Monitoring and Enforcement Program Content** — All approved Reliability Standards shall be included in the Regional Entity Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users within the defined boundaries of the Regional Entity. Compliance to approved Regional Reliability Standards is applicable only within the Region of the Regional Entity that submitted those particular Regional Reliability Standards for approval. NERC will identify the risk elements and related ~~minimum set of~~ Reliability Standards and Requirements to be ~~actively monitored~~considered by the Regional Entity in a given year in developing oversight plans for individual Registered Entities.

9. **Antitrust Provisions** — Each Regional Entity's Compliance Monitoring and Enforcement Program shall be structured and administered to abide by U.S. antitrust law and Canadian competition law.

10. **Information Submittal** — All Bulk Power System owners, operators, and users within the Regional Entity responsible for complying with Reliability Standards shall submit timely and accurate information when requested by the Regional Entity or NERC. NERC and the Regional Entities shall preserve any mark of confidentiality on information submitted pursuant to Section 1502.1.

10.1 Each Regional Entity has the authority to collect the necessary information to determine compliance and shall develop processes for gathering data from the Bulk Power System owners, operators, and users the Regional Entity monitors.

10.2 The Regional Entity or NERC has the authority to request information from Bulk Power System owners, operators, and users pursuant to Section 401.3 or this Section 403.10 without invoking a specific compliance monitoring and enforcement process in **Appendix 4C**, for purposes of determining whether to pursue one such process in a particular case and/or validating in the enforcement phase of a matter the conclusions reached through the compliance monitoring and enforcement process(es).

10.3 When required or requested, the Regional Entities shall report information to NERC promptly and in accordance with **Appendix 4C** and other NERC procedures.

10.4 Regional Entities shall notify NERC of all Possible, Alleged and Confirmed Violations of NERC Reliability Standards by Registered Entities over which the Regional Entity has compliance monitoring and enforcement authority, in accordance with **Appendix 4C**.

10.5 A Bulk Power System owner, operator, or user found in noncompliance with a Reliability Standard shall submit a Mitigation Plan with a timeline addressing how the noncompliance will be corrected, unless an enforcement process is used that does not require a Mitigation Plan. The Regional Entity Compliance Staff shall review and accept the Mitigation Plan in accordance with **Appendix 4C**.

10.6 An officer of a Bulk Power System owner, operator, or user shall certify as accurate all compliance data Self-Reported to the Regional Entity Compliance Monitoring and Enforcement Program.

10.7 Regional Entities shall develop and implement procedures to verify the compliance information submitted by Bulk Power System owners, operators, and users.

11. **Compliance Audits of Bulk Power System Owners, Operators, and Users** — Each Regional Entity will maintain and implement a program of proactive Compliance Audits of Bulk Power System owners, operators, and users responsible for complying with Reliability Standards, in accordance with **Appendix 4C**. A Compliance Audit is a process in which a detailed review of the activities of a Bulk Power System owner, operator, or user is performed to determine if that Bulk Power System owner, operator, or user is complying with approved Reliability Standards.

11.1 For an entity registered as a Balancing Authority, Reliability Coordinator, or Transmission Operator, the Compliance Audit will be performed at least once every three years. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, Compliance Audits shall be performed on a schedule established by NERC.

11.2 Compliance Audits of Balancing Authorities, Reliability Coordinators, and Transmission Operators will include a component at the audited entity's site. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, the Compliance Audit may be either an on-site Compliance Audit or based on review of documents, as determined to be necessary and appropriate by NERC or Regional Entity Compliance Staff.

11.3 Compliance Audits must include a detailed review of the activities of the Bulk Power System owner, operator, or user to determine if the Bulk Power System owner, operator, or user is complying with all approved Reliability Standards identified for audit by NERC. The Compliance Audit shall include a review of supporting documentation and evidence used by the Bulk Power System owner, operator or user to demonstrate compliance for an appropriate period prior to the Compliance Audit.

12. **Confidentiality of Compliance Monitoring and Enforcement Processes** — All compliance monitoring and enforcement processes, and information obtained from such processes, are to be non-public and treated as confidential in accordance with Section 1500 and **Appendix 4C** of these Rules of Procedure, unless NERC, the Regional Entity or FERC or another Applicable Governmental Authority with jurisdiction determines a need to conduct a Compliance Monitoring and Enforcement Program process on a public basis, provided, that NERC and the Regional Entities shall publish (i) schedules of Compliance Audits scheduled in each year, (ii) a public report of each Compliance Audit, and (iii) Notices of Penalty and settlement agreements. Advance authorization from the Applicable Governmental Authority is required to make public any compliance monitoring and enforcement process or any information relating to a compliance monitoring and enforcement process, or to permit interventions when determining whether to impose a Penalty. This prohibition on making public any compliance monitoring and enforcement process does not prohibit NERC or a Regional Entity from publicly disclosing (i) the initiation of or results from an analysis of a significant system event under Section 807 or of off-normal events or system performance under Section 808, or (ii) information of general applicability and usefulness to owners, operators, and users of the Bulk Power System concerning reliability and compliance matters, so long as specific allegations or conclusions regarding Possible or Alleged Violations of Reliability Standards are not included in such disclosures.

13. **Critical Energy Infrastructure Information** — Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident will be identified and protected from public disclosure as Critical Energy Infrastructure Information. In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall be redacted according to NERC procedures and shall not be released publicly.

14. **Penalties, Sanctions, and Remedial Action Directives** — Each Regional Entity will apply all Penalties, sanctions, and Remedial Action Directives in accordance with the approved *Sanction Guidelines*, **Appendix 4B** to these Rules of Procedure. Any changes to the *Sanction Guidelines* to be used by any Regional Entity must be approved by NERC and submitted to the Applicable Governmental Authority for approval. All Confirmed Violations, Penalties, and sanctions, including Confirmed Violations, Penalties and sanctions specified in a Regional Entity Hearing Body decision, will be provided to NERC for review and filing

with Applicable Governmental Authorities as a Notice of Penalty, in accordance with **Appendix 4C**.

15. **Regional Entity Hearing Process** — Each Regional Entity Compliance Monitoring and Enforcement Program shall establish and maintain a fair, independent, and nondiscriminatory process for hearing contested violations and any Penalties or sanctions levied, in conformance with Attachment 2 to **Appendix 4C** to these Rules of Procedure and any deviations therefrom that are set forth in the Regional Entity's delegation agreement. The hearing process shall allow Bulk Power System owners, operators, and users to contest findings of compliance violations, any Penalties and sanctions that are proposed to be levied, proposed Remedial Action Directives, and components of proposed Mitigation Plans. The Regional Entity hearing process shall be conducted before the Regional Entity board or a balanced committee established by and reporting to the Regional Entity board as the final adjudicator at the Regional Entity level, provided, that Canadian provincial regulators may act as the final adjudicator in their respective jurisdictions. The Regional Entity hearing process shall (i) include provisions for recusal of any members of the Hearing Body with a potential conflict of interest, real or perceived, from all compliance matters considered by the Hearing Body for which the potential conflict of interest exists and (ii) provide that no two industry sectors may control any decision and no single segment may veto any matter brought before the Hearing Body after recusals.

    Each Regional Entity will notify NERC of all hearings and NERC may observe any of the proceedings. Each Regional Entity will notify NERC of the outcome of all hearings.

    If a Bulk Power System owner, operator, or user or a Regional Entity has completed the Regional Entity hearing process and desires to appeal the outcome of the hearing, the Bulk Power System owner, operator, or user or the Regional Entity shall appeal to NERC in accordance with Section 409 of these Rules of Procedure, except that a determination of violation or Penalty that has been directly adjudicated by an Applicable Governmental Authority shall be appealed with that Applicable Governmental Authority.

16. **Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan** — Each Regional Entity shall annually develop and submit to NERC for approval a Regional Entity Compliance Monitoring and Enforcement Implementation Plan in accordance with **Appendix 4C** that, includes details on r~~R~~egional r~~R~~isk a~~A~~ssessment processes and results, Reliability Standards and Requirements associated with r~~R~~egional ~~R~~risk a~~A~~ssessment results, the methods to be used by the Regional Entity for reporting, monitoring, evaluati~~on~~ng, and assess~~ment of~~ ing performance criteria~~,~~ and the Regional Entity's Annual Audit Plan.~~identifies the Reliability Standards and Requirements to be actively monitored (both those required by NERC and any additional Reliability Standards the Regional Entity proposes to monitor), and how each NERC and Regional Entity identified Reliability Standard will be monitored,~~

~~evaluated, reported, sanctioned, and appealed.~~ These Regional Implementation Plans will be submitted to NERC on the schedule established by NERC, generally on or about October 1 of the preceding year. In conjunction with the annual Regional Implementation Plan, each Regional Entity must report to NERC regarding how it carried out its delegated compliance monitoring and enforcement authority in the previous year, the effectiveness of the Compliance Monitoring and Enforcement Program, and changes expected to correct any deficiencies identified. Each Regional Entity will provide its annual report on the schedule established by NERC, generally on or about February 15 of the following year.

404. NERC Monitoring of Compliance for Regional Entities or Bulk Power Owners, Operator, or Users

NERC shall monitor Regional Entity compliance with NERC Reliability Standards and, if no there is no delegation agreement in effect with a Regional Entity for the geographic area, shall monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards. Industry subject matter experts may be used as appropriate in Compliance Investigations, Compliance Audits, and other Compliance Monitoring and Enforcement Program activities, subject to confidentiality, antitrust, and conflict of interest provisions.

1. **NERC Obligations** — NERC Compliance Staff shall monitor the compliance of the Regional Entity with the Reliability Standards for which the Regional Entities are responsible, in accordance with **Appendix 4C**. NERC shall actively monitor in its annual Compliance Enforcement and Monitoring Program selected Reliability Standards that apply to the Regional Entities. NERC shall evaluate compliance and noncompliance with all of the Reliability Standards that apply to the Regional Entities and shall impose sanctions, Penalties, or Remedial Action Directives when there is a finding of noncompliance. NERC shall post all violations of Reliability Standards that apply to the Regional Entities as described in the reporting and disclosure process in **Appendix 4C**.

   In addition, NERC will directly monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards in any geographic area for which there is not a delegation agreement in effect with a Regional Entity, in accordance with **Appendix 4C**. In such cases, NERC will serve as the Compliance Enforcement Authority described in **Appendix 4C**. Compliance matters contested by Bulk Power System owners, operators, and users in such an event will be heard by the NERC Compliance and Certification Committee.

2. **Compliance Audit of the Regional Entity** — NERC shall perform a Compliance Audit of each Regional Entity responsible for complying with Reliability Standards at least once every three years. NERC shall make an evaluation of compliance based on the information obtained through the Compliance Audit. After due process is complete, the final Compliance Audit report shall be made public in accordance with the reporting and disclosure process in **Appendix 4C**.

3. **Appeals Process** —Any Regional Entity or Bulk Power System owner, operator or user found by NERC, as opposed to a Regional Entity, to be in noncompliance

with a Reliability Standard may appeal the findings of noncompliance with Reliability Standards and any sanctions or Remedial Action Directives that are issued by, or Mitigation Plan components imposed by, NERC, pursuant to the processes described in Sections 408 through 410.

405. Monitoring of Reliability Standards and Other Requirements Applicable to NERC

The NERC Compliance and Certification Committee shall establish and implement a process to monitor NERC's compliance with the Reliability Standards that apply to NERC. The process shall use independent monitors with no conflict of interest, real or perceived, in the outcomes of the process. All violations shall be made public according to the reporting and disclosure process in **Appendix 4C**. The Compliance and Certification Committee will also establish a procedure for monitoring NERC's compliance with its Rules of Procedure for the Standards Development, Compliance Monitoring and Enforcement, and Organization Registration and Certification Programs. Such procedures shall not be used to circumvent the appeals processes established for those programs.

406. Independent Audits of the NERC Compliance Monitoring and Enforcement Program

NERC shall provide for an independent audit of its Compliance Monitoring and Enforcement Program at least once every three years, or more frequently as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board. The independent audit shall meet the following minimum requirements and any other requirements established by the NERC Board.

1. **Effectiveness** — The audit shall evaluate the success and effectiveness of the NERC Compliance Monitoring and Enforcement Program in achieving its mission.

2. **Relationship** — The audit shall evaluate the relationship between NERC and the Regional Entity Compliance Monitoring and Enforcement Programs and the effectiveness of the programs in ensuring reliability.

3. **Final Report Posting** — The final report shall be posted by NERC for public viewing in accordance with **Appendix 4C**.

4. **Response to Recommendations** — If the audit report includes recommendations to improve the NERC Compliance Monitoring and Enforcement Program, the administrators of the NERC Compliance Monitoring and Enforcement Program shall provide a written response and plan to the Board within 30 days of the release of the final audit report.

407. Penalties, Sanctions, and Remedial Action Directives

1. **NERC Review of Regional Entity Penalties and Sanctions —** NERC shall review all Penalties, sanctions, and Remedial Action Directives imposed by each Regional Entity for violations of Reliability Standards, including Penalties, sanctions and Remedial Action Directives that are specified by a Regional Entity

Hearing Body final decision issued pursuant to Attachment 2 to **Appendix 4C**, to determine if the Regional Entity's determination is supported by a sufficient record compiled by the Regional Entity, is consistent with the *Sanction Guidelines* incorporated into these Rules of Procedure as **Appendix 4B** and with other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and is consistent with Penalties, sanctions and Remedial Action Directives imposed by the Regional Entity and by other Regional Entities for violations involving the same or similar facts and circumstances.

2. **Developing Penalties and Sanctions** — The Regional Entity Compliance Staff shall use the *Sanction Guidelines*, which are incorporated into these Rules of Procedure as **Appendix 4B**, to develop an appropriate Penalty, sanction, or Remedial Action Directive for a violation, and shall notify NERC of the Penalty, sanction or Remedial Action Directive.

3. **Effective Date of Penalty** — Where authorized by applicable legislation or agreement, no Penalty imposed for a violation of a Reliability Standard shall take effect until the thirty-first day after NERC files, with the Applicable Governmental Authority, a "Notice of Penalty" and the record of the proceedings in which the violation and Penalty were determined, or such other date as ordered by the Applicable Governmental Authority.

408. Review of NERC Decisions

1. **Scope of Review** — A Registered Entity or a Regional Entity wishing to challenge a finding of noncompliance and the imposition of a Penalty for a compliance measure directly administered by NERC, or a Regional Entity wishing to challenge a Regional Entity Compliance Monitoring and Enforcement Program audit finding, may do so by filing a notice of the challenge with NERC's director of enforcement no later than 21 days after issuance of the notice of finding of violation or audit finding. Appeals by Registered Entities or Regional Entities of decisions of Regional Entity Hearing Bodies shall be pursuant to Section 409.

2. **Contents of Notice** — The notice of challenge shall include the full text of the decision that is being challenged, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief.

3. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of challenge, the NERC director of enforcement may file with the Hearing Panel a response to the issues raised in the notice, with a copy to the Regional Entity.

4. **Hearing by Compliance and Certification Committee** — The NERC Compliance and Certification Committee shall provide representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program an opportunity to be heard and shall decide the matter

based upon the filings and presentations made, with a written explanation of its decision.

5. **Appeal** — The Regional Entity or Registered Entity may appeal the decision of the Compliance and Certification Committee by filing a notice of appeal with NERC's director of enforcement no later than 21 days after issuance of the written decision by the Compliance and Certification Committee. The notice of appeal shall include the full text of the written decision of the Compliance and Certification Committee that is being appealed, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not presented to the Compliance and Certification Committee.

6. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of appeal, the NERC Compliance Monitoring and Enforcement Program staff may file its response to the issues raised in the notice of appeal, with a copy to the entity filing the notice.

7. **Reply** — The entity filing the appeal may file a reply within 7 days.

8. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record, the response, and any reply. At its discretion, the Compliance Committee may invite representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program to appear before the Compliance Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

9. **Impartiality** — No member of the Compliance and Certification Committee or the Board of Trustees Compliance Committee having an actual or perceived conflict of interest in the matter may participate in any aspect of the challenge or appeal except as a party or witness.

10. **Expenses** — Each party in the challenge and appeals processes shall pay its own expenses for each step in the process.

11. **Non-Public Proceedings —** All challenges and appeals shall be closed to the public to protect Confidential Information.

409. Appeals from Final Decisions of Regional Entity Hearing Bodies

1. **Time for Appeal** — A Regional Entity acting as the Compliance Enforcement Authority, or an owner, operator or user of the Bulk Power System, shall be entitled to appeal from a final decision of a Regional Entity Hearing Body concerning an Alleged Violation of a Reliability Standard, a proposed Penalty or sanction for violation of a Reliability Standard, a proposed Mitigation Plan, or a proposed Remedial Action Directive, by filing a notice of appeal with NERC's

director of enforcement, with copies to the Regional Entity and any other Participants in the Regional Entity Hearing Body proceeding, no later than 21 days after issuance of the final decision of the Regional Entity Hearing Body.

2. **Contents** — The notice of appeal shall include the full text of the final decision of the Regional Entity Hearing Body that is being appealed, a concise statement of the error or errors contained in the final decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not first presented during the proceeding before the Regional Entity Hearing Body.

3. **Response to Notice of Appeal** — Within 21 days after the date the notice of appeal is filed, the Regional Entity shall file the entire record of the Regional Entity Hearing Body proceeding with NERC's director of enforcement, with a copy to the Participant filing the notice. Within 35 days after the date of the notice of appeal, all Participants in the proceeding before the Regional Entity Hearing Body, other than the Participant filing the notice of appeal, shall file their responses to the issues raised in the notice of appeal.

4. **Reply** — The Registered Entity filing the appeal may file a reply to the responses within 7 days.

5. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record of the proceeding before the Regional Entity Hearing Body, the responses, and any reply filed with NERC. At its discretion, the Compliance Committee may invite representatives of the entity making the appeal and the other Participants in the proceeding before the Regional Entity Hearing Body to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

6. **Expenses** — Each party in the appeals process shall pay its own expenses for each step in the process.

7. **Non-Public Proceedings** — All appeals shall be closed to the public to protect Confidential Information.

8. **Appeal of Hearing Body Decisions Granting or Denying Motions to Intervene** — This section is not applicable to an appeal of a decision of a Regional Entity Hearing Body granting or denying a motion to intervene in the Regional Entity Hearing Body proceeding. Appeals of decisions of Regional Entity Hearing Bodies granting or denying motions to intervene in Regional Entity Hearing Body proceedings shall be processed and decided pursuant to Section 414.

410. Hold Harmless

A condition of invoking the challenge or appeals processes under Section 408 or 409 is that the entity requesting the challenge or appeal agrees that neither NERC (defined to

include its Members, Board of Trustees, committees, subcommittees, staff and industry subject matter experts), any person assisting in the challenge or appeals processes, nor any company employing a person assisting in the challenge or appeals processes, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the challenge or appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

411. Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards

A Registered Entity that is subject to an Applicable Requirement of a NERC Critical Infrastructure Protection Standard for which Technical Feasibility Exceptions are permitted, may request a Technical Feasibility Exception to the Requirement, and the request will be reviewed, approved or disapproved, and if approved, implemented, in accordance with the NERC *Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standard*, Appendix 4D to these Rules of Procedure.

412. Certification of Questions from Regional Entity Hearing Bodies for Decision by the NERC Board of Trustees Compliance Committee

1. A Regional Entity Hearing Body that is conducting a hearing concerning a disputed compliance matter pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, may certify to the Board of Trustees, for decision, a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the hearing in whole or in part, and as to which there are other extraordinary circumstances that make prompt consideration of the question by the Compliance Committee appropriate, in accordance with Section 1.5.12 of the Hearing Procedures. All questions certified by a Regional Entity Hearing Body to the Board of Trustees shall be considered and disposed of by the Compliance Committee.

2. The Compliance Committee may accept or reject a certification of a question for decision. If the Compliance Committee rejects the certified question, it shall issue a written statement that the certification is rejected.

3. If the Compliance Committee accepts the certification of a question for decision, it shall establish a schedule by which the Participants in the hearing before the Regional Entity Hearing Body may file memoranda and reply memoranda stating their positions as to how the question certified for decision should be decided by the Compliance Committee. The Compliance Committee may also request, or provide an opportunity for, the NERC compliance operations department, the NERC compliance enforcement department, and/or the NERC general counsel to file memoranda stating their positions as to how the question certified for decision should be decided. After receiving such memoranda and reply memoranda as are

filed in accordance with the schedule, the Compliance Committee shall issue a written decision on the certified question.

4. Upon receiving the Compliance Committee's written decision on the certified question, the Regional Entity Hearing Body shall proceed to complete the hearing in accordance with the Compliance Committee's decision.

5. The Compliance Committee's decision, if any, on the certified question shall only be applicable to the hearing from which the question was certified and to the Participants in that hearing.

413. Review and Processing of Regional Entity Hearing Body Final Decisions that Are Not Appealed

NERC shall review and process all final decisions of Regional Entity Hearing Bodies issued pursuant to Attachment 2 to Appendix 4C concerning an Alleged Violation, proposed Penalty or sanction, or proposed Mitigation Plan that are not appealed pursuant to Section 409, as though the determination had been made by the Regional Entity Compliance Monitoring and Enforcement Program. NERC shall review and process such final decisions, and may require that they be modified by the Regional Entity, in accordance with, as applicable to the particular decision, Sections 5.8, 5.9 and 6.5 of Appendix 4C.

414. Appeals of Decisions of Regional Entity Hearing Bodies Granting or Denying Motions to Intervene in Regional Entity Hearing Body Proceedings

1. **Time to Appeal** — An entity may appeal a decision of a Regional Entity Hearing Body under Section 1.4.4 of Attachment 2 of **Appendix C** denying the entity's motion to intervene in a Regional Entity Hearing Body proceeding, and the Regional Entity Compliance Staff or any other Participant in the Regional Entity Hearing Body proceeding may appeal a decision of the Regional Entity Hearing Body under Section 1.4.4 of Attachment 2 of **Appendix C** granting or denying a motion to intervene in the Regional Entity Hearing Body proceeding, in either case by filing a notice of appeal with the NERC director of enforcement, with copies to the Regional Entity Clerk, the Regional Entity Hearing body, the Hearing Officer, the Regional Entity Compliance Staff, and all other Participants in the Regional Entity Hearing Body proceeding, no later than seven (7) days following the date of the Regional Entity Hearing Body decision granting or denying the motion to intervene.

2. **Contents of Notice of Appeal** — The notice of appeal shall set forth information and argument to demonstrate that the decision of the Regional Entity Hearing Body granting or denying the motion to intervene was erroneous under the grounds for intervention specified in Section 1.4.4 of Attachment 2 of **Appendix 4C** and that the entity requesting intervention should be granted or denied intervention, as applicable. Facts alleged in, and any offers of proof made in, the notice of appeal shall be supported by affidavit or verification. The notice of

appeal shall include a copy of the original motion to intervene and a copy of the decision of the Regional Entity Hearing Body granting or denying the motion to intervene.

3. **Responses to Notice of Appeal** — Within ten (10) days following the date the notice of appeal is filed, the Regional Entity Clerk shall transmit to the NERC director of enforcement copies of all pleadings filed in the Regional Entity Hearing Body proceeding on the motion to intervene. Within fourteen (14) days following the date the notice of appeal is filed, the Regional Entity Hearing Body, the Regional Entity Compliance Staff, and any other Participants in the Regional Entity Hearing Body proceeding, may each file a response to the notice of appeal with the NERC director of enforcement. Within seven (7) days following the last day for filing responses, the entity filing the notice of appeal, and any Participant in the Regional Entity Hearing Body proceeding that supports the appeal, may file replies to the responses with the NERC director of enforcement.

4. **Disposition of Appeal** — The appeal shall be considered and decided by the Compliance Committee. The NERC director of enforcement shall provide copies of the notice of appeal and any responses and replies to the Compliance Committee. The Compliance Committee shall issue a written decision on the appeal; provided, that if the Compliance Committee does not issue a written decision on the appeal within forty-five (45) days following the date of filing the notice of appeal, the appeal shall be deemed denied and the decision of the Regional Entity Hearing Body granting or denying the motion to intervene shall stand. The NERC director of enforcement shall transmit copies of the Compliance Committee's decision, or shall provide notice that the forty-five (45) day period has expired with no decision by the Compliance Committee, to the Regional Entity Clerk, the Regional Entity Hearing Body, the entity filing the notice of appeal, the Regional Entity Compliance Staff, and any other Participants in the Regional Entity Hearing Body proceeding that filed responses to the notice of appeal or replies to responses.

5. **Appeal of Compliance Committee Decision to FERC or Other Applicable Governmental Authority** — Any entity aggrieved by the decision of the Compliance Committee on an appeal of a Regional Entity Hearing Body decision granting or denying a motion to intervene in a Regional Entity Hearing Body proceeding (including a denial of such appeal by the expiration of the forty-five (45) day period as provided in Section 414.4) may appeal or petition for review of the decision of the Compliance Committee to FERC or to another Applicable Governmental Authority having jurisdiction over the matter, in accordance with the authorities, rules and procedures of FERC or such other Applicable Governmental Authority. Any such appeal or petition for review shall be filed within the time period, if any, and in the form and manner, specified by the applicable statutes, rules or regulations governing proceedings before FERC or the other Applicable Governmental Authority.

SECTION 500 — ORGANIZATION REGISTRATION AND CERTIFICATION

501. Scope of the Organization Registration and Organization Certification Programs

The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards. Registered Entities are not and do not become Members of NERC or a Regional Entity, by virtue of being listed on the NCR. Membership in NERC is governed by Article II of NERC's Bylaws; membership in a Regional Entity or regional reliability organization is governed by that entity's bylaws or rules.

The purpose of the Organization Certification Program is to ensure that the new entity (i.e., applicant to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures to demonstrate their ability to meet the Requirements/sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying thereby demonstrating the ability to become certified and then operational.

Organization Registration and Organization Certification may be delegated to Regional Entities in accordance with the procedures in this Section 500; the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into these Rules of Procedure as **Appendix 5A**; and, approved Regional Entity delegation agreements or other applicable agreements.

1. **NERC Compliance Registry** — NERC shall establish and maintain the NCR of the Bulk Power System owners, operators, and users that are subject to approved Reliability Standards.

   1.1 (a) The NCR shall set forth the identity and functions performed for each organization responsible for meeting Requirements/sub-Requirements of the Reliability Standards. Bulk Power System owners, operators, and users (i) shall provide to NERC and the applicable Regional Entity information necessary to complete the Registration, and (ii) shall provide NERC and the applicable Regional Entity with timely updates to information concerning the Registered Entity's ownership, operations, contact information, and other information that may affect the Registered Entity's Registration status or other information recorded in the Compliance Registry.

   (b) A generation or transmission cooperative, a joint-action agency or another organization may register as a Joint Registration Organization (JRO), in lieu of each of the JRO's members or related entities being registered individually for one or more functions. Refer to Section 507.

(c) Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function pursuant to a written agreement for the division of compliance responsibility. Refer to Section 508.

1.2 In the development of the NCR, NERC and the Regional Entities shall determine which organizations should be placed on the NCR based on the criteria provided in the NERC *Statement of Compliance Registry Criteria* which is incorporated into these Rules of Procedure as **Appendix 5B**.

1.3 NERC and the Regional Entities shall use the following rules for establishing and maintaining the NCR based on the Registration criteria as set forth in **Appendix 5B** *Statement of Compliance Registry Criteria*:

1.3.1 NERC shall notify each organization that it is on the NCR. The Registered Entity is responsible for compliance with all the Reliability Standards applicable to the functions for which it is registered from the time it receives the Registration notification from NERC.

1.3.2 Any organization receiving such a notice may challenge its placement on the NCR according to the process in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section V.

1.3.3 The Compliance Committee of the Board of Trustees shall promptly issue a written decision on the challenge, including the reasons for the decision.

1.3.4 The decision of the Compliance Committee of the Board of Trustees shall be final unless, within 21 days of the date of the Compliance Committee of the Board of Trustees decision, the organization appeals the decision to the Applicable Governmental Authority.

1.3.5 Each Registered Entity identified on the NCR shall notify its corresponding Regional Entity(s) of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the Registered Entity's responsibilities with respect to the Reliability Standards. Failure to notify will not relieve the Registered Entity from any responsibility to comply with the Reliability Standards or shield it from any Penalties or sanctions associated with failing to comply with the Reliability Standards applicable to its associated Registration.

1.4 For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall:

1.4.1 Ensure that all areas are under the oversight of one and only one Reliability Coordinator.

1.4.2 Ensure that all Balancing Authorities and Transmission Operator entities[2] are under the responsibility of one and only one Reliability Coordinator.

1.4.3 Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator.

1.4.4 Ensure that all Loads and generators are under the responsibility and control of one and only one Balancing Authority.

1.5 NERC shall maintain the NCR of organizations responsible for meeting the Requirements/sub-Requirements of the Reliability Standards currently in effect on its website and shall update the NCR monthly.

1.6 With respect to: (i) entities to be registered for the first time; (ii) currently-registered entities or (iii) previously-registered entities, for which registration status changes are sought, including availability and composition of a sub-set list of applicable Reliability Standards (which specifies the Reliability Standards and may specify Requirements/sub-Requirements), the registration process steps in Section III of **Appendix 5A** apply.

1.7 NERC shall establish a NERC-led, centralized review panel, comprised of a NERC lead with Regional Entity participants, in accordance with **Appendix 5A**, *Organization Registration and Organization Certification Manual*, Section III.D and **Appendix 5B**, *Statement of Compliance Registry Criteria*.

2. **Entity Certification** — NERC shall provide for Certification of all entities with primary reliability responsibilities requiring Certification. This includes those

[2] Some organizations perform the listed functions (e.g., Balancing Authority, Transmission Operator) over areas that transcend the Footprints of more than one Reliability Coordinator. Such organizations will have multiple Registrations, with each such Registration corresponding to that portion of the organization's overall area that is within the Footprint of a particular Reliability Coordinator.

entities that satisfy the criteria established in the NERC provisional Certification process. The NERC programs shall:

2.1 Evaluate and certify the competency of entities performing reliability functions. The entities presently expected to be certified include Reliability Coordinators, Transmission Operators, and Balancing Authorities.

2.2 Evaluate and certify each applicant's ability to meet the requirements for Certification.

2.3 Maintain process documentation.

2.4 Maintain records of currently certified entities.

2.5 Issue a Certification document to the applicant that successfully demonstrates its competency to perform the evaluated functions.

3. **Delegation and Oversight**

3.1 NERC may delegate responsibilities for Organization Registration and Organization Certification to Regional Entities in accordance with requirements established by NERC. Delegation will be via the delegation agreement between NERC and the Regional Entity or other applicable agreement. The Regional Entity shall administer Organization Registration and Organization Certification Programs in accordance with such delegations to meet NERC's programs goals and requirements subject to NERC oversight.

3.2 NERC shall develop and maintain a plan to ensure the continuity of Organization Registration and Organization Certification within the geographic or electrical boundaries of a Regional Entity in the event that no entity is functioning as a Regional Entity for that Region, or the Regional Entity withdraws as a Regional Entity, or does not operate its Organization Registration and Organization Certification Programs in accordance with delegation agreements.

3.3 NERC shall develop and maintain a program to monitor and oversee the NERC Organization Registration and Organization Certification Programs activities that are delegated to each Regional Entity through a delegation agreement or other applicable agreement.

3.3.1 This program shall monitor whether the Regional Entity carries out those delegated activities in accordance with NERC requirements, and whether there is consistency, fairness of administration, and comparability.

3.3.2 Monitoring and oversight shall be accomplished through direct participation in the Organization Registration and Organization Certification Programs with periodic reviews of documents and records of both programs.

502. Organization Registration and Organization Certification Program Requirements

1. NERC shall maintain the Organization Registration and Organization Certification Programs.

   1.1 The roles and authority of Regional Entities in the programs are delegated from NERC pursuant to the Rules of Procedure through regional delegation agreements or other applicable agreements.

   1.2 Processes for the programs shall be administered by NERC and the Regional Entities. Materials that each Regional Entity uses are subject to review and approval by NERC.

   1.3 The appeals process for the Organization Registration and Organization Certification Programs are identified in **Appendix 5A** *Organization Registration and Organization Certification Manual,* Sections V and VI, respectively.

   1.4 The Certification Team membership is identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section IV.8.d.

2. To ensure consistency and fairness of the Organization Registration and Organization Certification Programs, NERC shall develop procedures to be used by all Regional Entities and NERC in accordance with the following criteria:

   2.1 NERC and the Regional Entities shall have data management processes and procedures that provide for confidentiality, integrity, and retention of data and information collected.

   2.2 Documentation used to substantiate the conclusions of the Regional Entity/ NERC related to Registration and/or Certification must be retained by the Regional Entity for (6) six years, unless a different retention period is otherwise identified, for the purposes of future audits of these programs.

   2.3 To maintain the integrity of the NERC Organization Registration and Organization Certification Programs, NERC, Regional Entities, Certification Team members, program audit team members (Section 506), and committee members shall maintain the confidentiality of information provided by an applicant or entities.

      2.2.1 NERC and the Regional Entities shall have appropriate codes of conduct and confidentiality agreements for staff, Certification

Team, Certification related committees, and Certification program audit team members.

2.2.2 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall maintain the confidentiality of any Registration or Certification-related discussions or documents designated as confidential (see Section 1500 for types of Confidential Information).

2.2.3 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall treat as confidential the individual comments expressed during evaluations, program audits and report-drafting sessions.

2.2.4 Copies of notes, draft reports, and other interim documents developed or used during an entity Certification evaluation or program audit shall be destroyed after the public posting of a final, uncontested report.

2.2.5 Information deemed by an applicant, entity, a Regional Entity, or NERC as confidential, including Critical Energy Infrastructure Information, shall not be released publicly or distributed outside of a committee or team.

2.2.6 In the event that an individual violates any of the confidentiality rules set forth above, that individual and any member organization with which the individual is associated will be subject to immediate dismissal from the audit team and may be prohibited from future participation in Compliance Monitoring and Enforcement Program activities by the Regional Entity or NERC.

2.2.7 NERC shall develop and provide training in auditing skills to all individuals prior to their participation in Certification evaluations. Training for Certification Team leaders shall be more comprehensive than the training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

2.4 An applicant that is determined to be competent to perform a function after completing all Certification requirements shall be deemed certified by NERC to perform that function for which it has demonstrated full competency.

2.4.1 All NERC certified entities shall be included on the NCR.

503. Regional Entity Implementation of Organization Registration and Organization Certification Program Requirements

1. **Delegation** — Recognizing the Regional Entity's knowledge of and experience with their members, NERC may delegate responsibility for Organization Registration and Organization Certification to the Regional Entity through a delegation agreement.

2. **Registration** — The following Organization Registration activities shall be managed by the Regional Entity per the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into the Rules of Procedure as Appendix 5A *Organization Registration and Organization Certification Manual*:

    2.1 Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4).

3. **Certification —** The following Organization Certification activities shall be managed by the Regional Entity in accordance with an approved delegation agreement or another applicable agreement:

    3.1 An entity seeking Certification to perform one of the functions requiring Certification shall contact the Regional Entity for the Region(s) in which it plans to operate to apply for Certification.

    3.2 An entity seeking Certification and other affected entities shall provide all information and data requested by NERC or the Regional Entity to conduct the Certification process.

    3.3 Regional Entities shall notify NERC of all Certification applicants.

    3.4 NERC and/or the Regional Entity shall evaluate the competency of entities requiring Certification to meet the NERC Certification requirements.

    3.5 NERC or the Regional Entity shall establish Certification procedures to include evaluation processes, schedules and deadlines, expectations of the applicants and all entities participating in the evaluation and Certification processes, and requirements for Certification Team members.

        3.5.1 The NERC / Regional Entity Certification procedures will include provisions for on-site visits to the applicant's facilities to review the data collected through questionnaires, interviewing the operations and management personnel, inspecting the facilities and equipment (including requesting a demonstration of all tools identified in the Certification process), reviewing all necessary documents and data (including all agreements, processes, and procedures identified in the Certification process), reviewing Certification documents and projected system operator work schedules, and reviewing any additional documentation needed to

support the completed questionnaire or inquiries arising during the site visit.

3.5.2 The NERC/ Regional Entity Certification procedures will provide for preparation of a written report by the Certification Team, detailing any deficiencies that must be resolved prior to granting Certification, along with any other recommendations for consideration by the applicant, the Regional Entity, or NERC.

504. Appeals

1. NERC shall maintain an appeals process to resolve any disputes related to Registration or Certification activities per the *Organization Registration and Organization Certification Manual,* which is incorporated in these Rules of Procedure as Appendix 5A.

2. The Regional Entity Certification appeals process shall culminate with the Regional Entity board or a committee established by and reporting to the Regional Entity board as the final adjudicator, provided that where applicable, Canadian provincial governmental authorities may act as the final adjudicator in their jurisdictions. NERC shall be notified of all appeals and may observe any proceedings **(Appendix 5A** *Organization Registration and Organization Certification Manual*).

505. Program Maintenance

NERC shall maintain its program materials, including such manuals or other documents as it deems necessary, of the governing policies and procedures of the Organization Registration and Organization Certification Programs.

506. Independent Audit of NERC Organization Registration and Organization Certification Program

1. NERC, through the Compliance and Certification Committee, shall provide for an independent audit of its Organization Registration and Organization Certification Programs at least once every three years, or more frequently, as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board.

2. The audit shall evaluate the success, effectiveness and consistency of the NERC Organization Registration and Organization Certification Programs.

3. The final report shall be posted by NERC for public viewing.

4. If the audit report includes recommendations to improve the program, the administrators of the program shall provide a written response to the Board within 30 days of the final report, detailing the disposition of each and every

recommendation, including an explanation of the reasons for rejecting a recommendation and an implementation plan for the recommendations accepted.

507. Provisions Relating to Joint Registration Organizations (JRO)

1. In addition to registering as the entity responsible for all functions that it performs itself, an entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Any entity seeking to register as a JRO must submit a written agreement with its members or related entities for all Requirements/sub-Requirements for the function(s) for which the entity is registering for and takes responsibility for, which would otherwise be the responsibility of one or more of its members or related entities. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the JRO Registration.

2. The JRO Registration data must include the same Registration information as a normal compliance Registration entry. The JRO is responsible for providing all of the information and data, including submitting reports, as needed by the Regional Entity for performing assessments of compliance.

3. The Regional Entity shall notify NERC of each JRO that the Regional Entity accepts. The notification will identify the point of contact and the functions(s) being registered for on behalf of its members or related entities.

4. For purposes of Compliance Audits, the Regional Entity shall keep a list of all JROs. This document shall contain a list of each JRO's members or related entities and the function(s) for which the JRO is registered for that member(s) or related entity(s). It is the responsibility of the JRO to provide the Regional Entity with this information as well as the applicable JRO agreement(s).

5. The Regional Entity may request clarification of any list submitted to it that identifies the members of the JRO and may request such additional information as the Regional Entity deems appropriate.

6. The Regional Entity's acceptance of a JRO shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the JRO will meet the Registration requirements of Section 501(1.4).

7. NERC shall maintain, and post on its website, a JRO registry listing all JRO Registrations that have been reviewed and accepted by the Regional Entity. The posting shall identify the JRO entity taking compliance responsibilities for itself and its members.

8. The JRO shall inform the Regional Entity of any changes to an existing JRO. The Regional Entity shall promptly notify NERC of each such revision.

9. Nothing in Section 507 shall preclude a member of a JRO, a related entity, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the member or other entity is registering. A JRO member or related entity that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the JRO of its Registration.

508. Provisions Relating to Coordinated Functional Registration (CFR) Entities

1. In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.

2. Each CFR or each individual entity within a CFR must identify a point of contact that is responsible for providing information and data, including submitting reports as needed by the Regional Entity related to the CFR Registration.

3. The Regional Entity shall notify NERC of each CFR that the Regional Entity accepts.

4. NERC or the Regional Entity may request clarification of any list submitted to it that identifies the compliance responsibilities of the CFR and may request such additional information as NERC or the Regional Entity deems appropriate.

5. The Regional Entity's acceptance of that CFR shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the CFR will meet the Registration requirements of Section 501(1.4).

6. NERC shall maintain, and post on its website, a CFR registry listing all CFR Registrations that have been accepted by NERC or by a Regional Entity. The posting shall clearly list all the Reliability Standards or Requirements/sub-Requirements thereof for which each entity of the CFR is responsible for under the CFR.

7. The point of contact shall inform the Regional Entity of any changes to an existing CFR. The Regional Entity shall promptly notify NERC of each such revision.

8. In the event of a violation of a Reliability Standard or of a Requirement/sub-Requirement of a Reliability Standard for which an entity of a CFR is registered, that entity shall be identified in the Notice of Alleged Violation and shall be assessed the sanction or Penalty in accordance with the NERC Sanctions Guidelines. In the event a Regional Entity is not able to determine which entity(ies) is responsible for a particular Reliability Standard, or Requirements/sub-Requirements thereof that has been violated, the Regional Entity shall investigate the noncompliance in accordance with the NERC Rules of Procedure Section 400, *Compliance Enforcement*, to determine the entity(ies) to which the Regional Entity shall to issue the sanction or Penalty for the violation.

9. Nothing in Section 508 shall preclude an entity registered in a CFR, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the entity is registering. An entity registered in a CFR that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the point of contact of its Registration.

509. Exceptions to the Definition of the Bulk Electric System

An Element is considered to be (or not be) part of the Bulk Electric System by applying the BES Definition to the Element (including the inclusions and exclusions set forth therein). Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of the Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside of the definition of the Bulk Electric System should be considered part of the Bulk Electric System.

SECTION 600 — PERSONNEL CERTIFICATION

601. Scope of Personnel Certification

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The Personnel Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System. The Personnel Certification awards system operator Certification Credentials to individuals who demonstrate that they have attained essential knowledge relating to NERC Reliability Standards as well as principles of Bulk Power System operations. NERC, as the ERO, will ensure skilled, trained, and qualified system operators through the Personnel Certification Program.

Except as necessary to obtain approval of the Rules of Procedure, the NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the policies, sets fees, and monitors the performance of the Personnel Certification Program for system operators.

602. Structure of ERO Personnel Certification Program

1. The NERC Personnel Certification Program shall be international in scope.
2. The PCGC shall (1) be able to independently exercise decision-making for all matters pertaining to Certification, (2) include individuals from the discipline being certified and whose composition addresses the needs of the users of the program (e.g., employers, regulators, etc.), and (3) have representation for each specialty or level within a discipline.
3. NERC shall maintain a nominating process for membership in the governing body. Nominations shall be open to all interested parties and self-nominations shall be accepted. The NERC Board of Trustees shall appoint members to the governing body from among those nominated. The members of the governing body shall serve at the pleasure of the Board.
4. The PCGC shall have control over the matters related to the Personnel Certification and re-Certification Programs listed below, without being subject to approval by any other body.

    4.1 Policies and procedures, including eligibility requirements and application processing.

    4.2 Requirements for personnel Certification, maintaining Certification, and re-Certification.

    4.3 Examination content, development, and administration.

    4.4 Examination cut score.

4.5 Grievance and disciplinary processes.

4.6 Governing body and subgroup(s)' meeting rules including agenda, frequency, and related procedures.

4.7 Subgroup(s) appointments and work assignments.

4.8 Publications about personnel Certification and re-Certification.

4.9 Setting fees for application, and all other services provided as a part of the personnel Certification and re-Certification activities.

4.10 Program funding, spending, and budget authority. Financial matters related to the operation of the program shall be segregated from other NERC activities.

5. The Personnel Certification Program shall utilize written procedures for the selection of members of the governing body that prohibit the governing body from selecting a majority of its successors.

6. The Personnel Certification Program shall be separate from the accreditation and education functions of NERC in related disciplines.

7. No member of the PCGC or staff member working with the Personnel Certification Program governing body shall have or exercise any authority or responsibility for compliance matters related to Reliability Standards concerning personnel Certification.

603. Examination and Maintenance of NERC System Operator Certification Credentials

1. System operators seeking to obtain a Credential must pass an examination to earn the Credential.

2. A certificate will be issued to successful candidates which is valid for three years.

3. A system operator must earn Continuing Education Hours (CE Hours) in NERC-Approved Learning Activities within the three-year period preceding the expiration date of his/her certificate as determined by the PCGC and posted in the NERC System Operator Program Manual. A system operator must request a renewal and submit the appropriate fee for Certification renewal evaluation.

4. The Credential of a certified system operator who does not accumulate the required number and balance of CE Hours within the three-year period will be Suspended. A system operator with a Suspended certificate cannot perform any task that requires an operator to be NERC-certified. The system operator with a Suspended Credential will have up to twelve months to acquire the necessary CE Hours.

4.1 During the time of suspension, the original anniversary date will be maintained. Therefore, should the system operator accumulate the required number of CE Hours within the twelve month suspension period, he/she will be issued a certificate that will be valid for three years from the previous expiration date.

4.2 At the end of the twelve-month suspension period, if the system operator has not accumulated the required number of CE Hours, the Credential will be Revoked and all CE Hours earned will be forfeited. After a Credential is Revoked, the system operator will be required to pass an examination to become certified.

5. Hardship: Due to unforeseen events and extenuating circumstances, a certified system operator may be unable to accumulate the necessary CE Hours in the time frame required by the Personnel Certification Program to maintain the Credential. In such an event, the individual must submit a written request containing a thorough explanation of the circumstances and supporting information to the NERC Personnel Certification Manager. The PCGC retains the right to invoke this hardship clause as it deems appropriate to address such events or circumstances.

604. Dispute Resolution Process

1. Any dispute arising under the NERC agreement establishing the *NERC Personnel Certification Program* or from the establishment of any NERC rules, policies, or procedures dealing with any segment of the Certification process shall be subject to the NERC System Operator Certification Dispute Resolution Process. The Dispute Resolution Process is for the use of persons who hold an operator Certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the Registration process.

2. Dispute Resolution Process consists of three steps.

2.1. Notify NERC Personnel Certification Program Staff: This first step can usually resolve the issues without further actions. It is expected that most disputes will be resolved at this step. If the issue(s) is not resolved to the satisfaction of the parties involved in the first step, the issue can be brought to the PCGC Dispute Resolution Task Force.

2.2. PCGC Dispute Resolution Task Force: If the NERC staff did not resolve the issue(s) to the satisfaction of the parties involved, a written request must be submitted to the chairman of the PCGC through NERC staff explaining the issue(s) and requesting further action. Upon receipt of the letter, the PCGC chairman will present the request to the PCGC Dispute Resolution Task Force for action. This task force consists of three current members of the PCGC. The PCGC Dispute Resolution Task Force will

investigate and consider the issue(s) presented and make a decision. This decision will then be communicated to the submitting party, the PCGC chairman, and the NERC staff within 45 calendar days of receipt of the request.

3. Personnel Certification Governance Committee: If the PCGC Dispute Resolution Task Force's decision did not resolve the issue(s) to the satisfaction of the parties involved, the final step in the process is for the issue(s) to be brought before the PCGC. Within 45 days of the date of the Task Force's decision, the disputing party shall submit a written request to the PCGC chairman through NERC staff requesting that the issue(s) be brought before the PCGC for resolution. The chairman shall see that the necessary documents and related data are provided to the PCGC members as soon as practicable. The PCGC will then meet or conference to discuss the issue(s) and make their decision within 60 calendar days of the chairman's receipt of the request. The decision will be provided to the person bringing the issue(s) and the NERC staff. The PCGC is the governing body of the Certification program and its decision is final.

4. Dispute Resolution Process Expenses: All individual expenses associated with the Dispute Resolution Process, including salaries, meetings, or consultant fees, shall be the responsibility of the individual parties incurring the expense.

5. Decision Process: Robert's Rules of Order shall be used as a standard of conduct for the Dispute Resolution Process. A majority vote of the members present will decide all issues. The vote will be taken in a closed session. No member of the PCGC may participate in the Dispute Resolution Process, other than as a party or witness, if he or she has an interest in the particular matter.

   5.1 A stipulation of invoking the Dispute Resolution Process is that the entity invoking the Dispute Resolution Process agrees that neither NERC (its members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the Dispute Resolution Process, nor any company employing a person assisting in the Dispute Resolution Process, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the Dispute Resolution Process. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

605. Disciplinary Action

1. Disciplinary action may be necessary to protect the integrity of the system operator Credential. The PCGC may initiate disciplinary action should an individual act in a manner that is inconsistent with expectations, including but not limited to:

1.1. Willful, gross, and/or repeated violation of the NERC Reliability Standards as determined by a NERC investigation.

1.2. Willful, gross, and/or repeated negligence in performing the duties of a certified system operator as determined by a NERC investigation.

1.3. Intentional misrepresentation of information provided on a NERC application for a system operator Certification exam or to maintain a system operator Credential using CE Hours.

1.4. Intentional misrepresentation of identification in the exam process, including a person identifying himself or herself as another person to obtain Certification for the other person.

1.5. Any form of cheating during a Certification exam, including, but not limited to, bringing unauthorized reference material in the form of notes, crib sheets, or other methods of cheating into the testing center.

1.6. A certified system operator's admission to or conviction of any felony or misdemeanor directly related to his/her duties as a system operator.

2. Hearing Process: Upon report to NERC of a candidate's or certified system operator's alleged misconduct, the NERC PCGC Credential Review Task Force will convene for the determination of facts. An individual, government agency, or other investigating authority can file a report. Unless the Task Force initially determines that the report of alleged misconduct is without merit, the candidate or certified system operator will be given the right to notice of the allegation. A hearing will be held and the charged candidate or certified system operator will be given an opportunity to be heard and present further relevant information. The Task Force may seek out information from other involved parties. The hearing will not be open to the public, but it will be open to the charged candidate or certified system operator and his or her representative. The Task Force will deliberate in a closed session, but the Task Force cannot receive any evidence during the closed session that was not developed during the course of the hearing.

3. Task Force's decision: The Task Force's decision will be unanimous and will be in writing with inclusion of the facts and reasons for the decision. The Task Force's written decision will be delivered to the PCGC and by certified post to the charged candidate or certified system operator. In the event that the Task Force is unable to reach a unanimous decision, the matter shall be brought to the full committee for a decision.

3.1. No Action: Allegation of misconduct was determined to be unsubstantiated or inconsequential to the Credential.

3.2. Probation: A letter will be sent from NERC to the offender specifying:

3.2.1. The length of time of the probationary period (to be determined by the PCGC).

3.2.2. Credential will remain valid during the probationary period.

3.2.3. The probationary period does not affect the expiration date of the current certificate.

3.2.4. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

3.3. Revoke for Cause: A letter will be sent from NERC to the offender specifying:

3.3.1. The length of time of the probationary period (to be determined by the PCGC).

3.3.2. Credential is no longer valid.

3.3.3. Successfully passing an exam will be required to become recertified.

3.3.4. An exam will not be authorized until the revocation period expires

3.4. Termination of Credential: A letter will be sent from NERC to the offender specifying permanent removal of Credential.

4. Credential Review Task Force: The Credential Review Task Force shall be comprised of three active members of the PCGC assigned by the Chairman of the PCGC on an ad hoc basis. No one on the Credential Review Task Force may have an interest in the particular matter. The Task Force will meet in a venue determined by the Task Force chairman.

5. Appeal Process: The decision of the Task Force may be appealed using the NERC System Operator Certification Dispute Resolution Process.

606. Candidate Testing Mechanisms

1. The Personnel Certification Program shall utilize reliable testing mechanisms to evaluate individual competence in a manner that is objective, fair to all candidates, job-related, and based on the knowledge and skill needed to function in the discipline.

2. The Personnel Certification Program shall implement a formal policy of periodic review of the testing mechanisms to ensure ongoing relevance of the mechanisms to knowledge and skill needed in the discipline.

3. The Personnel Certification Program shall utilize policies and procedures to ensure that all test administration and development materials are secure and demonstrate that these policies and procedures are consistently implemented.

4. The Personnel Certification Program shall establish pass/fail levels that protect the public with a method that is based on competence and generally accepted in the psychometric community as being fair and reasonable.

5. The Personnel Certification Program shall conduct ongoing studies to substantiate the reliability and validity of the testing mechanisms.

6. The Personnel Certification Program shall utilize policies and procedures that govern how long examination records are kept in their original format.

7. The Personnel Certification Program shall demonstrate that different forms of the testing mechanisms assess equivalent content and that candidates are not penalized for taking forms of varying difficulty.

607. Public Information About the Personnel Certification Program

1. The Personnel Certification Program shall maintain and publish publicly a System Operator Certification Program Manual describing the procedures used in examination construction and validation; all eligibility requirements and determination; fees; and examination administration documents, including: reporting of results, re-Certification requirements, and disciplinary and dispute resolution.

2. The Personnel Certification Program shall maintain and publish publicly a comprehensive summary or outline of the information, knowledge, or functions covered by each examination.

3. The Personnel Certification Program shall publish publicly and make available at least annually a summary of Certification activities for the program, including at least the following information: number of examinations delivered, the number passed, the number failed, and the number certified.

608. Responsibilities to Applicants for Certification or Re-Certification

The Personnel Certification Program:

1. Shall not discriminate among applicants as to age, gender, race, religion, national origin, disability, or marital status and shall include a statement of non-discrimination in announcements of the program.

2. Shall comply with all requirements of applicable federal and state/provincial laws with respect to all Certification and re-Certification activities, and shall require compliance of all contractors and/or providers of services.

3. Shall make available to all applicants copies of formalized procedures for application for, and attainment of, personnel Certification and re-Certification and shall uniformly follow and enforce such procedures for all applicants.

4. Shall implement a formal policy for the periodic review of eligibility criteria and application procedures to ensure that they are fair and equitable.

5. Shall provide competently proctored examination sites.

6. Shall uniformly report examination results to applicants in a timely manner.

7. Shall give applicants failing the examination information on general content areas of deficiency.

609. Responsibilities to the Public and to Employers of Certified Practitioners

The Personnel Certification Program:

1. Shall demonstrate that the testing mechanisms adequately measure the knowledge and skill required for entry, maintenance, and/or advancement in the profession for each position to be certified.

2. Shall award Certification and re-Certification only after the skill and knowledge of the individual have been evaluated and determined to be acceptable.

3. Shall maintain, in an electronic format, a current list of those persons certified in the programs and have policies and procedures that delineate what information about a Credential holder may be made public and under what circumstances.

4. Shall have formal policies and procedures for discipline of a Credential holder, including the revocation of the certificate, for conduct deemed harmful to the public or inappropriate to the discipline (e.g., incompetence, unethical behavior, physical or mental impairment affecting performance). These procedures shall incorporate due process.

5. Shall demonstrate that any title or Credential awarded accurately reflects or applies to the practitioner's daily occupational or professional duties and is not confusing to employers, consumers, regulators, related professions, and/or other interested parties.

SECTION 700 — RELIABILITY READINESS EVALUATION AND IMPROVEMENT AND FORMATION OF SECTOR FORUMS

701. Confidentiality Requirements for Readiness Evaluations and Evaluation Team Members

1. All information made available or created during the course of any reliability readiness evaluation including, but not limited to, data, Documents, observations and notes, shall be maintained as confidential by all evaluation team members, in accordance with the requirements of Section 1500.

2. Evaluation team members are obligated to destroy all confidential evaluation notes following the posting of the final report of the reliability readiness evaluation.

3. NERC will retain reliability readiness evaluation-related documentation, notes, and materials for a period of time as defined by NERC.

4. These confidentiality requirements shall survive the termination of the NERC Reliability Readiness Evaluation and Improvement Program.

702. Formation of Sector Forum

1. NERC will form a sector forum at the request of any five members of NERC that share a common interest in the safety and reliability of the Bulk Power System. The members of sector forum may invite such others of the members of NERC to join the sector forum as the sector forum deems appropriate.

2. The request to form a sector forum must include a proposed charter for the sector forum. The Board must approve the charter.

3. NERC will provide notification of the formation of a sector forum to its membership roster. Notices and agendas of meetings shall be posted on NERC's website.

4. A sector forum may make recommendations to any of the NERC committees and may submit a Standards Authorization Request to the NERC *Reliability Standards Development Procedure*.

SECTION 800 — RELIABILITY ASSESSMENT AND PERFORMANCE ANALYSIS

801. Objectives of the Reliability Assessment and Performance Analysis Program

The objectives of the NERC Reliability Assessment and Performance Analysis Program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American Bulk Power Systems, both as existing and as planned; (2) analyze off-normal events on the Bulk Power System; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the Board for publication to the electric industry and the general public.

802. Scope of the Reliability Assessment Program

1. The scope of the Reliability Assessment Program shall include:

   1.1 Review, assess, and report on the overall electric generation and transmission reliability (adequacy and operating reliability) of the interconnected Bulk Power Systems, both existing and as planned.

   1.2 Assess and report on the key issues, risks, and uncertainties that affect or have the potential to affect the reliability of existing and future electric supply and transmission.

   1.3 Review, analyze, and report on Regional Entity self-assessments of electric supply and bulk power transmission reliability, including reliability issues of specific regional concern.

   1.4 Identify, analyze, and project trends in electric customer demand, supply, and transmission and their impacts on Bulk Power System reliability.

   1.5 Investigate, assess, and report on the potential impacts of new and evolving electricity market practices, new or proposed regulatory procedures, and new or proposed legislation (e.g. environmental requirements) on the adequacy and operating reliability of the Bulk Power Systems.

2. The Reliability Assessment Program shall be performed in a manner consistent with the Reliability Standards of NERC including but not limited to those that specify reliability assessment Requirements.

803. Reliability Assessment Reports

The number and type of periodic assessments that are to be conducted shall be at the discretion of NERC. The results of the reliability assessments shall be documented in three reports: the long-term and the annual seasonal (summer) and the annual seasonal (winter) assessment reports. NERC shall also conduct special reliability assessments from time to time as circumstances warrant. The reliability assessment reports shall be reviewed and approved for publication by the Board. The three regular reports are described below.

1. **Long-Term Reliability Assessment Report** — The annual long-term report shall cover a ten-year planning horizon. The planning horizon of the long-term reliability assessment report shall be subject to change at the discretion of NERC. Detailed generation and transmission adequacy assessments shall be conducted for the first five years of the review period. For the second five years of the review period, the assessment shall focus on the identification, analysis, and projection of trends in peak demand, electric supply, and transmission adequacy, as well as other industry trends and developments that may impact future electric system reliability. Reliability issues of concern and their potential impacts shall be presented along with any mitigation plans or alternatives. The long-term reliability assessment reports will generally be published in the fall (September) of each year. NERC will also publish electricity supply and demand data associated with the long-term reliability assessment report.

2. **Summer Assessment Report** — The annual summer seasonal assessment report typically shall cover the four-month (June–September) summer period. It shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected summer peak demands. It shall also identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may include possible mitigation alternatives. The report will generally be published in mid-May for the upcoming summer period.

3. **Winter Assessment Report** — The annual winter seasonal assessment report shall cover the three-month (December–February) winter period. The report shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected winter peak demands. Similar to the summer assessment, the winter assessment shall identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may also include possible mitigation alternatives. The winter assessment report will generally be published in mid-November for the upcoming winter period.

4. **Special Reliability Assessment Reports** — In addition to the long-term and seasonal reliability assessment reports, NERC shall also conduct special reliability assessments on a regional, interregional, and Interconnection basis as conditions warrant, or as requested by the Board or governmental authorities. The teams of reliability and technical experts also may initiate special assessments of key

reliability issues and their impacts on the reliability of a regions, subregions, or Interconnection (or a portion thereof). Such special reliability assessments may include, among other things, operational reliability assessments, evaluations of emergency response preparedness, adequacy of fuel supply, hydro conditions, reliability impacts of new or proposed environmental rules and regulations, and reliability impacts of new or proposed legislation that affects or has the potential to affect the reliability of the interconnected Bulk Power Systems in North America.

804. Reliability Assessment Data and Information Requirements

To carry out the reviews and assessments of the overall reliability of the interconnected Bulk Power Systems, the Regional Entities and other entities shall provide sufficient data and other information requested by NERC in support of the annual long-term and seasonal assessments and any special reliability assessments.

Some of the data provided for these reviews and assessment may be considered confidential from a competitive marketing perspective, a Critical Energy Infrastructure Information perspective, or for other purposes. Such data shall be treated in accordance with the provisions of Section 1500 – Confidential Information.

While the major sources of data and information for this program are the Regional Entities, a team of reliability and technical experts is responsible for developing and formulating its own independent conclusions about the near-term and long-term reliability of the Bulk Power Systems.

In connection with the reliability assessment reports, requests shall be submitted to each of the Regional Entities for required reliability assessment data and other information, and for each Regional Entity's self-assessment report. The timing of the requests will be governed by the schedule for the preparation of the assessment reports.

The Regional Entity self-assessments are to be conducted in compliance with NERC Reliability Standards and the respective regional planning criteria. The team(s) of reliability and technical experts shall also conduct interviews with the Regional Entities as needed. The summary of the Regional Entity self-assessments that are to be included in the assessment reports shall follow the general outline identified in NERC's request. This outline may change from time to time as key reliability issues change.

In general, the Regional Entity reliability self-assessments shall address, among other areas, the following topics: demand and Net Energy for Load; assessment of projected resource adequacy; any transmission constraints that may impact bulk transmission adequacy and plans to alleviate those constraints; any unusual operating conditions that could impact reliability for the assessment period; fuel supply adequacy; the deliverability of generation (both internal and external) to Load; and any other reliability issues in the Region and their potential impacts on the reliability of the Bulk Power Systems.

805. Reliability Assessment Process

Based on their expertise, the review of the collected data, the review of the Regional Entity self-assessment reports, and interviews with the Regional Entities, as appropriate, the teams of reliability and technical experts shall perform an independent review and assessment of the generation and transmission adequacy of each Region's existing and planned Bulk Power System. The results of the review teams shall form the basis of NERC's long-term and seasonal reliability assessment reports. The review and assessment process is briefly summarized below.

1. **Resource Adequacy Assessment** — The teams shall evaluate the regional demand and resource capacity data for completeness in the context of the overall resource capacity needs of the Region. The team shall independently evaluate the ability of the Regional Entity members to serve their obligations given the demand growth projections, the amount of existing and planned capacity, including committed and uncommitted capacity, contracted capacity, or capacity outside of the Region. If the Region relies on capacity from outside of the Region to meet its resource objectives, the ability to deliver that capacity shall be factored into the assessment. The demand and resource capacity information shall be compared to the resource adequacy requirements of the Regional Entity for the year(s) or season(s) being assessed. The assessment shall determine if the resource information submitted represents a reasonable and attainable plan for the Regional Entity and its members. For cases of inadequate capacity or reserve margin, the Regional Entity will be requested to analyze and explain any resource capacity inadequacies and its plans to mitigate the reliability impact of the potential inadequacies. The analysis may be expanded to include surrounding areas. If the expanded analysis indicates further inadequacies, then an interregional problem may exist and will be explored with the applicable Regions. The results of these analyses shall be described in the assessment report.

2. **Transmission Adequacy and Operating Reliability Assessment** — The teams shall evaluate transmission system information that relates to the adequacy and operating reliability of the regional transmission system. That information shall include: regional planning study reports, interregional planning study reports, and/or regional operational study reports. If additional information is required, another data request shall be sent to the Regional Entity. The assessment shall provide a judgment on the ability of the regional transmission system to operate reliably under the expected range of operating conditions over the assessment period as required by NERC Reliability Standards. If sub-areas of the regional system are especially critical to the Reliable Operation of the regional bulk transmission system, these Facilities or sub-areas shall be reviewed and addressed in the assessment. Any areas of concern related to the adequacy or operating reliability of the system shall be identified and reported in the assessment.

3. **Seasonal Operating Reliability Assessment** — The team(s) shall evaluate the overall operating reliability of the regional bulk transmission systems. In areas with potential resource adequacy or system operating reliability problems, operational readiness of the affected Regional Entities for the upcoming season

shall be reviewed and analyzed. The assessment may consider unusual but possible operating scenarios and how the system is expected to perform. Operating reliability shall take into account a wide range of activities, all of which should reinforce the Regional Entity's ability to deal with the situations that might occur during the upcoming season. Typical activities in the assessment may include: facility modifications and additions, new or modified operating procedures, emergency procedures enhancement, and planning and operating studies. The teams shall report the overall seasonal operating reliability of the regional transmission systems in the annual summer and winter assessment reports.

4. **Reporting of Reliability Assessment Results** — The teams of reliability and technical experts shall provide an independent assessment of the reliability of the Regional Entities and the North American interconnected Bulk Power System for the period of the assessment. While the Regional Entities are relied upon to provide the information to perform such assessments, the review team is not required to accept the conclusions provided by the Regional Entities. Instead, the review team is expected, based on their expertise, to reach their own independent conclusions about the status of the adequacy of the generation and bulk power transmission systems of North America.

   The review team also shall strive to achieve consensus in their assessments. The assessments that are made are based on the best information available at the time. However, since judgment is applied to this information, legitimate differences of opinion can develop. Despite these differences, the review team shall work to achieve consensus on their findings.

   In addition to providing long-term and seasonal assessments in connection with the Reliability Assessment Program, the review team of experts shall also be responsible for recommending new and revised Reliability Standards related to the reliability assessments and the reliability of the Bulk Power Systems. These proposals for new or revised Reliability Standards shall be entered into NERC's Reliability Standards development process.

   Upon completion of the assessment, the team shall share the results with the Regional Entities. The Regional Entities shall be given the opportunity to review and comment on the conclusions in the assessment and to provide additional information as appropriate. The reliability assessments and their conclusions are the responsibility of NERC's technical review team and NERC.

   The preparation and approval of NERC's reliability assessment reports shall follow a prescribed schedule including review, comment, and possible approval by appropriate NERC committees. The long-term and seasonal (summer and winter) reliability assessment reports shall be further reviewed for approval by the Board for publication to the electric industry.

806. Scope of the Reliability Performance and Analysis Program

The components of the program will include analysis of large-scale outages, disturbances, and near misses to determine root causes and lessons learned; identification and continuous monitoring of performance indices to detect emerging trends and signs of a decline in reliability performance; and communications of performance results, trends, recommendations, and initiatives to those responsible to take actions; followed with confirmation of actions to correct any deficiencies identified. Within NERC, the reliability performance program will provide performance results to the Reliability Standards Development and Compliance Monitoring and Enforcement Programs to make the necessary adjustments to preserve reliability based on a risk-based approach.

807. Analysis of Major Events

Responding to major events affecting the Bulk Power System such as significant losses of Load or generation, significant Bulk Power System disturbances, or other emergencies on the Bulk Power System, can be divided into four phases: situational assessment and communications; situation tracking and communications; data collection, investigation, analysis, and reporting; and follow-up on recommendations.

1. NERC's role following a major event is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the major event. Working closely with the Regional Entities and Reliability Coordinators, and other appropriate Registered Entities, NERC will coordinate and facilitate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

2. When responding to any major event where physical or cyber security is suspected as a cause or contributing factor to the major event, NERC will immediately notify appropriate government agencies and coordinate its activities with them.

3. To the extent that a Reliability Standard sets forth specific criteria and procedures for reporting the Bulk Power System disturbances and events described in that Reliability Standard, all Registered Entities that are subject to the Requirements of that Reliability Standard must report the information required by that Reliability Standard within the time periods specified. In addition to reporting information as required by applicable Reliability Standards, each user, owner, and operator of the Bulk Power System shall also provide NERC and the applicable Regional Entities with such additional information requested by NERC or the applicable Regional Entity as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

4. During the conduct of NERC analyses, assistance may be needed from government agencies. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; investigations related to possible criminal or terrorist involvement in the major event; resources for initial data gathering immediately after the major

event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies.

5. NERC shall work with all other participants to establish a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the investigation and reporting of findings, conclusions, and recommendations related to major events with the objective of avoiding, to the extent possible, multiple investigations of the same major event. If the major event is confined to a single Regional Entity, NERC representatives will participate as members of the Regional Entity analysis team. NERC will establish, maintain, and revise from time to time as appropriate based on experience, a manual setting forth procedures and protocols for communications and sharing and exchange of information between and among NERC, the affected Regional Entity or Entities, and relevant governmental authorities, industry organizations and Bulk Power System user, owners, and operators concerning the investigation and analysis of major events.

6. NERC and applicable entity(s) will apply, as appropriate to the circumstances of the major event, the NERC *Blackout and Disturbance Response Procedures*, which are incorporated into these Rules of Procedure as **Appendix 8**. These procedures provide a framework to guide NERC's response to major events that may have multiregional, national, or international implications. Experienced industry leadership shall be applied to tailor the response to the specific circumstances of the major event. In accordance with those procedures, the NERC president will determine whether the major event warrants analysis at the NERC level. A Regional Entity may request that NERC elevate any analysis of a major event to the NERC level.

7. NERC will screen and analyze the findings and recommendations from the analysis, and those with generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with Section 810.

808. Analysis of Off-Normal Occurrences, Bulk Power System Performance, and Bulk Power System Vulnerabilities

1. NERC and Regional Entities will analyze Bulk Power System and equipment performance occurrences that do not rise to the level of a major event, as described in Section 807. NERC and Regional Entities will also analyze potential vulnerabilities in the Bulk Power System that they discover or that are brought to their attention by other sources including government agencies. The purpose of these analyses is to identify the root causes of occurrences or conditions that may be precursors of major events or other potentially more serious occurrences, or that have the potential to cause major events or other more serious occurrences, to assess past reliability performance for lessons learned, and to develop reliability performance benchmarks and trends.

2. NERC and Regional Entities will screen and analyze off-normal occurrences, Bulk Power System performance, and potential Bulk Power System vulnerabilities for significance, and information from those indicated as having generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with Section 810.

3. To the extent that a Reliability Standard sets forth specific criteria and procedures for reporting the Bulk Power System disturbances and events described in that Reliability Standard, all Registered Entities that are subject to the Requirements of that Reliability Standard must report the information required by that Reliability Standard within the time periods specified. In addition to reporting information as required by applicable Reliability Standards, each user, owner, and operator, of the Bulk Power System shall provide NERC and the applicable Regional Entities with such additional information requested by NERC or the applicable Regional Entities as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

809. Reliability Benchmarking

NERC shall identify and track key reliability indicators as a means of benchmarking reliability performance and measuring reliability improvements. This program will include assessing available metrics, developing guidelines for acceptable metrics, maintaining a performance metrics "dashboard" on the NERC website, and developing appropriate reliability performance benchmarks.

810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions

1. Members of NERC and Bulk Power System owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.

2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the Reliability Assessment Program.

3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:

3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the Bulk Power System of findings and lessons learned;

3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of

owners, operators, and users of the Bulk Power System according to each entity's facts and circumstances;

3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the Bulk Power System to take to ensure the reliability of the Bulk Power System. Such Essential Actions require NERC Board approval before issuance.

4. The Bulk Power System owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such Bulk Power System owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.

5. NERC will advise the Commission and other Applicable Governmental Authorities of its intent to issue all Level 1 (Advisories), Level 2 (Recommendations), and Level 3 (Essential Actions) at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other Applicable Governmental Authorities no later than thirty (30) days following the date by which NERC has requested the Bulk Power System owners, operators, and users to which a Level 2 (Recommendation) or Level 3 (Essential Action) issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other Applicable Governmental Authorities will describe the actions taken by the relevant owners, operators, and users of the Bulk Power System and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for Confidential Information or Critical Energy Infrastructure Information.

811. Equipment Performance Data

Through its Generating Availability Data System (GADS), NERC shall collect operating information about the performance of electric generating equipment; provide assistance to those researching information on power plant outages stored in its database; and support equipment reliability as well as availability analyses and other decision-making processes developed by GADS subscribers. GADS data is also used in conducting assessments of generation resource adequacy.

SECTION 900 — TRAINING AND EDUCATION

901. Scope of the Training and Education Program

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires informed and trained personnel. The training and education program will provide the education and training necessary for Bulk Power System personnel and regulators to obtain the essential knowledge necessary to understand and operate the Bulk Electric System.

NERC shall develop and maintain training and education programs for the purpose of establishing training requirements, developing materials, and developing training activities. The target audience of the training and education programs shall be Bulk Power System operating personnel including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, training personnel, and other personnel directly responsible for complying with NERC Reliability Standards who, through their actions or inactions, may impact the real-time, or day-ahead reliability of the Bulk Power System.

NERC shall also develop and provide appropriate training and education for industry participants and regulators affected by new or changed Reliability Standards or compliance Requirements.

To accomplish those objectives:

1. NERC shall periodically conduct job task analyses for targeted Bulk Power System personnel to ensure that the training program content is properly aligned to the job tasks performed by those personnel.

2. NERC shall develop and maintain personnel training program curriculum requirements based on valid job-task analysis.

3. NERC shall periodically conduct performance surveys to determine the effectiveness of the training program and identify areas for further training development and improvement.

4. NERC shall develop training and education materials and activities to assist Bulk Power System entities implementing new or revised Reliability Standard Requirements or other NERC-related changes.

5. NERC shall develop and provide training to people who participate in NERC and Regional Entity evaluations, audits, and investigations for the Compliance Monitoring and Enforcement Program, Organization Certification Program, and the continuing education program.

902. Continuing Education Program

NERC shall develop and maintain a continuing education program to foster the improvement of training and to promote quality in the training programs used by and

implemented by Bulk Power System entities. The program shall approve or accredit those activities and entities meeting NERC continuing education requirements.

1. NERC shall develop and implement continuing education program requirements that promote excellence in training programs and advance improved performance for Bulk Power System personnel identified in Section 901.

2. NERC shall develop and maintain a process to approve or accredit continuing education Providers and activities seeking approval or accreditation and meeting NERC-approved continuing education requirements.

3. NERC shall perform periodic audits on continuing education Providers and training activities to ensure that the approved or accredited Providers and training activities satisfy NERC continuing education requirements.

4. NERC shall develop and maintain an appeals process for disputed application reviews, interpretations of guidelines and standards, probation or suspension of NERC-approved Provider status, or Continuing Education Hour disputes.

SECTION 1000 — SITUATION AWARENESS AND INFRASTRUCTURE SECURITY

1001. Situation Awareness

NERC shall through the use of Reliability Coordinators and available tools, monitor present conditions on the Bulk Power System and provide leadership coordination, technical expertise, and assistance to the industry in responding to events as necessary. To accomplish these goals, NERC will:

1. Maintain real-time situation awareness of conditions on the Bulk Power System;

2. Notify the industry of significant Bulk Power System events that have occurred in one area, and which have the potential to impact reliability in other areas;

3. Maintain and strengthen high-level communication, coordination, and cooperation with governments and government agencies regarding real-time conditions; and

4. Enable the Reliable Operation of interconnected Bulk Power Systems by facilitating information exchange and coordination among reliability service organizations.

1002. Reliability Support Services

NERC may assist in the development of tools and other support services for the benefit of Reliability Coordinators and other system operators to enhance reliability, operations and planning. NERC will work with the industry to identify new tools, collaboratively develop requirements, support development, provide an incubation period, and at the end of that period, transition the tool or service to another group or owner for long term operation of the tool or provision of the service. To accomplish this goal, NERC will:

1. Collaborate with industry to determine the necessity of new tools or services to enhance reliability;

2. For those tools that the collaborative process determines should proceed to a development phase, provide a start-up mechanism and development system;

3. Implement the tool either on its own or through an appropriate group or organization; and

4. Where NERC conducts the implementation phase of a new tool or service, develop a transition plan to turn maintenance and provision of the tool or service over to an organization identified in the development stage.

In addition to tools developed as a result of a collaborative process with industry, NERC may develop reliability tools on its own, but will consult with industry concerning the need for the tool prior to proceeding to development.

Tools and services being maintained by NERC as of January 1, 2012, will be reviewed and, as warranted, transitioned to an appropriate industry group or organization. NERC will develop and maintain a strategic reliability tools plan that will list the tools and services being maintained by NERC, and, where applicable, the plans for transition to an appropriate industry group or organization.

1003. Infrastructure Security Program

NERC shall coordinate electric industry activities to promote Critical Infrastructure protection of the Bulk Power System in North America by taking a leadership role in Critical Infrastructure protection of the electricity sector so as to reduce vulnerability and improve mitigation and protection of the electricity sector's Critical Infrastructure. To accomplish these goals, NERC shall perform the following functions.

1. Electric Sector Information Sharing and Analysis Center (ESISAC)

    1.1 NERC shall serve as the electricity sector's sector coordinator and operate its Information Sharing and Analysis Center to gather information and communicate security-related threats and incidents within the sector, with United States and Canadian government agencies, and with other Critical Infrastructure sectors.

    1.2 NERC shall improve the capability of the ESISAC to analyze security threats and incident information and provide situational assessments for the electricity sector and governments.

    1.3 NERC shall work closely with the United States Department of Homeland Security, Department of Energy, Natural Resources Canada, and Public Safety and Emergency Preparedness Canada.

    1.4 NERC shall strengthen and expand these functions and working relationships with the electricity sector, other Critical Infrastructure industries, governments, and government agencies throughout North America to ensure the protection of the infrastructure of the Bulk Power System.

    1.5 NERC shall fill the role of the Electricity Sector Coordinating Council and coordinate with the Government Coordinating Council.

    1.6 NERC shall coordinate with other Critical Infrastructure sectors through active participation with the other Sector Coordinating Councils, the other ISACs, and the National Infrastructure Advisory Committee.

    1.7 NERC shall encourage and participate in coordinated Critical Infrastructure protection exercises, including interdependencies with other Critical Infrastructure sectors.

2. Security Planning

2.1 NERC shall take a risk management approach to Critical Infrastructure protection, considering probability and severity, and recognizing that mitigation and recovery can be practical alternatives to prevention.

2.2 NERC shall keep abreast of the changing threat environment through collaboration with government agencies.

2.3 NERC shall develop criteria to identify critical physical assets and Critical Cyber Assets, assess security threats, identify risk assessment methodologies, and assess effectiveness of physical and cyber protection measures.

2.4 NERC shall enhance and maintain the Bulk Power System critical spare transformer program, encourage increased participation by asset owners, and continue to assess the need to expand this program to include other critical Bulk Power System equipment.

2.5 NERC shall support implementation of the Critical Infrastructure Protection Standards through education and outreach.

2.6 NERC shall review and improve existing security guidelines, develop new security guidelines to meet the needs of the electricity sector, and consider whether any guidelines should be developed into Reliability Standards.

2.7 NERC shall conduct education and outreach initiatives to increase awareness and respond to the needs of the electricity sector.

2.8 NERC shall strengthen relationships with federal, state, and provincial government agencies on Critical Infrastructure protection matters.

2.9 NERC shall maintain and improve mechanisms for the sharing of sensitive or classified information with federal, state, and provincial government agencies on Critical Infrastructure protection matters; work with DOE and DHS to implement the National Infrastructure Protection Plan, as applicable to the electricity sector; and coordinate this work with PSEPC.

2.10 NERC shall improve methods to better assess the impact of a possible physical attack on the Bulk Power System and means to deter, mitigate, and respond following an attack.

2.11 NERC shall assess the results of vulnerability assessments and enhance the security of system control and data acquisition (SCADA) and process control systems by developing methods to detect an emerging cyber attack and the means to mitigate impacts on the Bulk Power Systems.

2.12 NERC shall work with the National SCADA Test Bed and the Process Control Systems Forum to accelerate the development of technology that

will enhance the security, safety, and reliability of process control and SCADA systems.

SECTION 1100 — ANNUAL NERC BUSINESS PLANS AND BUDGETS

1101. Scope of Business Plans and Budgets

The Board shall determine the content of the budgets to be submitted to the Applicable Governmental Authorities with consultation from the members of the Member Representatives Committee, Regional Entities, and others in accordance with the Bylaws. The Board shall identify any activities outside the scope of NERC's statutory reliability functions, if any, and the appropriate funding mechanisms for those activities.

1102. NERC Funding and Cost Allocation

1. In order that NERC's costs shall be fairly allocated among Interconnections and among Regional Entities, the NERC funding mechanism for all statutory functions shall be based on Net Energy for Load (NEL).

2. NERC's costs shall be allocated so that all Load (or, in the case of costs for an Interconnection or Regional Entity, all Load within that Interconnection or Regional Entity) bears an equitable share of such costs based on NEL.

3. Costs shall be equitably allocated between countries or Regional Entities thereof for which NERC has been designated or recognized as the Electric Reliability Organization.

4. Costs incurred to accomplish the statutory functions for one Interconnection, Regional Entity, or group of entities will be directly assigned to that Interconnection, Regional Entity, or group of entities provided that such costs are allocated equitably to end-users based on Net Energy for Load.

1103. NERC Budget Development

1. The NERC annual budget process shall be scheduled and conducted for each calendar year so as to allow a sufficient amount of time for NERC to receive Member inputs, develop the budget, and receive Board and, where authorized by applicable legislation or agreement, Applicable Governmental Authority approval of the NERC budget for the following fiscal year, including timely submission of the proposed budget to FERC for approval in accordance with FERC regulations.

2. The NERC budget submittal to Applicable Governmental Authorities shall include provisions for all ERO functions, all Regional Entity delegated functions as specified in delegation agreements and reasonable reserves and contingencies.

3. The NERC annual budget submittal to Applicable Governmental Authorities shall include description and explanation of NERC's proposed ERO program activities for the year; budget component justification based on statutory or other authorities; explanation of how each budgeted activity lends itself to the accomplishment of the statutory or other authorities; sufficiency of resources

provided for in the budget to carry out the ERO program responsibilities; explanation of the calculations and budget estimates; identification and explanation of changes in budget components from the previous year's budget; information on staffing and organization charts; and such other information as is required by FERC and other Applicable Governmental Authorities having authority to approve the proposed budget.

4. NERC shall develop, in consultation with the Regional Entities, a reasonable and consistent system of accounts, to allow a meaningful comparison of actual results at the NERC and Regional Entity level by the Applicable Governmental Authorities.

1104. Submittal of Regional Entity Budgets to NERC

1. Each Regional Entity shall submit its proposed annual budget for carrying out its delegated authority functions as well as all other activities and funding to NERC in accordance with a schedule developed by NERC and the Regional Entities, which shall provide for the Regional Entity to submit its final budget that has been approved by its board of directors or other governing body no later than July 1 of the prior year, in order to provide sufficient time for NERC's review and comment on the proposed budget and approval of the Regional Entity budget by the NERC Board of Trustees in time for the NERC and Regional Entity budgets to be submitted to FERC and other Applicable Governmental Authorities for approval in accordance with their regulations. The Regional Entity's budget shall include supporting materials in accordance with the budget and reporting format developed by NERC and the Regional Entities, including the Regional Entity's complete business plan and organization chart, explaining the proposed collection of all dues, fees, and charges and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

2. NERC shall review and approve each Regional Entity's budget for meeting the requirements of its delegated authority. Concurrent with approving the NERC budget, NERC shall review and approve, or reject, each Regional Entity budget for filing.

3. NERC shall also have the right to review from time to time, in reasonable intervals but no less frequently than every three years, the financial books and records of each Regional Entity having delegated authority in order to ensure that the documentation fairly represents in all material aspects appropriate funding of delegated functions.

1105. Submittal of NERC and Regional Entity Budgets to Governmental Authorities for Approval

1. NERC shall file for approval by the Applicable Governmental Authorities at least 130 days in advance of the start of each fiscal year. The filing shall include: (1) the complete NERC and Regional Entity budgets including the business plans and organizational charts approved by the Board, (2) NERC's annual funding requirement (including Regional Entity costs for delegated functions), and (3) the

mechanism for assessing charges to recover that annual funding requirement, together with supporting materials in sufficient detail to support the requested funding requirement.

2. NERC shall seek approval from each Applicable Governmental Authority requiring such approval for the funding requirements necessary to perform ERO activities within their jurisdictions.

1106. NERC and Regional Entity Billing and Collections

1. NERC shall request the Regional Entities to identify all Load-Serving Entities[3] within each Regional Entity and the NEL assigned to each Load-Serving Entity, and the Regional Entities shall supply the requested information. The assignment of a funding requirement to an entity shall not be the basis for determining that the entity must be registered in the Compliance Registry.

2. NERC shall accumulate the NEL by Load-Serving Entities for each Applicable Governmental Authority and submit the proportional share of NERC funding requirements to each Applicable Governmental Authority for approval together with supporting materials in sufficient detail to support the requested funding requirement.

3. NEL reported by Balancing Authorities within a Region shall be used to rationalize and validate amounts allocated for collection through Regional Entity processes.

4. The billing and collection processes shall provide:

   4.1 A clear validation of billing and application of payments.

   4.2 A minimum of data requests to those being billed.

   4.3 Adequate controls to ensure integrity in the billing determinants including identification of entities responsible for funding NERC's activities.

   4.4 Consistent billing and collection terms.

5. NERC will bill and collect all budget requirements approved by Applicable Governmental Authorities (including the funds required to support those functions assigned to the Regional Entities through the delegation agreements) directly from the Load-Serving Entities or their designees or as directed by particular Applicable Governmental Authorities, except where the Regional Entity is required to collect the budget requirements for NERC, in which case the Regional Entity will collect directly from the Load-Serving Entities or as otherwise

[3] A Regional Entity may allocate funding obligations using an alternative method approved by NERC and by FERC and other Applicable Governmental Authorities, as provided for in the regional delegation agreement.

provided by agreement and submit funds to NERC. Alternatively, a load-serving entity may pay its allocated ERO costs through a Regional Entity managed collection mechanism.

6. NERC shall set a minimum threshold limit on the billing of small LSEs to minimize the administrative burden of collection.

7. NERC shall pursue any non-payments and shall request assistance from Applicable Governmental Authorities as necessary to secure collection.

8. In the case where a Regional Entity performs the collection for ERO, the Regional Entity will not be responsible for non-payment in the event that a user, owner or operator of the Bulk Power System does not pay its share of dues, fees and charges in a timely manner, provided that such a Regional Entity shall use reasonably diligent efforts to collect dues, fees, and other charges from all entities obligated to pay them. However, any revenues not paid shall be recovered from others within the same Region to avoid cross-subsidization between Regions.

9. Both NERC and the Regional Entities also may bill members or others for functions and services not within statutory requirements or otherwise authorized by the Applicable Governmental Authorities. Costs and revenues associated with these functions and services shall be separately identified and not commingled with billings associated with the funding of NERC or of the Regional Entities for delegated activities.

1107. Penalty Applications

1. Where NERC or a Regional Entity initiates a compliance monitoring and enforcement process that leads to imposition of a Penalty, the entity that initiated the process shall receive any Penalty monies imposed and collected as a result of that process, unless a different disposition of the Penalty monies is provided for in the delegation agreement, or in a contract or a disposition of the violation that is approved by NERC and FERC.

2. All funds from financial Penalties assessed in the United States received by the entity initiating the compliance monitoring and enforcement process shall be applied as a general offset to the entity's budget requirements for the subsequent fiscal year, if received by July 1, or for the second subsequent fiscal year, if received on or after July 1. Funds from financial Penalties shall not be directly applied to any program maintained by the entity conducting the compliance monitoring and enforcement process. Funds from financial Penalties assessed against a Canadian entity shall be applied as specified by legislation or agreement.

3. In the event that a compliance monitoring and enforcement process is conducted jointly by NERC and a Regional Entity, the Regional Entity shall receive the Penalty monies and offset the Regional Entity's budget requirements for the subsequent fiscal year.

4. Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC or any other Applicable Governmental Authority.

1108. Special Assessments

On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next funding cycle, NERC shall file with the Applicable Governmental Authorities, where authorized by applicable legislation or agreement, for authorization for an amended or supplemental budget for NERC or a Regional Entity and, if necessary under the amended or supplemental budget, to collect a special or additional assessment for statutory functions of NERC or the Regional Entity. Such filing shall include supporting materials to justify the requested funding, including any departure from the approved funding formula or method.

SECTION 1200 — REGIONAL DELEGATION AGREEMENTS

1201. Pro Forma Regional Delegation Agreement

NERC shall develop and maintain a pro forma Regional Entity delegation agreement, which shall serve as the basis for negotiation of consistent agreements for the delegation of ERO functions to Regional Entities.

1202. Regional Entity Essential Requirements

NERC shall establish the essential requirements for an entity to become qualified and maintain good standing as a Regional Entity.

1203. Negotiation of Regional Delegation Agreements

NERC shall, for all areas of North America that have provided NERC with the appropriate authority, negotiate regional delegation agreements for the purpose of ensuring all areas of the North American Bulk Power Systems are within a Regional Entity Region. In the event NERC is unable to reach agreement with Regional Entities for all areas, NERC shall provide alternative means and resources for implementing NERC functions within those areas. No delegation agreement shall take effect until it has been approved by the Applicable Governmental Authority.

1204. Conformance to Rules and Terms of Regional Delegation Agreements

NERC and each Regional Entity shall comply with all applicable ERO Rules of Procedure and the obligations stated in the regional delegation agreement.

1205. Sub-delegation

The Regional Entity shall not sub-delegate any responsibilities and authorities delegated to it by its regional delegation agreement with NERC except with the approval of NERC and FERC and other Applicable Governmental Authorities. Responsibilities and authorities may only be sub-delegated to another Regional Entity. Regional Entities may share resources with one another so long as such arrangements do not result in cross-subsidization or in any sub-delegation of authorities.

1206. Nonconformance to Rules or Terms of Regional Delegation Agreement

If a Regional Entity is unable to comply or is not in compliance with an ERO Rule of Procedure or the terms of the regional delegation agreement, the Regional Entity shall immediately notify NERC in writing, describing the area of nonconformance and the reason for not being able to conform to the Rule of Procedure. NERC shall evaluate each case and inform the affected Regional Entity of the results of the evaluation. If NERC determines that a Rule of Procedure or term of the regional delegation agreement has been violated by a Regional Entity or cannot practically be implemented by a Regional Entity, NERC shall notify the Applicable Governmental Authorities and take any actions necessary to address the situation.

1207. Regional Entity Audits

Approximately every five years and more frequently if necessary for cause, NERC shall audit each Regional Entity to verify that the Regional Entity continues to comply with NERC Rules of Procedure and the obligations of NERC delegation agreement. Audits of Regional Entities shall be conducted, to the extent practical, based on professional auditing standards recognized in the U.S., including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, and if applicable to the coverage of the audit, may be based on Canadian or other international standards. The audits required by this Section 1207 shall not duplicate the audits of Regional Entity Compliance Monitoring and Enforcement Programs provided for in **Appendix 4A**, Audit of Regional Compliance Programs, to these Rules of Procedure.

1208. Process for Considering Registered Entity Requests to Transfer to Another Regional Entity

1. A Registered Entity that is registered in the Region of one Regional Entity and believes its registration should be transferred to a different Regional Entity may submit a written request to both Regional Entities requesting that they process the proposed transfer in accordance with this section. The Registered Entity's written request shall set forth the reasons the Registered Entity believes justify the proposed transfer and shall describe any impacts of the proposed transfer on other Bulk Power System owners, operators, and users.

2. After receiving the Registered Entity's written request, the two Regional Entities shall consult with each other as to whether they agree or disagree that the requested transfer is appropriate. The Regional Entities may also consult with affected Reliability Coordinators, Balancing Authorities and Transmission Operators as appropriate. Each Regional Entity shall post the request on its website for public comment period of 21 days. In evaluating the proposed transfer, the Regional Entities shall consider the location of the Registered Entity's Bulk Power System facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators; and users, the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments to other Load-Serving Entities of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity would be transitioned from the current Regional Entity to the transferee Regional Entity; along with any other reasons for the proposed transfer stated by the Registered Entity and any other reasons either Regional Entity considers relevant. The Regional Entities may

request that the Registered Entity provide additional data and information concerning the proposed transfer for the Regional Entities' use in their evaluation. The Registered Entity's current Regional Entity shall notify the Registered Entity in writing as to whether (i) the two Regional Entities agree that the requested transfer is appropriate, (ii) the two Regional Entities agree that the requested transfer is not appropriate and should not be processed further, or (iii) the two Regional Entities disagree as to whether the proposed transfer is appropriate.

3. If the two Regional Entities agree that the requested transfer is appropriate, they shall submit a joint written request to NERC requesting that the proposed transfer be approved and that the delegation agreement between NERC and each of the Regional Entities be amended accordingly. The Regional Entities' joint written submission to NERC shall describe the reasons for the proposed transfer; the location of the Registered Entity's Bulk Power System Facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators, and users; the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity will be transitioned from the current Regional Entity to the transferee Regional Entity. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

4. If the two Regional Entities do not agree with each other that the proposed transfer is appropriate, the Regional Entity supporting the proposed transfer shall, if requested by the Registered Entity, submit a written request to NERC to approve the transfer and the related delegation agreement amendments. The Regional Entity's written request shall include the information specified in Section 1208.3. The Regional Entity that does not believe the proposed transfer is appropriate will be allowed to submit a written statement to NERC explaining why the Regional Entity believes the transfer is not appropriate and should not be approved. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional

information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

5. Prior to action by the NERC Board of Trustees on a proposed transfer of registration under Section 1208.3 or 1208.4, NERC shall post information concerning the proposed transfer, including the submissions from the Regional Entities, on its website for at least twenty-one (21) days for the purpose of receiving public comment.

6. If the NERC Board of Trustees disapproves a proposed transfer presented to it pursuant to either Section 1208.3 or 1208.4, the Regional Entity or Regional Entities that believe the transfer is appropriate may, if requested to do so by the Registered Entity, file a petition with FERC pursuant to 18 C.F.R. section 39.8(f) and (g) requesting that FERC order amendments to the delegation agreements of the two Regional Entities to effectuate the proposed transfer.

7. No transfer of a Registered Entity from one Regional Entity to another Regional Entity shall be effective (i) unless approved by FERC, and (ii) any earlier than the first day of January of the second calendar year following approval by FERC, unless an earlier effective date is agreed to by both Regional Entities and NERC and approved by FERC.

SECTION 1300 — COMMITTEES

1301. Establishing Standing Committees

The Board may from time to time create standing committees. In doing so, the Board shall approve the charter of each committee and assign specific authority to each committee necessary to conduct business within that charter. Each standing committee shall work within its Board-approved charter and shall be accountable to the Board for performance of its Board-assigned responsibilities. A NERC standing committee may not delegate its assigned work to a member forum, but, in its deliberations, may request the opinions of and consider the recommendations of a member forum.

1302. Committee Membership

Each committee shall have a defined membership composition that is explained in its charter. Committee membership may be unique to each committee, and can provide for balanced decision-making by providing for representatives from each Sector or, where Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area. Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate Net Energy for Load. All committees and other subgroups (except for those organized on other than a Sector basis because Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area) must ensure that no two stakeholder Sectors are able to control the vote on any matter, and no single Sector is able to defeat a matter. With regard to committees and subgroups pertaining to development of, interpretation of, or compliance with Reliability Standards, NERC shall provide a reasonable opportunity for membership from Sectors desiring to participate. Committees and subgroups organized on other than a Sector basis shall be reported to the NERC Board and the Member Representatives Committee, along with the reasons for constituting the committee or subgroup in the manner chosen. In such cases and subject to reasonable restrictions necessary to accomplish the mission of such committee or subgroup, NERC shall provide a reasonable opportunity for additional participation, as members or official observers, for Sectors not represented on the committee or subgroup.

1303. Procedures for Appointing Committee Members

Committee members shall be nominated and selected in a manner that is open, inclusive, and fair. Unless otherwise stated in these Rules of Procedure or approved by the Board, all committee member appointments shall be approved by the board, and committee officers shall be appointed by the Chairman of the Board.

1304. Procedures for Conduct of Committee Business

1. Notice to the public of the dates, places, and times of meetings of all committees, and all nonconfidential material provided to committee members, shall be posted

on NERC's website at approximately the same time that notice is given to committee members. Meetings of all standing committees shall be open to the public, subject to reasonable limitations due to the availability and size of meeting facilities; provided that the meeting may be held in or adjourn to closed session to discuss matters of a confidential nature, including but not limited to personnel matters, compliance enforcement matters, litigation, or commercially sensitive or Critical Energy Infrastructure Information of any entity.

2. NERC shall maintain a set of procedures, approved by the Board, to guide the conduct of business by standing committees.

1305. Committee Subgroups

Standing committees may appoint subgroups using the same principles as in Section 1302.

SECTION 1400 — AMENDMENTS TO THE NERC RULES OF PROCEDURE

1401. Proposals for Amendment or Repeal of Rules of Procedure

In accordance with the Bylaws of NERC, requests to amend or repeal the Rules of Procedure may be submitted by (1) any fifty Members of NERC, which number shall include Members from at least three membership Sectors, (2) the Member Representatives Committee, (3) a committee of NERC to whose function and purpose the Rule of Procedure pertains, or (4) an officer of NERC.

1402. Approval of Amendment or Repeal of Rules of Procedure

Amendment to or repeal of Rules of Procedure shall be approved by the Board after public notice and opportunity for comment in accordance with the Bylaws of NERC. In approving changes to the Rules of Procedure, the Board shall consider the inputs of the Member Representatives Committee, other ERO committees affected by the particular changes to the Rules of Procedure, and other stakeholders as appropriate. After Board approval, the amendment or repeal shall be submitted to the Applicable Governmental Authorities for approval, where authorized by legislation or agreement. No amendment to or repeal of the Rules of Procedure shall be effective until it has been approved by the Applicable Governmental Authorities.

SECTION 1500 — CONFIDENTIAL INFORMATION

1501. Definitions

1. **Confidential Information** means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition.

2. **Confidential Business and Market Information** means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

3. **Critical Energy Infrastructure Information** means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

4. **Critical Infrastructure** means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

5. **Cyber Security Incident Information** means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

1502. Protection of Confidential Information

1. **Identification of Confidential Information** — An owner, operator, or user of the Bulk Power System and any other party (the "Submitting Entity") shall mark as confidential any information that it submits to NERC or a Regional Entity (the "Receiving Entity") that it reasonably believes contains Confidential Information as defined by these Rules of Procedure, indicating the category or categories defined in Section 1501 in which the information falls. If the information is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the Submitting Entity shall so indicate and provide supporting references and details.

2. **Confidentiality** — Except as provided herein, a Receiving Entity shall keep in confidence and not copy, disclose, or distribute any Confidential Information or

any part thereof without the permission of the Submitting Entity, except as otherwise legally required.

3. **Information no longer Confidential –** If a Submitting Entity concludes that information for which it had sought confidential treatment no longer qualifies for that treatment, the Submitting Entity shall promptly so notify NERC or the relevant Regional Entity.

1503. Requests for Information

1. **Limitation** — A Receiving Entity shall make information available only to one with a demonstrated need for access to the information from the Receiving Entity.

2. **Form of Request** — A person with such a need may request access to information by using the following procedure:

   2.1 The request must be in writing and clearly marked "Request for Information."

   2.2 The request must identify the individual or entity that will use the information, explain the requester's need for access to the information, explain how the requester will use the information in furtherance of that need, and state whether the information is publicly available or available from another source or through another means. If the requester seeks access to information that is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the requester shall describe how it qualifies to receive such information.

   2.3 The request must stipulate that, if the requester does not seek public disclosure, the requester will maintain as confidential any information received for which a Submitting Party has made a claim of confidentiality in accordance with NERC's rules. As a condition to gaining access to such information, a requester shall execute a non-disclosure agreement in a form approved by NERC's Board of Trustees.

3. **Notice and Opportunity for Comment** — Prior to any decision to disclose information marked as confidential, the Receiving Entity shall provide written notice to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed. Failure to provide such comments or otherwise respond is not deemed waiver of the claim of confidentiality.

4. **Determination by ERO or Regional Entity** — Based on the information provided by the requester under Rule 1503.2, any comments provided by the Submitting Entity, and any other relevant available information, the chief

executive officer or his or her designee of the Receiving Entity shall determine whether to disclose such information.

5. **Appeal** — A person whose request for information is denied in whole or part may appeal that determination to the President of NERC (or the President's designee) within 30 days of the determination. Appeals filed pursuant to this Section must be in writing, addressed to the President of NERC (or the President's designee), and clearly marked "Appeal of Information Request Denial."

   NERC will provide written notice of such appeal to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed; provided that any such comments must be received within 30 days of the notice and any failure to provide such comments or otherwise respond is not deemed a waiver of the claim of confidentiality.

   The President of NERC (or the President's designee) will make a determination with respect to any appeal within 30 days. In unusual circumstances, this time limit may be extended by the President of NERC (or the President's designee), who will send written notice to the requester setting forth the reasons for the extension and the date on which a determination on the appeal is expected.

6. **Disclosure of Information** — In the event the Receiving Entity, after following the procedures herein, determines to disclose information designated as Confidential Information, it shall provide the Submitting Entity no fewer than 21 days' written notice prior to releasing the Confidential Information in order to enable such Submitting Entity to (a) seek an appropriate protective order or other remedy, (b) consult with the Receiving Entity with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Section. Should a Receiving Entity be required to disclose Confidential Information, or should the Submitting Entity waive objection to disclosure, the Receiving Entity shall furnish only that portion of the Confidential Information which the Receiving Entity's counsel advises is legally required.

7. **Posting of Determinations on Requests for Disclosure of Confidential Information** — Upon making its determination on a request for disclosure of Confidential Information, NERC or the Regional Entity, as applicable, shall (i) notify the requester that the request for disclosure is granted or denied, (ii) publicly post any determination to deny the request to disclose Confidential Information, including in such posting an explanation of the reasons for the denial (but without in such explanation disclosing the Confidential Information), and (iii) publicly post any determination that information claimed by the Submitting Entity to be Confidential Information is not Confidential Information (but without in such posting disclosing any information that has been determined to be Confidential Information).

1504. Employees, Contractors and Agents

A Receiving Entity shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom Confidential Information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

1505. Provision of Information to FERC and Other Governmental Authorities

1. **Request** — A request from FERC for reliability information with respect to owners, operators, and users of the Bulk Power System within the United States is authorized by Section 215 of the Federal Power Act. Other Applicable Governmental Authorities may have similar authorizing legislation that grants a right of access to such information. Unless otherwise directed by FERC or its staff or the other Applicable Governmental Authority requesting the information, upon receiving such a request, a Receiving Entity shall provide contemporaneous notice to the applicable Submitting Entity. In its response to such a request, a Receiving Entity shall preserve any mark of confidentiality and shall notify FERC or other Applicable Governmental Authorities that the Submitting Entity has marked the information as confidential.

2. **Continued Confidentiality** — Each Receiving Entity shall continue to treat as confidential all Confidential Information that it has submitted to NERC or to FERC or another Applicable Governmental Authority, until such time as FERC or the other Applicable Governmental Authority authorizes disclosure of such information.

1506. Permitted Disclosures

1. **Confirmed Violations** — Nothing in this Section 1500 shall prohibit the disclosure of a violation at the point when the matter is filed with an Applicable Governmental Authority as a Notice of Penalty, the "violator" admits to the violation, or the alleged violator and NERC or the Regional Entity reach a settlement regarding the violation.

2. **Compliance Information** — NERC and the Regional Entities are authorized to exchange Confidential Information related to evaluations, Compliance Audits, and Compliance Investigations in furtherance of the Compliance Monitoring and Enforcement Program, on condition they continue to maintain the confidentiality of such information.

1507. Remedies for Improper Disclosure

Any person engaged in NERC or Regional Entity activity under Section 215 of the Federal Power Act or the equivalent laws of other Applicable Governmental Authorities who improperly discloses information determined to be confidential may lose access to Confidential Information on a temporary or permanent basis and may be subject to adverse personnel action, including suspension or termination. Nothing in Section 1500

precludes an entity whose information was improperly disclosed from seeking a remedy in an appropriate court.

SECTION 1600 — REQUESTS FOR DATA OR INFORMATION

1601. Scope of a NERC or Regional Entity Request for Data or Information

Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these Rules of Procedure and as may be granted by Applicable Governmental Authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to Requirements contained in any Reliability Standard to provide data or information; the Requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.

1602. Procedure for Authorizing a NERC Request for Data or Information

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in Section 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with Section 1602.2 or issuing the request or modification to Reporting Entities following approval by the Board of Trustees.

2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.

    2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "Confidential Information," "Critical Energy Infrastructure Information,"

"aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the Reporting Entities to accommodate the data or information request.

2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the Reporting Entities to accommodate the modified data or information request, and (iii) any other items from Section 1602.2.1 that require updating as a result of the modifications.

3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.

4. In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.

5. NERC may make minor changes to an authorized request for data or information without Board approval. However, if a Reporting Entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.

6. Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the Applicable Governmental Authority.

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the Bulk Power System registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a Reporting Entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the Reporting Entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1604. Requests by Regional Entity for Data or Information

1. A Regional Entity may request that NERC seek authorization for a request for data or information to be applicable within the Region of the Regional Entity, either as a freestanding request or as part of a proposed NERC request for data or information. Any such request must be consistent with this Section 1600.

2. A Regional Entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural elements as are included in this Section 1600. Any such Regional Entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other Applicable Governmental Authorities applicable to the Regional Entity. The Regional Entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other Applicable Governmental Authority.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the Bulk Power System, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is

reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.

4. The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the Applicable Governmental Authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's website.

SECTION 1700 — CHALLENGES TO DETERMINATIONS

1701. Scope of Authority

Section 1702 sets forth the procedures to be followed for Registered Entities to challenge determinations made by Planning Coordinators under Reliability Standard PRC-023. Section 1703 sets forth the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

1702. Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023

1. This Section 1702 establishes the procedures to be followed when a Registered Entity wishes to challenge a determination by a Planning Coordinator of the sub-200 kV circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers (defined as "Registered Entities" for purposes of this Section 1702) must comply with the requirements of Reliability Standard PRC-023.

2. Planning Coordinator Procedures

   2.1 Each Planning Coordinator shall establish a procedure for a Registered Entity to submit a written request for an explanation of a determination made by the Planning Coordinator under PRC-023.

   2.2 A Registered Entity shall follow the procedure established by the Planning Coordinator for submitting the request for explanation and must submit any such request within 60 days of receiving the determination under PRC-023 from the Planning Coordinator.

   2.3 Within 30 days of receiving a written request from a Registered Entity, the Planning Coordinator shall provide the Registered Entity with a written explanation of the basis for its determination under PRC-023, unless the Planning Coordinator provided a written explanation of the basis for its determination when it initially informed the Registered Entity of its determination.

3. A Registered Entity may challenge the determination of the Planning Coordinator by filing with the appropriate Regional Entity, with a copy to the Planning Coordinator, within 60 days of receiving the written explanation from the Planning Coordinator. The challenge shall include the following: (a) an explanation of the technical reasons for its disagreement with the Planning Coordinator's determination, along with any supporting documentation, and (b) a copy of the Planning Coordinator's written explanation. Within 30 days of receipt of a challenge, the Planning Coordinator may file a response to the Regional Entity, with a copy to the Registered Entity.

4. The filing of a challenge in good faith shall toll the time period for compliance with PRC-023 with respect to the subject facility until such time as the challenge is withdrawn, settled or resolved.

5. The Regional Entity shall issue its written decision setting forth the basis of its determination within 90 days after it receives the challenge and send copies of the decision to the Registered Entity and the Planning Coordinator. The Regional Entity may convene a meeting of the involved entities and may request additional information. The Regional Entity shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

6. A Planning Coordinator or Registered Entity affected by the decision of the Regional Entity may, within 30 days of the decision, file an appeal with NERC, with copies to the Regional Entity and the Planning Coordinator or Registered Entity. The appeal shall state the basis of the objection to the decision of the Regional Entity and shall include the Regional Entity decision, the written explanation of the Planning Coordinator's determination under PRC-023, and the documents and reasoning filed by the Registered Entity with the Regional Entity in support of its objection. The Regional Entity, Planning Coordinator or Registered Entity may file a response to the appeal within 30 days of the appeal.

7. The Board of Trustees shall appoint a panel to decide appeals from Regional Entity decisions under Section 1702.5. The panel, which may contain alternates, shall consist of at least three appointees, one of whom must be a member of the NERC staff, who are knowledgeable about PRC-023 and transmission planning and do not have a direct financial or business interest in the outcome of the appeal. The panel shall decide the appeal within 90 days of receiving the appeal from the decision of the Regional Entity and shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

8. The Planning Coordinator or Registered Entity affected by the decision of the panel may request that the Board of Trustees review the decision by filing its request for review and a statement of reasons with NERC's Chief Reliability Officer within 30 days of the panel decision. The Board of Trustees may, in its discretion, decline to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. Within 90 days of the request for review under this Section 1702.8, the Board of Trustees may either (a) issue a decision on the merits, which shall be the final NERC decision, or (b) issue a notice declining to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. If no written decision or notice declining review is issued within 90 calendar days, the appeal shall be deemed to have been denied by the Board of Trustees and this will have the same effect as a notice declining review.

9. The Registered Entity or Planning Coordinator may appeal the final NERC decision to the Applicable Governmental Authority within 30 days of receipt of

the Board of Trustees' final decision or notice declining review, or expiration of the 90-day review period without any action by NERC.

10. The Planning Coordinator and Registered Entity are encouraged, but not required, to meet to resolve any dispute, including use of mutually agreed to alternative dispute resolution procedures, at any time during the course of the matter. In the event resolution occurs after the filing of a challenge, the Registered Entity and Planning Coordinator shall jointly provide to the applicable Regional Entity a written acknowledgement of withdrawal of the challenge or appeal, including a statement that all outstanding issues have been resolved.

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509

1. This Section 1703 establishes the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

2. A Submitting Entity (or Owner if different) aggrieved by the decision of NERC to approve or disapprove an Exception Request or to terminate an Exception with respect to any Element may, within 30 days following the date of the decision, file a written challenge to the decision with the NERC director of compliance operations, with copies to the Regional Entity and the Submitting Entity or Owner if different. The challenge shall state the basis of the objection to the decision of NERC. The Regional Entity, and the Submitting Entity or Owner if different, may file a response to the challenge within 30 days following the date the challenge is filed with NERC.

3. The challenge shall be decided by the Board of Trustees Compliance Committee. Within 90 days of the date of submission of the challenge, the Board of Trustees Compliance Committee shall issue its decision on the challenge. The decision of the Board of Trustees Compliance Committee shall be the final NERC decision; provided, that the Board of Trustees Compliance Committee may extend the deadline date for its decision to a date more than 90 days following submission of the challenge, by issuing a notice to the Submitting Entity, the Owner (if different) and the Regional Entity stating the revised deadline date and the reason for the extension.

4. The Submitting Entity, or Owner if different, may appeal the final NERC decision to, or seek review of the final NERC decision by, the Applicable Governmental Authority(ies), in accordance with the legal authority and rules and procedures of the Applicable Governmental Authority(ies). Any such appeal shall be filed within thirty (30) days following the date of the decision of the Board of Trustees Compliance Committee, or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

DEFINITIONS USED IN THE RULES OF PROCEDURE

APPENDIX 2 TO THE RULES OF PROCEDURE

Effective: TBD

General

For purposes of the NERC Rules of Procedure, including all Appendices, the terms defined in this Appendix shall have the meanings set forth herein. For convenience of reference to the user, definitions of terms that are used in a particular Appendix may be repeated in that Appendix.

Where used in the Rules of Procedure, a defined term will be capitalized. Where a term defined in this Appendix appears in the Rules of Procedure but is not capitalized, the term is there being used in its ordinary and commonly understood meaning and not as defined in this Appendix (if different). Other terms that are not defined terms, such as the names of entities, organizations, committees, or programs; position titles; titles of documents or forms; section headings; geographic locations; and other terms commonly presented as proper nouns, may also be capitalized in the Rules of Procedure without being defined in this Appendix.

Definitions of terms in this Appendix that are marked with asterisks (**) are taken from the NERC *Glossary of Terms Used in Reliability Standards*. Definitions of terms in this Appendix that are marked with "pluses" (++) are taken from Section 215 of the Federal Power Act or the Commission's regulations at 18 C.F.R. Part 39 or Part 388.

Other terms used in the Rules of Procedure but not defined in this Appendix that have commonly understood and used technical meanings in the electric power industry, including applicable codes and standards, shall be construed in accordance with such commonly understood and used technical meanings.

Specific Definitions

"Acceptance of the Exception Request" or "Acceptance" means the determination that an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) contains all the Required Information so that it can undergo substantive review.

"Adjacent Balancing Authority" means a Balancing Authority Area that is interconnected to another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.**

"Adjusted Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as determined based on application of the adjustment factors identified in Section 4.3 of the *Sanction Guidelines* to the Base Penalty Amount.

"Advisories" or "Level 1 (Advisories)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Alleged Violation" means a Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.

"Annual Audit Plan" means a plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited and the schedule of Compliance Audits for the calendar year.

"Annual Report" means the annual report to be filed by NERC with FERC and other Applicable Governmental Authorities in accordance with Section 13.0 of Appendix 4D.

"Applicable Governmental Authority" means the FERC within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.

"Applicable Requirement" means a Requirement of a CIP Standard that (i) expressly provides either (A) that compliance with the terms of the Requirement is required where or as technically feasible, or (B) that technical limitations may preclude compliance with the terms of the Requirement; or (ii) is subject to Appendix 4D by FERC directive.

"Approval of the Exception Request" or "Approval" means the determination by NERC that an Exception Request meets the criteria to receive the requested Exception.

"Balancing Authority" means the responsible entity that integrates resource plans ahead of time, maintains Load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.**

"Balancing Authority Area" means the collection of generation, transmission, and Loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains Load-resource balance within this area.**

"Base Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as initially determined pursuant to Sections 4.1 and 4.2 of the NERC *Sanction Guidelines*, before application of any adjustment factors.

"BES Definition" means the NERC definition of the Bulk Electric System as set forth in the NERC *Glossary of Terms Used in Reliability Standards.*

"Blackstart Resource" means a generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for Real and Reactive Power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan.**

"Board" or "Board of Trustees" means the Board of Trustees of NERC.

"Board of Trustees Compliance Committee," "BOTCC" or "Compliance Committee" means the Compliance Committee of the NERC Board of Trustees.

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded by application of Exclusion E1 or E3.

- **I2** - Generating resource(s) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above with:
    a) Gross individual nameplate rating greater than 20 MVA. Or,
    b) Gross plant/facility aggregate nameplate rating greater than 75 MVA.

- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.

- **I4** - Dispersed power producing resources that aggregate to a total capacity greater than 75 MVA (gross nameplate rating), and that are connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage of 100 kV or above. Thus, the facilities designated as BES are:
    a) The individual resources, and
    b) The system designed primarily for delivering capacity from the point where those resources aggregate to greater than 75 MVA to a common point of connection at a voltage of 100 kV or above.

- **I5** - Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1 unless excluded by application of Exclusion E4.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:

    a) Only serves Load. Or,

    b) Only includes generation resources, not identified in Inclusions I2, I3, or I4, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,

    c) Where the radial system serves Load and includes generation resources, not identified in Inclusions I2, I3 or I4, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

Note 1 – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

Note 2 – The presence of a contiguous loop, operated at a voltage level of 50 kV or less, between configurations being considered as radial systems, does not affect this exclusion.

- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customers and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:

    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusions I2, I3, or I4 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);

    b) Real Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and

    c) Not part of a Flowgate or transfer path: The LN does not contain any part of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

- **E4** - Reactive Power devices installed for the sole benefit of a retail customer(s).

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.**

"Bulk Power System" means, depending on the context: (i) Facilities and control systems necessary for operating an interconnected electric energy supply and transmission network (or any portion thereof), and electric energy from generating facilities needed to maintain

transmission system reliability. The term does not include facilities used in the local distribution of electric energy [++]. (ii) Solely for purposes of Appendix 4E, Bulk Electric System.

"Canadian" means one of the following: (a) a company or association incorporated or organized under the laws of Canada, or its designated representative(s) irrespective of nationality; (b) an agency of a federal, provincial, or local government in Canada, or its designated representative(s) irrespective of nationality; or (c) a self-representing individual who is a Canadian citizen residing in Canada.

"Canadian Entity" means a Registered Entity (or, solely for purposes of Appendix 4D, a Responsible Entity) that is organized under Canadian federal or provincial law.

"Cascading" means the uncontrolled successive loss of System Elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.**

"CCC" means the NERC Compliance and Certification Committee.

"Certification" means, depending on the context, (i) the process undertaken by NERC and a Regional Entity to verify that an entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator and/or Reliability Coordinator; such Certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure; or (ii) for purposes of Section 600 of the Rules of Procedure, an official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

"Certification Staff" means individuals employed or contracted by NERC who have the authority to make initial determinations of Certification of entities performing reliability functions.

"Certification Team" means a team assembled by a Regional Entity that will be responsible for performing the activities included in the Certification process for an entity pursuant to Appendix 5A.

"Classified National Security Information" means Required Information that has been determined to be protected from unauthorized disclosure pursuant to Executive Order No. 12958, as amended, and/or the regulations of the NRC at 10 C.F.R. §95.35; or pursuant to any comparable provision of Canadian federal or provincial law.

"Clerk" means an individual assigned by the Compliance Enforcement Authority to perform administrative tasks relating to the conduct of hearings as described in Attachment 2, Hearing Procedures, to Appendix 4C.

"Commission" means the Federal Energy Regulatory Commission or FERC.

"Complaint" means an allegation that a Registered Entity violated a Reliability Standard.

"Compliance and Certification Manager" means individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities with applicable NERC Reliability Standards.

"Compliance Audit" means a systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.

"Compliance Audit Participants" means Registered Entities scheduled to be audited and the audit team members.

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Compliance Exception" means a noncompliance that is addressed in Section 3A.0 of Appendix 4C, and is not pursued through an enforcement action under Section 5.0 of Appendix 4C to these Rules of Procedure by a Compliance Enforcement Authority.

"Compliance Investigation" means a comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.

"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC *Uniform Compliance Monitoring and Enforcement Program* (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

"Compliant Date" means the date by which a Responsible Entity is required to be in compliance with an Applicable Requirement of a CIP Standard.

"Confidential Business and Market Information" means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

"Confidential Information" means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the

course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition; or (vii) for purposes of Appendix 4D, any other information that is designated as Confidential Information in Section 11.0 of Appendix 4D.

"Confirmed Violation" means an Alleged Violation for which (1) the Registered Entity has accepted or not contested the Notice of Alleged Violation and Penalty or Sanction or other notification of the Alleged Violation, or (2) there has been the issuance of a final order from NERC or a Regional Entity Hearing Body finding a violation, Penalty or sanction, or (3) the period for requesting a hearing or an appeal has expired, or (4) the Registered Entity has executed a settlement agreement pursuant to Section 5.6.

"Continuing Education Hour" or "CE Hour" means based on sixty clock minutes, and includes at least fifty minutes of participation in a group or self-study learning activity that meets the criteria of the NERC Continuing Education Program.

"Continuing Education Program Provider" or "Provider" means the individual or organization offering a learning activity to participants and maintaining documentation required by Section 600 of the Rules of Procedure.

"Coordinated Functional Registration" means where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more Reliability Standard(s) applicable to a particular function, and/or for one or more Requirement(s)/sub-Requirement(s) within particular Reliability Standard(s).

"Covered Asset" means a Cyber Asset or Critical Cyber Asset that is subject to an Applicable Requirement.

"Credential" means a NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

"Critical Assets" means Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.**

"Critical Cyber Assets" means Cyber Assets critical to the reliable operation of Critical Assets.**

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.++

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.++

"Critical Infrastructure Protection Standard" or "CIP Standard" means any of NERC Reliability Standards CIP-002 through CIP-009.

"Cross-Border Regional Entity" means a Regional Entity that encompasses a part of the United States and a part of Canada or Mexico.++

"Cyber Assets" means programmable electronic devices and communication networks including hardware, software, and data.**

"Cyber Security Incident" means any malicious or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.++

"Cyber Security Incident Information" means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

"Days", as used in Appendix 5A with respect to the Registration and Certification processes, means calendar days.

"Deactivation," as used in Appendix 5A with respect to the Registration processes, refers to removal of an entity from the NCR for a specific functional category. As a result of deactivation, the entity is no longer subject to any prospective compliance obligations with respect to Reliability Standards applicable to that functional category.

"Delegate" means a person to whom the Senior Manager of a Responsible Entity has delegated authority pursuant to Requirement R2.3 of CIP Standard CIP-003-1 (or any successor provision).

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, or other individual designated by the Compliance Enforcement Authority who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Disapproval of the Exception Request" or "Disapproval" means the determination by NERC that an Exception Request does not meet the criteria to receive the requested Exception.

"Distribution Factor" means the portion of an Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate).**

"Distribution Provider" means the entity that provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus,

the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"Effective Date" means the date, as specified in a notice disapproving a TFE Request or terminating an approved TFE, on which the disapproval or termination becomes effective.

"Electric Reliability Organization" or "ERO" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Element" means any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An Element may be comprised of one or more components.**

"Eligible Reviewer" means a person who has the required security clearances or other qualifications, or who otherwise meets the applicable criteria, to have access to Confidential Information, Classified National Security Information, NRC Safeguards Information or Protected FOIA Information, as applicable to the particular information to be reviewed.

"End Date" means the last date of the period to be covered in a Compliance Audit.

"Essential Actions" or "Level 3 (Essential Actions)" is a notification issued by NERC in accordance with Section 810.3.3 of the Rules of Procedure.

"Evidentiary Hearing" means a hearing at which one or more Participants submits evidence for the record. A Testimonial Hearing is an Evidentiary Hearing, but an Evidentiary Hearing does not necessarily include the presentation of testimony by witnesses in person.

"Exception" means either an Inclusion Exception or an Exclusion Exception.

"Exception Procedure" means the procedure set forth in Appendix 5C.

"Exception Report" means information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.

"Exception Request" means a request made by a Submitting Entity in accordance with Appendix 5C for an Exception.

"Exception Request Form" means the form adopted by each Regional Entity, in accordance with a template provided by NERC, for use by Submitting Entities in submitting Exception Requests; provided, that the Exception Request Form must include Section III.B as adopted by NERC.

"Exclusion Exception" means a determination that an Element that falls within the BES Definition should be excluded from the BES.

"Expiration Date" means the date on which an approved TFE expires.

"Facility" means a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)**

"FERC" means the United States Federal Energy Regulatory Commission.

"Final Penalty Amount" means the final, proposed Penalty for violation of a Reliability Standard, determined in accordance with the *Sanction Guidelines*.

"Find, Fix, Track~~,~~ and Report" or "FFT" means a streamlined process, addressed in Section ~~3A.0~~5.2A of Appendix 4C, to resolve ~~lesser risk~~minimal or moderate risk, remediated Possible Violations that are not assessed a financial penalty.

"Flowgate" means 1.) A portion of the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.**

"FOIA" means the U.S. Freedom of Information Act, 5 U.S.C. §552.

"Footprint" means the geographical or electric area served by an entity.
"Functional Entity" means an entity responsible for a function that is required to ensure the Reliable Operation of the electric grid as identified in the NERC Reliability Standards.

"Generator Operator" means the entity that operates generating Facility(ies) and performs the functions of supplying energy and Interconnected Operations Services.

"Generator Owner" means an entity that owns and maintains generating Facility(ies).

"Hearing Body" or "Regional Entity Hearing Body" means the body established or designated by the Compliance Enforcement Authority to conduct hearings and issue decisions concerning disputed compliance matters in accordance with Attachment 2, Hearing Procedures, of Appendix 4C.

"Hearing Officer" means, depending on the context, (i) an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, or (ii) solely for hearings conducted pursuant to Appendix 4E, (A) a CCC member or (B) an individual employed or contracted by NERC, as designated and approved by the CCC to preside over hearings conducted pursuant to the Hearing Procedures in Appendix E; the Hearing Officer shall not be a member of the Hearing Panel.

"Hearing Panel" means the five person hearing body established as set forth in the CCC Charter on a case by case basis and that is responsible for adjudicating a matter as set forth in Appendix 4E.

"Hearing Procedures" means, depending on the context, (i) Attachment 2 to the NERC or a Regional Entity CMEP, as applicable, or (ii) the hearing procedures of the NERC Compliance and Certification Committee in Appendix 4E.

"Inclusion Exception" means a determination that an Element that falls outside the BES Definition should be included in the BES.

"Inherent Risk Assessment" or "IRA" means a review ~~of~~ by the Compliance Enforcement Authority of potential risks posed by an individual Registered Entity to the reliability of the Bulk Power System. An IRA considers factors such as, but is not limited to, assets, system, geography, interconnectivity, prior compliance history and factors unique to the Registered Entity. The results of an entity-specific IRA may result in the scope of compliance monitoring for a particular Registered Entity to include more, fewer, or different Reliability Standards than those contained in the annual Implementation Plans.

"Interchange" means energy transfers that cross Balancing Authority boundaries.**

"Interchange Authority" means the responsible entity that authorizes the implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communications of Interchange information for reliability assessment purposes.**

"Interchange Distribution Calculator" means the mechanism used by Reliability Coordinators in the Eastern Interconnection to calculate the distribution of Interchange Transactions over specific Flowgates. It includes a database of all Interchange Transactions and a matrix of the Distribution Factors for the Eastern Interconnection.**

"Interchange Schedule" means an agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.**

"Interchange Transaction" means an agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.**

"Interconnected Operations Service" means a service (exclusive of basic energy and Transmission Services) that is required to support the Reliable Operation of interconnected Bulk Electric Systems.**

"Interconnection" means a geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control.++

"Interconnection Reliability Operating Limit" means a System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.**

"Internal Control Evaluation" or "ICE" means a review by the Compliance Enforcement Authority of a Registered Entity's internal controls. The ICE may further refine the compliance oversight plan, including the scope of an audit, the type and application of compliance monitoring tools, the depth and breadth of a particular area of review~~, or determine whether an audit is necessary if the Registered Entity demonstrates effective internal controls~~.

"Interpretation" means an addendum to a Reliability Standard, developed in accordance with the NERC *Standard Processes Manual* and approved by the Applicable Governmental Authority(ies), that provides additional clarity about one or more Requirements in the Reliability Standard.

"ISO/RTO" means an independent transmission system operator or regional transmission organization approved by the FERC or the Public Utility Commission of Texas.

"Joint Registration Organization" means an entity that registers in the Compliance Registry to perform reliability functions for itself and on behalf of one or more of its members or related entities for which such members or related entities would otherwise be required to register.

"Lead Entity" means the entity that submits Exception Request information that is common to a group of Submitting Entities that are submitting Exception Requests jointly.

"Lead Mediator" means a member of a mediation team formed pursuant to Appendix 4E who is selected by the members to coordinate the mediation process and serve as the mediation team's primary contact with the Parties.

"Load" means an end-user device or customer that receives power from the electric system.**

"Load-Serving Entity" means an entity that secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.**

"Mapping" means the process of determining whether a Regional Entity's Footprint is being served by Registered Entities.

"Material Change" means a change in facts that modifies Required Information in connection with an approved TFE. Examples of a Material Change could include, but are not limited to an increase in device count (but not a decrease), change in compensating measures, change in statement of basis for approval for the TFE, a change in the Expiration Date of the TFE, or a Responsible Entity achieving Strict Compliance with the Applicable Requirement.

"Material Change Report" means a report submitted by the Responsible Entity to the Regional Entity in the event there is a Material Change to the facts underlying an approved TFE pursuant to Section 4.0 of Appendix 4D.

"Mediation Settlement Agreement" means a written agreement entered into by the Parties to a mediation pursuant to Appendix 4E that resolves the dispute.

"Member" means a member of NERC pursuant to Article II of its Bylaws.

"Member Representatives Committee" or "MRC" means the body established pursuant to Article VIII of the NERC Bylaws.

"Mexican Entity" means a Registered Entity that is organized under Mexican law.

"Mitigating Activities" means actions taken by a Registered Entity to correct and prevent recurrence of a noncompliance, whether or not the actions are embodied in a Mitigation Plan.

"Mitigation Plan" means an action plan developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.

"NERC-Approved Learning Activity" means training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

"NERC Compliance Monitoring and Enforcement Program Implementation Plan" or "NERC Implementation Plan" means the annual NERC ~~Compliance Monitoring and Enforcement Program~~ Implementation Plan that ~~specifies the Reliability Standards that are subject to reporting~~identifies the risk elements to prioritize risks to the Bulk Power System. These risk elements and related NERC Reliability Standards and Requirements become inputs for Regional Entities in developing their Regional Compliance Monitoring and Enforcement Program Implementation Plans and the compliance oversight for individual ~~by~~ Registered Entities ~~to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard~~. The NERC Implementation Plan may be updated more often than annually as needed.

"NERC Compliance Registry," "Compliance Registry" or "NCR" means a list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in

support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.

"NERC Identification Number" or "NERC ID" means a number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.

"NERC Organization Certification" or "Organization Certification" means the process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator; such certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure.

"Net Energy for Load" or "NEL" means net generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.

"Notice of Alleged Violation and Proposed Penalty or Sanction" means a notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3 of Appendix 4C.

"Notice of Completion of Enforcement Action" means a notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10 of Appendix 4C, stating than an enforcement action is closed.

"Notice of Confirmed Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards.

"Notice of Penalty" means a notice prepared by NERC and filed with FERC, following approval by NERC of a Notice or other notification of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.

"Notice of Possible Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

"NRC" means the United States Nuclear Regulatory Commission.

"NRC Safeguards Information" means Required Information that is subject to restrictions on disclosure pursuant to 42 U.S.C. §2167 and the regulations of the NRC at 10 C.F.R. §73.21-73.23; or pursuant to comparable provisions of Canadian federal or provincial law.

"Open Access Transmission Tariff" means an electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.**

"Owner" means the owner(s) of an Element or Elements that is or may be determined to be part of the BES as a result of either the application of the BES Definition or an Exception, or another entity, such as an operator, authorized to act on behalf of the owner of the Element or Elements in the context of an Exception Request.

"Participant" means a Respondent and any other Person who is allowed or required by the Hearing Body or by FERC to participate as an intervenor in a proceeding conducted pursuant to the Hearing Procedures, and as used in the Hearing Procedures shall include, depending on the context, the members of the Compliance Staff that participate in a proceeding or the members of the Certification Staff that participate in a proceeding pursuant to Appendix 4E.

"Party" or "Parties" means a Person or the Persons participating in a mediation pursuant to Appendix 4E.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Periodic Data Submittals" means modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.
"Planning Authority" means the responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.**

"Point of Delivery" means a location that a Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.**

"Point of Receipt" means a location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a generator delivers its output.

"Possible Violation" means the identification, by the Compliance Enforcement Authority, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.

"Preliminary Screen" means an initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered, and (3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation which is currently being processed.

"Probation" means a step in the disciplinary process pursuant to Section 605 of the Rules of Procedure during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

"Protected FOIA Information" means Required Information, held by a governmental entity, that is subject to an exemption from disclosure under FOIA (5 U.S.C. §552(e)), under any similar state or local statutory provision, or under any comparable provision of Canadian federal or provincial law, which would be lost were the Required Information to be placed into the public domain.

"Protection System" means protective relays which respond to electrical quantities, communications systems necessary for correct operation of protective functions, voltage and current sensing devices providing inputs to protective relays, station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.**

"Purchasing-Selling Entity" means the entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.**

"Reactivation" refers to re-registration pursuant to the NERC Rules of Procedure Section 500 and Appendices 5A and 5B of an entity to the NCR for a specific functional category or the revocation of, or additions to, a sub-set list of Reliability Standards (which specifies Reliability Standards and may specify Requirements/sub-Requirements) that has been granted to an entity. Reactivation may be initiated by NERC, a Regional Entity or an entity with respect to such entity's own functional categories or sub-set list of Reliability Standards (which specifies Reliability Standards and may specify Requirements/sub-Requirements).

"Reactive Power" means the portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive Power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive

losses on transmission facilities. Reactive Power is provided by generators, synchronous condensers, or electrostatic equipment such as capacitors and directly influences electric system voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar).**

"Real Power" means the portion of electricity that supplies energy to the Load.**

"Receiving Entity" means NERC or a Regional Entity receiving Confidential Information from an owner, operator, or user of the Bulk Power System or from any other party.

"Recommendation" for purposes of Appendix 5C means the report to NERC containing the evaluation prepared in accordance with section 5.2 of Appendix 5C concerning whether or to what extent an Exception Request should be approved.

"Recommendations" or "Level 2 (Recommendations)" is a notification issued by NERC in accordance with Section 810.3.2 of the Rules of Procedure.

"Region" means the geographic area, as specified in a Regional Entity's delegation agreement with NERC, within which the Regional Entity is responsible for performing delegated functions.

"Regional Criteria" means reliability requirements developed by a Regional Entity that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Such Regional Criteria may be necessary to account for physical differences in the Bulk Power System but are not inconsistent with Reliability Standards nor do they result in lesser reliability. Such Regional Criteria are not enforceable pursuant to NERC-delegated authorities, but may be enforced through other available mechanisms. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents.

"Regional Entity" means an entity having enforcement authority pursuant to 18 C.F.R. § 39.8.++

"Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan" or "Regional Implementation Plan" means an annual Regional Entity plan, submitted ~~by~~ on or about October 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC ~~Compliance Monitoring and Enforcement Program~~ Implementation Plan, ~~identifies~~ includes (1) details on r~~R~~egional r~~R~~isk a~~A~~ssessment processes and results; ~~all Reliability Standards identified by NERC to be actively monitored during each year,~~ (2) ~~other~~ Reliability Standards and Requirements associated with r~~R~~egional r~~R~~isk a~~A~~ssessment results~~proposed for active monitoring by the Regional Entity;~~, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria ~~with each Reliability Standard,~~; and (4) the Regional Entity's Annual Audit Plan.

"Regional Reliability Standard" means a type of Reliability Standard that is applicable only within a particular Regional Entity or group of Regional Entities. A Regional Reliability Standard may augment, add detail to, or implement another Reliability Standard or cover matters not addressed by other Reliability Standards. Regional Reliability Standards, upon adoption by

NERC and approval by the Applicable Governmental Authority(ies), shall be Reliability Standards and shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Registered Ballot Body" means that aggregation of all entities or individuals that qualify for one of the Segments approved by the Board of Trustees, and are registered with NERC as potential ballot participants in the voting on proposed Reliability Standards.

"Registered Entity" means an owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.

"Registration" or "Organization Registration" means the processes undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region.

"Rejection of the Exception Request" or "Rejection" means the determination that an Exception Request is not an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) or does not contain all the Required Information in accordance with section 4.5 of Appendix 5C in order to be reviewed for substance.

"Reliability Coordinator" means the entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.**

"Reliability Coordinator Area" means the collection of generation, transmission and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.**

"Reliability Standard" means a requirement to provide for Reliable Operation of the Bulk Power System, including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation capacity. A Reliability Standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the Applicable Governmental Authority.

"Reliability Standards Development Plan" means the forward-looking plan developed by NERC on an annual basis setting forth the Reliability Standards development projects that are scheduled

to be worked on during the ensuing three-year period, as specified in Section 310 of the Rules of Procedure.

"Reliable Operation" means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements.++

"Remedial Action Directive" means an action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat.

"Reporting Entity" means an entity required to provide data or information requested by NERC or a Regional Entity in a request for data or information pursuant to Section 1600 of the Rules of Procedure.

"Requirement" means an explicit statement in a Reliability Standard that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each Requirement shall be a statement with which compliance is mandatory.

"Required Date" means the date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.

"Required Information" means, as applicable, either (i) the information required to be provided in a TFE Request, as specified in Section 4.0 of Appendix 4D; or (ii) the information required to be provided in an Exception Request, as specified in section 4.0 of Appendix 5C.

"Reserve Sharing Group" means a group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g. ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.**

"Resource Planner" means the entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority area.**

"Respondent" means, depending on the context, the Registered Entity, who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable, or the Registered Entity that is the subject of the Certification decision that is the basis for a proceeding under Appendix 4E.

"Responsible Entity" means an entity that is registered for a reliability function in the NERC Compliance Registry and is responsible for complying with an Applicable Requirement, as specified in the "Applicability" section of the CIP Standard.

"Revoked" means a NERC certificate that has been suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

"Revoke for Cause" means a step in the disciplinary process pursuant to Section 605 of the Rules of Procedure during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

"Scope of Responsibility" means the registered functions of a Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority and the geographical or electric region in which the Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority operates to perform its registered functions, or with respect to a Regional Entity, its Regional Entity Region.

"Section I Required Information" means Required Information that is to be provided in Section I of a Submitting Entity's Exception Request.

"Section II Required Information" means Required Information that is to be provided in Section II of a Submitting Entity's Exception Request.

"Section III Required Information" means Required Information that is to be provided in Section III of a Submitting Entity's Exception Request.

"Sector" means a group of Members of NERC that are Bulk Power System owners, operators, or users or other persons and entities with substantially similar interests, including governmental entities, as pertinent to the purposes and operations of NERC and the operation of the Bulk Power System, as defined in Article II, Section 4 of the NERC Bylaws. Each Sector shall constitute a class of Members for purposes of the New Jersey Nonprofit Corporation Act.

"Segment" means one of the subsets of the Registered Ballot Body whose members meet the qualification criteria for the subset.

"Self-Certification" means an attestation by a Registered Entity that it is compliant or non-compliant with a Reliability Standard Requirement that is the subject of the Self-Certification, or that it does not own Facilities that are subject to the Reliability Standard Requirement, or that the Reliability Standard Requirement is not applicable to the Registered Entity.

"Self-Logging" means a process by which Registered Entities found to be eligible by a Compliance Enforcement Authority, after a formal review of internal controls, record possible noncompliance on a log, in accordance with Section 3.5A of Appendix 4C, in lieu of individually submitted S~~s~~elf-R~~r~~eports of~~ing~~ each possible noncompliance.

"Self-Report" means a report by a Registered Entity stating that the Registered Entity believes it has, or may have, violated a Reliability Standard.

"Senior Manager" means the person assigned by the Responsible Entity, in accordance with CIP Standard CIP-003-1 Requirement R2 (or subsequent versions), to have overall responsibility for leading and managing the Responsible Entity's implementation of, and adherence to, the CIP Standards.

"Sink Balancing Authority" means the Balancing Authority in which the Load (sink) is located for an Interchange Transaction.**

"Source Balancing Authority" means the Balancing Authority in which the generation (source) is located for an Interchange Transaction.**

"Special Protection System" means an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. A Special Protection System does not include (a) underfrequency or undervoltage Load shedding or (b) fault conditions that must be isolated, or (c) out-of-step relaying (not designed as an integral part of a Special Protection System).**

"Spot Check" means a process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Report, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to operating problems or system events.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Strict Compliance" means compliance with the terms of an Applicable Requirement without reliance on a Technical Feasibility Exception.

"Submitting Entity" means (i) an owner, operator, or user of the Bulk Power System or any other party that submits information to NERC or a Regional Entity that it reasonably believes contains Confidential Information or, (ii) solely for purposes of Appendix 5C, the entity that submits an Exception Request in accordance with section 4.0 of Appendix 5C.

"Suspended" means certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

"System" means a combination of generation, transmission and distribution components.**

"System Operating Limit" means the value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria.**

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies NERC's or the Compliance Enforcement Authority's (as applicable) conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body or Hearing Panel.

"Technical Feasibility Exception" or "TFE" means an exception from Strict Compliance with the terms of an Applicable Requirement on grounds of technical feasibility or technical limitations in accordance with one or more of the criteria in section 3.0 of Appendix 4D.

"Technical Review Panel" means a panel established pursuant to section 5.3 of Appendix 5C.

"Termination of Credential" means a step in the disciplinary process pursuant to Section 605 of the Rules of Procedure whereby a Credential is permanently Revoked.

"Testimonial Hearing" means an Evidentiary Hearing at which the witness or witnesses on behalf of one or more Participants appears in person to present testimony and be subject to cross-examination.

"TFE Request" means a request submitted by a Responsible Entity in accordance with Appendix 4D for an exception from Strict Compliance with an Applicable Requirement.

"Transmission Customer" means 1. any eligible customer (or its designated agent) that can or does execute a Transmission Service agreement or can and does receive Transmission Service. 2. Any of the following entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.

"Transmission Operator" means the entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission Facilities.**

"Transmission Owner" means the entity that owns and maintains transmission Facilities.**

"Transmission Planner" means the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.**

"Transmission Service" means services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.**

"Transmission Service Provider" means the entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.**

"Variance" means an aspect or element of a Reliability Standard that applies only within a particular Regional Entity or group of Regional Entities, or to a particular entity or class of entities. A Variance allows an alternative approach to meeting the same reliability objective as the Reliability Standard, and is typically necessitated by a physical difference. A Variance is embodied within a Reliability Standard and as such, if adopted by NERC and approved by the Applicable Governmental Authority(ies), shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Violation Risk Factor" or "VRF" means a factor (lower, medium or high) assigned to each Requirement of a Reliability Standard to identify the potential reliability significance of noncompliance with the Requirement.

"Violation Severity Level" or "VSL" means a measure (lower, moderate, high or severe) of the degree to which compliance with a Requirement was not achieved.

"Wide Area" means the entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.**

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

DEFINITIONS USED IN THE RULES OF PROCEDURE

APPENDIX 2 TO THE RULES OF PROCEDURE

Effective: TBD

General

For purposes of the NERC Rules of Procedure, including all Appendices, the terms defined in this Appendix shall have the meanings set forth herein. For convenience of reference to the user, definitions of terms that are used in a particular Appendix may be repeated in that Appendix.

Where used in the Rules of Procedure, a defined term will be capitalized. Where a term defined in this Appendix appears in the Rules of Procedure but is not capitalized, the term is there being used in its ordinary and commonly understood meaning and not as defined in this Appendix (if different). Other terms that are not defined terms, such as the names of entities, organizations, committees, or programs; position titles; titles of documents or forms; section headings; geographic locations; and other terms commonly presented as proper nouns, may also be capitalized in the Rules of Procedure without being defined in this Appendix.

Definitions of terms in this Appendix that are marked with asterisks (**) are taken from the NERC *Glossary of Terms Used in Reliability Standards*. Definitions of terms in this Appendix that are marked with "pluses" (++) are taken from Section 215 of the Federal Power Act or the Commission's regulations at 18 C.F.R. Part 39 or Part 388.

Other terms used in the Rules of Procedure but not defined in this Appendix that have commonly understood and used technical meanings in the electric power industry, including applicable codes and standards, shall be construed in accordance with such commonly understood and used technical meanings.

Specific Definitions

"Acceptance of the Exception Request" or "Acceptance" means the determination that an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) contains all the Required Information so that it can undergo substantive review.

"Adjacent Balancing Authority" means a Balancing Authority Area that is interconnected to another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.**

"Adjusted Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as determined based on application of the adjustment factors identified in Section 4.3 of the *Sanction Guidelines* to the Base Penalty Amount.

"Advisories" or "Level 1 (Advisories)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Alleged Violation" means a Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.

"Annual Audit Plan" means a plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited and the schedule of Compliance Audits for the calendar year.

"Annual Report" means the annual report to be filed by NERC with FERC and other Applicable Governmental Authorities in accordance with Section 13.0 of Appendix 4D.

"Applicable Governmental Authority" means the FERC within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.

"Applicable Requirement" means a Requirement of a CIP Standard that (i) expressly provides either (A) that compliance with the terms of the Requirement is required where or as technically feasible, or (B) that technical limitations may preclude compliance with the terms of the Requirement; or (ii) is subject to Appendix 4D by FERC directive.

"Approval of the Exception Request" or "Approval" means the determination by NERC that an Exception Request meets the criteria to receive the requested Exception.

"Balancing Authority" means the responsible entity that integrates resource plans ahead of time, maintains Load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.**

"Balancing Authority Area" means the collection of generation, transmission, and Loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains Load-resource balance within this area.**

"Base Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as initially determined pursuant to Sections 4.1 and 4.2 of the NERC *Sanction Guidelines*, before application of any adjustment factors.

"BES Definition" means the NERC definition of the Bulk Electric System as set forth in the NERC *Glossary of Terms Used in Reliability Standards.*

"Blackstart Resource" means a generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for Real and Reactive Power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan.**

"Board" or "Board of Trustees" means the Board of Trustees of NERC.

"Board of Trustees Compliance Committee," "BOTCC" or "Compliance Committee" means the Compliance Committee of the NERC Board of Trustees.

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- **I1** - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded by application of Exclusion E1 or E3.

- **I2** - Generating resource(s) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above with:
    a) Gross individual nameplate rating greater than 20 MVA. Or,
    b) Gross plant/facility aggregate nameplate rating greater than 75 MVA.

- **I3** - Blackstart Resources identified in the Transmission Operator's restoration plan.

- **I4** - Dispersed power producing resources that aggregate to a total capacity greater than 75 MVA (gross nameplate rating), and that are connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage of 100 kV or above. Thus, the facilities designated as BES are:
    a) The individual resources, and
    b) The system designed primarily for delivering capacity from the point where those resources aggregate to greater than 75 MVA to a common point of connection at a voltage of 100 kV or above.

- **I5** - Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1 unless excluded by application of Exclusion E4.

Exclusions:

- **E1** - Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:

    a) Only serves Load. Or,

    b) Only includes generation resources, not identified in Inclusions I2, I3, or I4, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,

    c) Where the radial system serves Load and includes generation resources, not identified in Inclusions I2, I3 or I4, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).

Note 1 – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

Note 2 – The presence of a contiguous loop, operated at a voltage level of 50 kV or less, between configurations being considered as radial systems, does not affect this exclusion.

- **E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

- **E3** - Local networks (LN): A group of contiguous transmission Elements operated at less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customers and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:

    a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusions I2, I3, or I4 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);

    b) Real Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and

    c) Not part of a Flowgate or transfer path: The LN does not contain any part of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

- **E4** - Reactive Power devices installed for the sole benefit of a retail customer(s).

Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.**

"Bulk Power System" means, depending on the context: (i) Facilities and control systems necessary for operating an interconnected electric energy supply and transmission network (or any portion thereof), and electric energy from generating facilities needed to maintain

transmission system reliability. The term does not include facilities used in the local distribution of electric energy [++]. (ii) Solely for purposes of Appendix 4E, Bulk Electric System.

"Canadian" means one of the following: (a) a company or association incorporated or organized under the laws of Canada, or its designated representative(s) irrespective of nationality; (b) an agency of a federal, provincial, or local government in Canada, or its designated representative(s) irrespective of nationality; or (c) a self-representing individual who is a Canadian citizen residing in Canada.

"Canadian Entity" means a Registered Entity (or, solely for purposes of Appendix 4D, a Responsible Entity) that is organized under Canadian federal or provincial law.

"Cascading" means the uncontrolled successive loss of System Elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.**

"CCC" means the NERC Compliance and Certification Committee.

"Certification" means, depending on the context, (i) the process undertaken by NERC and a Regional Entity to verify that an entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator and/or Reliability Coordinator; such Certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure; or (ii) for purposes of Section 600 of the Rules of Procedure, an official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

"Certification Staff" means individuals employed or contracted by NERC who have the authority to make initial determinations of Certification of entities performing reliability functions.

"Certification Team" means a team assembled by a Regional Entity that will be responsible for performing the activities included in the Certification process for an entity pursuant to Appendix 5A.

"Classified National Security Information" means Required Information that has been determined to be protected from unauthorized disclosure pursuant to Executive Order No. 12958, as amended, and/or the regulations of the NRC at 10 C.F.R. §95.35; or pursuant to any comparable provision of Canadian federal or provincial law.

"Clerk" means an individual assigned by the Compliance Enforcement Authority to perform administrative tasks relating to the conduct of hearings as described in Attachment 2, Hearing Procedures, to Appendix 4C.

"Commission" means the Federal Energy Regulatory Commission or FERC.

"Complaint" means an allegation that a Registered Entity violated a Reliability Standard.

"Compliance and Certification Manager" means individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities with applicable NERC Reliability Standards.

"Compliance Audit" means a systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.

"Compliance Audit Participants" means Registered Entities scheduled to be audited and the audit team members.

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Compliance Exception" means a noncompliance that is addressed in Section 3A.0 of Appendix 4C, and is not pursued through an enforcement action under Section 5.0 of Appendix 4C to these Rules of Procedure by a Compliance Enforcement Authority.

"Compliance Investigation" means a comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.

"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC *Uniform Compliance Monitoring and Enforcement Program* (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

"Compliant Date" means the date by which a Responsible Entity is required to be in compliance with an Applicable Requirement of a CIP Standard.

"Confidential Business and Market Information" means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

"Confidential Information" means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the

course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition; or (vii) for purposes of Appendix 4D, any other information that is designated as Confidential Information in Section 11.0 of Appendix 4D.

"Confirmed Violation" means an Alleged Violation for which (1) the Registered Entity has accepted or not contested the Notice of Alleged Violation and Penalty or Sanction or other notification of the Alleged Violation, or (2) there has been the issuance of a final order from NERC or a Regional Entity Hearing Body finding a violation, Penalty or sanction, or (3) the period for requesting a hearing or an appeal has expired, or (4) the Registered Entity has executed a settlement agreement pursuant to Section 5.6.

"Continuing Education Hour" or "CE Hour" means based on sixty clock minutes, and includes at least fifty minutes of participation in a group or self-study learning activity that meets the criteria of the NERC Continuing Education Program.

"Continuing Education Program Provider" or "Provider" means the individual or organization offering a learning activity to participants and maintaining documentation required by Section 600 of the Rules of Procedure.

"Coordinated Functional Registration" means where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more Reliability Standard(s) applicable to a particular function, and/or for one or more Requirement(s)/sub-Requirement(s) within particular Reliability Standard(s).

"Covered Asset" means a Cyber Asset or Critical Cyber Asset that is subject to an Applicable Requirement.

"Credential" means a NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

"Critical Assets" means Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.**

"Critical Cyber Assets" means Cyber Assets critical to the reliable operation of Critical Assets.**

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.++

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.++

"Critical Infrastructure Protection Standard" or "CIP Standard" means any of NERC Reliability Standards CIP-002 through CIP-009.

"Cross-Border Regional Entity" means a Regional Entity that encompasses a part of the United States and a part of Canada or Mexico.++

"Cyber Assets" means programmable electronic devices and communication networks including hardware, software, and data.**

"Cyber Security Incident" means any malicious or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.++

"Cyber Security Incident Information" means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

"Days", as used in Appendix 5A with respect to the Registration and Certification processes, means calendar days.

"Deactivation," as used in Appendix 5A with respect to the Registration processes, refers to removal of an entity from the NCR for a specific functional category. As a result of deactivation, the entity is no longer subject to any prospective compliance obligations with respect to Reliability Standards applicable to that functional category.

"Delegate" means a person to whom the Senior Manager of a Responsible Entity has delegated authority pursuant to Requirement R2.3 of CIP Standard CIP-003-1 (or any successor provision).

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, or other individual designated by the Compliance Enforcement Authority who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Disapproval of the Exception Request" or "Disapproval" means the determination by NERC that an Exception Request does not meet the criteria to receive the requested Exception.

"Distribution Factor" means the portion of an Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate).**

"Distribution Provider" means the entity that provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus,

the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"Effective Date" means the date, as specified in a notice disapproving a TFE Request or terminating an approved TFE, on which the disapproval or termination becomes effective.

"Electric Reliability Organization" or "ERO" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Element" means any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An Element may be comprised of one or more components.**

"Eligible Reviewer" means a person who has the required security clearances or other qualifications, or who otherwise meets the applicable criteria, to have access to Confidential Information, Classified National Security Information, NRC Safeguards Information or Protected FOIA Information, as applicable to the particular information to be reviewed.

"End Date" means the last date of the period to be covered in a Compliance Audit.

"Essential Actions" or "Level 3 (Essential Actions)" is a notification issued by NERC in accordance with Section 810.3.3 of the Rules of Procedure.

"Evidentiary Hearing" means a hearing at which one or more Participants submits evidence for the record. A Testimonial Hearing is an Evidentiary Hearing, but an Evidentiary Hearing does not necessarily include the presentation of testimony by witnesses in person.

"Exception" means either an Inclusion Exception or an Exclusion Exception.

"Exception Procedure" means the procedure set forth in Appendix 5C.

"Exception Report" means information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.

"Exception Request" means a request made by a Submitting Entity in accordance with Appendix 5C for an Exception.

"Exception Request Form" means the form adopted by each Regional Entity, in accordance with a template provided by NERC, for use by Submitting Entities in submitting Exception Requests; provided, that the Exception Request Form must include Section III.B as adopted by NERC.

"Exclusion Exception" means a determination that an Element that falls within the BES Definition should be excluded from the BES.

"Expiration Date" means the date on which an approved TFE expires.

"Facility" means a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)**

"FERC" means the United States Federal Energy Regulatory Commission.

"Final Penalty Amount" means the final, proposed Penalty for violation of a Reliability Standard, determined in accordance with the *Sanction Guidelines*.

"Find, Fix, Track~~,~~ and Report" or "FFT" means a streamlined process, addressed in Section ~~3A.0~~5.2A of Appendix 4C, to resolve ~~lesser risk~~minimal or moderate risk, remediated Possible Violations that are not assessed a financial penalty.

"Flowgate" means 1.) A portion of the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.**

"FOIA" means the U.S. Freedom of Information Act, 5 U.S.C. §552.

"Footprint" means the geographical or electric area served by an entity.
"Functional Entity" means an entity responsible for a function that is required to ensure the Reliable Operation of the electric grid as identified in the NERC Reliability Standards.

"Generator Operator" means the entity that operates generating Facility(ies) and performs the functions of supplying energy and Interconnected Operations Services.

"Generator Owner" means an entity that owns and maintains generating Facility(ies).

"Hearing Body" or "Regional Entity Hearing Body" means the body established or designated by the Compliance Enforcement Authority to conduct hearings and issue decisions concerning disputed compliance matters in accordance with Attachment 2, Hearing Procedures, of Appendix 4C.

"Hearing Officer" means, depending on the context, (i) an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, or (ii) solely for hearings conducted pursuant to Appendix 4E, (A) a CCC member or (B) an individual employed or contracted by NERC, as designated and approved by the CCC to preside over hearings conducted pursuant to the Hearing Procedures in Appendix E; the Hearing Officer shall not be a member of the Hearing Panel.

"Hearing Panel" means the five person hearing body established as set forth in the CCC Charter on a case by case basis and that is responsible for adjudicating a matter as set forth in Appendix 4E.

"Hearing Procedures" means, depending on the context, (i) Attachment 2 to the NERC or a Regional Entity CMEP, as applicable, or (ii) the hearing procedures of the NERC Compliance and Certification Committee in Appendix 4E.

"Inclusion Exception" means a determination that an Element that falls outside the BES Definition should be included in the BES.

"Inherent Risk Assessment" or "IRA" means a review ~~of~~ by the Compliance Enforcement Authority of potential risks posed by an individual Registered Entity to the reliability of the Bulk Power System. An IRA considers factors such as, but is not limited to, assets, system, geography, interconnectivity, prior compliance history and factors unique to the Registered Entity. The results of an entity-specific IRA may result in the scope of compliance monitoring for a particular Registered Entity to include more, fewer, or different Reliability Standards than those contained in the annual Implementation Plans.

"Interchange" means energy transfers that cross Balancing Authority boundaries.**

"Interchange Authority" means the responsible entity that authorizes the implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communications of Interchange information for reliability assessment purposes.**

"Interchange Distribution Calculator" means the mechanism used by Reliability Coordinators in the Eastern Interconnection to calculate the distribution of Interchange Transactions over specific Flowgates. It includes a database of all Interchange Transactions and a matrix of the Distribution Factors for the Eastern Interconnection.**

"Interchange Schedule" means an agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.**

"Interchange Transaction" means an agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.**

"Interconnected Operations Service" means a service (exclusive of basic energy and Transmission Services) that is required to support the Reliable Operation of interconnected Bulk Electric Systems.**

"Interconnection" means a geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control.++

"Interconnection Reliability Operating Limit" means a System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.**

"Internal Control Evaluation" or "ICE" means a review by the Compliance Enforcement Authority of a Registered Entity's internal controls. The ICE may further refine the compliance oversight plan, including the scope of an audit, the type and application of compliance monitoring tools, the depth and breadth of a particular area of review~~, or determine whether an audit is necessary if the Registered Entity demonstrates effective internal controls~~.

"Interpretation" means an addendum to a Reliability Standard, developed in accordance with the NERC *Standard Processes Manual* and approved by the Applicable Governmental Authority(ies), that provides additional clarity about one or more Requirements in the Reliability Standard.

"ISO/RTO" means an independent transmission system operator or regional transmission organization approved by the FERC or the Public Utility Commission of Texas.

"Joint Registration Organization" means an entity that registers in the Compliance Registry to perform reliability functions for itself and on behalf of one or more of its members or related entities for which such members or related entities would otherwise be required to register.

"Lead Entity" means the entity that submits Exception Request information that is common to a group of Submitting Entities that are submitting Exception Requests jointly.

"Lead Mediator" means a member of a mediation team formed pursuant to Appendix 4E who is selected by the members to coordinate the mediation process and serve as the mediation team's primary contact with the Parties.

"Load" means an end-user device or customer that receives power from the electric system.**

"Load-Serving Entity" means an entity that secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.**

"Mapping" means the process of determining whether a Regional Entity's Footprint is being served by Registered Entities.

"Material Change" means a change in facts that modifies Required Information in connection with an approved TFE. Examples of a Material Change could include, but are not limited to an increase in device count (but not a decrease), change in compensating measures, change in statement of basis for approval for the TFE, a change in the Expiration Date of the TFE, or a Responsible Entity achieving Strict Compliance with the Applicable Requirement.

"Material Change Report" means a report submitted by the Responsible Entity to the Regional Entity in the event there is a Material Change to the facts underlying an approved TFE pursuant to Section 4.0 of Appendix 4D.

"Mediation Settlement Agreement" means a written agreement entered into by the Parties to a mediation pursuant to Appendix 4E that resolves the dispute.

"Member" means a member of NERC pursuant to Article II of its Bylaws.

"Member Representatives Committee" or "MRC" means the body established pursuant to Article VIII of the NERC Bylaws.

"Mexican Entity" means a Registered Entity that is organized under Mexican law.

"Mitigating Activities" means actions taken by a Registered Entity to correct and prevent recurrence of a noncompliance, whether or not the actions are embodied in a Mitigation Plan.

"Mitigation Plan" means an action plan developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.

"NERC-Approved Learning Activity" means training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

"NERC Compliance Monitoring and Enforcement Program Implementation Plan" or "NERC Implementation Plan" means the annual NERC ~~Compliance Monitoring and Enforcement Program~~ Implementation Plan that ~~specifies the Reliability Standards that are subject to reporting~~identifies the risk elements to prioritize risks to the Bulk Power System. These risk elements and related NERC Reliability Standards and Requirements become inputs for Regional Entities in developing their Regional Compliance Monitoring and Enforcement Program Implementation Plans and the compliance oversight for individual ~~by~~ Registered Entities ~~to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard~~. The NERC Implementation Plan may be updated more often than annually as needed.

"NERC Compliance Registry," "Compliance Registry" or "NCR" means a list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in

support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.

"NERC Identification Number" or "NERC ID" means a number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.

"NERC Organization Certification" or "Organization Certification" means the process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator; such certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure.

"Net Energy for Load" or "NEL" means net generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.

"Notice of Alleged Violation and Proposed Penalty or Sanction" means a notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3 of Appendix 4C.

"Notice of Completion of Enforcement Action" means a notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10 of Appendix 4C, stating than an enforcement action is closed.

"Notice of Confirmed Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards.

"Notice of Penalty" means a notice prepared by NERC and filed with FERC, following approval by NERC of a Notice or other notification of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.

"Notice of Possible Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

"NRC" means the United States Nuclear Regulatory Commission.

"NRC Safeguards Information" means Required Information that is subject to restrictions on disclosure pursuant to 42 U.S.C. §2167 and the regulations of the NRC at 10 C.F.R. §73.21-73.23; or pursuant to comparable provisions of Canadian federal or provincial law.

"Open Access Transmission Tariff" means an electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.**

"Owner" means the owner(s) of an Element or Elements that is or may be determined to be part of the BES as a result of either the application of the BES Definition or an Exception, or another entity, such as an operator, authorized to act on behalf of the owner of the Element or Elements in the context of an Exception Request.

"Participant" means a Respondent and any other Person who is allowed or required by the Hearing Body or by FERC to participate as an intervenor in a proceeding conducted pursuant to the Hearing Procedures, and as used in the Hearing Procedures shall include, depending on the context, the members of the Compliance Staff that participate in a proceeding or the members of the Certification Staff that participate in a proceeding pursuant to Appendix 4E.

"Party" or "Parties" means a Person or the Persons participating in a mediation pursuant to Appendix 4E.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Periodic Data Submittals" means modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.
"Planning Authority" means the responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.**

"Point of Delivery" means a location that a Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.**

"Point of Receipt" means a location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a generator delivers its output.

"Possible Violation" means the identification, by the Compliance Enforcement Authority, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.

"Preliminary Screen" means an initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered, and (3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation which is currently being processed.

"Probation" means a step in the disciplinary process pursuant to Section 605 of the Rules of Procedure during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

"Protected FOIA Information" means Required Information, held by a governmental entity, that is subject to an exemption from disclosure under FOIA (5 U.S.C. §552(e)), under any similar state or local statutory provision, or under any comparable provision of Canadian federal or provincial law, which would be lost were the Required Information to be placed into the public domain.

"Protection System" means protective relays which respond to electrical quantities, communications systems necessary for correct operation of protective functions, voltage and current sensing devices providing inputs to protective relays, station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.**

"Purchasing-Selling Entity" means the entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.**

"Reactivation" refers to re-registration pursuant to the NERC Rules of Procedure Section 500 and Appendices 5A and 5B of an entity to the NCR for a specific functional category or the revocation of, or additions to, a sub-set list of Reliability Standards (which specifies Reliability Standards and may specify Requirements/sub-Requirements) that has been granted to an entity. Reactivation may be initiated by NERC, a Regional Entity or an entity with respect to such entity's own functional categories or sub-set list of Reliability Standards (which specifies Reliability Standards and may specify Requirements/sub-Requirements).

"Reactive Power" means the portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive Power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive

losses on transmission facilities. Reactive Power is provided by generators, synchronous condensers, or electrostatic equipment such as capacitors and directly influences electric system voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar).**

"Real Power" means the portion of electricity that supplies energy to the Load.**

"Receiving Entity" means NERC or a Regional Entity receiving Confidential Information from an owner, operator, or user of the Bulk Power System or from any other party.

"Recommendation" for purposes of Appendix 5C means the report to NERC containing the evaluation prepared in accordance with section 5.2 of Appendix 5C concerning whether or to what extent an Exception Request should be approved.

"Recommendations" or "Level 2 (Recommendations)" is a notification issued by NERC in accordance with Section 810.3.2 of the Rules of Procedure.

"Region" means the geographic area, as specified in a Regional Entity's delegation agreement with NERC, within which the Regional Entity is responsible for performing delegated functions.

"Regional Criteria" means reliability requirements developed by a Regional Entity that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Such Regional Criteria may be necessary to account for physical differences in the Bulk Power System but are not inconsistent with Reliability Standards nor do they result in lesser reliability. Such Regional Criteria are not enforceable pursuant to NERC-delegated authorities, but may be enforced through other available mechanisms. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents.

"Regional Entity" means an entity having enforcement authority pursuant to 18 C.F.R. § 39.8.++

"Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan" or "Regional Implementation Plan" means an annual Regional Entity plan, submitted ~~by~~ on or about October 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC ~~Compliance Monitoring and Enforcement Program~~ Implementation Plan, ~~identifies~~ includes (1) details on r~~R~~egional r~~R~~isk a~~A~~ssessment processes and results; ~~all Reliability Standards identified by NERC to be actively monitored during each year,~~ (2) ~~other~~ Reliability Standards and Requirements associated with r~~R~~egional r~~R~~isk a~~A~~ssessment results~~proposed for active monitoring by the Regional Entity;~~, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria ~~with each Reliability Standard,~~; and (4) the Regional Entity's Annual Audit Plan.

"Regional Reliability Standard" means a type of Reliability Standard that is applicable only within a particular Regional Entity or group of Regional Entities. A Regional Reliability Standard may augment, add detail to, or implement another Reliability Standard or cover matters not addressed by other Reliability Standards. Regional Reliability Standards, upon adoption by

NERC and approval by the Applicable Governmental Authority(ies), shall be Reliability Standards and shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Registered Ballot Body" means that aggregation of all entities or individuals that qualify for one of the Segments approved by the Board of Trustees, and are registered with NERC as potential ballot participants in the voting on proposed Reliability Standards.

"Registered Entity" means an owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.

"Registration" or "Organization Registration" means the processes undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region.

"Rejection of the Exception Request" or "Rejection" means the determination that an Exception Request is not an eligible Exception Request (i.e., a Request permitted by section 4.1 of Appendix 5C) or does not contain all the Required Information in accordance with section 4.5 of Appendix 5C in order to be reviewed for substance.

"Reliability Coordinator" means the entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.**

"Reliability Coordinator Area" means the collection of generation, transmission and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.**

"Reliability Standard" means a requirement to provide for Reliable Operation of the Bulk Power System, including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation capacity. A Reliability Standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the Applicable Governmental Authority.

"Reliability Standards Development Plan" means the forward-looking plan developed by NERC on an annual basis setting forth the Reliability Standards development projects that are scheduled

to be worked on during the ensuing three-year period, as specified in Section 310 of the Rules of Procedure.

"Reliable Operation" means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements.++

"Remedial Action Directive" means an action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat.

"Reporting Entity" means an entity required to provide data or information requested by NERC or a Regional Entity in a request for data or information pursuant to Section 1600 of the Rules of Procedure.

"Requirement" means an explicit statement in a Reliability Standard that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each Requirement shall be a statement with which compliance is mandatory.

"Required Date" means the date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.

"Required Information" means, as applicable, either (i) the information required to be provided in a TFE Request, as specified in Section 4.0 of Appendix 4D; or (ii) the information required to be provided in an Exception Request, as specified in section 4.0 of Appendix 5C.

"Reserve Sharing Group" means a group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g. ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.**

"Resource Planner" means the entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority area.**

"Respondent" means, depending on the context, the Registered Entity, who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable, or the Registered Entity that is the subject of the Certification decision that is the basis for a proceeding under Appendix 4E.

"Responsible Entity" means an entity that is registered for a reliability function in the NERC Compliance Registry and is responsible for complying with an Applicable Requirement, as specified in the "Applicability" section of the CIP Standard.

"Revoked" means a NERC certificate that has been suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

"Revoke for Cause" means a step in the disciplinary process pursuant to Section 605 of the Rules of Procedure during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

"Scope of Responsibility" means the registered functions of a Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority and the geographical or electric region in which the Planning Authority, Reliability Coordinator, Transmission Operator, Transmission Planner or Balancing Authority operates to perform its registered functions, or with respect to a Regional Entity, its Regional Entity Region.

"Section I Required Information" means Required Information that is to be provided in Section I of a Submitting Entity's Exception Request.

"Section II Required Information" means Required Information that is to be provided in Section II of a Submitting Entity's Exception Request.

"Section III Required Information" means Required Information that is to be provided in Section III of a Submitting Entity's Exception Request.

"Sector" means a group of Members of NERC that are Bulk Power System owners, operators, or users or other persons and entities with substantially similar interests, including governmental entities, as pertinent to the purposes and operations of NERC and the operation of the Bulk Power System, as defined in Article II, Section 4 of the NERC Bylaws. Each Sector shall constitute a class of Members for purposes of the New Jersey Nonprofit Corporation Act.

"Segment" means one of the subsets of the Registered Ballot Body whose members meet the qualification criteria for the subset.

"Self-Certification" means an attestation by a Registered Entity that it is compliant or non-compliant with a Reliability Standard Requirement that is the subject of the Self-Certification, or that it does not own Facilities that are subject to the Reliability Standard Requirement, or that the Reliability Standard Requirement is not applicable to the Registered Entity.

"Self-Logging" means a process by which Registered Entities found to be eligible by a Compliance Enforcement Authority, after a formal review of internal controls, record possible noncompliance on a log, in accordance with Section 3.5A of Appendix 4C, in lieu of individually submitted Sself-Rreports ofing each possible noncompliance.

"Self-Report" means a report by a Registered Entity stating that the Registered Entity believes it has, or may have, violated a Reliability Standard.

"Senior Manager" means the person assigned by the Responsible Entity, in accordance with CIP Standard CIP-003-1 Requirement R2 (or subsequent versions), to have overall responsibility for leading and managing the Responsible Entity's implementation of, and adherence to, the CIP Standards.

"Sink Balancing Authority" means the Balancing Authority in which the Load (sink) is located for an Interchange Transaction.**

"Source Balancing Authority" means the Balancing Authority in which the generation (source) is located for an Interchange Transaction.**

"Special Protection System" means an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. A Special Protection System does not include (a) underfrequency or undervoltage Load shedding or (b) fault conditions that must be isolated, or (c) out-of-step relaying (not designed as an integral part of a Special Protection System).**

"Spot Check" means a process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Report, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to operating problems or system events.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Strict Compliance" means compliance with the terms of an Applicable Requirement without reliance on a Technical Feasibility Exception.

"Submitting Entity" means (i) an owner, operator, or user of the Bulk Power System or any other party that submits information to NERC or a Regional Entity that it reasonably believes contains Confidential Information or, (ii) solely for purposes of Appendix 5C, the entity that submits an Exception Request in accordance with section 4.0 of Appendix 5C.

"Suspended" means certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

"System" means a combination of generation, transmission and distribution components.**

"System Operating Limit" means the value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria.**

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies NERC's or the Compliance Enforcement Authority's (as applicable) conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body or Hearing Panel.

"Technical Feasibility Exception" or "TFE" means an exception from Strict Compliance with the terms of an Applicable Requirement on grounds of technical feasibility or technical limitations in accordance with one or more of the criteria in section 3.0 of Appendix 4D.

"Technical Review Panel" means a panel established pursuant to section 5.3 of Appendix 5C.

"Termination of Credential" means a step in the disciplinary process pursuant to Section 605 of the Rules of Procedure whereby a Credential is permanently Revoked.

"Testimonial Hearing" means an Evidentiary Hearing at which the witness or witnesses on behalf of one or more Participants appears in person to present testimony and be subject to cross-examination.

"TFE Request" means a request submitted by a Responsible Entity in accordance with Appendix 4D for an exception from Strict Compliance with an Applicable Requirement.

"Transmission Customer" means 1. any eligible customer (or its designated agent) that can or does execute a Transmission Service agreement or can and does receive Transmission Service. 2. Any of the following entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.

"Transmission Operator" means the entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission Facilities.**

"Transmission Owner" means the entity that owns and maintains transmission Facilities.**

"Transmission Planner" means the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.**

"Transmission Service" means services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.**

"Transmission Service Provider" means the entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.**

"Variance" means an aspect or element of a Reliability Standard that applies only within a particular Regional Entity or group of Regional Entities, or to a particular entity or class of entities. A Variance allows an alternative approach to meeting the same reliability objective as the Reliability Standard, and is typically necessitated by a physical difference. A Variance is embodied within a Reliability Standard and as such, if adopted by NERC and approved by the Applicable Governmental Authority(ies), shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Violation Risk Factor" or "VRF" means a factor (lower, medium or high) assigned to each Requirement of a Reliability Standard to identify the potential reliability significance of noncompliance with the Requirement.

"Violation Severity Level" or "VSL" means a measure (lower, moderate, high or severe) of the degree to which compliance with a Requirement was not achieved.

"Wide Area" means the entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.**

COMPLIANCE MONITORING AND ENFORCEMENT PROGRAM

1.0 INTRODUCTION

This Compliance Monitoring and Enforcement Program ("Compliance Program") is the program to be used by the North American Electric Reliability Corporation ("NERC") and the Regional Entities to monitor, assess, and enforce compliance with Reliability Standards within the United States. Compliance Monitoring and Enforcement Programs also will be implemented in Canada consistent with Canadian laws and agreements.

1.1 Definitions

Capitalized terms used in this Compliance Program shall have the meanings set forth in Appendix 2 of the NERC Rules of Procedure. ~~For convenience of reference, defined terms frequently used in this Appendix are also set forth below:~~

~~Alleged Violation: A Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.~~

~~Annual Audit Plan: A plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited and the schedule of Compliance Audits for the calendar year.~~

~~Applicable Governmental Authority: The Federal Energy Regulatory Commission ("FERC") within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.~~

~~Complaint: An allegation that a Registered Entity violated a Reliability Standard.~~

~~Compliance Audit: A systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.~~

~~Compliance Audit Participants: Registered Entities scheduled to be audited and the audit team members.~~

~~Compliance Enforcement Authority: NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.~~

~~Compliance Exception: A noncompliance that is addressed in Section 3A.0 of Appendix 4C, and is not pursued through an enforcement action under Section 5.0 of Appendix 4C by a Compliance Enforcement Authority.~~

~~**1.1.8**~~**9** ~~Compliance Investigation: A comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.~~**1.1.9** ~~—~~

~~**1.1.10** Confirmed Violation: An Alleged Violation for which (1) the Registered Entity has accepted or not contested the Notice of Alleged Violation and Proposed Penalty or Sanction or other notification of the Alleged Violation, or (2) there has been the issuance of a final order from NERC or a Regional Entity Hearing Body finding a violation, Penalty or sanction, or (3) the period for requesting a hearing or an appeal has expired, or (4) the Registered Entity has executed a settlement agreement pursuant to Section 5.6.~~

~~**1.1.10**11 End Date: The last date of the period to be covered in a Compliance Audit.~~

~~**1.1.11**12 Exception Report: Information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.~~

~~**1.1.13** Find, Fix, Track, and Report: A streamlined process, addressed in Section 3A.0 of Appendix 4C, to resolve lesser-risk, remediated Possible Violations that are not assessed a financial penalty.~~

~~**1.1.14** Inherent Risk Assessment ("IRA"): A review by the Compliance Enforcement Authority of potential risks posed by an individual Registered Entity to the reliability of the Bulk Power System. An IRA considers factors such as, but not limited to, assets, system, geography, interconnectivity, prior compliance history, and factors unique to the Registered Entity. The results of an entity-specific IRA may result in the scope of compliance monitoring for a particular Registered Entity to include more, fewer, or different Reliability Standards than those contained in the annual Implementation Plans.~~

~~**1.1.15** Internal Control Evaluation: A review by the Compliance Enforcement Authority of a Registered Entity's internal controls. The ICE may further refine the compliance oversight plan, including the scope of an audit, the type and application of compliance monitoring tools, the depth and breadth of a particular area of review, or determine whether an audit is necessary if the Registered Entity demonstrates effective internal controls.~~

~~**1.1.16**2 ISO/RTO: An independent transmission system operator or regional transmission organization approved by the FERC or the Public Utility Commission of Texas.~~

~~**1.1.17**3 Mitigating Activities: Actions taken by a Registered Entity to correct and prevent recurrence of a noncompliance, whether or not the actions are embodied in a Mitigation Plan.~~

~~**1.1.18**4 Mitigation Plan: An action plan developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.~~

~~**1.1.19**5 NERC Compliance Registry: A list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.~~

~~**1.1.16**20 NERC Compliance Monitoring and Enforcement Program Implementation Plan or NERC Implementation Plan: The annual NERC Compliance Monitoring and Enforcement~~

~~Program Implementation Plan that specifies the Reliability Standards that are subject to reporting~~identifies the risk elements to prioritize risks to the reliability of the Bulk Power System. These risk elements and related NERC Reliability Standards Requirements become inputs for Regional Entities in developing their Regional Implementation Plans and the compliance oversight plan for individual ~~by Registered Entities to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard. The NERC Implementation Plan may be updated as needed.~~

~~**1.1.17**~~**21** ~~Notice of Alleged Violation and Proposed Penalty or Sanction: A notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3.~~

~~**1.1.18**~~**22** ~~Notice of Completion of Enforcement Action: A notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10, stating than an enforcement action is closed.~~

~~**1.1.19**~~**23** ~~Notice of Confirmed Violation: A notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards.~~

~~**1.1.20**~~**24** ~~Notice of Penalty: A notice prepared by NERC and filed with FERC, following approval by NERC of a Notice or other notification of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.~~

~~**1.1.21**~~**25** ~~Notice of Possible Violation: A notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.~~

~~**1.1.22**~~**26** ~~Periodic Data Submittals: Modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.~~

~~**1.1.23**~~**27** ~~Possible Violation: The identification, by the Compliance Enforcement Authority, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.~~

~~**1.1.24**~~**28** ~~Preliminary Screen: An initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered, and (3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation which is currently being processed.~~

~~**1.1.2529** Regional Implementation Plan: An annual~~ Regional Entity plan, ~~submitted by on or about October 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC Compliance Monitoring and Enforcement Program Implementation Plan,~~ includes (1) details on Regional Risk Assessment processes and results; (2) Reliability Standards and Requirements associated with Regional Risk Assessment results; ~~identifies (1) all Reliability Standards identified by NERC to be actively monitored during each year, (2) other Reliability Standards proposed for active monitoring by the Regional Entity, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria with each Reliability Standard;~~, and ~~(4) the Regional Entity's Annual Audit Plan.~~

~~**1.1.2630** Registered Entity: An owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.~~

~~**1.1.2731** Remedial Action Directive: An action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat.~~

~~**1.1.2832** Required Date: The date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.~~

~~**1.1.2933** Self-Certification: An attestation by a Registered Entity that it is compliant or non-compliant with a Reliability Standard Requirement that is the subject of the Self-Certification, or that it does not own Facilities that are subject to the Reliability Standard Requirement, or that the Reliability Standard Requirement is not applicable to the Registered Entity.~~

~~**1.1.34** Self-Logging: A process by which Registered Entities found to be eligible by a Compliance Enforcement Authority, after a formal review of internal controls, record noncompliance on a log, in accordance with Section 3.5A of Appendix 4C, in lieu of individually self-reporting each possible noncompliance.~~

~~**1.1.3035** Self-Report: A report by a Registered Entity stating that the Registered Entity believes it has, or may have, violated a Reliability Standard.~~

~~**1.1.3136** Spot Check: A process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Report, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to operating problems or system events.~~

2.0 IDENTIFICATION OF ORGANIZATIONS RESPONSIBLE FOR COMPLYING WITH RELIABILITY STANDARDS

NERC shall register the organizations responsible for complying with Reliability Standards, in accordance with Section 500 of the NERC Rules of Procedure and Appendix 5B, *Statement of*

Compliance Registry Criteria. Organizations are responsible to register and to comply with Reliability Standards if they are owners, operators, and users of the Bulk Power System, perform a function listed in the functional types identified in Section II of Appendix 5B, and are material to the Reliable Operation of the Bulk Power System as defined by the criteria and notes in Appendix 5B. Regional Entities shall (i) develop and provide to NERC information to assist NERC to register organizations responsible for complying with Reliability Standards, and (ii) in the event of a Registration appeal to NERC or an Applicable Governmental Authority, provide information requested by NERC concerning how the Registered Entity meets the Registration criteria or is otherwise material to the reliability of the Bulk Power System.

NERC shall notify organizations of their inclusion on the NERC Compliance Registry and shall maintain the NERC Compliance Registry on its web site. NERC shall inform each Registered Entity at the time of Registration of the Reliability Standards that are applicable to reliability functions for which the Registered Entity is registered. Each Registered Entity shall inform NERC or the applicable Regional Entity promptly of changes to the Registered Entity's Registration information including planned or completed changes in ownership of Bulk Power System Facilities, Registration status, address and other contact information, and name of designated compliance contact. NERC will provide FERC and Applicable Governmental Authorities monthly updates to the NERC Compliance Registry.

NERC and each Regional Entity will designate a contact person(s) and require each Registered Entity to designate a contact person(s) responsible for sending and receiving all necessary information and communications concerning compliance matters. NERC and the applicable Regional Entity will designate where Registered Entities are to send information, data, Mitigation Plans, or any other compliance-related correspondence.

NERC shall maintain on its website a current listing of Reliability Standards that are applicable to all Registered Entities.

As provided for herein, during the course of compliance monitoring and enforcement activities relating to U.S. entities, NERC may obtain information that it will provide to FERC and, if the information pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such provision of information to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure.

3.0 COMPLIANCE MONITORING PROCESSES

NERC, with input from the Regional Entities, stakeholders, and regulators, shall at least annually identify risk elements and related NERC Reliability Standards and Requirements to be considered in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan (Implementation Plan). NERC identifies the risk elements using data including, but not limited to: compliance findings; event analysis experience; data analysis; and the expert judgment of NERC and Regional Entity staff, committees, and subcommittees. NERC uses these risk elements to identify and prioritize continent-wide risks to the reliability of the ~~BPS~~Bulk Power System. These identified risks represent the focus for oversight activities in the

upcoming year, and become inputs for developing oversight plans for individual Registered Entities.

The Compliance Enforcement Authority will monitor Registered Entities' compliance with Reliability Standards using the compliance monitoring processes described in this Section. A Compliance Enforcement Authority will determine the type and frequency of application of the compliance monitoring tools appropriate for a particular Registered Entity based on the Registered Entity's specific risks to the reliability of the Bulk Power System.

If a compliance monitoring process described in this Section reveals a potential noncompliance with a Reliability Standard, the Compliance Enforcement Authority will conduct a Preliminary Screen of the potential noncompliance in accordance with Section 3.8. In addition, if the Compliance Enforcement Authority obtains evidence or information of a potential noncompliance with a Reliability Standard through any other means, including but not limited to an Exception Report or other report of noncompliance that a Registered Entity is required to submit in accordance with the terms of a Reliability Standard, the Compliance Enforcement Authority will conduct a Preliminary Screen of the information in accordance with Section 3.8. If the Preliminary Screen results in an affirmative determination with respect to the Preliminary Screen criteria, a Possible Violation exists and the Compliance Enforcement Authority will proceed in accordance with Section 5.0, Enforcement Actions ~~unless an alternative enforcement process is used, in accordance with Section 3A.0~~except as otherwise authorized in these Rules of Procedure.

Registered Entities found in violation of a Reliability Standard will be required to mitigate the violation regardless of any enforcement actions taken.

The compliance monitoring processes in this Section require timely information, reports and data from Registered Entities to effectively monitor compliance with Reliability Standards. The Compliance Enforcement Authority has authority to collect Documents, data and information in the manner it deems most appropriate, including requesting copies of Documents, data and information to be made and removing those copies from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the Documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. If Documents, data, information or other reports to determine compliance requested from a Registered Entity are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for Documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC general counsel.

Any report or other submission of information by a Registered Entity required by the Compliance Program shall be signed by an officer, employee, attorney or other authorized representative of the Registered Entity. Electronic signatures are permitted in accordance with processes established by NERC and the Regional Entity. NERC or the Compliance Enforcement Authority may require the signer to provide a statement of the basis of his or her authority to sign on behalf of the Registered Entity.

3.1 Compliance Audits

All Registered Entities are subject to audit for compliance with all Reliability Standards applicable to the functions for which the Registered Entity is registered. Compliance Audits are conducted on the Registered Entity's site to the extent required by NERC Rule of Procedure 403.11.2. Compliance Audit processes for Compliance Audits conducted in the United States shall be based on professional auditing standards recognized in the U.S., which may include for example Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards and standards sanctioned by the Institute of Internal Auditors. Compliance Audit processes for Compliance Audits conducted outside the U.S. may be based on Canadian or other international standards. All Compliance Audits shall be conducted in accordance with audit guides established for the Reliability Standards included in the Compliance Audit, consistent with accepted auditing guidelines as approved by NERC. The audit guides will be posted on NERC's website.

3.1.1 Compliance Audit Process Steps

The process steps for a Compliance Audit are as follows:

- The Compliance Enforcement Authority posts the Annual Audit Plan (developed in coordination with NERC). The Compliance Enforcement Authority provides additional information to the Compliance Audit Participants, including Compliance Audit materials, coordinating agendas and changes to the Compliance Audit schedule as required. NERC or the Regional Entity provides the Compliance Audit schedules to FERC and to any other Applicable Governmental Authority based upon the agreements in place with the other Applicable Governmental Authority.

- At least ninety (90) days prior to commencement of a regularly scheduled Compliance Audit, the Compliance Enforcement Authority notifies the Registered Entity of the Compliance Audit and the Reliability Standards to be evaluated, identifies the Compliance Audit team members and their recent employment history, and requests data, including a completed NERC pre-Compliance Audit questionnaire. If the Compliance Audit team members change from the time of the original notification, the Compliance Enforcement Authority will promptly notify the Registered Entity of the change and will allow time for the Registered Entity to object to the new Compliance Audit team member(s) (see Section 3.1.5.4).

- The Registered Entity provides to the Compliance Enforcement Authority the required information in the format and by the Required Date specified in the request.

- The Compliance Audit team reviews the submitted information for conformance with the Requirements of the Reliability Standards.

- The Compliance Audit team conducts an exit briefing with the Registered Entity, provides for a review of the Compliance Audit report with the Registered Entity before it is finalized, and completes a Compliance Audit report in accordance with Section 3.1.6.

- If the Compliance Audit Team identifies evidence of a potential noncompliance with a Reliability Standard Requirement by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

3.1.2 Compliance Enforcement Authority Annual Audit Plan and Schedule

The Compliance Enforcement Authority shall develop an Annual Audit Plan. The Annual Audit Plan of Regional Entities will be included in the Regional Implementation Plans submitted to NERC for review and approval (see Section 4.2). NERC or the Regional Entity provides the Annual Audit Plans to FERC and to any other Applicable Governmental Authority consistent with the agreements in place with the Applicable Governmental Authority.

Prior to October 1 of the year preceding the year covered by the Annual Audit Plan, the Compliance Enforcement Authority shall notify Registered Entities subject to Compliance Audits during the upcoming year of the Compliance Audit schedule. The Compliance Enforcement Authority will give due consideration to any schedule changes requested by Registered Entities for reasonable cause.

Revisions and additions to a Regional Entity Annual Audit Plan shall be communicated to and approved by NERC, and shall be communicated to the Registered Entity in a timely manner (normally sixty (60) days in advance) of changes or revisions to scheduled Compliance Audit dates.

3.1.3 Frequency of Compliance Audits

The Compliance Enforcement Authority will perform comprehensive Compliance Audits as required by the NERC Rules of Procedure and based on criteria established by NERC. In addition to scheduled Compliance Audits, the Compliance Enforcement Authority (i) may initiate an unscheduled Compliance Audit of any Registered Entity at any time if the Compliance Enforcement Authority reasonably determines it to be necessary to ensure the Registered Entity's compliance with Reliability Standards, and (ii) shall initiate an unscheduled Compliance Audit if directed by FERC. The Compliance Enforcement Authority shall notify NERC and FERC prior to or on the same date it notifies the Registered Entity that an unscheduled Compliance Audit is being initiated. If NERC initiates the unscheduled Compliance Audit, it shall notify the appropriate Regional Entity or Entities. The Compliance Enforcement Authority shall provide at least ten (10) business days advance notice to the Registered Entity that an unscheduled Compliance Audit is being initiated, which notice shall include identification of the members of the Compliance Audit team.

3.1.4 Scope of Compliance Audits

3.1.4.1 Reliability Standards

A Compliance Audit shall include those Reliability Standards applicable to the Registered Entity that are ~~identified in the NERC Implementation Plan for the current year~~determined through the NERC approved risk-based processes described herein, and may include other Reliability Standards applicable to the Registered Entity whether or not they are identified in the Regional Entity's Regional Implementation Plan for the current year.

Regional Entities will tailor the final scope of any Compliance Audit based on the results of the Registered Entity's Inherent Risk Assessment and, if applicable, taking into consideration the results of an Internal Controls Evaluation. ~~a Registered Entity's inherent risk and on the evaluation, if applicable, of the Registered Entity's internal controls pertinent to the applicable Reliability Standards.~~ Except as otherwise required in the Rules of Procedure, the Compliance Enforcement Authority may use any process herein, in addition to, or in lieu of a Compliance Audit to monitor compliance with Reliability Standards.

3.1.4.2 Period Covered

The Registered Entity's data and information must show compliance with the Reliability Standards that are the subject of the Compliance Audit for the entire period covered by the Compliance Audit. The Compliance Enforcement Authority will indicate the beginning and End Date of the audit period in its notice of the Compliance Audit. The audit period begins the day after the End Date of the prior Compliance Audit by the Compliance Enforcement Authority (or the later of June 18, 2007 or the date the Registered Entity became subject to Reliability Standards if the Registered Entity has not previously been subject to a Compliance Audit). The audit period will not begin prior to the End Date of the previous Compliance Audit. The Compliance Enforcement Authority may modify the beginning date of the audit period for any given Reliability Standard Requirement based on an intervening compliance monitoring process. The End Date should be a specified date prior to the scheduled start of the Compliance Audit, such as the date of the notification issued to the Registered Entity pursuant to Section 3.1.1 or the date that is thirty (30) days following the date of the notification.

The Registered Entity will be expected to demonstrate compliance for the entire period described above. If a Reliability Standard specifies a document retention period that does not cover the entire period described above, the Registered Entity will not be found in noncompliance solely on the basis of the lack of specific information that has rightfully not been retained based on the retention period specified in the Reliability Standard. However, in such cases, the Compliance Enforcement Authority will require the Registered Entity to demonstrate compliance through other means. In addition, if the Compliance Audit team discovers a potential noncompliance occurring subsequent to the End Date, the potential noncompliance will be subject to a Preliminary Screen pursuant to Section 3.8.

3.1.4.3 Review of Mitigating Activities

The Compliance Audit may include a review of any Mitigating Activities which the Registered Entity has not yet completed, for the purpose of determining whether the Registered Entity is making adequate progress towards completion of the Mitigating Activities.

3.1.5 Conduct of Compliance Audits

3.1.5.1 Composition of Compliance Audit Teams

The Compliance Audit team shall be comprised of members whom the Compliance Enforcement Authority has determined have the requisite knowledge, training and skills to conduct the Compliance Audit. The Compliance Audit team may include (i) contractors and industry subject matter experts, (ii) NERC staff members (which may include contractors to NERC), (iii) compliance staff members of other Regional Entities, and (iv) representatives of FERC and other Applicable Governmental Authorities so long as the Registered Entity is subject to the Applicable Governmental Authority's reliability jurisdiction. The Compliance Audit team leader shall be a staff member from the Compliance Enforcement Authority and is responsible for the conduct of the Compliance Audit and preparation of the Compliance Audit report.

3.1.5.2 Requirements for Compliance Audit Team Members

Each Compliance Audit team member must:

- Be free of conflicts of interests in accordance with the Compliance Enforcement Authority policies. Employees or contractors of the Registered Entity being audited shall not be allowed to participate as auditors in the Compliance Audit of the Registered Entity.

- Comply with the NERC Antitrust Compliance Guidelines and shall have either signed appropriate confidentiality agreements or acknowledgments that the confidentiality agreement signed by the Compliance Enforcement Authority is applicable.

- Successfully complete all NERC or NERC-approved Regional Entity auditor training applicable to the Compliance Audit.

- Prior to the Compliance Audit, the Compliance Enforcement Authority shall provide confirmation to the Registered Entity that all Compliance Audit team members have executed confidentiality agreements or acknowledgements.

3.1.5.3 Compliance Audit Observers and Other Attendees

In any Regional Entity Compliance Audit of a Registered Entity, in addition to the Compliance Audit team members, the following may participate as observers: (i) NERC Staff (which may include contractors to NERC); (ii) other members of the Regional Entity's Compliance Staff; (iii) with the permission of the Regional Entity, Compliance Staff members of other Regional Entities; and (iv) representatives of FERC and of other Applicable Governmental Authorities so long as the Registered Entity is subject to the Applicable Governmental Authority's reliability jurisdiction. Any members of NERC staff, Regional Entity Compliance Staff, or Compliance Staffs of other Regional Entities or representatives of FERC or other Applicable Governmental

Authorities who are not Compliance Audit team members identified pursuant to Section 3.1.1 are observers.

In addition, at the request of the Registered Entity being audited, the Regional Entity may allow attendance at the Compliance Audit by: (1) representatives of corporate affiliates of the Registered Entity being audited that are Registered Entities or that provide compliance services, support or oversight to the Registered Entity being audited, and (2) representatives of Registered Entities whose compliance activities are conducted by the Registered Entity being audited or by the same corporate entity that conducts the compliance activities of the Registered Entity being audited (e.g., representatives of other members of a Joint Registration Organization or of participants in a Coordinated Functional Registration pursuant to Section 500 of the Rules of Procedure). Each such additional attendee must execute a confidentiality agreement approved by the Regional Entity.

Compliance Audit observers and attendees are not Compliance Audit team members and do not participate in conducting the Compliance Audit or in making Compliance Audit findings and determinations.

The Compliance Audit team leader or other staff of the Regional Entity conducting the Compliance Audit will communicate in advance with any observers or other attendees to ensure there are no undue disruptions to the Compliance Audit, such as space limitations, no conflicts of interest, and no other considerations that in the judgment of the Compliance Audit team leader may be detrimental to the conduct and quality of the Compliance Audit. If the Compliance Audit team leader identifies any such issues, he/she shall work with the proposed observers or attendees to facilitate observation in a less disruptive manner; or, alternatively, the Regional Entity Compliance staff will work with the proposed observers or attendees to schedule their participation in, observation of, or attendance at a different Compliance Audit in which such issues are not presented.

3.1.5.4 Registered Entity Objections to Compliance Audit Team

A Registered Entity subject to a Compliance Audit may object to any member of the Compliance Audit team on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties. Any such objections must be provided in writing to the Compliance Enforcement Authority no later than fifteen (15) days prior to the start of on-site Compliance Audit work. This fifteen (15) day requirement shall not apply where a Compliance Audit team member has been appointed less than twenty (20) days prior to the start of on-site Compliance Audit work, in which case the Registered Entity must provide any objections to the Compliance Enforcement Authority within five (5) business days after receiving notice of the appointment of the Compliance Audit team member.

In the case of an unscheduled Compliance Audit pursuant to Section 3.1.3, the Registered Entity must provide any objections to the Compliance Enforcement Authority at least five (5) business days prior to the start of on-site Compliance Audit work for the unscheduled Compliance Audit.

The Compliance Enforcement Authority will make a final determination on whether the member will participate in the Compliance Audit of the Registered Entity. Nothing in Section 3.1 shall be read to limit the participation of NERC staff in the Compliance Audit or to limit the participation of FERC staff in a Compliance Audit of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction.

3.1.6 Compliance Audit Reports

The Compliance Audit team shall develop a draft Compliance Audit report that shall include a description of the objective, scope, and methodology of the Compliance Audit; identify any evidence of potential noncompliance with Reliability Standards by the Registered Entity found by the Compliance Audit team; identify any Remedial Action Directives, Mitigation Plans or other Mitigating Activities which have been completed or pending in the year of the Compliance Audit; and identify if any Confidential Information has been redacted. The report may also state areas of concern and recommendations identified by the Compliance Audit team. The draft report will be provided to the Registered Entity for comment.

The Compliance Audit team considers corrections based on comments of the Registered Entity, finalizes the Compliance Audit report, and provides the Registered Entity with a copy of the final report on or before the date the final report is provided to NERC. The Compliance Enforcement Authority provides the final report to NERC, which in turn provides the report to FERC if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which FERC has jurisdiction and/or to another Applicable Governmental Authority if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which the other Applicable Governmental Authority has jurisdiction. The provision of the final Compliance Audit report to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure. Work papers and other documentation associated with the Compliance Audit shall be maintained by the Compliance Enforcement Authority in accordance with NERC or Regional Entity requirements.

NERC will not publicly post the final Compliance Audit report for at least five (5) business days following receipt. If the Compliance Audit report identifies any Possible Violations of one or more Reliability Standards, the final Compliance Audit report, or pertinent part thereof identifying the Possible Violations, shall not be released to the public by NERC until (i) the Possible Violation is dismissed prior to becoming a Confirmed Violation, or (ii) NERC submits a Notice of Penalty to FERC or other Applicable Governmental Authority, or (iii) the Registered Entity executes a settlement agreement with the Compliance Enforcement Authority pursuant to Section 5.6.

Information deemed by a Compliance Enforcement Authority or the Registered Entity as Critical Energy Infrastructure Information or Confidential Information shall be redacted from any public reports.

3.2 Self-Certifications

The Compliance Enforcement Authority may require Registered Entities to self-certify their compliance with Reliability Standards.

3.2.1 Self-Certification Process Steps

The process steps for the Self-Certification process are as follows:

- The Compliance Enforcement Authority posts and updates the reporting schedule containing the applicable reporting periods and informs Registered Entities. The Compliance Enforcement Authority and NERC will ensure that the appropriate Reliability Standards, compliance procedures, and required submittal forms for the Reliability Standards being evaluated are maintained and available.

- The Compliance Enforcement Authority requests the Registered Entity to make a Self-Certification within the advance notice period specified by the Reliability Standard. If the Reliability Standard does not specify the advance notice period, this request will be issued in a timely manner (normally thirty (30) days advance notice).

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the form and manner, and by the Required Date, specified by the Compliance Enforcement Authority. The Self-Certification response may state that (i) the Registered Entity is in compliance with the Reliability Standard Requirement, (ii) the Registered Entity is not in compliance with the Reliability Standard Requirement, (iii) the Registered Entity does not own Facilities that are subject to the Reliability Standard Requirement, or (iv) the Reliability Standard requirement is not applicable to the Registered Entity.

- At a minimum, the Compliance Enforcement Authority reviews Self-Certifications of non-compliance and Self-Certifications in which the Registered Entity has responded that it does not own Facilities that are subject to the Reliability Standard Requirement or that the Reliability Standard Requirement is not applicable to the Registered Entity and the Compliance Enforcement Authority may request additional data and/or information if necessary.

- If the Compliance Enforcement Authority's review of the Self-Certification indicates a potential noncompliance with a Reliability Standard by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

Receipt of a Self-Certification by the Compliance Enforcement Authority shall not be construed as a finding by the Compliance Enforcement Authority that the Registered Entity is compliant with, not compliant with, subject to, or not subject to, the Reliability Standard Requirement.

3.3 Spot Checks

Spot Checks will be conducted by the Compliance Enforcement Authority. Spot Checks may be initiated at the discretion of the Compliance Enforcement Authority or as directed by NERC at any time to verify or confirm Self-Certifications, Self-Reports, and Periodic Data Submittals. Spot Checks may also be random or may be initiated in response to events, as described in the Reliability Standards, or to operating problems, or system events.

3.3.1 Spot Check Process Steps

The process steps for Spot Checking are as follows:

- The Compliance Enforcement Authority shall issue a notification letter to the Registered Entity that a Spot Check will be performed, the reason for the Spot Check, and the scope of the Spot Check including the Reliability Standard Requirements that will be covered, in accordance with the advance notice period specified by the Reliability Standard. If the Reliability Standard Requirement does not specify an advance notice period, any information submittal request made by the Compliance Enforcement Authority will allow at least twenty (20) days for the Registered Entity to submit the information or make it available for review.

- The Compliance Enforcement Authority, as part of the notification package, shall provide the Registered Entity with the names and employment histories of the persons who will be conducting the Spot Check. The Compliance Enforcement Authority shall provide confirmation to the Registered Entity that the members of the Spot Check team have executed confidentiality agreements or acknowledgements. The Registered Entity may object to inclusion of any individual on the Spot Check team on the grounds specified in Section 3.1.5.4. Any such objections must be submitted to the Compliance Enforcement Authority by the later of (i) five (5) business days before the information being requested by the Compliance Enforcement Authority is submitted and (ii) five (5) business days after the Registered Entity is notified of the persons on the Spot Check team. Nothing in Section 3.1 shall be read to limit the participation of NERC staff in a Spot Check or to limit the participation of FERC staff in a Spot Check of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction.

- The Spot Check may require submission of data, documentation, and information and an on-site review.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date specified in the request.

- The Spot Check Team conducts a review of the information submitted to determine compliance with the Reliability Standards Requirements and may request additional data and/or information if necessary.

- If the Spot Check team's review of the information submitted indicates a potential noncompliance with a Reliability Standard Requirement by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen pursuant to Section 3.8.

- The Spot Check team prepares a draft Spot Check report and provides the Registered Entity ten (10) business days to comment on the draft report.

- The Spot Check team considers any corrections based on the Registered Entity's comments, finalizes the Spot Check report and provides it to the Registered Entity and to NERC.

- If the Compliance Enforcement Authority is a Regional Entity, the Regional Entity provides the final report to NERC. NERC provides the report to FERC if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which FERC has jurisdiction and/or to another Applicable Governmental Authority if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which the other Applicable Governmental Authority has jurisdiction. The provision of the report to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure.

- The report will not be publicly posted, or otherwise made publicly available, by the Regional Entity or by NERC.

3.4 Compliance Investigations

A Compliance Investigation may be initiated at any time by the Compliance Enforcement Authority or NERC in response to a system disturbance, Complaint, or any potential noncompliance with a Reliability Standard identified by any other means.

Compliance Investigations will generally be led by the Regional Entity's staff. NERC reserves the right to assume the leadership of a Compliance Investigation.[1] The Regional Entity shall not be entitled to appeal NERC's decision to lead a Compliance Investigation.

Compliance Investigations are confidential, unless FERC directs that a Compliance Investigation should be public or that certain information obtained in the Compliance Investigation should be publicly disclosed. Confirmed Violations resulting from a Compliance Investigation will be made public.

FERC or another Applicable Governmental Authority may initiate an investigation at any time in response to a system disturbance, Complaint, or potential noncompliance with a Reliability Standard identified by any other means, or for any other purpose authorized by law. Investigations initiated by FERC or another Applicable Governmental Authority shall be governed by and conducted pursuant to the statutory authority and rules of the Applicable Governmental Authority and not the procedures set forth herein. If an Applicable Governmental Authority other than FERC initiates an investigation of a U.S.-related matter, NERC shall provide notice to FERC of the investigation prior to disclosure of any non-public U.S.-related compliance information regarding the matter to be investigated to the other Applicable Governmental Authority. NERC's notice to FERC shall identify the other Applicable Governmental Authority, shall describe the nature of the proposed disclosures to the other Applicable Governmental Authority, and shall state the procedures NERC will utilize in

[1]Examples of situations in which NERC may decide to lead a Compliance Investigation include: (i) to assure consistency in investigative processes, (ii) to coordinate Compliance Investigations into matters that may cross Regional Entity boundaries, (iii) where the potential noncompliance is related to the Regional Entity or one of its affiliates, divisions, committees or subordinate structures, or (iv) where the Regional Entity determines it cannot conduct the Compliance Investigation.

connection with the Compliance Investigation to ensure compliance with the requirements of 18 C.F.R. §39.7(b)(4) concerning nondisclosure of violations and Alleged Violations.

If FERC initiates an investigation of a non-U.S.-related matter, NERC shall provide notice of the investigation to the Applicable Governmental Authority having jurisdiction over the Registered Entity or the portion of the Bulk Power System that is the subject of the investigation prior to disclosure to FERC of any non-public non-U.S.-related compliance information regarding the matter to be investigated. NERC's notice to the other Applicable Governmental Authority shall describe the nature of the proposed disclosures to FERC and shall state the procedures NERC will utilize in connection with the investigation to ensure compliance with regulations of the other Applicable Governmental Authority or other law of the applicable jurisdiction concerning disclosure of non-public compliance information.

3.4.1 Compliance Investigation Process Steps

The process steps for a Compliance Investigation are as follows:

- The Compliance Enforcement Authority becomes aware of circumstances indicating a Reliability Standard may have been or is being violated and determines whether a Compliance Investigation is warranted. Within three (3) business days of the decision to initiate a Compliance Investigation, the Compliance Enforcement Authority: (i) notifies the Registered Entity of the initiation and initial scope of the Compliance Investigation, (ii) instructs the Registered Entity to preserve all records and information relevant to the Compliance Investigation, and (iii) provides a copy of the notice to NERC. The Compliance Investigation may be expanded beyond the initial scope based on information obtained by the Compliance Enforcement Authority after initiation of the Compliance Investigation.

- NERC assigns a NERC staff member to the Compliance Investigation as an observer or team member and to serve as a single point of contact for communications with NERC, and notifies the Registered Entity as to whether the NERC staff member is acting as an observer or as a team member. Within three (3) business days after NERC receives notice of the decision to initiate a Compliance Investigation, NERC will notify FERC and each other Applicable Governmental Authority having jurisdiction over a Registered Entity or a portion of the Bulk Power System to which the Compliance Investigation relates. Any such notice to FERC or to another Applicable Governmental Authority will be provided in accordance with Section 8.0, Reporting and Disclosure.

  The Compliance Enforcement Authority requests data or documentation and provides a list of individuals on the Compliance Investigation team and their recent employment history. Within ten (10) business days of receiving the notification of a Compliance Investigation, a Registered Entity subject to a Compliance Investigation may object to any individual member of the Compliance Investigation team on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties; however, the Registered Entity may not object to participation by NERC, by FERC staff or by staff of another Applicable Governmental Authority having reliability jurisdiction over the Registered Entity in the Compliance Investigation. Such objections must be provided in writing to

the Compliance Enforcement Authority within such ten (10) business day period. The Compliance Enforcement Authority will make a final determination as to whether the individual will participate in the Compliance Investigation of the Registered Entity.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date as specified in the request. If information is not received in the time and format requested, the Compliance Enforcement Authority may initiate the steps in **Process for Non-Submittal of Requested Data in Attachment 1.**

- If necessary, the Compliance Investigation may include an on-site visit with interviews of the appropriate personnel and review of data.

- The Compliance Enforcement Authority may require the Registered Entity to (i) provide a verification under oath by an officer, employee, attorney or other authorized representative of the Registered Entity attesting to the accuracy, completeness and truth of the Registered Entity's responses to the Compliance Enforcement Authority's requests for information; and (ii) produce one or more officers, employees or other authorized representatives of the Registered Entity who are familiar with the matter(s) that are the subject of the Compliance Investigation, to be interviewed or to provide testimony under oath concerning such matters. The Compliance Enforcement Authority shall determine in each case (i) whether representatives of the Registered Entity shall be allowed to be present when an interview is taking place or testimony is being taken, and (ii) whether, and by what method, the interview or testimony shall be recorded; provided, that counsel for the person being interviewed or giving testimony may be present when the interview is being conducted or testimony is being taken (regardless of whether such counsel also represents the Registered Entity).

- The Compliance Enforcement Authority reviews information to determine compliance with the Reliability Standards. The Compliance Enforcement Authority may request additional data and/or information, if necessary.

- The Compliance Enforcement Authority completes the assessment of compliance with the Reliability Standard, which may include review of a Mitigation Plan or Mitigating Activities, and provides a report of the Compliance Investigation to NERC and the Registered Entity.

- If the Compliance Enforcement Authority, at any time during the Compliance Investigation, identifies a potential noncompliance with a Reliability Standard Requirement by a Registered Entity, the Compliance Enforcement Authority shall conduct a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

- If the Compliance Enforcement Authority determines that no violation occurred, it shall send the Registered Entity and NERC a notice that the Compliance Investigation has been completed. NERC will in turn notify FERC and, if the Compliance Investigation pertained to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, will also notify such other

Applicable Governmental Authority. Any such notice to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.

3.5 Self-Reports

Self-Reports are encouraged at the time a Registered Entity becomes aware (i) that it has, or may have, violated a Reliability Standard, or (ii) the Violation Severity Level of a previously reported violation has changed. Self-Reports of a violation of a Reliability Standard are encouraged regardless of whether the Reliability Standard requires reporting on a pre-defined schedule in the Compliance Program or whether the violation is determined outside the pre-defined reporting schedule. If possible, and without delaying the Self-Report, a Self-Report may include the actions that have been taken or will be taken to resolve the violation.

3.5.1 Self-Report Process Steps

The process steps for Self-Reports are as follows:

- The Compliance Enforcement Authority posts the Self-Report submittal forms and ensures they are maintained and available.
- The Registered Entity provides the Self-Report information to the Compliance Enforcement Authority.
- The Compliance Enforcement Authority reviews the information to evaluate compliance with the Reliability Standards and may request that the Registered Entity provide clarification or additional data and/or information.
- The Compliance Enforcement Authority conducts a Preliminary Screen of the Self-Report information in accordance with Section 3.8.

3.5A Self-Logging

Registered Entities found by the Compliance Enforcement Authority to be eligible, after a formal review of internal controls, pursuant to procedures adopted by NERC and the Regional Entities and provided to Applicable Governmental Authorities, may be granted approval by the Compliance Enforcement Authority to log noncompliance for subsequent review in lieu of submitting a Self-Report. The log shall be limited to noncompliance posing a minimal risk to the reliability of the Bulk Power System unless otherwise authorized by an Applicable Governmental Authority. Approved Registered Entities shall maintain a log with a detailed description of the noncompliance, the risk assessment, and the mitigating activities completed or to be completed. There is a rebuttable presumption that noncompliance logged in this manner will be resolved as a Compliance Exception. The Compliance Enforcement Authority will periodically review the logs and will make the logs available for review, upon request, by NERC and Applicable Governmental Authorities.

3.6 Periodic Data Submittals

The Compliance Enforcement Authority requires Periodic Data Submittals in accordance with the schedule stated in the applicable Reliability Standard, or as established by the Compliance Enforcement Authority, or on an as-needed basis. The Compliance Enforcement Authority shall issue requests for Periodic Data Submittals to Registered Entities within at least the minimum advance notice period specified by the applicable Reliability Standard. If the Reliability Standard does not specify an advance notice period, the Compliance Enforcement Authority will normally issue this request with no less than twenty (20) days advance notice.

3.6.1 Periodic Data Submittals Process Steps

The process steps for Periodic Data Submittal are as follows:

- The Compliance Enforcement Authority posts the current data reporting schedule on its website and informs Registered Entities of changes and/or updates. The Compliance Enforcement Authority ensures that the required submittal forms for the Reliability Standards being evaluated are maintained and available.

- The Compliance Enforcement Authority makes a request for a Periodic Data Submittal.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date specified in the request.

- The Compliance Enforcement Authority reviews the data submittal to determine compliance with the Reliability Standards and may request additional data and/or information if necessary.

- If the Compliance Enforcement Authority's review of the data submittal indicates a potential noncompliance with a Reliability Standard Requirement by the Registered Entity, the Compliance Enforcement Authority performs a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

Receipt of a Periodic Data Submittal by the Compliance Enforcement Authority shall not be construed as a finding by the Compliance Enforcement Authority that the Registered Entity is compliant with, not compliant with, subject to, or not subject to, the Reliability Standard Requirement.

3.7 Complaints

Either NERC or Regional Entities may receive Complaints alleging violations of a Reliability Standard. The Compliance Enforcement Authority will conduct a review of each Complaint it receives to determine if the Complaint provides sufficient basis for initiating another compliance monitoring or enforcement process, except that NERC will review any Complaint where the Compliance Enforcement Authority determines it cannot conduct the review, or if the complainant wishes to remain anonymous or specifically requests NERC to conduct the review of the Complaint.

If the Complaint is submitted to NERC, NERC will forward the information to the Regional Entity, as appropriate.

All anonymous Complaints will be reviewed and any resulting compliance monitoring or enforcement processes conducted by NERC will be conducted in accordance with Section 3.7.2 to prevent disclosure of the identity of the complainant.

The Compliance Enforcement Authority conducting the review will determine if the Complaint may be closed as a result of the initial review and assessment or if it provides sufficient basis for initiating another compliance monitoring or enforcement process. The Compliance Enforcement Authority will report the results of its review of the Complaint to NERC. If, as a result of the initial review of the Complaint, the Compliance Enforcement Authority determines that initiating another compliance monitoring or enforcement process is warranted, the Compliance Enforcement Authority shall conduct that compliance monitoring or enforcement process in accordance with the applicable provisions of Section 3.0.

3.7.1 Complaint Process Steps

The detailed process steps for the Complaint process are as follows:

- The complainant notifies NERC or a Regional Entity using the NERC compliance hotline, submitting a NERC Complaint reporting form, or by other means. NERC and the Regional Entity shall post a link to the Complaint reporting form on their respective websites. The Complaint should include sufficient information to enable NERC or the Regional Entity to make an assessment regarding whether the initiation of another compliance monitoring or enforcement process is warranted. NERC or the Regional Entity may not act on a Complaint if the Complaint is incomplete and does not include sufficient information.

- If the Compliance Enforcement Authority determines that initiation of another compliance monitoring or enforcement process is warranted, it initiates the compliance monitoring or enforcement process in accordance with the applicable provisions of Section 3.0 or Section 5.0; otherwise it takes no further action. The Compliance Enforcement Authority notifies the complainant, the Registered Entity, and NERC of the initiation of the compliance monitoring or enforcement process. If the Compliance Enforcement Authority determines that initiation of another compliance monitoring or enforcement process is not warranted, it will notify the complainant, NERC, and the Registered Entity that no further action will be taken.

- The Compliance Enforcement Authority fully documents the Complaint and the Complaint review, and whether another compliance monitoring or enforcement process is warranted.

3.7.2 Anonymous Complainant Notification Procedure

A complainant who believes, or has information indicating, there has been a violation of a Reliability Standard, and wishes to remain anonymous, can report the information and request

that the complainant's identity not be disclosed.[2] All Complaints lodged by a person or entity requesting that the complainant's identity not be disclosed shall be investigated by NERC following the procedural steps described in Section 3.7.1. Anonymous Complaints received by a Regional Entity will either be directed to NERC or the Regional Entity will collect and forward the information to NERC, at the Regional Entity's discretion. Neither NERC nor the Regional Entity shall disclose the identity of any person or entity reporting information indicating violations of Reliability Standards to NERC or to a Regional Entity that requests that his/her/its identity not be revealed. The identity of the complainant will only be known by NERC and in the case where a Regional Entity collects the information, by NERC and the Regional Entity. If the Compliance Enforcement Authority determines that initiation of another compliance monitoring and enforcement process is not warranted, it will notify the complainant, NERC, and the Registered Entity that no further action will be taken.

3.8 Preliminary Screen

If the Compliance Enforcement Authority obtains information, through one of the compliance monitoring processes described in this Section 3.0 or by any other means, that indicates a potential noncompliance with a Reliability Standard Requirement, the Compliance Enforcement Authority shall conduct a Preliminary Screen of the potential noncompliance. The Preliminary Screen shall be conducted within five (5) business days after the Compliance Enforcement Authority identifies the potential noncompliance, except that (i) if the Compliance Enforcement Authority identifies the potential noncompliance during a Compliance Audit, the Preliminary Screen shall be conducted immediately following the exit briefing of the Registered Entity, and (ii) if the Compliance Enforcement Authority identifies the potential noncompliance during a Compliance Investigation, the Preliminary Screen shall be conducted immediately after the Registered Entity is first notified of the potential noncompliance identified by the Compliance Investigation.

A Preliminary Screen shall be limited to determining whether:

(1) the entity allegedly involved in the potential noncompliance is a Registered Entity;

(2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to the entity, has been approved by the Applicable Governmental Authority, and is in effect at the time of the potential noncompliance; and

(3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation that is currently being processed.

If the Preliminary Screen results in an affirmative determination with respect to the above criteria, a Possible Violation exists and the Compliance Enforcement Authority shall proceed in

[2]NERC has established a Compliance Hotline that may be used for the submission of Complaints by persons or entities that do not want his/her/its identity disclosed (see www.nerc.com for additional information).

accordance with Section 5.0, unless ~~an alternative enforcement~~the Compliance Exception ~~p~~Process is used in accordance with Section 3A.0.

The Compliance Enforcement authority shall maintain records of all Preliminary Screens.

3A.0 ENFORCEMENT DISCRETION

Not all instances of noncompliance with Reliability Standards require the same type of processing and documentation. Noncompliance that does not pose a serious or substantial risk to the reliability of the Bulk Power System may be resolved through streamlined processes, when appropriate, consistent with processes approved by NERC and Applicable Governmental Authorities.

Absolute adherence to the enforcement process set out in section 5.0 may not be the most appropriate, efficient, or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the Compliance Enforcement Authority, and the Registered Entity.

The Find, Fix, Track, and Report and the Compliance Exception processes are alternatives to the process outlined in section 5.0. ~~The Find, Fix, Track, and Report process may be used to address noncompliance posing a minimal or moderate risk to the reliability of the Bulk Power System.~~

3A.1 Compliance Exception Process

The Compliance Exception~~s~~ process may be used to address noncompliance posing a minimal risk to the reliability of the Bulk Power System, unless an Applicable Governmental Authority authorizes expansion of the program. Compliance Exceptions are not included in a Registered Entity's compliance history for penalty purposes. However, a Compliance Enforcement Authority must (a) consider a history of C~~c~~ompliance E~~e~~xceptions where the failure to fully remediate the underlying compliance matter contributes to a subsequent serious or substantial noncompliance and (b) assess subsequent noncompliance to determine whether a Registered Entity should continue to qualify for Compliance Exception treatment.

The Compliance Exception process requires that:

(1) The Registered Entity mitigates the noncompliance; and

(2) The facts and circumstances of the noncompliance, including those associated with the determination of the level of risk and the related mitigation, are available for review by NERC and Applicable Governmental Authorities; and

(3) The noncompliance is tracked and analyzed as necessary and appropriate to identify emerging risks and other pertinent trends; and

(4) The Registered Entity is provided the opportunity to object to the use of the ~~alternative approach~~Compliance Exception Process to resolution of the noncompliance.

Changes to the processes and principles articulated in this section must be approved by Applicable Governmental Authorities.

~~**3A.2 Find, Fix, Track and Report Process**~~

~~The Find, Fix, Track and Report process may be used to address noncompliance posing a minimal or moderate risk to the reliability of the Bulk Power System.~~

~~The Find, Fix, Track, and Report process and the Compliance Exception process requires that:~~

- ~~The Registered Entity mitigates the noncompliance; and~~
- ~~The facts and circumstances of the noncompliance, including those associated with the determination of the level of risk and the related mitigation, are available for review by NERC and Applicable Governmental Authorities; and~~
- ~~The noncompliance is tracked and analyzed as necessary and appropriate to identify emerging risks and other pertinent trends; and~~
- ~~The Registered Entity is provided the opportunity to object to the use of the alternative approach to resolution of the noncompliance.~~

~~Changes to the processes and principles articulated in this section must be approved by Applicable Governmental Authorities.~~

4.0 ANNUAL IMPLEMENTATION PLANS

4.1 NERC Compliance Monitoring and Enforcement Program Implementation Plan

NERC will maintain and update the NERC Implementation Plan, to be carried out by Compliance Enforcement Authorities in the performance of their responsibilities and duties in implementing the NERC Compliance Monitoring and Enforcement Program. The NERC Implementation Plan will be provided to the Regional Entities on or about September 1 of each year and will ~~specify~~ identify risk elements related to the Reliability Standards ~~requiring reporting by Registered Entities~~to be considered for compliance oversight ~~to~~ by the Compliance Enforcement Authority ~~to provide verification of compliance through one of the monitoring methods described in this Compliance Program~~. The NERC Implementation Plan will be posted on the NERC website. NERC may update and revise the NERC Implementation Plan during the course of the year as necessary. Regional Entities have discretion to make modifications to the NERC Implementation Plan with respect to individual Registered Entities.

4.2 Regional Implementation Plan

By on or about October 1 of each year, each Regional Entity will submit a Regional Implementation Plan for the following calendar year to NERC for review and approval. The Regional Implementation Plan and the Regional Entity's other relevant Compliance Program documents shall be posted on the Regional Entity's website. The Regional Entity may update

and revise the Regional Entity Implementation Plan during the course of the year as necessary, with NERC approval, or as required by NERC. Regional Entities have discretion to make modifications to the Regional Entity Implementation Plan with respect to individual Registered Entities.

5.0 ENFORCEMENT ACTIONS

The Compliance Enforcement Authority shall determine (i) whether there have been violations of Reliability Standards by Registered Entities within the Compliance Enforcement Authority's Area of Responsibility, and (ii) if so, the appropriate Mitigating Activities, and Penalties and sanctions, as prescribed in the NERC *Sanction Guidelines* (Appendix 4B to the NERC Rules of Procedure). NERC will work to achieve consistency in the application of the *Sanction Guidelines* by Regional Entities by direct oversight and review of Penalties and sanctions, and each Regional Entity shall provide to NERC such information as is requested by NERC concerning any Penalty, sanction, or Mitigating Activities imposed by the Regional Entity.

The imposition and acceptance of Penalties and sanctions shall not be considered an acceptable alternative to any Registered Entity's continuing obligation to comply with the Reliability Standards.

The Compliance Enforcement Authority has authority to collect Documents, data and information in the manner it deems most appropriate, including requesting copies be made of Documents, data and information and removing those copies from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the Documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for Documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC general counsel. If Documents, data or information requested from a Registered Entity in connection with an enforcement process are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

The following enforcement process is undertaken by the Compliance Enforcement Authority following identification of a Possible Violation of a Reliability Standard Requirement by a Registered Entity. However, under the circumstances presented by some Possible Violations, Alleged Violations or Confirmed Violations, absolute adherence to the following enforcement process, to the exclusion of other approaches, may not be the most appropriate, efficient or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the Compliance Enforcement Authority and the Registered Entity. In such circumstances, other approaches may be considered and employed. The Registered Entity shall be entitled to object to the use of any such other approach.

5.1 Notice of Possible Violation

If a Preliminary Screen conducted in accordance with Section 3.8 results in an affirmative determination with respect to the Preliminary Screen criteria, a Possible Violation exists. Unless the Compliance Exception process in Section 3A.0 is used to address the Possible Violation, ~~T~~the Compliance Enforcement Authority shall issue a Notice of Possible Violation to the Registered Entity. The Notice of Possible Violation shall:

(i) state that a Possible Violation by the Registered Entity has been identified;

(ii) provide a brief description of the Possible Violation, including the Reliability Standard requirement(s) and, if known, the date(s) involved; and

(iii) instruct the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

Upon issuing a Notice of Possible Violation, the Compliance Enforcement Authority reports the Possible Violation to NERC. NERC reports the Possible Violation to the Board of Trustees Compliance Committee and submits a Notice of Possible Violation, on a confidential basis, to FERC and to other Applicable Governmental Authorities, as applicable. Any such notice to FERC or to other Applicable Governmental Authorities shall be provided in accordance with Section 8.0, Reporting and Disclosure.

5.2 Assessment of Possible Violation

After issuing a Notice of Possible Violation, the Compliance Enforcement Authority shall conduct an assessment of the facts and circumstances surrounding the Possible Violation to determine whether evidence exists to indicate the Registered Entity has violated the Reliability Standard Requirement(s) identified in the Notice of Possible Violation, or whether the Possible Violation should be dismissed. The Compliance Enforcement Authority may consider any additional information to demonstrate that the Possible Violation should be dismissed or modified or resolved through the Find, Fix, Track and Report (FFT) process in section 5.2A.

5.2A FFT Process

The Find, Fix, Track and Report process may be used to address noncompliance posing a minimal or moderate risk to the reliability of the Bulk Power System.

The FFT process requires that:

(1) The Registered Entity mitigates the noncompliance; and

(2) The facts and circumstances of the noncompliance, including those associated with the determination of the level of risk and the related mitigation, are available for review by NERC and Applicable Governmental Authorities; and

(3) FFTs are tracked and analyzed as necessary by NERC as appropriate to identify emerging risks and other pertinent trends; and

(4) The Registered Entity is provided the opportunity to object to the use of the FFT process to resolution of the noncompliance.

5.3 Notification to Registered Entity of Alleged Violation

If the Compliance Enforcement Authority determines, based on an assessment of the facts and circumstances surrounding a Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard, the Compliance Enforcement Authority shall notify the Registered Entity of the determination of the Alleged Violation, through issuance of a Notice of Alleged Violation and Proposed Penalty or Sanction or similar notification, and shall report the Alleged Violation to NERC The notification of Alleged Violation shall be transmitted by the Compliance Enforcement Authority to the Registered Entity by electronic mail and shall be effective as of the date of the electronic mail message from the Compliance Enforcement Authority transmitting the notification. The notification of Alleged Violation shall include, at a minimum:

(i) the Reliability Standard and Requirement(s) thereof the Registered Entity has allegedly violated,

(ii) the date and time the Alleged Violation occurred (or is occurring),

(iii) the facts the Compliance Enforcement Authority believes demonstrate or constitute the Alleged Violation,

(iv) the proposed Penalty or sanction, if any, determined by the Compliance Enforcement Authority to be applicable to the Alleged Violation in accordance with the NERC *Sanction Guidelines*, including an explanation of the basis on which the particular Penalty or sanction was determined to be applicable,

(v) notice that the Registered Entity shall, within thirty (30) days, elect one of the following options or the Compliance Enforcement Authority will deem the Registered Entity to have accepted the determination of violation and proposed Penalty or sanction:

1. agree with the Alleged Violation and proposed Penalty or sanction, and agree to submit and implement a Mitigation Plan or other Mitigating Activities to correct the violation and its underlying causes, and may provide a response in accordance with Section 5.4, or

2. agree with the Alleged Violation and agree to submit and implement a Mitigation Plan or other Mitigating Activities to eliminate the violation and its underlying causes, but contest the proposed Penalty or sanction, and may provide a response in accordance with Section 5.4, or

3. contest both the Alleged Violation and proposed Penalty or sanction,

(vi) notice that the Registered Entity may elect to submit a Mitigation Plan while contesting the Alleged Violation and/or the proposed Penalty or sanction, and that submission of a Mitigation Plan will not waive the Registered Entity's right to contest the Alleged Violation and/or the proposed Penalty or sanction;

(vii) notice that if the Registered Entity elects to contest the Alleged Violation and/or the proposed Penalty or sanction, the Registered Entity may elect to have a hearing conducted pursuant to either (i) the short-form procedure in Section 1.3.4, or (ii) the general hearing procedure, in **Attachment 2, Hearing Procedures**, and

(viii) required procedures to submit the Registered Entity's Mitigation Plan.

NERC shall notify FERC of the Alleged Violation and, if the Alleged Violation pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, shall notify such other Applicable Governmental Authority of the Alleged Violation, within two (2) business days of receipt from the Compliance Enforcement Authority. Any such notice to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.

5.4 Registered Entity Response

If the Registered Entity agrees with, does not contest, or does not respond to the notification of Alleged Violation within thirty (30) days following the date of the notification of Alleged Violation by electronic mail, it shall be deemed to have accepted the Compliance Enforcement Authority's determination of violation and Penalty or sanction, and the Compliance Enforcement Authority shall issue a Notice of Confirmed Violation or similar notification to the Registered Entity and shall report the Confirmed Violation to NERC. At the time of notifying the Registered Entity of the Confirmed Violation, the Compliance Enforcement Authority shall also provide notice to the Registered Entity that it may provide a written explanatory statement to accompany the filing with FERC and public posting of the Confirmed Violation. The Registered Entity's statement must include the name, title, and signature of an officer, employee, attorney or other authorized representative of the Registered Entity.

If the Registered Entity contests the Alleged Violation or the proposed Penalty or sanction, the Registered Entity shall submit to the Compliance Enforcement Authority, within thirty (30) days following the date of the notification of the Alleged Violation, a response explaining its position, signed by an officer, employee, attorney or other authorized representative together with any supporting information and documents. The Compliance Enforcement Authority shall schedule a conference with the Registered Entity within ten (10) business days after receipt of the response. If the Compliance Enforcement Authority and the Registered Entity are unable to resolve all issues within forty (40) days after the Registered Entity's response, the Registered Entity may request a hearing. The Compliance Enforcement Authority and the Registered Entity may agree in writing to extend the forty (40) day period. If no hearing request is made prior to the end of the forty (40) day period, the violation will be become a Confirmed Violation.

If a hearing is requested the Compliance Enforcement Authority shall initiate the hearing process in accordance with **Attachment 2, Hearing** Procedures.

5.5 Hearing Process for Compliance Hearings

The Compliance Enforcement Authority hearing process is set forth in **Attachment 2**.

5.6 Settlement Process

The Registered Entity can request settlement negotiations at any time, including prior to the issuance of notification of an Alleged Violation; however, the Compliance Enforcement Authority may decline to engage in or to continue settlement negotiations after a Possible Violation or Alleged Violation becomes a Confirmed Violation in accordance with Section 5.4. The Registered Entity or the Compliance Enforcement Authority may terminate settlement negotiations at any time. Where the Compliance Enforcement Authority has agreed top engage in settlement negotiations, the running of the time period specified in Section 5.4 for the Registered Entity to respond to the notification of Alleged Violation is suspended until settlement negotiations are concluded or terminate. NERC shall be notified of all settlement negotiations and may participate in any settlement negotiations. All settlement negotiations will be confidential until such time as the settlement is approved by NERC. For all settlement discussions, the Compliance Enforcement Authority shall require the Registered Entity to designate an individual(s) authorized to negotiate on its behalf.

The Compliance Enforcement Authority may consider all relevant facts in settlement negotiations. A settlement agreement must ensure that the reliability of the Bulk Power System will not be compromised by the settlement and that a violation of a Reliability Standard will not occur as a result of the settlement. All settlement agreements must provide, if the settlement is approved, for waiver of the Registered Entity's right to further hearings and appeal.

The Compliance Enforcement Authority and the Registered Entity will execute a settlement agreement setting forth the final settlement terms including all Penalties, sanctions and mitigation requirements provided for in the final settlement.

The Compliance Enforcement Authority shall report the terms of all settlements of compliance matters to NERC. NERC will review the settlement for the purpose of evaluating its consistency with other settlements entered into for similar violations or under other, similar circumstances. The Registered Entity may submit an explanatory statement, conforming to the requirements of Section 5.4, to be included in the settlement agreement and which shall be subject to consent of the Compliance Enforcement Authority as part of the settlement agreement. The settlement agreement may state that the Registered Entity (i) admits the Alleged Violation, or (ii) does not contest the Alleged Violation, or (iii) neither admits nor denies the Alleged Violation, but may not state that the Registered Entity denies the Alleged Violation. Based on this review, NERC will either approve the settlement or reject the settlement and notify the Compliance Enforcement Authority of any changes to the settlement that would result in approval, and within five (5) business days the Compliance Enforcement Authority will in turn notify the Registered Entity. If NERC rejects the settlement, the Compliance Enforcement Authority will attempt to negotiate a revised settlement agreement with the Registered Entity including any changes to the settlement specified by NERC.

NERC will report the approved settlement of the violation to FERC and, if the settlement relates to a Registered Entity or to a portion of the Bulk Power System over which another Applicable

Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such report shall be provided in accordance with Section 8.0, Reporting and Disclosure. NERC will also publicly post the violation settled (regardless of whether the settlement includes or does not include an admission of a violation) and the resulting Penalty or sanction provided for in the settlement. This posting shall include a copy of the settlement or a description of the terms of the settlement, and a copy of any Mitigation Plan that is agreed to as part of the settlement, with any Critical Energy Infrastructure Information and Confidential Information redacted. The Compliance Enforcement Authority will issue a letter setting forth the final settlement terms including all Penalties, sanctions and mitigation requirements provided for in the final settlement. Postings of Notices of Confirmed Violations are addressed in Section 8.0.

5.7 NERC Appeal Process

A Registered Entity or the Compliance Enforcement Authority may appeal the decision of a Regional Entity Hearing Body to NERC, as provided for in NERC Rules of Procedure, Section 409.

On appeal, NERC shall either affirm the decision or remand to the Compliance Enforcement Authority with reasons for its remand, which may include a direction to the Compliance Enforcement Authority to revise the decision. If NERC affirms the decision, the Compliance Enforcement Authority shall issue a Notice of Confirmed Violation to the Registered Entity. If NERC directs the Compliance Enforcement Authority to revise the decision, a Registered Entity that was the subject of the decision or the Compliance Enforcement Authority may reopen the proceeding on any issue whose resolution is affected by NERC's directive, irrespective of whether the issue was previously litigated, settled or unopposed.

5.8 Notification of Confirmed Violation

A Notice or other notification of Confirmed Violation issued to a Registered Entity pursuant to Sections 5.4 or 5.7 shall include a detailed record of the enforcement action, including the facts and circumstances analyzed and the information on which the Compliance Enforcement Authority relied in proposing a Penalty or sanction.

After NERC receives a notification of Confirmed Violation from the Compliance Enforcement Authority, NERC shall review the notification of Confirmed Violation and utilize the information therein to prepare a Notice of Penalty. NERC shall advise the Compliance Enforcement Authority of any additional detail or further development of the factual findings that NERC deems necessary before the Notice of Penalty can be issued.

NERC may direct the Compliance Enforcement Authority to revise a Penalty determination, in which case the Registered Entity subject to the Penalty, or the Compliance Enforcement Authority, as applicable, may reopen the proceedings on any issue on which the Penalty was based, irrespective of whether the issue was previously litigated, settled or unopposed.

5.9 Notice of Penalty

If (i) the Registered Entity accepts the Notice of Alleged Violation and Proposed Penalty or Sanction or other notification of enforcement action from the Compliance Enforcement

Authority, or (ii) a decision has been entered affirming an Alleged Violation and all appeals have been concluded, or (iii) a settlement agreement has been reached addressing the Possible Violation or Alleged Violation, NERC shall submit a Notice of Penalty to the Applicable Governmental Authority and provide a copy to the Compliance Enforcement Authority. The Compliance Enforcement Authority shall inform the Registered Entity that a Notice of Penalty is pending public filing, at least five (5) business days prior to the public filing and posting. NERC will file the Notice of Penalty with FERC and any other Applicable Governmental Authority no sooner than five (5) business days after NERC approves the Notice of Confirmed Violation or settlement agreement.

NERC shall file the Notice of Penalty with FERC and, if the Possible Violation or Alleged Violation pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such filing with FERC or with another Applicable Governmental Authority shall be made in accordance with Section 8.0, Reporting and Disclosure. NERC will include with the Notice of Penalty any statement provided by the Registered Entity as set forth in Sections 5.4 or 5.6.

The Penalty or sanction will be effective upon expiration of the thirty (30) day period following filing with FERC of the Notice of Penalty (or such longer period as ordered by FERC) or, if FERC decides to review the Penalty or sanction, upon final determination by FERC.

5.10 Completion of Enforcement Action

Following FERC approval of, or expiration of the period for action by FERC on, a Notice of Penalty filed by NERC, the Compliance Enforcement Authority shall issue a payment due notice and invoice to the Registered Entity. The payment due notice and invoice shall state the payment due date which shall be thirty (30) days from the date of the payment due notice and invoice. Upon payment of all monetary Penalties by the Registered Entity, the Compliance Enforcement Authority shall issue a notice confirming payment to the Registered Entity, and provide a copy of the notice confirming payment to NERC. Following the completion by the Registered Entity of all requirements set forth in the Notice of Penalty and any settlement agreement, the Compliance Enforcement Authority shall issue the Registered Entity a Notice of Completion of Enforcement Action.

If the Compliance Enforcement Authority dismisses or disposes of a Possible Violation or Alleged Violation that does not become a Confirmed Violation, the Compliance Enforcement Authority shall issue a Notice of Completion of Enforcement Action to the Registered Entity.

A copy of the Notice of Completion of Enforcement Action shall also be provided to NERC by the Compliance Enforcement Authority.

The Notice of Completion of Enforcement Action shall include a release of any data retention directives that were previously issued to the Registered Entity in connection with the matter. Upon issuance of a Notice of Completion of Enforcement Action, tracking of the violation is completed, and the enforcement action shall be closed.

5.11 Special Procedures for an Enforcement Action Against an ISO/RTO Where the Monetary Penalty May be Allocated by the ISO/RTO to Other Entities

A Registered Entity that is an ISO/RTO may have authority to allocate, pursuant to a proceeding under section 205 of the Federal Power Act, some or all of a monetary Penalty imposed on the ISO/RTO for violation of a Reliability Standard, to another entity(ies) that the Compliance Enforcement Authority, NERC or FERC determines was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation of the Reliability Standard. This section sets forth the procedures to be followed when an ISO/RTO that has received a Notice of Possible Violation requests a determination by the Compliance Enforcement Authority that another entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation.

The procedures in this section apply only where an ISO/RTO requests a determination that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in a Notice of Possible Violation issued to the ISO/RTO, and shall not apply where the ISO/RTO anticipates or is entitled to allocate or assign a monetary Penalty among all, or an identified segment of, its members, customers or users, pursuant to general cost recovery provisions in the ISO/RTO's tariffs, agreements or governance documents and regardless of actual fault or responsibility of the entities to whom the monetary Penalty is issued for the violation.

5.11.1 ISO/RTO's Request for Determination and Notice to Other Entity(ies)

In order to request the Compliance Enforcement Authority to make a determination in an enforcement action that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation (if confirmed) of a Reliability Standard for which the ISO/RTO has received a Notice of Possible Violation, the ISO/RTO shall, no later than ten (10) business days after receiving the Notice of Possible Violation or such additional period as the Compliance Enforcement Authority may permit for good cause shown (i) submit a written request to the Compliance Enforcement Authority and (ii) issue a notice to the specified other entity(ies), each conforming to the requirements of the following two paragraphs of this section.

The ISO/RTO's written request to the Compliance Enforcement Authority shall contain:

(1) the Compliance Enforcement Authority's identification number for the Notice of Possible Violation;

(2) a statement that the ISO/RTO is requesting that the Compliance Enforcement Authority make a determination that a specified other entity(ies) was responsible, in whole or in part, for actions and omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation;

(3) the name(s) of, and contact information for, the specified other entity(ies), including name(s) and address(es) of the entity(ies) and name(s), telephone number(s) and e-mail address(es) of the contact person(s) for the other entity(ies);

(4) a statement that the ISO/RTO has authority to allocate some or all of the monetary Penalty to the specified other entity(ies), including citations to any supporting tariffs, agreements, orders, or governance documents, and a brief explanation to show that the specified other entity(ies) are subject to the tariffs, agreements, orders and/or other governance documents; and

(5) a brief statement of the factual basis on which the ISO/RTO contends in good faith that the specified other entity(ies) was responsible for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. As the enforcement action proceeds, the ISO/RTO may supplement, expand or modify this explanation as additional information becomes available during the course of the enforcement action.

The ISO/RTO's notice to the specified other entity(ies) shall contain the following information:

(1) The name of the specified other entity, and the name, telephone number and e-mail address of the specified other entity's contact person (person to whom the notice is being sent);

(2) A statement that the ISO/RTO has received a Notice of Possible Violation from the Compliance Enforcement Authority, the Compliance Enforcement Authority's identification number for the Notice of Possible Violation, and contact information for the Compliance Enforcement Authority;

(3) A statement that the ISO/RTO has requested the Compliance Enforcement Authority to determine that the specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, and that the ISO/RTO intends to seek to allocate to the specified other entity all or a portion of any monetary Penalty that is imposed on the ISO/RTO for the violation (if confirmed), if the Compliance Enforcement Authority determines the specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation.

(4) A statement that the specified other entity should promptly contact the Compliance Enforcement Authority for further information and to request to participate in the enforcement action relating to the Notice of Possible Violation.

The ISO/RTO shall cause its notice to the specified other entity(ies) to be delivered to the other entity(ies) by next-business-day delivery using a delivery service that provides verification of delivery. The ISO/RTO shall provide the Compliance Enforcement Authority with (i) a copy of the notice sent to each specified other entity, and (ii) a copy of the delivery service's verification of delivery of the notice to each specified other entity.

5.11.2 Responses of the Compliance Enforcement Authority and the Specified Other Entity(ies) to ISO/RTO's Request for Determination and Notice

If (i) the ISO/RTO's written request meets the requirements of Section 5.11.1, the Compliance Enforcement Authority shall provide the specified other entity(ies) with a copy of a non-disclosure agreement (which shall include the specified other entity's agreement to comply with the confidentiality requirements of the Compliance Program and of Section 1500 of the NERC Rules of Procedure) that must be executed to obtain a copy of the Notice of Possible Violation and a copy of the ISO/RTO's written request to the Compliance Enforcement Authority for a determination that the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. In addition, the Compliance Enforcement Authority shall advise the specified other entity(ies) that: (i) the specified other entity(ies) may elect not to participate in the enforcement action, and may submit a written statement to the Compliance Enforcement Authority stating why the specified other entity is not participating and providing any facts or information the other entity wishes to provide concerning the occurrence(s) that are the subject of the Notice of Possible Violation, and (ii) whether or not the specified other entity elects to participate in the enforcement action, the Compliance Enforcement Authority may determine that the specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation.

If the ISO/RTO's written request meets the requirements of Section 5.11.1, then the specified other entity(ies) shall be permitted to participate in the enforcement action concerning the Notice of Possible Violation if the other entity(ies) submits a written request to participate to the Compliance Enforcement Authority and executes a non-disclosure agreement in the form provided by the Compliance Enforcement Authority. The specified other entity must submit its written request to participate prior to, as applicable (i) the date of execution of a settlement agreement between the Compliance Enforcement Authority and the ISO/RTO, or (ii) the date that the Compliance Enforcement Authority issues a Notice of Confirmed Violation to the ISO/RTO. The Compliance Enforcement Authority is not required to suspend or delay the enforcement process pending receipt of a request to participate from the specified other entity(ies), nor to revisit or redo any aspect of the enforcement process that has already occurred prior to receipt of the specified other entity(ies)'s written request to participate; however, upon receipt of a written request to participate and executed nondisclosure agreement from the specified other entity(ies), the Compliance Enforcement Authority shall suspend activity in the enforcement action until it has acted on the request to participate.

Upon receiving the specified other entity's written request to participate in the enforcement action and the other entity's executed nondisclosure agreement, the Compliance Enforcement Authority shall issue a notice to the ISO/RTO and to the specified other entity stating that the specified other entity is allowed to participate in the enforcement action. The Compliance Enforcement Authority's notice that the specified other entity is allowed to participate in the enforcement action shall include a copy of the Notice of Possible Violation originally issued to the ISO/RTO and, if a Notice of Alleged Violation and Proposed Penalty or Sanction or similar notification has been issued to the ISO/RTO, a copy of the latter Notice or notification. Upon receiving notice from the Compliance Enforcement Authority that it is allowed to participate in the enforcement action, the specified other entity may participate in the same manner as the ISO/RTO and shall be subject to all applicable requirements and deadlines specified in the NERC Compliance Program.

If the ISO/RO fails to meet the requirements of Section 5.11.1, the Compliance Enforcement Authority shall issue a notice to the ISO/RTO and to the specified other entity(ies) stating that the Compliance Enforcement Authority will not make the determination requested by the ISO/RTO and therefore the specified other entity will not be allowed to participate in the enforcement action relating to the Notice of Possible Violation.

5.11.3 Compliance Enforcement Authority's Notices to NERC

(a) Within five (5) business days after receiving an ISO/RTO's written request for a determination that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation identified in the Notice of Possible Violation issued to the ISO/RTO, the Compliance Enforcement Authority shall provide to NERC (i) a copy of the ISO/RTO's written request for a determination that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, and (ii) the ISO/RTO's notice to the specified other entity(ies).

(b) On the same day that the Compliance Enforcement Authority issues a notice pursuant to Section 5.11.2 stating, as applicable, that (i) it will or will not make the determination requested by the ISO/RTO or (ii) the specified other entity(ies) are or are not allowed to participate in the enforcement action, the Compliance Enforcement Authority shall provide a copy of the notice to NERC and shall send a copy of the notice to any other entities that have been allowed to participate in the enforcement action.

5.11.4 Compliance Enforcement Authority's Determination

After issuing a notice pursuant to Section 5.11.3 that it will make a determination as to whether the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation that is the subject of the Notice of Possible Violation issued to the ISO/RTO, then, if the enforcement action is not resolved by a settlement agreement stating whether or not the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, the Compliance Enforcement Authority shall make, and include in its proposed Notice of Penalty, its determination of whether or not the specified other entity(ies) were responsible, in whole or in part, for actions or omissions that caused or contributed to the violation. The Compliance Enforcement Authority's determination shall only address whether or not the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, and shall not address whether all or a part of any monetary Penalty imposed on the ISO/RTO for the violation should be allocated or assigned to the specified other entity(ies).

The specified other entity(ies) shall be entitled to request a hearing on the Compliance Enforcement Authority's determination pursuant to Section 1.3.1 of Attachment 2 of this Appendix 4C, and to appeal the Hearing Body's decision pursuant to Section 1.7.10 of Attachment 2 to this Appendix 4C, as though the specified other entity(ies) were a Registered Entity(ies).

5.11.5 Procedure Where ISO/RTO Members Are Allowed to Directly Assign Monetary Penalties for Violations of Reliability Standards to the ISO/RTO

If an ISO/RTO's tariffs, agreement or other relevant governance documents establish procedures that allow members of the ISO/RTO to directly assign to the ISO/RTO monetary Penalties imposed on the ISO/RTO member(s) for violations of Reliability Standards, then the ISO/RTO members may follow the same requirements of Sections 5.11.1 and 511.2 as are applicable to an ISO/RTO under those sections, and the ISO/RTO shall be afforded the same rights to participate in the enforcement action as a specified other entity under Sections 5.11.1, 5.11.2, and 5.11.4, subject to the same requirements and conditions specified in those sections. In such circumstances, the ISO/RTO shall be deemed to be a "specified other entity" for purposes of this Section.

5.11.6 Obligation to Pay Monetary Penalty

(a) The ISO/RTO shall be obligated and responsible to pay any monetary Penalty imposed by the Compliance Enforcement Authority on the ISO/RTO for violation of a Reliability Standard, in accordance with Section 5.10, (i) regardless of whether the Compliance Enforcement Authority has made a determination that a specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, (ii) without regard to the timing of any separate proceeding(s) in which the ISO/RTO seeks to allocate some or all of the monetary Penalty to a specified other entity(ies), and (iii) without regard to whether or when the ISO/RTO receives payment from the specified other entity(ies).

(b) In an enforcement action subject to Section 5.11.5, the ISO/RTO member(s) shall be obligated and responsible to pay any monetary Penalty imposed by the Compliance Enforcement Authority on the ISO/RTO member(s) for violation of a Reliability Standard, regardless of whether or when the ISO/RTO members receive payment or reimbursement from the ISO/RTO.

6.0 MITIGATION OF VIOLATIONS OF RELIABILITY STANDARDS

The Compliance Enforcement Authority has authority to collect Documents, data and information in the manner it deems most appropriate, including requesting copies be made of Documents, data and information and removing those copies from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the Documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for Documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC general counsel. If

Documents, data, information or other reports requested from a Registered Entity in connection with development of a Mitigation Plan or other Mitigating Activities are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

6.1 Requirement for Submission of Mitigation Plans

A Registered Entity found to be in violation of a Reliability Standard shall file with the Compliance Enforcement Authority (i) a proposed Mitigation Plan to correct the violation, or (ii) a description of how the violation has been mitigated, and any requests for extensions of Mitigation Plans or a report of completed mitigation. A Registered Entity may also submit a proposed Mitigation Plan at any other time, including with a Self-Report, or, without admitting it has committed a violation, in response to a Notice of Possible Violation or notification of Alleged Violation.

6.2 Contents of Mitigation Plans

A Mitigation Plan shall include the following information:

- The Registered Entity's point of contact for the Mitigation Plan, who shall be a person (i) responsible for filing the Mitigation Plan, (ii) technically knowledgeable regarding the Mitigation Plan, and (iii) authorized and competent to respond to questions regarding the status of the Mitigation Plan. This person may be the Registered Entity's point of contact described in Section 2.0.

- The Possible, Alleged or Confirmed Violation(s) of Reliability Standard(s) the Mitigation Plan will correct.

- The cause of the Possible, Alleged or Confirmed Violation(s).

- The Registered Entity's action plan to correct the Possible, Alleged or Confirmed Violation(s).

- The Registered Entity's action plan to correct the cause of the Possible, Alleged or Confirmed Violation.

- The Registered Entity's action plan to prevent recurrence of the Possible, Alleged or Confirmed Violation(s).

- The anticipated impact of the Mitigation Plan on the Bulk Power System reliability and an action plan to mitigate any increased risk to the reliability of the Bulk Power System while the Mitigation Plan is being implemented.

- A timetable for completion of the Mitigation Plan including the completion date by which the Mitigation Plan will be fully implemented and the Possible, Alleged or Confirmed Violation(s) corrected.

- Implementation milestones no more than three (3) months apart for Mitigation Plans with

expected completion dates more than three (3) months from the date of submission. Additional violations could be determined for not completing work associated with accepted milestones.

- Any other information deemed necessary or appropriate.

The Mitigation Plan shall be signed by an officer, employee, attorney or other authorized representative of the Registered Entity.

6.3 Timetable for Completion of Mitigation Plans

The Mitigation Plan shall be completed in accordance with its terms. At the Compliance Enforcement Authority's discretion, the completion deadline may be extended for good cause including, but not limited to: (i) operational issues such as the inability to schedule an outage to complete Mitigating Activities, and (ii) construction requirements in the Mitigation Plan that require longer to complete than originally anticipated. If the Mitigation Plan extends beyond the next applicable reporting/assessment period, sanctions for any violation of the applicable Reliability Standard(s) occurring during the implementation period will be held in abeyance and will be waived if the Mitigation Plan is satisfactorily completed.

Any violations assessed during the period of time the accepted Mitigation Plan is being implemented will be recorded by the Compliance Enforcement Authority with associated sanctions or Penalties. Regional Entities will report any findings of violations recorded during this time period to NERC with the notation that the Registered Entity is working under an accepted Mitigation Plan with an extended completion date with Penalties and sanctions held in abeyance until completion of the Mitigation Plan. Upon completion of the accepted Mitigation Plan in accordance with Section 6.6, the Compliance Enforcement Authority will notify the Registered Entity that any findings of violations of the applicable Reliability Standard during the period that the accepted Mitigation Plan was being implemented have been waived and no Penalties or sanctions will apply. Regional Entities will also notify NERC of any such waivers of violations of Reliability Standards.

A request for an extension of any milestone or the completion date of the accepted Mitigation Plan by a Registered Entity must be received by the Compliance Enforcement Authority at least five (5) business days before the original milestone or completion date. The Compliance Enforcement Authority may accept a request for an extension or modification of a Mitigation Plan if the Compliance Enforcement Authority determines the request is justified, and shall notify NERC of the extension or modification within five (5) business days.

If a Mitigation Plan submitted by a Registered Entity is rejected by the Regional Entity acting as Compliance Enforcement Authority or the Hearing Body in accordance with Section 6.5, the Registered Entity shall be subject to any findings of violation of the applicable Reliability Standards during the period the Mitigation Plan was under consideration and to imposition of any Penalties or sanctions imposed for such violations.

6.4 Submission of Mitigation Plans

A Mitigation Plan may be submitted at any time but shall have been submitted by the Registered Entity within thirty (30) days after being served the notification of Alleged Violation, if the Registered Entity does not contest the Alleged Violation and Penalty or sanction, or shall be reflected in a settlement agreement or Notice of Penalty. If the Registered Entity disputes the Alleged Violation or the Penalty or sanction, the Registered Entity shall submit its Mitigation Plan within ten (10) business days following issuance of the written decision of the Hearing Body, unless the Registered Entity elects to appeal the Hearing Body's determination to NERC. The Registered Entity may choose to submit a Mitigation Plan while it contests an Alleged Violation or Penalty or sanction or in response to a Notice of Possible Violation; such submission shall not be deemed an admission of a violation or the appropriateness of a Penalty or sanction. If the Registered Entity has not yet submitted a Mitigation Plan, or the Registered Entity submits a Mitigation Plan but it is rejected by the Regional Entity acting as Compliance Enforcement Authority or the Hearing Body in accordance with Section 6.5, any subsequent violations of the Reliability Standard identified by the Compliance Enforcement Authority before the Hearing Body renders its decision will not be held in abeyance and will be considered as repeat violations of the Reliability Standard.

6.5 Review and Acceptance or Rejection of Proposed Mitigation Plans

Unless the time period is extended by the Compliance Enforcement Authority, it will complete its review of the Mitigation Plan, and will issue a written statement accepting or rejecting the Mitigation Plan, within thirty (30) days of receipt; otherwise the Mitigation Plan will be deemed accepted. In order to extend the initial or an extended period for review of the Mitigation Plan, the Compliance Enforcement Authority shall, within the initial or extended review period, notify the Registered Entity (and NERC if NERC is not the Compliance Enforcement Authority) that the review period is being extended and identify the date by which the Compliance Enforcement Authority will complete its review of the Mitigation Plan. The Compliance Enforcement Authority's extension notice shall also state that if the Compliance Enforcement Authority has not issued a notice by the end of the extended review period either stating that the Compliance Enforcement Authority accepts or rejects the proposed Mitigation Plan or further extending the Compliance Enforcement Authority's period for review of the Mitigation Plan, the Mitigation Plan will be deemed accepted.

If the Compliance Enforcement Authority rejects a Mitigation Plan, the Compliance Enforcement Authority will provide the Registered Entity with a written statement describing the reasons for the rejection, and will require the Registered Entity to submit a revised Mitigation Plan by the Required Date. The Compliance Enforcement Authority will notify the Registered Entity within ten (10) business days after receipt of a revised Mitigation Plan whether the Compliance Enforcement Authority will accept or reject the revised Mitigation Plan and provide a written statement describing the reasons for rejection and the Required Date for the second revised Mitigation Plan. If the second review results in rejection of the Mitigation Plan, the Registered Entity may request a hearing in accordance with the Hearing Procedures, by submitting to the Compliance Enforcement Authority a written request for hearing including an explanation of why the Mitigation Plan should be accepted. After the hearing is completed, the Compliance Enforcement Authority will issue a written statement accepting a Mitigation Plan it deems as appropriate.

Within five (5) business days after a Regional Entity accepts a Mitigation Plan, the Regional Entity (i) will notify NERC and the Registered Entity of the acceptance of the Mitigation Plan and (ii) will provide the accepted Mitigation Plan to NERC. NERC will review the accepted Mitigation Plan and, within thirty (30) days following its receipt of the Mitigation Plan from the Regional Entity, will notify the Regional Entity and the Registered Entity, on a contemporaneous basis, as to whether the Mitigation Plan is approved or disapproved by NERC. If NERC disapproves a Mitigation Plan that was accepted by the Regional Entity, NERC shall state its reasons for the rejection, and may state the changes to the Mitigation Plan that would result in approval by NERC. The Registered Entity shall not be subject to findings of violations of the specific Requirements of Reliability Standards that are the subject of the Mitigation Plan or to imposition of Penalties or sanctions for such violations with respect to the period of time the Mitigation Plan was under consideration by NERC and for a reasonable period following NERC's disapproval of the Mitigation Plan, so long as the Registered Entity promptly submits a modified Mitigation Plan that addresses the concerns identified by NERC.

If a Registered Entity submits a Mitigation Plan prior to issuance of a notification of Confirmed Violation or entry into a settlement, such as with a Self-Report or in response to a Notice of Possible Violation, the Regional Entity may provisionally accept the proposed Mitigation Plan. If the Regional Entity subsequently determines, upon completing its assessment of the Possible Violation, that the facts and circumstances are different than those on which the accepted Mitigation Plan was based, the Regional Entity may, by notice to the Registered Entity and to NERC, require the Registered Entity to submit a revised Mitigation Plan that fully addresses the facts and circumstances of the violation. The Regional Entity's notice shall state the additional or different facts and circumstances that need to be addressed in the revised Mitigation Plan. The Registered Entity shall submit a revised Mitigation Plan in response to the notice within thirty (30) days following the date of the notice, unless the Regional Entity specifies or allows a longer time period. The Registered Entity's revised Mitigation Plan shall be subject to review and acceptance or rejection by the Regional Entity and by NERC in accordance with this Section 6.5. If the Regional Entity issues a notification of Confirmed Violation or enters into a settlement with the Registered Entity and does not identify a need to request modifications to the provisionally-accepted Mitigation Plan based on additional or different facts and circumstances, the Regional Entity shall issue a notice to the Registered Entity, with a copy to NERC, stating that the "provisional" nature of the acceptance is terminated and the acceptance is final. The Regional Entity shall issue such notice within five (5) business days of issuance of the Notice of Confirmed Violation or entry into the settlement.

NERC will submit to FERC, as non-public information, an approved Mitigation Plan relating to violations of Reliability Standards within seven (7) business days after NERC approves the Mitigation Plan. NERC shall publicly post the approved Mitigation Plan as part of the public posting of the related Notice of Penalty in accordance with Section 8.0 or settlement in accordance with Section 5.6.

6.6 Completion/Confirmation of Implementation of Mitigation Plans

The Registered Entity shall provide updates at least quarterly to the Compliance Enforcement Authority on the progress of the Mitigation Plan. The Compliance Enforcement Authority will track the Mitigation Plan to completion and may conduct on-site visits and review status during Compliance Audit to monitor Mitigation Plan implementation.

Upon completion of the Mitigation Plan, the Registered Entity shall provide to the Compliance Enforcement Authority certification, signed by an officer, employee, attorney or other authorized representative of the Registered Entity, that all required actions described in the Mitigation Plan have been completed and shall include data or information sufficient for the Compliance Enforcement Authority to verify completion. The Compliance Enforcement Authority shall request such data or information and conduct follow-up assessments, on-site or other Spot Checks, or Compliance Audits as it deems necessary to verify that all required actions in the Mitigation Plan have been completed.

In the event all required actions in the Mitigation Plan are not completed within the applicable deadline including any extensions of the original deadline granted under Section 6.3, any violation(s) of a Reliability Standard subject to the Mitigation Plan that occurred during the originally scheduled time period for completion will be enforced immediately and a new Mitigation Plan must be submitted for acceptance by the Compliance Enforcement Authority. In addition, the Compliance Enforcement Authority may conduct a Compliance Audit of, or issue a Remedial Action Directive to, the Registered Entity.

Upon request by NERC, the Regional Entity will provide to NERC the quarterly status reports and such other information as NERC requests. The Regional Entity will notify NERC when each Mitigation Plan is verified to have been completed.

6.7 Recordkeeping

The Compliance Enforcement Authority will maintain a record containing the following information for each Mitigation Plan:

- Name of Registered Entity.
- The date of the violation.
- Monitoring method by which the violation was detected, i.e., Self-Certification, Self-Report, Compliance Audit, Compliance Investigation, Complaint, etc.
- Date(s) of Notice of Possible Violation and notification of Alleged Violation (if applicable).
- Expected and actual completion date of the Mitigation Plan and major milestones.
- Expected and actual completion date for each required action.
- Accepted changes to milestones, completion dates, or scope of Mitigation Plan.
- Registered Entity's completion notice and data submitted as evidence of completion.

7.0 REMEDIAL ACTION DIRECTIVES

The Compliance Enforcement Authority may issue a Remedial Action Directive when such action is immediately necessary to protect the reliability of the Bulk Power System from an

imminent or actual threat. A Remedial Action Directive may include, but is not limited to, any of the following: specifying operating or planning criteria, limits, or limitations; requiring specific system studies; defining operating practices or guidelines; requiring confirmation of data, practices, or procedures through inspection testing or other methods; requiring specific training for personnel; requiring development of specific operating plans; directing a Registered Entity to develop and comply with a plan to remediate a violation; imposing increased auditing or additional training requirements; and requiring a Registered Entity to cease an activity that may constitute a violation of a Reliability Standard.

A Remedial Action Directive may be issued to a Registered Entity at any time, including during any procedures relating to a Possible Violation or an Alleged Violation of a Reliability Standard. The Compliance Enforcement Authority will specify whether a Remedial Action Directive obviates the need for a Mitigation Plan.

Prior to issuing a Remedial Action Directive, the Compliance Enforcement Authority shall consult the Reliability Coordinator for the Registered Entity.

Any Remedial Action Directive must be provided in a notice to the Registered Entity and shall include: (i) a list of the Possible Violation(s) or Alleged Violation(s) of Reliability Standards that are the basis for issuance of the Remedial Action Directive; (ii) a discussion of the factual basis for the Remedial Action Directive; (iii) the requirements the Compliance Enforcement Authority is imposing to remove the imminent or actual threat to the reliability of the Bulk Power System; (iv) a deadline for compliance and a schedule for specific periodic updates to the Compliance Enforcement Authority; and (v) notice to the Registered Entity that failure to comply with the directive by the Required Date may result in further Remedial Action Directives or significantly increased sanctions.

The Compliance Enforcement Authority will cause the notice of the Remedial Action Directive to be delivered to the Registered Entity by (i) electronic mail to the Registered Entity's CEO or equivalent and copied to the Registered Entity's designated contact person for reliability matters and (ii) by a recognized express courier service that provides tracking and verification of delivery to the recipient. The notice will be deemed received on the earlier of the actual date of receipt of the electronic submission or receipt of the express courier delivery as specified by the express courier service's verification of delivery. The Compliance Enforcement Authority will monitor implementation of Remedial Action Directives as necessary to verify compliance.

The Compliance Enforcement Authority will notify NERC within two (2) business days after issuing a Remedial Action Directive and will copy NERC on all correspondence sent to the Registered Entity.

Once the Compliance Enforcement Authority has given the Registered Entity notice of the Remedial Action Directive, the Registered Entity may contest the Remedial Action Directive by giving written notice to the Compliance Enforcement Authority within two (2) business days following the date of actual receipt of notice of the Remedial Action Directive. Due to the urgency of resolving any objections to a Remedial Action Directive, the hearing shall be conducted under the expedited hearing process set forth in Section 1.9 of **Attachment 2, Hearing Procedures**. Notice to contest the Remedial Action Directive and participation in the hearing process set forth in Section 1.9 of **Attachment 2, Hearing Procedures** shall constitute

the Registered Entity's right to appeal the Remedial Action Directive. The Registered Entity may elect not to implement the Remedial Action Directive until the hearing process is completed, or may proceed with implementing the Remedial Action Directive even if it is contesting the Remedial Action Directive.

8.0 REPORTING AND DISCLOSURE

8.1 Information to be Reported

Regional Entities shall promptly submit to NERC electronic reports containing current information concerning the information listed below. NERC will work with Regional Entities to specify form, content, timing, and method of submitting reports and notices.

(1) The status of the review and assessment of all Possible Violations, Alleged Violations and Confirmed Violations of Reliability Standards by Registered Entities,

(2) The potential impact of any Alleged Violation or Confirmed Violation on the reliability of the Bulk Power System,

(3) Sanctions and Penalties,

(4) Remedial Action Directives imposed,

(5) Mitigation Plans, and

(6) The name of a Regional Entity staff person knowledgeable about the information to serve as a point of contact.

8.2 Reporting to Applicable Governmental Authorities and Public Disclosure

Within two (2) business days of receiving a report from a Regional Entity of a Possible Violation, Alleged Violation, or Confirmed Violation, NERC shall notify FERC of the Possible Violation, Alleged Violation or Confirmed Violation.

Where the report pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, NERC shall notify such other Applicable Governmental Authority, within two (2) business days of receiving a report of a Possible Violation, Alleged Violation or Confirmed Violation from the Regional Entity; provided, that NERC will not disclose any non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to an Applicable Governmental Authority other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure. Likewise, NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.

In any notice to, and request for permission to disclose compliance information from, FERC or another Applicable Governmental Authority pursuant to any provision of this Compliance Program, NERC will identify each Applicable Governmental Authority to which it proposes to disclose the information and the specific procedures that will be used for protecting from public disclosure any non-public compliance information that will be transferred to the other Applicable Governmental Authority or Authorities. The provisions of this paragraph do not apply to the provision by NERC to an Applicable Governmental Authority of information that is not directly related to a specific Registered Entity's compliance with a requirement of a Reliability Standard. NERC will publicly post on its website each Notice of Penalty, with any Critical Energy Infrastructure Information or other Confidential Information redacted (unless posting of the Critical Energy Infrastructure Information or Confidential Information has been determined to be permissible in accordance with Section 1500 of the Rules of Procedure), with the identity of the violator, together with any statement submitted by the Registered Entity, when NERC files the Notice of Penalty with FERC pursuant to Section 5.9.

NERC will provide reports quarterly to FERC and, where a report contains information pertaining to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority, on the status of all Possible, Alleged and Confirmed Violations for which mitigation activities have not been completed. All such reports to FERC and to other Applicable Governmental Authorities shall be provided in accordance with this Section.

9.0 DATA RETENTION AND CONFIDENTIALITY

9.1 Records Management

The Compliance Enforcement Authority records management policy shall provide for a routine and orderly process for the retention and disposal of electronic and paper records related to the Compliance Program, ensure verification of compliance with appropriate business, regulatory, and legal requirements and at a minimum conform to the data retention requirements of the Reliability Standards. The policy shall allow for the maintenance of records as required to implement the Compliance Program.

9.2 Retention Requirements

The Compliance Enforcement Authority records management policy will require that information and data generated or received pursuant to Compliance Program activities, including Compliance Audits, Self-Certifications, Spot Checks, Compliance Investigations, Self-Reports, Periodic Data Submittals, Exception Reporting, and Complaints, as well as a hearing process, will be retained for the longer of (i) five (5) years or (ii) any retention period specified in a Reliability Standard or by FERC or another Applicable Governmental Authority. The obligation to retain information and data commences upon the initiation of the Compliance Program activity that produces the data or information. If the information or data is material to the resolution of a controversy, the retention period for such data shall not commence until after the controversy is resolved.

Upon request from NERC, Regional Entities will provide to NERC copies of such information and data. NERC will retain the information and data in order to maintain a record of activity under the Compliance Program. In providing the information and data to NERC, the Regional Entity shall preserve any mark of confidentiality.

9.3 Confidentiality and Critical Energy Infrastructure Information

9.3.1 Definitions

Information or data generated or received pursuant to Compliance Program activities, including a hearing process, shall be treated in a confidential manner pursuant to the provisions of Section 1500 of the NERC Rules of Procedure. The terms "Confidential Information," "Confidential Business and Market Information," "Critical Energy Infrastructure Information," and "Critical Infrastructure" shall have the meanings stated in Appendix 2 to the NERC Rules of Procedure.

9.3.2 Protection of Confidential Information

The Compliance Enforcement Authority personnel (including any contractors, consultants and industry subject matter experts) and committee members, and participants in Compliance Program activities shall be informed of, and agree to comply with, Section 1500 of the NERC Rules of Procedure concerning Confidential Information.

9.3.3 Critical Energy Infrastructure Information

The Compliance Enforcement Authority will keep confidential all Critical Energy Infrastructure Information in accordance with Section 1500 of the NERC Rules of Procedures. Information deemed to be Critical Energy Infrastructure Information shall be redacted, in accordance with Section 1500 of the NERC Rules of Procedure, and shall not be released publicly.

ATTACHMENT 1

PROCESS FOR NON-SUBMITTAL OF REQUESTED DATA

FERC's regulations at 18 C.F.R §39.2(d) provide that each user, owner or operator of the Bulk Power System within the United States (other than Alaska and Hawaii) shall provide FERC, the ERO and the applicable Regional Entity such information as is necessary to implement section 215 of the Federal Power Act as determined by FERC and set out in the rules of the ERO and each Regional Entity. In order to enforce this requirement, if data, information, or other reports (including Mitigation Plans) requested from a Registered Entity in connection with a compliance monitoring process or enforcement process are not received by the Required Date, the Compliance Enforcement Authority may sequentially execute the following steps for each Reliability Standard Requirement for which the Compliance Enforcement Authority has requested data, information, or other reports. However, upon a request from the Registered Entity submitted prior to the Required Date stating in reasonable detail the basis for the Registered Entity's need for additional time, the Compliance Enforcement Authority may afford the Registered Entity reasonable additional time to submit the data, information or report due to the scope or difficulty of the request or requirement for data, information or reports, the amount of the data, information or reports requested or required, or the form in which the data, information, or other reports has been requested or is required to be provided.

Step 1: The Compliance Enforcement Authority will issue a notification to the Registered Entity's designated contact for reliability matters, identifying the data, information or report that were requested or required and the Required Date and stating that the Required Date has passed and the Registered Entity should, within five (5) business days, either provide the data, information or report, or contact the Compliance Enforcement Authority with a proposed date by which the Registered Entity will provide the data, information or report. If the Compliance Enforcement Authority agrees with the Registered Entity on a revised date by which the Registered Entity will provide the data, information or report, the agreed revised date shall become the Revised Required Date.

Step2: If the Registered Entity does not provide a response to the notification in, and in accordance with, Step 1, within five (5) business days, or by a revised date as agreed to in Step 1, the Compliance Enforcement Authority will issue a notification to the Registered Entity's designated contact for reliability matters, with a copy to the Registered Entity's chief executive officer or equivalent, stating that if the data, information or report is not received within ten (10) business days, the Compliance Enforcement Authority may (i) implement a compliance monitoring process directed to the Registered Entity, or (ii) issue a Notice or other notification of Alleged Violation and Proposed Penalty or Sanction at the Severe Violation Severity Level to the Registered Entity for the Reliability Standard Requirement to which the requested or required

data, information or report relates.

Step 3: If the Registered Entity fails to produce the requested or required data, information or report in response to the notification in Step 2 within the ten (10) business day cure period set forth in the Step 2 notification, the Compliance Enforcement Authority may take any action of which the Registered Entity was notified in the Step 2 notification, including issuing a Notice or other notification of Alleged Violation and Proposed Penalty or Sanctionat the Severe Violation Severity Level for the Reliability Standard Requirement to which the requested or required data, information or report relates.

The process described in this Attachment 1 is intended to be applied where a Registered Entity does not respond by the Required Date to an initial request for data, information or reports in connection with a compliance monitoring and enforcement process and does not respond to subsequent requests (Steps 1 and 2 above) by the stated deadline. This process is not intended to apply where the Registered Entity responds, prior to the Required Date, to the initial request or requirement for data, information or reports with requests for clarification, definition of scope, or similar questions concerning the request or requirement for data, information or reports, or requests, prior to the Required Date, additional time to respond based on the scope or difficulty of the request or requirement for data, information or reports, the amount or extent of the data, information or reports requested or required, or the form in which the data, information or report is to be provided, and works with the Compliance Enforcement Authority in good faith to respond to the request or requirement for data, information or reports, as modified if appropriate by the Compliance Enforcement Authority based on questions raised by the Registered Entity.

ATTACHMENT 2 - HEARING PROCEDURES

1.1 Applicability, Definitions and Interpretation

1.1.1 Procedure Governed

(a) The provisions set forth in this **Attachment 2** ("Hearing Procedures") shall apply to and govern practice and procedure before the Compliance Enforcement Authority in hearings in the United States conducted into:

(1) whether Registered Entities within the Compliance Enforcement Authority's Area of Responsibility have violated Reliability Standards, and

(2) if so, to determine the appropriate Mitigation Plans as well as any Remedial Action Directives, Penalties and/or sanctions in accordance with the NERC *Sanction Guidelines* and other applicable Penalty guidelines approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2).

(b) Any hearing conducted pursuant to these Hearing Procedures shall be conducted before a Hearing Officer and a Hearing Body established by the Compliance Enforcement Authority. Where the Hearing Body is comprised, in whole or in part, of industry stakeholders, the composition of the Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision by the Hearing Body on any matter brought before it for decision. Where the Hearing Body is comprised solely of independent members and an independent hearing Officer, decisions shall require a majority vote.

(c) The standard of proof in any proceeding under these Hearing Procedures shall be by a preponderance of the evidence. The burden of persuasion on the merits of the proceedings shall rest upon the Compliance Staff alleging noncompliance with a Reliability Standard, proposing a Penalty, opposing a Registered Entity's Mitigation Plan, or requiring compliance with a Remedial Action Directive.

(d) If a final order has been entered by the Hearing Body, or the Hearing Body has issued a ruling determining that there are no issues to be decided regarding the Alleged Violation, proposed Penalty amount, proposed Mitigation Plan or proposed Remedial Action Directive, or the Registered Entity and the Compliance Enforcement Authority have entered into a settlement agreement resolving the matters that are the subject of the hearing, the hearing shall be terminated by the Hearing Body and no further proceedings shall be conducted before the Hearing Body.

1.1.2 Deviation

To the extent permitted by law, any provision in these Hearing Procedures may be waived, suspended or modified by the Hearing Officer or the Hearing Body, for good cause shown, either upon the Hearing Officer's or the Hearing Body's own motion or upon the motion of any Participant.

1.1.3 Standards for Discretion

The Compliance Enforcement Authority's discretion under these Hearing Procedures shall be exercised to accomplish the following goals:

(a) Integrity of the Fact-Finding Process - The principal goal of the hearing process is to assemble a complete factual record to serve as a basis for a correct and legally sustainable ruling, decision or order.

(b) Fairness - Persons appearing in Compliance Enforcement Authority proceedings should be treated fairly. To this end, Participants should be given fair notice and opportunity to present explanations, factual information, documentation and legal argument. Action shall be taken as necessary to eliminate any disadvantage or prejudice to a Participant that would otherwise result from another Participant's failure to act diligently and in good faith.

(c) Independence - The hearing process should be tailored to protect against undue influence from any Person, Participant or interest group.

(d) Balanced Decision-Making - Decisions should be based solely on the facts and arguments of record in a proceeding and by individuals who satisfy the Compliance Enforcement Authority's conflict of interest policy.

(e) Impartiality - Persons appearing before the Hearing Body should not be subject to discriminatory or preferential treatment. Registered Entities should be treated consistently unless a reasonable basis is shown in any particular proceeding to depart from prior rulings, decisions or orders.

(f) Expedition - Proceedings shall be brought to a conclusion as swiftly as is possible in keeping with the other goals of the hearing process.

1.1.4 Interpretation

(a) These Hearing Procedures shall be interpreted in such a manner as will aid in effectuating the Standards for Discretion set forth in Section 1.1.3, and so as to require that all practices in connection with the hearings shall be just and reasonable.

(b) Any ruling, order or decision of the Hearing Officer referenced in these Hearing Procedures shall be made by the Hearing Body where the composition of the Hearing Body consists of independent members and an independent Hearing Officer.

(c) Unless the context otherwise requires, the singular of a term used herein shall include the plural and the plural of a term shall include the singular.

(d) To the extent that the text of a rule is inconsistent with its caption, the text of the rule shall control.

1.1.5 Definitions

Unless otherwise defined, as used in these Hearing Procedures, definitions in Appendix 2 of the NERC Rules of Procedure shall apply. For ease of reference, the following defined terms used in these Hearing Procedures are also set forth below:

"Clerk" shall mean an individual assigned by the Compliance Enforcement Authority to perform administrative tasks relating to the conduct of hearings as described in these Hearing Procedures.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that: (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

"Cyber Security Incident" means any malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, or other individual designated by the Compliance Enforcement Authority, who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"ERO" or "Electric Reliability Organization" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Evidentiary Hearing" means a hearing at which one or more Participants submits evidence for the record. A Testimonial Hearing is an Evidentiary Hearing, but an Evidentiary Hearing does not necessarily include the presentation of testimony by witnesses in person.

"FERC" means the Federal Energy Regulatory Commission.

"Hearing Body" means the body established or designated by the Compliance Enforcement Authority to conduct hearings and issue decisions concerning disputed compliance matters in accordance with these Hearing Procedures.

"Hearing Officer" means an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to these Hearing Procedures.

"Participant" means a Respondent and any other Person who is allowed or required by the Hearing Body or by FERC to participate as an intervenor in a proceeding conducted pursuant to these Hearing Procedures, and as used in these Hearing Procedures shall include the members of the Compliance Staff of the Compliance Enforcement Authority that participate in a proceeding.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.

"Respondent" means the Registered Entity who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies the Compliance Enforcement Authority's conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body.

"Testimonial Hearing" means an Evidentiary Hearing at which the witness or witnesses on behalf of one or more Participants appears in person to present testimony and be subject to cross-examination.

1.2 General Provisions including Filing, Service, Transcription and Participation

1.2.1 Contents of Filings

All filings made with the Hearing Body must contain:

(a) A caption that sets forth the title of the proceeding and the designated docket number or, if the filing initiates a proceeding, a space for the docket number;

(b) A heading that describes the filing and the Participant on whose behalf the filing is made;

(c) The full name, address, telephone number and email address of the Participant or the representative of the Participant making the filing;

(d) A plain and concise statement of any facts upon which the filing is based, which facts shall be supported by citations to the record of the hearing, if available, or other evidence; and

(e) The specific relief sought, which may be in the alternative, and the authority that provides for or otherwise allows the relief sought.

1.2.2 Form of Filings

(a) All filings shall be typewritten, printed, reproduced or prepared using a computer or other word or data processing equipment on white paper 8½ inches by 11 inches with inside text margins of not less than one inch. Page numbers shall be centered and have a bottom margin of not less than ½ inch. Line numbers, if any, shall have a left-hand margin of not less than ½ inch. The impression shall be on one side of the paper only and shall be double spaced; footnotes may be single spaced and quotations may be single spaced and indented.

(b) All pleadings shall be composed in either Arial or Times New Roman font, black type on white background. The text of pleadings or documents shall be at least 12-point. Footnotes shall be at least 10-point. Other material not in the body of the text, such as schedules, attachments and exhibits, shall be at least 8-point.

(c) Reproductions may be by any process provided that all copies are clear and permanently legible.

(d) Testimony prepared for the purpose of being entered into evidence shall include line numbers on the left-hand side of each page of text. Line numbers shall be continuous.

(e) Filings may include schedules, attachments or exhibits of a numerical or documentary nature which shall, whenever practical, conform to these requirements; however, any log,

graph, map, drawing, chart or other such document will be accepted on paper larger than prescribed in subparagraph (a) if it cannot be provided legibly on letter size paper.

1.2.3 Submission of Documents

(a) Where to File

Filings shall be made with the Clerk of the Compliance Enforcement Authority located at its principal office. The office will be open during the Compliance Enforcement Authority's regular business hours each day except Saturday, Sunday, legal holidays and any other day declared by the Compliance Enforcement Authority.

(b) When to File

Filings shall be made within the time limits set forth in these Hearing Procedures or as otherwise directed by the Hearing Officer or the Hearing Body. Filings will be considered made when they are date stamped received by the Clerk. To be timely, filings must be received no later 5:00 P.M. local time on the date specified.

(c) How to File

Filings may be made by personal delivery, mailing documents that are properly addressed with first class postage prepaid, or depositing properly addressed documents with a private express courier service with charges prepaid or payment arrangements made. Alternatively, filing by electronic means will be acceptable upon implementation of a suitable and secure system by the Compliance Enforcement Authority.

(d) Number of Copies to File

One original and five exact copies of any document shall be filed. The Clerk will provide each member of the Hearing Body with a copy of each filing.

(e) Signature

The original of every filing shall be signed by the Participant on whose behalf the filing is made, either by an attorney of the Participant or, by the individual if the Participant is an individual, by an officer of the Participant if the Participant is not an individual, or if the Participant is Staff, by a designee authorized to act on behalf of Staff.

(f) Verification

The facts alleged in a filing need not be verified unless required by these Hearing Procedures, the Hearing Officer or the Hearing Body. If verification is required, it must be under oath by a person having knowledge of the matters set forth in the filing. If any verification is made by an individual other than the signer, a statement must be included in or attached to the verification explaining why a person other than the signer is providing verification.

(g) Certificate of Service

Filings shall be accompanied by a certificate of service stating the name of the individuals served, the Participants whose interests the served individuals represent, the date on which service is made, the method of service and the addresses to which service is made. The certificate shall be executed by the individual who caused the service to be made.

1.2.4 Service

(a) Service List

For each proceeding, the Clerk shall prepare and maintain a list showing the name, address, telephone number, and facsimile number and email address, if available, of each individual designated for service. The Hearing Officer, Director of Compliance and the Registered Entity's compliance contact as registered with the Compliance Enforcement Authority, shall automatically be included on the service list. Participants shall identify all other individuals whom they would like to designate for service in a particular proceeding in their appearances or other filings. Participants may change the individuals designated for service in any proceeding by filing a notice of change in service list in the proceeding. Participants are required to update their service lists to ensure accurate service throughout the course of the proceeding. Copies of the service list may be obtained from the Clerk.

b) By Participants

Subject to the provisions of Section 1.5.10, any Participant filing a Document in a proceeding must serve a copy of the Document on each individual whose name is on the service list for the proceeding. Unless otherwise provided, service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made.

(c) By the Clerk

The Clerk shall serve all issuances of the Hearing Officer and Hearing Body upon the members of the Hearing Body and each individual whose name is on the service list for the proceeding. Service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made. The Clerk shall transmit a copy of the record of a proceeding to the ERO at the time the Compliance Enforcement Authority transmits to the ERO either (1) a Notice of Penalty, or (2) a Hearing Body final order that includes a Notice of Penalty.

(d) Effective Date of Service

Service by personal delivery or email is effective immediately. Service by mail or registered mail is effective upon mailing; service by a private express courier service is effective upon delivery to the private express courier service. Unless otherwise provided, whenever a Participant has the right or is required to do some act within a prescribed period after the service

of a document upon the Participant, four (4) days shall be added to the prescribed period when the document is served upon the Participant by mail or registered mail.

1.2.5 Computation of Time

The time in which any action is required to be done shall be computed by excluding the day of the act or event from which the time period begins to run, and by including the last day of the time period, unless the last day is a Saturday, Sunday, legal holiday or any other day upon which the office of the Compliance Enforcement Authority is closed, in which event it also shall be excluded and the date upon which the action is required shall be the first succeeding day that is not a Saturday, Sunday, legal holiday, or day upon which the office of the Compliance Enforcement Authority is closed.

1.2.6 Extensions of Time

Except as otherwise provided by law, the time by which a Participant is required or allowed to act may be extended by the Hearing Officer or Hearing Body for good cause upon a motion made before the expiration of the period prescribed. If any motion for extension of time is made after the expiration of the period prescribed, the Hearing Officer or Hearing Body may permit performance of the act if the movant shows circumstances sufficient to justify the failure to act in a timely manner.

1.2.7 Amendments

Amendments to any documents filed in a proceeding may be allowed by the Hearing Officer or the Hearing Body upon motion made at any time on such terms and conditions as are deemed to be just and reasonable.

1.2.8 Transcripts

(a) A full and complete record of all hearings, including any oral argument, shall be transcribed verbatim by a certified court reporter, except that the Hearing Officer may allow off-the-record discussion of any matter provided the Hearing Officer states the ruling on any such matter, and the Participants state their positions or agreement in relation thereto, on the record. The court reporter shall file a copy of each transcript with the Clerk. Upon receipt of a transcript from the court reporter, the Clerk shall send notice to the Participants stating that a transcript has been filed by the court reporter, the date or dates of the hearing that the transcript records, and the date the transcript was filed with the Clerk.

(b) Unless otherwise prescribed by the Hearing Officer, a Participant may file and serve suggested corrections to any portion of a transcript within fourteen (14) days from the date of the Clerk's notice that the transcript has been filed with the Clerk, and any responses shall be filed within ten (10) days after service of the suggested corrections. The Hearing Officer shall determine what changes, if any, shall be made, and shall only allow changes that conform the transcript to the statements being transcribed and ensure the accuracy of the record.

(c) The Compliance Enforcement Authority will pay for transcription services, for a copy of the transcript for the record and for a copy of the transcript for Staff. Any other Participant shall pay for its own copy of the transcript if it chooses to obtain one and, should any Participant seek to obtain a copy of the transcript on an expedited basis, it shall pay for the expedited transcription services.

1.2.9 Rulings, Notices, Orders and Other Issuances

Any action taken by the Hearing Officer or the Hearing Body shall be recorded in a ruling, notice, order or other applicable issuance, or stated on the record for recordation in the transcript, and is effective upon the date of issuance unless otherwise specified by the Hearing Officer or the Hearing Body. All notices of hearings shall set forth the date, time and place of hearing.

1.2.10 Location of Hearings and Conferences

All hearings and oral arguments shall be held at the principal office of the Compliance Enforcement Authority unless the Hearing Officer or Hearing Body designates a different location.

1.2.11 Participant Participation

Participants may appear at any hearing via teleconference subject to the approval of the Hearing Officer and, in the event of oral argument, the Hearing Body, except as required by Section 1.6.6. Staff may participate and be represented by counsel in hearings, and shall have the rights and duties of any Participant.

1.2.12 Interventions

(a) The Respondent(s) and Staff shall be Participants to the proceeding. Unless otherwise authorized by the Hearing Body or by FERC, no other Persons shall be permitted to intervene or otherwise become a Participant to the proceeding.

(b) The Hearing Body may allow a Person to intervene only if the Hearing Body determines that the Person seeking intervention has a direct and substantial interest in the outcome of the Alleged Violation, proposed Penalty or sanction, Mitigation Plan, or Remedial Action Directive that is the subject of the proceeding. Examples of a direct and substantial interest in the outcome shall include

(1) that the Person seeking intervention has received a Notice of Alleged Violation or a Remedial Action Directive involving the same Reliability Standard requirement(s) and arising out of the same event or occurrence as the existing Respondent(s) that is the subject of the proceeding, or

(2) that the Person seeking intervention will or may be contractually or legally liable to the original Respondent(s) for payment of all or a portion of the proposed Penalty or sanction that is the subject of the proceeding, provided, that after the Person seeking intervention sufficiently demonstrates it will or may be contractually or legally liable for payment of all or a portion of the proposed Penalty or sanction to be granted intervention, the Person granted intervention and

the existing Respondents will not be allowed to litigate in the proceeding whether the Person granted intervention is contractually or legally liable for payment of all or a portion of the proposed Penalty or sanction or the amount of the proposed Penalty or Sanction for which the Person granted intervention is or may be liable.

That the Person seeking intervention has received a Notice of Alleged Violation for the same Reliability Standard Requirement(s) as the original Respondent(s) but arising out of a different event or occurrence; or seeks to intervene to advocate an interpretation of the Reliability Standard Requirement(s) or provision(s) of the *Sanction Guidelines*, that are at issue in the proceeding, without more, shall not constitute a direct and substantial interest in the outcome and shall not be grounds on which the Hearing Body may allow the Person to intervene.

(c) A Person seeking intervention shall do so by filing a motion to intervene with the Clerk. The motion shall state the Person's interest in sufficient factual detail to demonstrate that the Person should be allowed to intervene pursuant to Section 1.2.12(b). The motion to intervene shall also state the Person's agreement to maintain the confidential and non-public nature of the hearing, including all pleadings and other Documents filed or exchanged in connection with the request for intervention. Any facts alleged in, or offers of proof made in, the motion to intervene shall be supported by affidavit or verification.

(d) The Clerk shall promptly provide copies of the motion to intervene to the Hearing Officer and the Participants. The Hearing Officer shall promptly set a time period, not to exceed seven (7) days, within which the Participants may file responses to the motion to intervene. Within seven (7) days following the end of the response period, the Hearing Officer shall issue a recommendation to the Hearing Body as to whether or not the motion to intervene should be granted.

(e) The Hearing Body may, within seven (7) days following the date of the Hearing Officer's recommendation, issue a decision granting or denying the motion to intervene. If the Hearing Body does not issue a decision granting or denying the motion to intervene within seven (7) days following the date of the Hearing Officer's recommendation, the Hearing Officer's recommendation shall become the decision of the Hearing Body and the motion to intervene shall be deemed granted or denied by the Hearing Body in accordance with the Hearing Officer's recommendation.

(f) The Hearing Officer, on motion of a Participant or on his or her own motion, or the Hearing Body, on recommendation by the Hearing Officer or its own motion, may stay or suspend the proceeding while a request to intervene, including a request to intervene filed directly with FERC, and including any appeal of the grant or denial of the request to intervene, is being resolved.

(g) A Person allowed to intervene and become a Participant to a proceeding shall be designated as a Respondent and deemed to be aligned with the existing Respondent(s), unless the Hearing Body, in the decision granting intervention, states that the Person allowed to intervene shall be deemed to be aligned with another Participant to the proceeding.

(h) A Person allowed to intervene and become a Participant to a proceeding is required to take the record and the procedural status of the proceeding as it stands on the date the Person's motion to intervene is granted by the Hearing Body.

(i) A Person may appeal a decision of the Hearing Body denying the Person's motion to intervene, and the Compliance Staff, the Respondent or any other Participant may appeal a decision granting or denying a motion to intervene, in accordance with Section 414 of the NERC Rules of Procedure. A notice of appeal shall be filed with the NERC director of enforcement no later than seven (7) days following the date of the decision of the Hearing Body granting or denying the motion to intervene.

1.2.13 Proceedings Closed to the Public

No hearing, oral argument or meeting of the Hearing Body shall be open to the public, and no notice, ruling, order or any other issuance of the Hearing Officer or Hearing Body, or any transcript, made in any proceeding shall be publicly released unless the ERO (within the U.S., in accordance with the authorization previously granted by FERC to release information about a non-public proceeding) or FERC (in the case of U.S.-related information) or another Applicable Governmental Authority (in the case of non-U.S.-related information) determine that public release is appropriate. Only the members of the Hearing Body, the Participants, the Hearing Officer and the Technical Advisors, if any, shall be allowed to participate in or obtain information relating to a proceeding.

1.2.14 Docketing System

The Clerk shall maintain a system for docketing proceedings. A docketed proceeding shall be created upon the filing of a request for a hearing. Unless NERC provides a different docketing system that will be used uniformly by the Compliance Enforcement Authorities, docket numbers shall be assigned sequentially beginning with a two digit number that relates to the last two digits of the year in which the docket is initiated, followed by a dash ("-"), followed by the letters "[RE]", followed by a dash ("-"), followed by a four digit number that will be "0001" on January 1 of each calendar year and ascend sequentially until December 31 of the same calendar year.

1.2.15 Representations Deemed to be Made in All Pleadings

A Participant presenting any pleading to the Hearing Officer or Hearing Body shall be deemed to certify that to the best of the Participant's knowledge, information and belief, formed after and based on an inquiry that is reasonable under the circumstances:

(a) the factual allegations set forth in the pleading have or will have support in the evidence or the Participant believes they will have support in the evidence after reasonable opportunity for further investigation or discovery;

(b) the denials in the pleading of factual allegations made by another Participant are warranted by or will be warranted by the evidence or, if specifically so identified, are reasonably based on belief or on a lack of information;

(c) the claims, defenses and other contentions set forth in the pleading are warranted based on the applicable Reliability Standard Requirement(s) or Rules of Procedure provisions; and

(d) the pleading is not being presented for any improper purpose, such as to harass, cause unnecessary delay, or needlessly increase the cost of the hearing or the cost incurred by any Participant.

1.2.16 Hold Harmless

A condition of a Participant invoking these Hearing Procedures and participating in a hearing is that the Participant agrees that the Compliance Enforcement Authority, including without limitation its members, board of directors or trustees, compliance committee, any other committees or subcommittees, Staff, contracted employees, Hearing Body members, Hearing Officers and Technical Advisors, shall not be liable, and shall be held harmless against the consequences of, or any action or inaction arising out of, the hearing process, or of any agreement reached in resolution of a dispute or any failure to reach agreement as a result of a proceeding. This "hold harmless" provision does not extend to matters constituting gross negligence, intentional misconduct or breach of confidentiality.

1.3 Initiation of the Hearing Process

1.3.1 Registered Entity's Option to Request a Hearing

(a) Except when contesting a Remedial Action Directive pursuant to Section 1.9 of these Hearing Procedures, a Registered Entity may file a statement, in accordance with Section 1.3.1(e), with the Compliance Enforcement Authority requesting a hearing if either:

(1) The Registered Entity files a response to a Notice of Alleged Violation that contests either the Alleged Violation, the proposed Penalty, or both; or

(2) The Compliance Staff submits to the Registered Entity a statement rejecting the Registered Entity's proposed revised Mitigation Plan submitted after Compliance Staff rejected the Registered Entity's initial proposed Mitigation Plan.

(b) A Registered Entity must file its hearing request within forty (40) days after

(1) the Registered Entity files its response to the Notice of Alleged Violation; or

(2) the Compliance Staff submits to the Registered Entity its statement identifying a disagreement with the Registered Entity's proposed Mitigation Plan, whichever is applicable.

(c) If the Registered Entity does not file a hearing request within the time period set forth in this Section, then the Registered Entity will be deemed to have agreed and waived any objection to the proposed Penalty, the Alleged Violation or the Compliance Staff's rejection of the revised Mitigation Plan, whichever is applicable.

(d) In accordance with Section 5.3 of the Compliance Program, a Notice of Alleged Violation issued to a Registered Entity or a Staff statement setting forth its rejection of a Registered Entity's proposed revised Mitigation Plan shall clearly state that the Registered Entity has the option to contest the Alleged Violation, proposed Penalty, or both, or the Compliance Staff's rejection of the proposed revised Mitigation Plan, using either the shortened hearing procedure pursuant to Section 1.3.4 or the general hearing procedure described in Sections 1.4 to 1.7.

(e) The Registered Entity's statement requesting a hearing shall:

(1) contain a plain and concise statement of the facts and arguments supporting the Registered Entity's position, as applicable, that it did not violate the Reliability Standard Requirement(s) set forth in the Notice of Alleged Violation, that the proposed Penalty or sanction is too high and should be reduced, or that the Registered Entity's proposed Mitigation Plan should be approved;

(2) state the relief that the Registered Entity requests the Hearing Body to grant; and

(3) state whether the Registered Entity requests the shortened hearing procedure or the general hearing procedure.

The Registered Entity's statement may set forth two or more alternative grounds on which the Registered Entity bases its position, as applicable, that it did not violate the Reliability Standard Requirement(s) set forth in the Notice of Alleged Violation, that the proposed Penalty or sanction is too high and should be reduced, or that the Registered Entity's proposed Mitigation Plan should be approved.

(f) If the Registered Entity (or any Respondent if there are more than one Respondent) requests the general hearing procedure, the general hearing procedure shall apply. If the Registered Entity (or all Respondents if there are more than one Respondent) requests the shortened hearing procedure, Compliance Staff and any other Participants shall submit a filing within five (5) days of the Registered Entity's hearing request that states whether Staff or such other Participant agrees to use the shortened hearing procedure. If Staff or another Participant makes a filing requesting the general hearing procedure, then the general hearing procedure shall apply; otherwise the shortened hearing procedure requested by the Registered Entity or Entities shall be used. Once either the general or shortened hearing procedure has been selected, the Participants shall not be allowed to revert to the non-selected hearing procedure unless the Participants mutually agree.

(g) A Registered Entity shall attach to a request for hearing whichever of the following are applicable:

(1) The Registered Entity's Self-Report of a violation;

(2) The Notice of Alleged Violation and the Registered Entity's response thereto; and/or

(3) The Registered Entity's proposed revised Mitigation Plan and the Compliance Staff's statement rejecting the proposed revised Mitigation Plan.

1.3.2 Compliance Staff's Response to Request for Hearing

(a) If the Registered Entity's request for hearing requests that the shortened hearing procedure be used, the Compliance Staff shall file a response stating whether it agrees to the use of the shortened hearing procedure.

(b) If the Registered Entity's request for hearing requests that the Registered Entity's proposed revised Mitigation Plan should be approved, the Compliance Staff shall file a response stating the Compliance Staff's position as to why the Registered Entity's proposed revised Mitigation Plan should not be approved and setting forth any additional terms that the Compliance Staff believes should be included in the Mitigation Plan.

(c) If the Registered Entity's request for hearing does not request that the shortened hearing procedure be used and does not request that the Registered Entity's proposed revised Mitigation Plan should be approved, the Compliance Staff may, but is not required to, file a response stating, as applicable, the basis for the Compliance Staff's position that the Registered Entity violated the Reliability Standard Requirement(s) specified in the Notice of Alleged Violation or that the proposed Penalty or sanction is appropriate under the *Sanction Guidelines* and should not be reduced.

(d) Any response by the Compliance Staff required or permitted by this Section shall be filed within fifteen (15) days after the date the request for hearing was filed, unless the Hearing Officer or Hearing Body allows a longer time to file the response.

1.3.3 Notice of Hearing

(a) The Clerk shall issue a notice of hearing not less than sixteen (16) days, and not more than twenty-one (21) days, after the Registered Entity files its request for hearing.

(b) The notice of hearing shall state whether the shortened hearing procedure or the general hearing procedure will be used.

(c) The notice of hearing shall identify the Hearing Officer and the date, time and place for the initial prehearing conference.

(1) If the shortened hearing procedure is to be used, the initial prehearing conference shall be set for a date within seven (7) days following the date of the notice of hearing.

(2) If the general hearing procedure is to be used, the initial prehearing conference shall be set for a date within fourteen (14) days following the date of the notice of hearing.

1.3.4 Shortened Hearing Procedure

The shortened hearing procedure shall be as set forth in this Section. The rules applicable to the general hearing procedure shall apply to the shortened hearing procedure unless the context of such a rule is inconsistent with the procedure set forth in this Section or otherwise renders it inapplicable to the shortened hearing procedure. The rules concerning ex parte communications

in Section 1.4.7 are hereby expressly made applicable to the shortened hearing procedure under this Section.

The Hearing Body shall utilize a Hearing Officer to preside over the shortened hearing procedure in accordance with Section 1.4.2. But, no Testimonial Hearing will be held in the shortened hearing procedure and the Participants will not present witness testimony or file briefs, except that briefs on exceptions and briefs in reply to exceptions may be allowed pursuant to subsection (g). Instead, the following events shall take place within the following periods:

(a) The initial prehearing conference shall be held within seven (7) days after the date on which the notice of hearing is issued. In addition to any other matters set forth in Section 1.5.2 that may apply, the initial prehearing conference will be used to develop a schedule for the preparation and submission of comments in accordance with subsections (c) through (e).

(b) Within ten (10) days after the date on which the notice of hearing is issued, Staff shall make Documents available to the Registered Entity for inspection and copying pursuant to Section 1.5.7.

(c) Within twenty-one (21) days after the initial prehearing conference, the Staff shall file:

(1) initial comments stating Staff's position on all issues and the rationale in support of its position, including all factual and legal argument;

(2) all Documents that Staff seeks to introduce in support of its position that have not already been submitted in the proceeding; and

(3) a verification attesting to the truthfulness of the facts alleged in the filing.

(d) Within fourteen (14) days of Staff's initial comment filing pursuant to subsection (c), the Registered Entity shall file:

(1) responsive comments stating the Registered Entity's position on all issues and the rationale in support of its position, including all factual and legal argument, which comment also may respond to Staff's initial comments;

(2) all Documents that the Registered Entity seeks to introduce in support of its position that have not already been submitted in the proceeding; and

(3) a verification attesting to the truthfulness of the facts alleged in the filing.

(e) Within seven (7) days after the Registered Entity's responsive comment filing pursuant to subsection (d), Staff shall file reply comments that shall be limited in scope to responding to the Registered Entity's responsive comments and be supported by a verification attesting to the truthfulness of the facts alleged in the filing. Staff shall not submit any additional Documents in support of its position as part of this filing except upon motion and good cause shown. If Staff is allowed to file additional Documents in support of its position based upon such a

motion, the Registered Entity shall have the right to file additional Documents in support of its position that are responsive to the additional Documents that Staff is allowed to file provided that any additional Registered Entity filing also shall be verified.

(f) The Hearing Officer shall issue an initial opinion within twenty-one (21) days after the Staff's reply comments filing or any additional filing by the Registered Entity pursuant to subsection (e).

(g) If either Participant requests, the Hearing Officer shall allow each Participant to file, within seven (7) days after the Hearing Officer's initial opinion, exceptions to the Hearing Officer's initial opinion in a brief designated "brief on exceptions" in accordance with Section 1.7.5 and within seven (7) days thereafter, a reply brief designated "brief in reply to exceptions."

(h) The Hearing Body shall strive, but is not required, to issue a final order within one hundred twenty (120) days of the notice of hearing.

The Hearing Officer or Hearing Body may modify any time period set forth within this Paragraph as warranted by the circumstances but it will be the objective of the Hearing Body to issue the final order within one hundred twenty (120) days of the notice of hearing.

1.4 General Hearing Procedure

1.4.1 [Intentionally Left Blank]

[Blank.]

1.4.2 Hearing Officer

(a) The Compliance Enforcement Authority shall utilize a Hearing Officer to preside over each hearing conducted pursuant to these Hearing Procedures, provided that the Hearing Officer's actions shall be subject to the authority of the Hearing Body as set forth in Section 1.4.3. Members of the Hearing Body may attend any aspect of the hearing.

(b) The Hearing Officer is responsible for the conduct of the hearing, including administering the hearing from the initial prehearing conference through the issuance of the Hearing Officer's initial opinion, any administrative hearing functions thereafter, and submission of the matter to the Hearing Body for final decision through the presentation to the Hearing Body of an initial opinion. The Hearing Officer shall have those duties and powers necessary to those ends, consistent with and as further enumerated in these Hearing Procedures, including the following:

(1) To administer oaths and affirmations;

(2) To schedule and otherwise regulate the course of the hearing, including the ability to call to recess, reconvene, postpone or adjourn a hearing;

(3) Consistent with any timing or deadline requirements imposed by these Hearing Procedures or by applicable law, to separate any issue or group of issues from other issues in a proceeding and treat such issue(s) as a separate phase of the proceeding;

(4) Consistent with any timing or deadline requirements imposed by these Hearing Procedures or by applicable law, to modify any time period, if such modification is in the interest of justice and will result in no undue prejudice to any other Participant;

(5) To supervise and issue orders concerning discovery;

(6) To conduct prehearing conferences, status hearings and Evidentiary Hearings;

(7) To hear argument on all objections, motions and other requests, and to rule upon all objections, motions and other requests that do not result in the final determination of the proceeding;

(8) To rule on and receive evidence;

(9) To call upon a Participant to produce further evidence that is material and relevant to any issue;

(10) To issue protective orders pursuant to Section 1.5.10;

(11) To issue initial opinions; and

(12) To ensure that hearings are conducted in a full, fair and impartial manner, that order is maintained and that unnecessary delay is avoided in the disposition of the proceedings.

(c) The Compliance Enforcement Authority shall disclose the employment history and professional affiliations of the Hearing Officer within two (2) days of the Hearing Officer's assignment to the proceeding, and Participants to the hearing may raise objections to the Hearing Officer's participation in accordance with Section 1.4.5.

1.4.3 Hearing Body

(a) The composition of the Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision of the Hearing Body on any matter brought before it for decision.

(b) The Hearing Body is vested with the authority to issue a final order resolving the issue(s) in all cases. To that end:

(1) Upon receiving a filing by a Participant, the Clerk shall promptly send a notice to the members of the Hearing Body identifying the date of the filing and the Participant making the filing and briefly describing the nature of the filing. Any member of the Hearing Body may request of, and shall receive from, the Clerk, a

copy of any filing by a Participant. The Hearing Body shall not receive Documents made available by Staff for inspection and copying by the Respondent, or other responses to discovery between the Participants, unless such Documents are placed into the record pursuant to Section 1.6.7.

(2) The Clerk shall send all issuances of the Hearing Officer to the members of the Hearing Body.

(3) The Hearing Body or any individual member thereof may, but is not required to, attend any prehearing conference, status hearing or Evidentiary Hearing, and/or to submit questions to the Hearing Officer to submit to a Participant or any witness at any hearing. At any prehearing conference or hearing attended by a member of the Hearing Body, any member of the Hearing Body may ask questions directly of any Participant or witness.

(4) The Hearing Body shall have the same authority as the Hearing Officer, as set forth in these Hearing Procedures, to require the Participants or any individual Participant to: (i) address a specific issue in testimony, evidence or briefs; (ii) present oral argument on an issue; (iii) file pre-Evidentiary Hearing memorandums; or (iv) produce further evidence that is material and relevant to any issue. To this end, the Hearing Body shall be entitled to issue questions or requests for information to any Participant or any witness at any time until the issuance of a final order.

(5) To the extent that the Hearing Body disagrees with any issuance or ruling of the Hearing Officer, it may, on its own motion or upon petition for interlocutory review meeting the requirements of Section 1.4.4, reverse or modify the issuance or ruling in whole or in part, or take any other action as may be appropriate.

(6) The Hearing Body shall resolve the issue(s) in every hearing through the issuance of a final order. In issuing a final order, the Hearing Body shall consider the Hearing Officer's initial opinion but shall have the authority to reject, modify or approve the initial opinion in whole or in part.

1.4.4 Interlocutory Review

(a) A Participant shall be allowed to seek interlocutory review by the Hearing Body of any ruling of the Hearing Officer where the ruling for which interlocutory review is sought presents an extraordinary circumstance which makes prompt review necessary to prevent prejudice to a Participant's ability to present its position in the proceeding. Failure to seek such review shall not operate as a waiver of any objection to such ruling.

(b) Unless good cause is shown or unless otherwise ordered by the Hearing Officer or the Hearing Body, the Participant seeking review shall file a petition for interlocutory review within fourteen (14) days after the date of the action that is the subject of the petition. The petition shall contain, in a separately identified section, a demonstration that the ruling for which interlocutory review is sought presents an extraordinary circumstance which makes prompt review necessary to prevent prejudice to the Participant's ability to present its position in the proceeding. The

petition shall be filed with any offer of proof and supported by references to the record, or by affidavit if based on facts that do not appear in the record. Responses to petitions for interlocutory review shall be filed within seven (7) days after service of the petition. No replies to responses shall be allowed.

(c) The Hearing Officer shall file a report to the Hearing Body within fourteen (14) days from the filing of the petition. The Hearing Officer's report shall set forth the relevant facts and other background information relating to the ruling on which interlocutory review is sought, the basis for the Hearing Officer's ruling, a summary of the Participants' arguments on the petition for interlocutory review, and the recommendation of the Hearing Officer for the disposition of the petition by the Hearing Body.

(d) On review of a Hearing Officer's ruling, the Hearing Body may affirm or reverse the ruling in whole or in part, and may take any other just and reasonable action with respect to the ruling, such as declining to act on an interlocutory basis. The Hearing Body may reject the petition for interlocutory review on the grounds that the ruling for which review is sought does not present an extraordinary circumstance which makes prompt review necessary to prevent prejudice to a Participant's ability to present its position in the proceeding, without considering or ruling on the substance of the petitioner's arguments.

(e) Issuance of a ruling on a petition for interlocutory review shall require (i) a quorum (as defined in Section 1.7.8) of the Hearing Body, and (ii) majority vote of the members of the Hearing Body voting on the final order (which number of members voting shall not be less than a quorum). Petitions to rehear or reconsider the Hearing Body's action taken on interlocutory review shall not be allowed. Filing and disposition of a petition for interlocutory review of a ruling of the Hearing Officer shall not suspend or otherwise delay a hearing or any other scheduled dates in the proceeding except as authorized by the Hearing Officer or the Hearing Body based on a finding of exceptional circumstances.

(f) A non-Participant that has been ordered by the Hearing Officer pursuant to Section 1.5.8 to produce or provide Documents, information or testimony, and has failed to obtain the relief sought from the Hearing Officer through filing objections to or a motion to quash the order, shall also be entitled to seek interlocutory review by the Hearing Body of the Hearing Officer's order, with respect to (i) whether the non-Participant is within the class of Persons subject to such orders pursuant to Section 1.5.8, and (ii) the reasonableness of the Hearing Officer's order to produce or provide Documents, information or testimony.

1.4.5 Disqualification

(a) A Hearing Officer, Technical Advisor or member of the Hearing Body shall recuse himself or herself from a proceeding if participation would violate the Compliance Enforcement Authority's applicable conflict of interest policy.

(b) Any Participant may file a motion to disqualify or for recusal of a Hearing Officer, Technical Advisor or member of the Hearing Body from a proceeding on grounds of a conflict of interest, an ex parte communication prohibited by section 1.4.7, or the existence of other circumstances that could interfere with the impartial performance of his or her duties. The Participant shall set forth and support its alleged grounds for disqualification by affidavit. A

motion for disqualification shall be filed within fifteen (15) days after the later of: (1) the time when the Participant learns of the facts believed to constitute the basis for disqualification; or (2) the time when the Participant is notified of the assignment of the Hearing Officer or Technical Advisor.

(c) The Hearing Officer shall issue a proposed ruling for the Hearing Body's consideration upon the filing of a motion for disqualification unless the Hearing Officer is the subject of the motion. The Hearing Body, without the participation of any member who is the subject of the motion, shall issue a final ruling on the motion. If the Hearing Officer recuses himself or herself or is disqualified, the Hearing Body will appoint a replacement Hearing Officer. To ensure fairness to the Participants and expedite completion of the proceeding when a replacement Hearing Officer is appointed after a hearing has commenced, the replacement Hearing Officer may recall any witness or may take other steps necessary to ensure familiarity with any part or all of the record.

(d) If a quorum (as defined in Section 1.7.8) of the Hearing Body does not remain after any recusals and rulings on motions for disqualification, then the Compliance Enforcement Authority shall appoint at least the number of new members to the Hearing Body necessary to create a quorum. The new member(s) shall serve on the Hearing Body through the conclusion of the proceeding but not thereafter. Any new member of the Hearing Body shall be subject to the provisions applicable herein to all Hearing Body members.

1.4.6 Technical Advisor

(a) The Hearing Officer and/or the Hearing Body may elect to use one or more Technical Advisors to assist in any proceeding. Such an election may be made at any time during the course of a proceeding. Any Staff member who serves as a Technical Advisor shall not have been involved in or consulted at any time in regard to any Compliance Staff investigation, determination of a Possible Violation, Alleged Violation or Penalty, or assessment of a Registered Entity's proposed Mitigation Plan that resulted in the proceeding in which technical advice would be rendered, and shall not be a member of Staff participating in the proceeding on which such technical advice would be rendered.

(b) If the Hearing Officer or Hearing Body uses a Technical Advisor to assist in any hearing, the Hearing Officer or Hearing Body shall disclose the identity, employment history and professional affiliations of the Technical Advisor within two (2) days of the Technical Advisor's assignment to the proceeding, and Participants to the hearing may raise objections to the Technical Advisor's participation in accordance with Section 1.4.5.

1.4.7 No Ex Parte Communications

(a) Once a Registered Entity requests a hearing pursuant to Section 1.3.1:

(1) neither the Hearing Body, the Hearing Officer, nor the Technical Advisor(s), if any, may communicate either directly or indirectly with any Person concerning any issue in the proceeding outside of the hearing process; except that

(2) the Hearing Body, the Hearing Officer, and the Technical Advisor(s), if any, may communicate outside of the hearing process either directly or indirectly with a Participant or a Participant's representative:

(A) in writing if the writing is simultaneously provided to all Participants; or

(B) orally if a representative for every Participant is present in person or by telephone;

(C) subject to the requirement that the substance of any ruling on any issue discussed shall be memorialized on the record or by the issuance of a notice or ruling, and that any Participant objecting to the ruling shall have the opportunity to state its objection on the record.

(b) Exceptions

(1) The proscription in subsection (a)(1) does not prohibit members of the Compliance Staff from communicating with the Registered Entity, and representatives, agents or employees thereof on any topic, provided that any member of the Compliance Staff involved in any such communication relating to the subject matter of the proceeding may not be, and may not subsequently serve as, a Technical Advisor.

(2) The proscription in subsection (a)(1) does not prohibit communications between or among members of the Hearing Body, the Hearing Officer and any Technical Advisor.

(3) The proscription in subsection (a)(1) does not prohibit communications between the Hearing Officer or members of the Hearing Body to the Clerk for the purpose of transmitting documents, giving instructions to the Clerk, or discussing scheduling and other procedural matters relating to the proceeding.

(4) The proscription in subsection (a)(1) does not prohibit communications between or among the Clerk, the Hearing Body and representatives of the Compliance Enforcement Authority for purposes of establishing the hearing forum.

(c) Any member of the Hearing Body, the Hearing Officer or any Technical Advisor who receives or who makes or knowingly allows a communication prohibited by this Section shall, within seven (7) days of the communication, file and serve on the Participants in the proceeding a notice of ex parte communication setting forth the date, time and place of communication, a summary of the substance and nature of the communication and all responses thereto, and a list of each Person who made or received the communication and, if the communication or any response thereto was in writing, a copy of the written communication shall be attached.

1.4.8 Appearances

(a) Participants shall file written appearances within seven (7) days after the notice of hearing is issued. A Participant's written appearance shall identify the name(s) of each

individual authorized to represent the Participant in the proceeding exclusive of witnesses. An individual may appear on his or her own behalf. A corporation, limited liability company, association, partnership or governmental body may appear by any bona fide officer or designee who has the authority to act on behalf of the Participant. A Participant also may appear by an attorney.

(b) A Participant's written appearance shall state, with respect to each individual that the Participant identifies for service, the individual's name, address, telephone number, and facsimile number and email address, if available, where service shall be made.

A Participant may withdraw any individual from the Participant's representation or otherwise change the identity of individuals authorized to represent the Participant in a proceeding by filing a notice of a change in service list.

(c) Any attorney appearing on behalf of a Participant shall be licensed to practice law and in good standing before the Supreme Court of the United States or the highest court of any State, territory of the United States or the District of Columbia. All representatives appearing before the Hearing Body or Hearing Officer shall conform to the standards of ethical conduct required of practitioners before the courts of the United States.

(d) Individuals representing Participants in any hearing also shall enter their appearances at the beginning of the hearing by stating their names, addresses, telephone numbers and email addresses orally on the record.

1.4.9 Failure to Appear or Exercise Diligence

The failure of any Participant to appear during any hearing without good cause and without notification may be grounds for dismissal or deciding against the interests of such Participant.

1.4.10 Consolidation of Proceedings

(a) In the event that more than one Registered Entity receives a Notice of Alleged Violation for the same event or occurrence, and each Registered Entity selects the general hearing procedure described in Sections 1.4 to 1.7, the Hearing Body on its own motion or on motion of a Participant may exercise its discretion to examine the actions of all such Registered Entities in a single proceeding as long as an initial opinion has not been rendered by the Hearing Officer pursuant to Section 1.7.4 in any proceeding to be consolidated.

(b) A Participant may file a motion to consolidate into a single proceeding Alleged Violations of different Reliability Standards against a single Respondent, and related contests of Penalties or Mitigation Plans, arising out of the same event or occurrence. Such consolidation may be allowed in the discretion of the Hearing Officer or Hearing Body, as applicable.

1.5 Prehearing Procedure

1.5.1 [Intentionally left blank]

1.5.2 Prehearing Conference

(a) The Hearing Officer shall hold at least one prehearing conference, which may be the initial prehearing conference or a subsequently scheduled prehearing conference, for the following purposes:

(1) Preliminarily identify the issues and discuss the anticipated form of the hearing;

(2) Discuss a schedule for any discovery to be conducted and address any discovery issues that are raised at that time;

(3) Explore the possibility of obtaining admissions of fact and of the authenticity of Documents that would avoid unnecessary proof;

(4) Develop a schedule for the preparation and submission of evidence and witness testimony, including the disclosure of witnesses and exhibits and whether the use of pre-filed testimony may not be appropriate, in advance of the Evidentiary Hearing;

(5) Develop a schedule or schedules for any anticipated motions;

(6) Schedule a date(s) for the Evidentiary Hearing, which shall be within ninety (90) days of the prehearing conference described in this subsection, unless a different date or dates is specified by the Hearing Officer or the Hearing Body and with the consent of all Participants or for good cause shown; and

(7) Address such other matters as may aid in the simplification of the evidence and disposition of the proceeding.

(b) The Hearing Officer shall also hold a final prehearing conference prior to the Evidentiary Hearing, for the purpose of discussing:

(1) the anticipated duration of the hearing;

(2) the scheduling of witnesses' appearances to testify;

(3) the issues anticipated to be presented at the hearing;

(4) whether prehearing memoranda should be filed and if so, the schedule; and

(5) any other matters identified by the Hearing Officer for the management of the Evidentiary Hearing.

Participants may submit to the Hearing Officer, at least ten (10) days prior to the scheduled date of the final prehearing conference, a proposed list or lists of matters to be discussed at the final prehearing conference.

1.5.3 Summary Disposition

(a) Availability

A Hearing Officer, on the Hearing Officer's own motion or on the motion of a Participant, may issue an initial opinion granting, in whole or in part, summary disposition if it appears that there are no issues of material fact and a Participant is entitled to issuance of a final order in its favor.

(b) Motion for Summary Disposition and Responses

(1) A Participant moving for summary disposition must clearly identify the material facts that are not in dispute, demonstrate that there are no other material facts in dispute, and demonstrate that on the basis of the undisputed material facts, the Participant is entitled to issuance of a final order in its favor.

(2) A Participant opposing a motion for summary disposition must clearly identify in its response to the motion the material facts that the Participant contends remain in dispute, and/or explain why the moving Participant is not entitled to issuance of a final order in its favor even though there are no disputed issues of material fact.

(c) Summary Disposition on the Hearing Officer's Own Motion

If the Hearing Officer is considering summary disposition in the absence of a Participant motion, the Hearing Officer shall request the Participants to identify in writing any issues of material fact and to comment on the proposed disposition. Factual information in the Participants' comments shall be supported by affidavit. Following review of the Participants' comments, if it still appears to the Hearing Officer that there are no genuine issues of material fact, the Hearing Officer may proceed without an Evidentiary Hearing. The Hearing Officer shall, however, allow the Participants the opportunity to file briefs.

(d) Hearing Officer's Initial Opinion Granting Summary Disposition

When the Hearing Officer issues an initial opinion granting summary disposition in whole or in part, the ruling shall set forth the rationale for the grant. An initial opinion of the Hearing Officer granting summary disposition shall be confirmed, rejected or modified in a final order issued by the Hearing Body.

1.5.4 Status Hearings

Any Participant may request, and the Hearing Officer may call, a status hearing at any time subsequent to the initial prehearing conference to address issues that have arisen between the Participants or other matters relevant to the conduct of the hearing. Such issues may include, but are not limited to, discovery disputes and scheduling matters. A Participant requesting a status hearing to resolve a dispute shall include in its request a certification that it has made a good faith effort to resolve the dispute with the other Participant(s) before requesting the status hearing. The Hearing Officer shall direct the Clerk to issue a notice of status hearing that sets forth the date, time and place for the hearing, and identifies the matters to be addressed at the hearing.

1.5.5 Motions and Responses

(a) Unless otherwise provided in these Hearing Procedures or by the procedural schedule established by the Hearing Officer or Hearing Body, a Participant may file a motion at any time requesting any relief as may be appropriate. Unless the Hearing Officer allows a motion to be made orally on the record, motions shall be filed in writing. Motions based on facts that do not appear of record shall be supported by affidavit.

(b) Unless otherwise specified by the Hearing Officer or Hearing Body, responses to motions shall be filed within fourteen (14) days after service of the motion, and replies to responses shall be filed within seven (7) days after service of the responses. A Hearing Officer or Hearing Body may deny dilatory, repetitive, or frivolous motions without awaiting a response. Unless otherwise ordered by a Hearing Officer or Hearing Body, the filing of a motion does not stay the proceeding or extend any scheduled dates in the proceeding.

1.5.6 Experts

(a) A Participant may employ an expert(s) to testify or consult in a proceeding. Any expert utilized in either capacity shall sign an agreement evidencing the expert's understanding and acknowledgement of the non-public nature of the proceeding and that unauthorized public disclosure of information obtained in connection with the expert's participation in the proceeding is prohibited.

(b) The Participant employing the expert shall propose the agreement for approval by a motion, and its approval shall be subject, in addition to consideration of any objections by other Participants, to ensuring that appropriate safeguards are maintained to protect the confidentiality of the proceeding and the information disclosed therein.

1.5.7 Inspection and Copying of Documents in Possession of Staff

(a) Documents to be Available for Inspection and Copying

(1) Within twenty-five (25) days after the date the request for hearing is filed, Staff shall make available for inspection and copying by the other Participants, all Documents prepared or obtained by Staff through or in connection with any compliance monitoring processes that led to the institution of proceedings. Such Documents shall include but are not limited to:

(A) requests for information to the Respondent;

(B) every written request, including e-mail, directed to persons not employed by the Compliance Enforcement Authority to provide information or Documents or to be interviewed;

(C) the Documents provided in response to any such requests described in (A) and (B) above;

(D) all transcripts of testimony recorded during the Staff investigation and all exhibits to the transcript;

(E) all other Documents obtained from the Respondent; and

(F) all other Documents obtained from persons not employed by the Compliance Enforcement Authority.

The sole grounds on which Staff is authorized to withhold Documents from inspection and copying are the bases set forth in subsection 1.5.7(b); provided, however, that the Documents made available for inspection and copying need not include (i) exact copies of Documents the Respondent previously provided to Staff, and (ii) any Documents provided to the Respondent with or as part of the Notice of Alleged Violation, Notice of Penalty, assessment of proposed Mitigation Plan or Remedial Action Directive.

(2) Where there are Participants in a proceeding in addition to a single Respondent and Compliance Staff, the Hearing Officer or Hearing Body shall oversee the Staff's designation of Documents to be produced to such other Participants and the development, execution and enforcement of any protective order deemed necessary.

(3) Staff shall promptly inform the Hearing Officer and each other Participant if, after the issuance of a notice of hearing, requests for information are issued by Staff related to the same compliance monitoring process(es) that led to the institution of the proceeding. If Staff receives Documents pursuant to a request for information after Staff has made Documents available for inspection and copying as set forth in subsection (a)(1), the additional Documents shall be made available to the Participants not later than fourteen (14) days after Staff receives such Documents. If a date for the Evidentiary Hearing has been scheduled, Staff shall make the additional Documents available to the other Participants not less than ten (10) days before the Evidentiary Hearing. If Staff receives such Documents ten or fewer days before the Evidentiary Hearing is scheduled to begin or after the Evidentiary Hearing begins, Staff shall make the additional Documents available immediately to the other Participants.

(4) Nothing in subsection (a)(1) shall limit the discretion of the Compliance Enforcement Authority to make any other Document available to the Participants or the authority of the Hearing Officer to order the production of any other Documents or information by any Participant.

(b) Documents That May Be Withheld by Staff

(1) Staff may withhold a Document from inspection and copying by a Participant if:

(A) the Document is privileged to the Compliance Enforcement Authority or constitutes attorney work product of counsel for the Compliance

Enforcement Authority (in applying this provision, the attorney-client privilege shall be recognized as absolute and any demand for production of attorney work product shall be granted only after a showing of substantial need by the Respondent or other Participant);

(B) the Document is an examination or inspection report, an internal memorandum, or other note or writing prepared by a Staff member that will not be offered in evidence or otherwise relied on by Staff in the hearing;

(C) the Document would disclose

(i) an examination, investigatory or enforcement technique or guideline not otherwise made public of the Compliance Enforcement Authority, a federal, state, or foreign regulatory authority, or a self-regulatory organization;

(ii) the identity of a source, including a federal, state, or foreign regulatory authority or a self-regulatory organization, that furnished information or was furnished information on a confidential basis regarding an investigation, an examination, an enforcement proceeding, or any other type of civil or criminal enforcement action; or

(iii) an examination, an investigation, an enforcement proceeding, or any other type of civil or criminal enforcement action under consideration by, or initiated by, the Compliance Enforcement Authority, a federal, state, or foreign regulatory authority, or a self-regulatory organization; or

(D) the Hearing Officer grants leave to withhold a Document or category of Documents as not relevant to the subject matter of the proceeding, or for other good cause shown.

Provided, that where a Document contains information of the type listed in subsections (A), (B), (C) or (D) that is capable of being redacted, Staff shall make the Document available for inspection and copying by the other Participants in redacted form.

(2) Nothing in subsections (b)(1)(B), (C) or (D) authorizes Staff to withhold a Document, or a part thereof, that contains exculpatory evidence. Nothing in subsection (b)(1) requires Staff to withhold a Document from disclosure.

(c) Withheld Document List

At the time it is required to make Documents available for inspection and copying, Staff shall also provide to the Hearing Officer, the Respondent and any other Participant to which Documents are being made available, a list of Documents withheld by Staff pursuant to

subsection (b)(1), with a statement of the grounds that support withholding the Document. Upon review, for good cause shown, the Hearing Officer may order Staff to make any Document withheld, other than a Document that is subject to the attorney-client privilege, available to the other Participants for inspection and copying.

(d) Timing of Inspection and Copying

Except as set forth in this Section, the Hearing Officer shall determine the schedule of production of Documents for inspection and copying, provided that the Hearing Officer may modify any time period for production set forth in this Section as warranted by the circumstances.

(e) Place and Time of Inspection and Copying

Documents subject to inspection and copying pursuant to this Section shall be made available to the Respondent and other Participants for inspection and copying at the Compliance Enforcement Authority office where the Documents are ordinarily maintained, or at such other office as the Hearing Officer, in his or her discretion, shall designate, or as the Participants otherwise agree. A Participant shall be given access to the Documents at the Compliance Enforcement Authority's offices during normal business hours. A Participant shall not be given custody of the Documents or be permitted to remove the Documents from the Compliance Enforcement Authority's offices, other than copies of Documents made available by the Compliance Enforcement Authority for that purpose.

(f) Copying Costs

A Participant may obtain a photocopy of all Documents made available for inspection. A Participant shall be responsible for the cost of photocopying. Unless otherwise ordered by the Hearing Officer, charges for copies made at the request of a Participant shall be at a rate to be established by the Compliance Enforcement Authority.

(g) Failure to Make Documents Available — Harmless Error

In the event that a Document required to be made available to a Participant pursuant to this Section is not made available by Staff, no rehearing or amended decision of a proceeding already heard or decided shall be required where the failure to make the Document available was harmless error. Should a dispute arise as to whether a rehearing or amended decision is required due to the failure of Staff to produce a Document, the burden shall be on Staff to show that such failure was harmless error. The Hearing Officer, or, upon review, the Hearing Body shall determine whether the failure to make the Document available was harmless error.

1.5.8 Other Discovery Procedures

(a) In addition to the production of Documents by Staff for inspection and copying by Respondent and other Participants pursuant to Section 1.5.7, the Participants shall be entitled to utilize all other discovery methods provided for in Rules 402 through 409 of the FERC Rules of Practice and Procedure, 18 C.F.R. §385.402 through 385.409, including data requests, written interrogatories and requests for production of Documents or things, depositions by oral

examination, requests for inspection of Documents and other property, requests for admissions, and requests for issuance of orders to one or more Registered Entities to produce Documents for inspection and copying or at the hearing or to provide testimony by an authorized representative in deposition or at the hearing.

(b) Unless otherwise directed by the Hearing Officer or Hearing Body upon motion by a Participant, or by the Hearing Officer, or by the Hearing Body on its own motion, such discovery, and the resolution of any disputes concerning such discovery, shall be conducted in accordance with the provisions of Rules 402 through 410 and 510(e) of the FERC Rules of Practice and Procedure, 18 C.F.R. §385.402 through 385.410 and 385.510(e), which are hereby incorporated by reference into these Hearing Procedures, subject to the following limitations and modifications to such Rules:

(1) The provisions of subsections (d), (e) and (f) of Section 1.5.7 shall apply to any such discovery.

(2) Rule 403(b)(2) (18 C.F.R. §385.403(b)(2)) and Rule 410(d)(2) (18 C.F.R. §385.410(d)(2)) shall not be applicable.

(3) The Hearing Officer and the Hearing Body have the authority to issue orders to compel the appearance by or production of Documents or information by, only a Person that (i) is a Participant or (ii) is a Registered Entity (including an authorized representative thereof) that is not a Participant. The Hearing Officer and the Hearing Body do not have authority to require a United States marshal or deputy marshal to serve an order to produce or provide Documents, information or testimony.

(4) References to "subpoena" in Rules 404, 409, 410 and 510(e) shall be deemed to be to an order to a non-Participant Registered Entity to produce or provide Documents, information or testimony.

(5) References to the "Commission" in Rules 402 through 410 and 510(e) shall be to FERC except as follows:

(i) the references in Rules 402(a), 404(b)(1) and 405(b), the second reference in Rule 410(d), and the references in Rule 510(e)(1) and (2) shall be deemed to be to the Hearing Body,

(ii) the reference in Rule 385.406(b)(4) to "Commission trial staff" shall be deemed to be to Compliance Staff, and

(iii) the reference in Rule 510(e)(3) shall be deemed to be to the Hearing Officer or Hearing Body.

(6) Unless otherwise ordered by the Hearing Officer or Hearing Body, a data request, set of interrogatories, request for production of Documents or things, request for inspection of Documents or other property, request for admissions, or order to

produce or provide Documents, information or testimony, shall not specify a due date or response date that is fewer than 21 days from the date of service of the request or date of the order.

(7) A list of withheld Documents, if any, shall be provided by any Participant required to produce Documents, at the time the Documents are required to be produced, to the Hearing Officer and to each Participant entitled to receive production of the Documents. Upon review, for good cause shown, the Hearing Officer may order the Participant to make any Document withheld available to any other Participant or Participants for inspection and copying.

(8) In the event a Document or information required to be produced or provided by a Participant pursuant to discovery is not produced or provided by the Participant, no rehearing or amended decision of a proceeding already heard or decided shall be required where the failure to produce or provide the Document or information was harmless error. Should a dispute arise as to whether a rehearing or amended decision is required due to the failure of a Participant to produce or provide a Document or information, the burden shall be on the Participant that failed to produce or provide the Document or information to show that such failure was harmless error. The Hearing Officer or, upon review, the Hearing Body shall determine whether the failure to make the Document available was harmless error.

(9) Unless otherwise ordered by the Hearing Officer or Hearing Body, all such discovery shall be requested, scheduled and conducted so as to be completed within six (6) months following the date the request for hearing was filed.

(10) Notwithstanding subsections (b)(6) and (b)(9), however, if the shortened hearing procedure in Section 1.3.4 is used in a proceeding, the Hearing Officer, on his or her own motion or on motion of a Participant, shall establish a schedule for discovery, including response periods for responding to discovery requests, that are consistent with the expedited nature of the proceeding contemplated by the shortened hearing procedure.

(c) The Hearing Officer's ruling on all motions relating to disputes concerning such discovery shall consider the following objectives:

(1) full disclosure of all relevant Documents and information;

(2) the exercise of due diligence in the conduct of discovery by a Participant; and

(3) disallowing use of discovery as a means to delay the proceeding or to harass or burden any other Participant.

1.5.9 Pre-Evidentiary Hearing Submission of Testimony and Evidence

(a) Unless the Hearing Officer orders otherwise and with the exception of (i) any adverse Participant examination pursuant to Section 1.6.16 and (ii) the testimony and Documents of a non-Participant provided pursuant to an order to produce or provide Documents, information or testimony, all witness direct testimony to be submitted in an Evidentiary Hearing must be prepared in written form, may have exhibits, schedules and attachments thereto, and shall be filed in advance of the Evidentiary Hearing pursuant to a schedule determined by the Hearing Officer, as it may be amended.

(b) Where a Participant intends to use a Document or other demonstrative evidence that has not been filed as part of written testimony in the conduct of cross-examination (other than Documents that are to be produced by a non-Participant at the hearing pursuant to an order to produce Documents), the Participant intending to use such Document or demonstrative evidence shall provide it to the other Participants and the Hearing Officer at least three (3) business days prior to the date at which the witness will be cross-examined at a Testimonial Hearing.

(c) Compliance Staff shall file the Documents it intends to offer into evidence as its direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, first. The Registered Entity shall file the Documents it intends to offer into evidence as its direct case, which also may be responsive to Staff's direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, second. Staff shall file as its rebuttal case the Documents it intends to offer into evidence in response to the Registered Entity's direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, third.

(d) If appropriate due to the number and/or complexity of the issues, the Hearing Officer may allow for the Registered Entity to submit a rebuttal case that responds to Staff's rebuttal case, in which event the Hearing Officer shall also allow Staff to submit a surrebuttal case that responds to the Registered Entity's rebuttal case.

(e) Each round of evidence shall be limited in scope to responding to the preceding round of evidence, except that the Registered Entity's direct case may exceed the scope of Staff's direct case if necessary for the Registered Entity to set forth its direct case fully.

(f) The Participants shall file the Documents they intend to offer into evidence in accordance with the Hearing Officer's schedule, as it may be amended. Such filings of written testimony and other evidence in advance of the Evidentiary Hearing shall not entitle the Documents to be admitted into the evidentiary record. The Participants must offer their witnesses' testimony and other proposed evidence for admission into the evidentiary record during the Evidentiary Hearing.

(g) Any Participant who fails, without good cause shown, to comply with the Hearing Officer's schedule for the filing of written testimony and other evidence in advance of the Evidentiary Hearing may be limited in the presentation of its evidence during the Evidentiary Hearing or have its participation in the Evidentiary Hearing otherwise restricted by the Hearing Officer to avoid undue prejudice and delay.

1.5.10 Protective Orders

(a) All proceedings conducted pursuant to these Hearing Procedures, and any written testimony, exhibits, other evidence, transcripts, comments, briefs, rulings and other issuances, shall be non-public and shall be held in confidence by all Participants, except as the ERO (within the U.S., in accordance with the authorization previously granted by FERC to release information about a non-public proceeding) or FERC (in the case of U.S.-related information) or another Applicable Governmental Authority (in the case of non-U.S.-related information) authorizes or directs public disclosure of any portion of the record. In addition to this general proscription, at any time during a proceeding, the Hearing Officer, on his or her own motion or on the motion of any Participant or of any non-Participant ordered to produce Documents, information or testimony, may enter a protective order to designate as proprietary and protect the confidential, proprietary or trade secret nature of any data, information or studies, or any other information the public release of which may cause a security risk or harm to a Participant.

(b) The following types of information will be considered entitled to protection through a protective order:

(1) Confidential Business and Market Information, including information that is proprietary, commercially valuable, or competitively sensitive;

(ii) Critical Energy Infrastructure Information;

(iii) information related to a Cyber Security Incident;

(iv) personnel information that identifies or could be used to identify a specific individual, or that reveals personnel, financial, medical or other personal information;

(v) audit work papers;

(vi) investigative files or Documents that would disclose investigative techniques of Staff, any Compliance Enforcement Authority, the ERO or any federal, state or foreign regulatory authority.

Nothing in this subsection 1.5.10(b) shall require Staff to produce any Documents it is entitled to withhold under subsection 1.5.7(b).

(c) A motion for a protective order shall specify the proposed expiration date for the proprietary status of the data, Documents or information, if any, and shall propose requirements or safeguards to be met for individuals participating in the proceeding to review the protected information while maintaining its proprietary status.

(d) A Document submitted and marked as proprietary, or a statement made at a hearing and identified as proprietary, shall be afforded proprietary treatment pending the timely submission of a motion to protect the confidential, proprietary or trade secret nature of that Document or statement and a ruling on such a motion by the Hearing Officer.

(e) The protective order shall identify the data, Documents or information that will be accorded proprietary treatment; the individuals participating in the proceeding, by category or otherwise, entitled to view the proprietary information; and the requirements, conditions or safeguards that must be met before an individual may view the information.

(f) A public redacted version of each Document and transcript that contains information that is protected pursuant to this Section must be filed with the proprietary version and must be served on each Participant for distribution to those individuals participating in the proceeding who are not entitled to view the proprietary information.

(g) Should it be necessary to address proprietary information during a hearing, the Hearing Officer shall, while the information is being addressed, close the hearing to all individuals other than those entitled to view or hear the proprietary information in accordance with the protective order.

1.5.11 Pre-Evidentiary Hearing Memorandum

(a) The Hearing Officer or the Hearing Body may request the submission of memoranda prior to the Evidentiary Hearing that set forth each Participant's position on the issue(s) in dispute, the key facts and arguments, the applicable Reliability Standard, rules, orders or other authority, and such other matters as may be directed by the Hearing Officer or the Hearing Body.

(b) The purpose of such memoranda will be to aid the Hearing Officer and Hearing Body in preparation for the Evidentiary Hearing. A Participant will not be deemed to have waived any issue, fact or argument that is not set forth in a pre-Evidentiary Hearing memorandum.

(c) The Hearing Officer may establish word limitations on such submissions.

1.5.12 Certification of Questions to the NERC Board of Trustees

(a) Should a hearing present a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the proceeding in whole or in part, and as to which there are other extraordinary circumstances that make prompt consideration of the question by the NERC Board of Trustees appropriate, the Hearing Officer, on his or her own motion or on motion of a Participant, may recommend to the Hearing Body that it certify, or the Hearing Body on its own motion may decide to certify, the question to the Board of Trustees for determination pursuant to Section 412 of the Rules of Procedure.

(b) If the Hearing Officer, on his or her own motion, or the Hearing Body, on its own motion, wishes to present a question to the Hearing Body for certification to the NERC Board of Trustees, the Hearing Officer shall first provide the Participants the opportunity to submit memoranda addressing whether the question should be certified and the precise terms of the question to be certified.

(c) If a Participant files a motion requesting, or the Hearing Officer determines on his or her own motion, that a question should be certified to the Board of Trustees, the Hearing Officer shall submit a written recommendation on the matter to the Hearing Body. If the request for certification is based on the motion of a Participant, the Hearing Officer shall also submit to the Hearing Body the motion and any answers to the motion that were filed. If the request for

certification is on the Hearing Officer's own motion, the Hearing Officer shall also submit to the Hearing Body the Participants' memoranda that were filed pursuant to subsection (b).

(d) Questions of fact presented by the particular matter in dispute in a hearing shall not be the subject of a certification to the Board of Trustees.

(e) The Hearing Body shall determine, based on the criteria specified in subsection (a), whether the proposed question shall be certified to the Board of Trustees for determination. To certify the proposed question, the Hearing Body must determine that the question is a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the proceeding, in whole or in part, and that there are extraordinary circumstances that make prompt consideration of the question by the Board of Trustees appropriate. If the Hearing Body determines that the proposed question should be certified to the Board of Trustees, the Hearing Body shall also determine whether the hearing should be suspended, in whole or in part, while the question is pending before the Board of Trustees for determination.

(f) As provided in Rule of Procedure Section 412, the Board of Trustees may decide to reject a proposed certification from a Hearing Body.

(f) If the Board of Trustees accepts certification of a question and issues a determination on the question, the hearing shall proceed following the determination in accordance with the Board of Trustees' decision.

1.6 Procedure at Evidentiary Hearing

1.6.1 Purpose of Evidentiary Hearing

The purpose of the Evidentiary Hearing shall be to admit the Participants' evidence into the record, and for each Participant to have the opportunity to cross-examine the other Participant's witnesses. A schedule for briefs, unless waived by the Participants, shall be set at the conclusion of the Evidentiary Hearing.

1.6.2 Order of Receiving Evidence

In all proceedings Compliance Staff shall open and close.

1.6.3 Opening and Closing Statements

Opening and closing statements will not be made during the Evidentiary Hearing as a matter of course except that such statements may be allowed when requested by a Participant, and shall be required when requested by the Hearing Officer or the Hearing Body. Any Participant's request for such statements, or a Hearing Officer or Hearing Body notice requiring such statements, shall be made at least ten (10) days in advance of the start of the Evidentiary Hearing.

1.6.4 Right of Participant to Present Evidence

Subject to compliance with the requirements of these Hearing Procedures concerning the timing of submission of written testimony and other evidence, a Participant has the right to present such

evidence, to make such objections and arguments, and to conduct such cross-examination as may be necessary to assure the true and full disclosure of the facts.

1.6.5 Exhibits

(a) All material offered in evidence, except oral testimony allowed by the Hearing Officer or the testimony of a non-Participant pursuant to an order to produce or provide Documents, information or testimony, shall be offered in the form of an exhibit.

(B) Each exhibit must be marked for identification. A Participant must provide the court reporter with two (2) copies of every exhibit that the Participant offers into evidence, and will provide copies of any exhibit not served in advance of the Evidentiary Hearing to the Participants and the Hearing Officer.

1.6.6 Witness Attendance at Testimonial Hearing

(a) Each witness shall attend the Testimonial Hearing in person unless a Participant has been informed in advance of the Testimonial Hearing that all other Participants waive cross-examination of the witness and neither the Hearing Officer nor the members of the Hearing Body have any questions for the witness, in which event the witness does need not be present at the Testimonial Hearing.

(b) A person compelled to appear, voluntarily testifying, or making a statement may be accompanied, represented and advised by an attorney.

(c) All testimony offered at a Testimonial Hearing is to be under oath or affirmation. If a witness is not required to attend the Testimonial Hearing, then the Participant on whose behalf the witness prepared testimony shall submit an affidavit of the witness attesting to the veracity of the witness' testimony, and the Participant shall be allowed to introduce the witness' testimony, and the exhibits, schedules and attachments thereto, into the evidentiary record based on such affidavit.

1.6.7 Admission of Evidence

(a) Compliance Staff shall offer its exhibits into evidence first and the Registered Entity second, unless the Participants agree otherwise.

(b) Except for witnesses who are not required to attend the Testimonial Hearing, the Participants shall call each witness in turn. Following the witness' swearing in, the witness shall attest to the veracity of his or her written testimony. The witness may identify any language and/or figures in his or her written testimony or exhibits that the witness would like to change or correct. Subject to objection, such changes or corrections may be allowed at the Hearing Officer's discretion for the purpose of obtaining a full, accurate and complete record without imposing undue delay or prejudice on any Participant. The Participant whose witness has made changes or written corrections to written testimony and exhibits shall file corrected copies with the Clerk and provide corrected copies to the Hearing Officer and other Participant.

(c) Once a witness has attested to the veracity of his or her testimony, the Participant on whose behalf the witness is testifying shall move for admission of the witness' testimony,

including all exhibits, schedules and attachments thereto, into evidence. Other Participants may object to the introduction of the witness' testimony, or any part thereof, as set forth in Section 1.6.11. Subject to the Hearing Officer's ruling on the objection, the witness' testimony shall be admitted into evidence.

(d) The witness shall then be turned over for cross-examination by other Participants, and for any questions by the Hearing Officer or any member of the Hearing Body, in accordance with Section 1.6.14, and then for redirect examination in accordance with Section 1.6.15. Witnesses shall be cross-examined on all previously-served testimony (direct, rebuttal or surrebuttal) when they first take the witness stand.

(e) Except (i) in exceptional cases and upon a showing of good cause and (ii) witnesses testifying pursuant to an order to produce or provide Documents, information or testimony issued to a non-Participant, no witness shall be allowed to testify unless a Participant has served the witness' written testimony in advance of the Testimonial Hearing in accordance with the schedule established by the Hearing Officer. Due to the undue prejudice such surprise witness testimony would impose on other Participants, it is the Compliance Enforcement Authority's policy to discourage witness testimony at a Testimonial Hearing when a Participant has not served the witness' written testimony in advance of the Testimonial Hearing. If such testimony is allowed, sufficient procedural steps shall be taken by the Hearing Officer to provide the other Participants with a fair opportunity for response and cross-examination.

1.6.8 Evidence that is Part of a Book, Paper or Document

(a) When relevant and material matter offered in evidence is embraced in a book, paper or Document containing other matter that is not material or relevant, the Participant offering the same must plainly designate the matter offered as evidence, and segregate and exclude the material not offered to the extent practicable.

(b) If the material not offered is in such volume as would unnecessarily encumber the record, such book, papers or Document will not be received in evidence but may be marked for identification and, if properly authenticated, the relevant or material matter may be read into the record, or, if the Hearing Officer so directs, a separate copy of such matter in proper form shall be offered as an exhibit.

(c) All other Participants shall be afforded an opportunity to examine the book, paper or Document and to offer in evidence in like manner other portions thereof if found to be material and relevant.

1.6.9 Stipulations

The Participants may stipulate to any relevant fact or the authenticity of any relevant Document. Stipulations may be made in writing or entered orally in the record. Notwithstanding stipulation, the Hearing Officer may require evidence of the facts stipulated in order to provide a complete evidentiary record on which to base the final order.

1.6.10 Official Notice

(a) Where relevant and material to the subject matter of the proceeding, the Hearing Officer may, upon request of a Participant, take official notice of any of the following:

(1) Rules, regulations, administrative rulings and orders, written policies of governmental bodies, and rulings and orders of other Compliance Enforcement Authorities.

(2) The orders, transcripts, exhibits, pleadings or any other matter contained in the record of other docketed proceedings of the Compliance Enforcement Authority.

(3) State, provincial and federal statutes and municipal and local ordinances.

(4) The decisions of state, provincial and federal courts.

(5) Generally recognized scientific or technical facts within the specialized knowledge of the Compliance Enforcement Authority.

(6) All other matters of which the courts of the United States may take judicial notice.

(b) All requests to take official notice shall be submitted in advance of the Evidentiary Hearing in accordance with a schedule established by the Hearing Officer. Before ruling on a request to take official notice, the Hearing Officer shall afford the other Participant opportunity to object or to show the contrary to the matter for which official notice is requested.

(c) An accurate copy of any item officially noticed shall be introduced into the record in the form of an exhibit presented by the Participant requesting official notice unless waived by the Participants and approved by the Hearing Officer. Any information officially noticed and not presented as an exhibit shall be set forth in a statement on the record.

1.6.11 Admissibility of Evidence

(a) Any evidence offered, including that included in a book, paper or Document pursuant to Section 1.6.8, shall be subject to appropriate and timely objections. Any Participant objecting to the admission or exclusion of evidence must state the grounds for objection.

(b) The admission of evidence shall not be limited by the generally recognized rules of evidence as applied in the courts of the United States or of the states, although the Hearing Officer may take such rules of evidence into consideration in ruling on the admissibility of evidence. The Hearing Officer will exercise discretion in the admission of evidence based upon arguments advanced by the Participants, and shall admit evidence if it is of a type commonly relied upon by reasonably prudent persons in the conduct of their affairs. The Hearing Officer may only exclude material from the record in response to a motion or objection by a Participant.

(c) Formal exception to a ruling on admissibility of evidence need not be taken to be preserved.

1.6.12 Offer of Proof

Any Participant who has had evidence excluded may make an offer of proof on the record. The offer of proof may consist of a statement made on the record of the substance of the evidence that the Participant claims would have been adduced, or any written or documentary exhibit that the Participant sought to introduce. Any such exhibit shall be retained as part of the record.

1.6.13 Reservation of Evidentiary Ruling

(a) The Hearing Officer shall rule upon any objection to the admissibility of evidence at the time the objection is made; provided that the Hearing Officer has discretion to reserve such a ruling or to require the Participants to file written arguments in relation thereto.

(b) If the Hearing Officer reserves the ruling, appropriate steps shall be taken during the Evidentiary Hearing to ensure a full, complete and accurate record in relation to the objected to evidence in the event the objection to the evidence's admissibility is overruled.

1.6.14 Cross-Examination

(a) Each witness shall be tendered for cross-examination subsequent to the admission of the witness' testimony into the evidentiary record. Each Participant shall have the right to cross-examine each witness of any other Participants. A Participant may waive cross-examination of any witness. Leading questions are permitted on cross-examination.

(b) The credibility of a witness may be attacked by any Participant, including the Participant calling the witness.

(c) The Hearing Officer and any member of the Hearing Body may ask the witness questions following the conclusion of the witness' cross-examination by the other Participant, and prior to the witness' redirect examination pursuant to Section 1.6.15.

1.6.15 Redirect Examination

A Participant shall be entitled to conduct redirect examination of each of the Participant's witnesses who are subject to cross-examination or questions of the Hearing Officer or a member of the Hearing Body. Any redirect examination shall be limited in scope to the witness' cross-examination and questions of the Hearing Officer and members of the Hearing Body.

1.6.16 Examination of Adverse Participant

(a) Any Participant may call any adverse Participant, or any employee or agent thereof, during the Testimonial Hearing to provide oral testimony on the Participant's behalf, and may conduct such oral examination as though the witness were under cross-examination.

(b) If a Participant intends to call an adverse Participant for examination, it shall give notice to the Hearing Officer and all other Participants setting forth the grounds for such examination at least fourteen (14) days in advance of the Testimonial Hearing, and the Participant who, or whose employee or agent, is sought to be called shall file any objection at least seven (7) days in advance of the Testimonial Hearing.

(c) Any Participant may conduct oral examination of a witness testifying pursuant to an order to produce or provide Documents, information or testimony issued to a non-Participant, as though the witness were under cross-examination.

1.6.17 Close of the Evidentiary Record

(a) The Hearing Officer shall designate the time at which the evidentiary record will be closed, which will typically be at the conclusion of the Evidentiary Hearing.

(b) Evidence may not be added to the evidentiary record after it is closed, provided that, prior to issuance of the Hearing Body's final order, the Hearing Officer may reopen the evidentiary record for good cause shown by any Participant. For the purpose of reopening the evidentiary record, newly discovered evidence that is material to the issues in dispute and could not, by due diligence, have been discovered prior to or during the Evidentiary Hearing, shall constitute good cause.

1.7 Post- Evidentiary Hearing Procedure

1.7.1 Briefs

(a) At the close of the Evidentiary Hearing, Participants may file initial and reply briefs.

(b) Briefs shall be concise, and, if in excess of twenty (20) pages, excluding appendices, shall contain a table of contents. Statements of fact should be supported by record citations.

(c) The Hearing Officer will prescribe the time for filing briefs, giving due regard to the nature of the proceeding, the extent of the record, the number and complexity of the issues, and the objective of expedition.

(d) Unless the Hearing Officer prescribes otherwise, all Participants shall file initial and reply briefs simultaneously.

(e) Participants' reply briefs shall be limited in scope to responding to arguments and issues raised in other Participants' initial briefs.

(f) The Hearing Officer may allow oral closing statements to be made on the record in lieu of briefs.

(g) The Hearing Officer may establish reasonable word limitations applicable to briefs.

1.7.2 Other Pleadings

Post-hearing pleadings other than briefs are permitted, but, absent good cause shown, such pleadings may not seek to introduce additional evidence into the record.

1.7.3 Draft Initial Opinions

The Hearing Officer may permit or require Participants to file draft initial opinions that set forth the Participants' proposed findings of fact and conclusions.

1.7.4 Hearing Officer's Initial Opinion

(a) At the conclusion of the Evidentiary Hearing, and following the submission of initial and reply briefs and draft orders, if any, the Hearing Officer shall prepare an initial opinion for the Hearing Body's review and consideration.

(b) The initial opinion shall include a statement of each finding and conclusion, and the reasons or basis therefore, for all material issues presented on the record. The initial opinion also shall contain the appropriate orders to dispose of the proceeding, including any Penalty, Mitigation Plan or Remedial Action Directive that the Hearing Officer proposes the Hearing Body require.

(c) The initial opinion shall note if the subject of the proceeding has been deemed to involve a Cyber Security Incident, if any information in the proceeding was deemed to be Critical Energy Infrastructure Information, or if any information in the proceeding is the subject of a protective order pursuant to Section 1.5.10.

1.7.5 Exceptions

(a) Within twenty-one (21) days after service of the initial opinion, or such other time as is fixed by the Hearing Officer, any Participant may file exceptions to the initial opinion in a brief designated "brief on exceptions" and, within fourteen (14) days after the time for filing briefs on exceptions or such other time as is set by the Hearing Officer, any Participant may file as a reply, a "brief in reply to exceptions."

(b) Exceptions and replies thereto with respect to statements, findings of fact or conclusion in the initial opinion must be specific and must be stated and numbered separately in the brief. With regard to each exception, the Participant must specify each error asserted, and include a concise discussion of any policy considerations applicable and any other evidence and arguments in support of the Participant's position. Suggested replacement language for all statements to which exception is taken must be provided. Exceptions and arguments may be filed (1) together in one brief; or (2) in two separate documents, one designated as the brief containing arguments, and the other designated "Exceptions," containing the suggested replacement language.

(c) Arguments in briefs on exceptions and replies thereto shall be concise and, if in excess of twenty (20) pages, shall contain a table of contents.

(d) Participants shall not raise arguments in their briefs in reply to exceptions that are not responsive to any argument raised in any other Participant's brief on exceptions.

(e) Statements of fact should be supported by citation to the record.

(f) The Hearing Officer may establish reasonable word limitations applicable to arguments included in briefs on exception and briefs in reply to exceptions. Such word limitations shall not apply to a Participant's proposed replacement language.

(g) Unless good cause is shown, if a Participant does not file a brief on exceptions, or if a Participant filed a brief on exceptions that does not object to a part of the initial opinion,

the Participant shall be deemed to have waived any objection to the initial opinion in its entirety, or to the part of the initial opinion to which the Participant did not object, whichever applies. This provision shall not prohibit the Participant, in its brief in reply to exceptions, from responding to another Participant's exceptions to such part of the initial opinion or from proposing alternative replacement language to the replacement language proposed by the other Participant for such part of the initial opinion.

1.7.6 Oral Argument

(a) The Hearing Body may elect to hear oral argument. If oral argument is held without briefs having been filed, Participants will be given the opportunity to present argument on all issues.

(b) If oral argument is held where briefs have been filed, argument may be limited to issues identified by the Hearing Body. The Hearing Body will direct the Clerk to issue a notice of oral argument that identifies the date, time, place and issues for the argument.

(c) The presentation of written materials or visual aids is permitted at oral argument. To the extent such materials or aids contain factual information, they shall be supported by the record, and contain accurate citations to the record. Such materials or aids may not contain new calculations or quantitative analyses not presented in the record, unless they are based on underlying data contained in the record. Copies of all written materials or visual aids to be presented at oral argument shall be served on all Participants not less than forty-eight (48) hours prior to the time and date of oral argument.

1.7.7 Additional Hearings

After the evidentiary record has been closed but before issuance of the Hearing Body's final order, the Hearing Officer may reopen the evidentiary record and hold additional hearings. Such action may be taken on the Hearing Officer's or the Hearing Body's own motion if there is reason to believe that reopening is warranted by any changes in conditions, or by the need to compile a complete evidentiary record on which to base the final order. Any Participant may file a motion to reopen the record, which shall contain the reasons for reopening, including material changes in conditions or the identification of additional evidence that should be included in the record, and a brief statement of proposed additional evidence and an explanation why such evidence was not previously adduced.

1.7.8 Hearing Body Final Order

(a) Following the receipt of the initial opinion, any exceptions and replies thereto, and oral argument, if any, the Hearing Body shall issue its final order.

(b) Issuance of a final order shall require (i) a quorum of the Hearing Body, which shall be (after any recusals, disqualifications and appointments of replacement members) at least fifty (50) percent of the number of members normally assigned to the Hearing Body, and (ii) majority vote of the members of the Hearing Body voting on the final order (which number of members voting shall not be less than a quorum).

(c) The Hearing Body shall strive, but shall not be required, to issue its final order within thirty (30) days following the last to occur of the initial opinion, exceptions or replies thereto, or oral argument. The final order may adopt, modify, amend or reject the initial opinion in its entirety or in part. The final order shall include a statement of each finding and conclusion, and the reasons or basis therefore, for all material issues presented on the record.

(d) The Hearing Body will base its determinations in the final order on the record. The final order also shall contain the appropriate orders to dispose of the proceeding, including any Penalty, Remedial Action Directive or Mitigation Plan required.

(e) The final order shall note if the subject of the proceeding has been deemed to involve a Cyber security Incident, if any information in the proceeding was deemed to be Critical Energy Infrastructure Information, or if any information in the proceeding is the subject of a protective order issued pursuant to Section 1.5.10.

(f) The service of the final order shall include a notice informing the Participants of their appeal rights to the ERO or to FERC, as applicable.

1.7.9 The Record

The Clerk shall maintain the record for all dockets. The record shall include any of the following, including all attachments thereto and Documents filed therewith, that exist in any docket:

(1) Notice of Alleged Violation and Registered Entity's response thereto;

(2) Registered Entity's proposed Mitigation Plan and Staff's statement identifying its disagreement(s) therewith;

(3) Remedial Action Directives and the Registered Entity's notice contesting the Remedial Action Directive;

(4) Registered Entity's request for a hearing;

(5) Participant filings, motions, and responses;

(6) Notices, rulings, orders and other issuances of the Hearing Officer and Hearing Body;

(7) Transcripts;

(8) Evidence received;

(9) Written comments submitted in lieu of written testimony;

(10) Matters officially noticed;

(11) Offers of proof, objections and rulings thereon, and any written or documentary evidence excluded from the evidentiary record;

(12) Pre-Evidentiary Hearing memorandums, briefs, and draft opinions;

(13) Post-hearing pleadings other than briefs;

(14) The Hearing Officer's initial opinion;

(15) Exceptions to the Hearing Officer's initial opinion, and any replies thereto;

(16) The Hearing Body's final order and the Clerk's notice transmitting the final order to the Participants;

(17) All notices of ex parte communications; and

(18) Any notifications of recusal and motions for disqualification of a member of the Hearing Body or Hearing Officer or Technical Advisor and any responses or replies thereto.

1.7.10 Appeal

A Participant or a Regional Entity acting as the Compliance Enforcement Authority, may appeal a final order of the Hearing Body to NERC in accordance with Rule of Procedure Section 409.

1.8 Settlement

Settlements may be entered into at any time pursuant to Section 5.6 of the NERC Compliance Monitoring and Enforcement Program and the Compliance Enforcement Authority's settlement procedures, provided, that (i) the Compliance Enforcement Authority may decline to engage in or continue settlement negotiations after a Possible Violation or Alleged Violation becomes a Confirmed Violation, and (ii) the Compliance Enforcement Authority, the Registered Entity or any other Participant may terminate settlement negotiations at any time.

1.9 Remedial Action Directives

1.9.1 Initiation of Remedial Action Directive Hearing

(a) Staff may issue a Remedial Action Directive to a Registered Entity at any time, including during any proceeding related to an Alleged Violation of a Reliability Standard. The Remedial Action Directive shall be delivered to the Registered Entity in accordance with Section 7.0 of the NERC Compliance Monitoring and Enforcement Program. The Compliance Enforcement Authority will notify NERC within two (2) business days after its Staff issues a Remedial Action Directive.

(b) The Registered Entity may contest the Remedial Action Directive by filing a written notice with the Clerk of the Compliance Enforcement Authority that states that the Registered Entity contests the Remedial Action Directive and that the Registered Entity requests a Remedial Action Directive hearing. The Registered Entity shall attach a copy of the Remedial Action Directive to its written notice. The Registered Entity must provide such notice within two (2) business days following the date of actual receipt (as defined in Section 7.0 of the NERC Compliance Monitoring and Enforcement Program) of the Remedial Action Directive. If the

Registered Entity does not give written notice to the Compliance Enforcement Authority within the required time period, the Registered Entity shall be deemed to have waived its right to contest the Remedial Action Directive.

(c) The Clerk shall assign a docket number, and issue a notice of hearing that sets forth the date, time and place at which the hearing will convene.

1.9.2 Remedial Action Directive Hearing Procedure

(a) Hearings to address Remedial Action Directives shall be conducted only under the expedited hearing process set forth in this Section 1.9.2. The general hearing procedures described in Sections 1.4 to 1.7 are applicable to the Remedial Action Directive hearing unless the context of a provision is inconsistent with or otherwise renders it inapplicable to the procedures set forth in this Section.

(b) The Remedial Action Directive hearing shall be presided over by a Hearing Officer and will be conducted according to the following guidelines:

(1) The Hearing Officer or the Hearing Body will hold a prehearing conference within two (2) business days after receipt of the Registered Entity's request for a hearing.

(2) A Testimonial Hearing will be conducted on the matter, in person or by teleconference, within seven (7) business days after the prehearing conference.

(3) At the Testimonial Hearing, Staff shall present oral witness testimony and evidence to show why the Remedial Action Directive should be complied with, and the Registered Entity shall present oral witness testimony and evidence to show why the Remedial Action Directive is not necessary or should be modified. All witness testimony shall be rendered under oath.

(4) At the Testimonial Hearing, the Participants shall have the opportunity to make opening statements. In addition, the Participants shall have the opportunity to make closing arguments, and Staff shall have the opportunity to make a rebuttal to the Registered Entity's closing argument.

(5) The Participants may file initial briefs and reply briefs, and/or draft opinions, on an expedited schedule set by the Hearing Officer or the Hearing Body. Oral argument shall not be held.

(c) The Hearing Body shall issue a summary written decision within ten (10) days following submission of the last brief, stating whether the Registered Entity shall or shall not be required to comply with the Remedial Action Directive and identifying any modifications to the Remedial Action Directive that the Hearing Body finds appropriate. Upon issuance of the summary written decision, the Registered Entity is required to comply with the Remedial Action Directive as specified in the summary written decision.

(d) Within thirty (30) days following issuance of its summary written decision, the Hearing Body shall issue a full written decision. The written decision shall state the conclusions of the

Hearing Body with respect to the Remedial Action Directive, and shall explain the reasons for the Hearing Body's conclusions.

COMPLIANCE MONITORING AND ENFORCEMENT PROGRAM

1.0 INTRODUCTION

This Compliance Monitoring and Enforcement Program ("Compliance Program") is the program to be used by the North American Electric Reliability Corporation ("NERC") and the Regional Entities to monitor, assess, and enforce compliance with Reliability Standards within the United States. Compliance Monitoring and Enforcement Programs also will be implemented in Canada consistent with Canadian laws and agreements.

1.1 Definitions

Capitalized terms used in this Compliance Program shall have the meanings set forth in Appendix 2 of the NERC Rules of Procedure. ~~For convenience of reference, defined terms frequently used in this Appendix are also set forth below:~~

~~Alleged Violation: A Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.~~

~~Annual Audit Plan: A plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited and the schedule of Compliance Audits for the calendar year.~~

~~Applicable Governmental Authority: The Federal Energy Regulatory Commission ("FERC") within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.~~

~~Complaint: An allegation that a Registered Entity violated a Reliability Standard.~~

~~Compliance Audit: A systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.~~

~~Compliance Audit Participants: Registered Entities scheduled to be audited and the audit team members.~~

~~Compliance Enforcement Authority: NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.~~

~~Compliance Exception: A noncompliance that is addressed in Section 3A.0 of Appendix 4C, and is not pursued through an enforcement action under Section 5.0 of Appendix 4C by a Compliance Enforcement Authority.~~

~~**1.1.89** Compliance Investigation: A comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.**1.1.9**~~

~~**1.1.10** Confirmed Violation: An Alleged Violation for which (1) the Registered Entity has accepted or not contested the Notice of Alleged Violation and Proposed Penalty or Sanction or other notification of the Alleged Violation, or (2) there has been the issuance of a final order from NERC or a Regional Entity Hearing Body finding a violation, Penalty or sanction, or (3) the period for requesting a hearing or an appeal has expired, or (4) the Registered Entity has executed a settlement agreement pursuant to Section 5.6.~~

~~**1.1.1011** End Date: The last date of the period to be covered in a Compliance Audit.~~

~~**1.1.1112** Exception Report: Information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.~~

~~**1.1.13** Find, Fix, Track, and Report: A streamlined process, addressed in Section 3A.0 of Appendix 4C, to resolve lesser-risk, remediated Possible Violations that are not assessed a financial penalty.~~

~~**1.1.14** Inherent Risk Assessment ("IRA"): A review by the Compliance Enforcement Authority of potential risks posed by an individual Registered Entity to the reliability of the Bulk Power System. An IRA considers factors such as, but not limited to, assets, system, geography, interconnectivity, prior compliance history, and factors unique to the Registered Entity. The results of an entity-specific IRA may result in the scope of compliance monitoring for a particular Registered Entity to include more, fewer, or different Reliability Standards than those contained in the annual Implementation Plans.~~

~~**1.1.15** Internal Control Evaluation: A review by the Compliance Enforcement Authority of a Registered Entity's internal controls. The ICE may further refine the compliance oversight plan, including the scope of an audit, the type and application of compliance monitoring tools, the depth and breadth of a particular area of review, or determine whether an audit is necessary if the Registered Entity demonstrates effective internal controls.~~

~~**1.1.162** ISO/RTO: An independent transmission system operator or regional transmission organization approved by the FERC or the Public Utility Commission of Texas.~~

~~**1.1.173** Mitigating Activities: Actions taken by a Registered Entity to correct and prevent recurrence of a noncompliance, whether or not the actions are embodied in a Mitigation Plan.~~

~~**1.1.184** Mitigation Plan: An action plan developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.~~

~~**1.1.195** NERC Compliance Registry: A list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.~~

~~**1.1.1620** NERC Compliance Monitoring and Enforcement Program Implementation Plan or NERC Implementation Plan: The annual NERC Compliance Monitoring and Enforcement~~

~~Program Implementation Plan that specifies the Reliability Standards that are subject to reporting~~identifies the risk elements to prioritize risks to the reliability of the Bulk Power System. These risk elements and related NERC Reliability Standards Requirements become inputs for Regional Entities in developing their Regional Implementation Plans and the compliance oversight plan for individual ~~by Registered Entities to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard.~~ The NERC Implementation Plan may be updated as needed.

~~**1.1.17**~~**21** ~~Notice of Alleged Violation and Proposed Penalty or Sanction: A notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3.~~

~~**1.1.18**~~**22** ~~Notice of Completion of Enforcement Action: A notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10, stating than an enforcement action is closed.~~

~~**1.1.19**~~**23** ~~Notice of Confirmed Violation: A notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards.~~

~~**1.1.20**~~**24** ~~Notice of Penalty: A notice prepared by NERC and filed with FERC, following approval by NERC of a Notice or other notification of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.~~

~~**1.1.21**~~**25** ~~Notice of Possible Violation: A notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.~~

~~**1.1.22**~~**26** ~~Periodic Data Submittals: Modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.~~

~~**1.1.23**~~**27** ~~Possible Violation: The identification, by the Compliance Enforcement Authority, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.~~

~~**1.1.24**~~**28** ~~Preliminary Screen: An initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered, and (3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation which is currently being processed.~~

~~**1.1.2529** Regional Implementation Plan: An annual Regional Entity plan, submitted by on or about October 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC Compliance Monitoring and Enforcement Program Implementation Plan, includes (1) details on Regional Risk Assessment processes and results; (2) Reliability Standards and Requirements associated with Regional Risk Assessment results; identifies (1) all Reliability Standards identified by NERC to be actively monitored during each year, (2) other Reliability Standards proposed for active monitoring by the Regional Entity, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria with each Reliability Standard;, and (4) the Regional Entity's Annual Audit Plan.~~

~~**1.1.2630** Registered Entity: An owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.~~

~~**1.1.2731** Remedial Action Directive: An action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat.~~

~~**1.1.2832** Required Date: The date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.~~

~~**1.1.2933** Self-Certification: An attestation by a Registered Entity that it is compliant or non-compliant with a Reliability Standard Requirement that is the subject of the Self-Certification, or that it does not own Facilities that are subject to the Reliability Standard Requirement, or that the Reliability Standard Requirement is not applicable to the Registered Entity.~~

~~**1.1.34** Self-Logging: A process by which Registered Entities found to be eligible by a Compliance Enforcement Authority, after a formal review of internal controls, record noncompliance on a log, in accordance with Section 3.5A of Appendix 4C, in lieu of individually self-reporting each possible noncompliance.~~

~~**1.1.3035** Self-Report: A report by a Registered Entity stating that the Registered Entity believes it has, or may have, violated a Reliability Standard.~~

~~**1.1.3136** Spot Check: A process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Report, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to operating problems or system events.~~

2.0 IDENTIFICATION OF ORGANIZATIONS RESPONSIBLE FOR COMPLYING WITH RELIABILITY STANDARDS

NERC shall register the organizations responsible for complying with Reliability Standards, in accordance with Section 500 of the NERC Rules of Procedure and Appendix 5B, *Statement of*

Compliance Registry Criteria. Organizations are responsible to register and to comply with Reliability Standards if they are owners, operators, and users of the Bulk Power System, perform a function listed in the functional types identified in Section II of Appendix 5B, and are material to the Reliable Operation of the Bulk Power System as defined by the criteria and notes in Appendix 5B. Regional Entities shall (i) develop and provide to NERC information to assist NERC to register organizations responsible for complying with Reliability Standards, and (ii) in the event of a Registration appeal to NERC or an Applicable Governmental Authority, provide information requested by NERC concerning how the Registered Entity meets the Registration criteria or is otherwise material to the reliability of the Bulk Power System.

NERC shall notify organizations of their inclusion on the NERC Compliance Registry and shall maintain the NERC Compliance Registry on its web site. NERC shall inform each Registered Entity at the time of Registration of the Reliability Standards that are applicable to reliability functions for which the Registered Entity is registered. Each Registered Entity shall inform NERC or the applicable Regional Entity promptly of changes to the Registered Entity's Registration information including planned or completed changes in ownership of Bulk Power System Facilities, Registration status, address and other contact information, and name of designated compliance contact. NERC will provide FERC and Applicable Governmental Authorities monthly updates to the NERC Compliance Registry.

NERC and each Regional Entity will designate a contact person(s) and require each Registered Entity to designate a contact person(s) responsible for sending and receiving all necessary information and communications concerning compliance matters. NERC and the applicable Regional Entity will designate where Registered Entities are to send information, data, Mitigation Plans, or any other compliance-related correspondence.

NERC shall maintain on its website a current listing of Reliability Standards that are applicable to all Registered Entities.

As provided for herein, during the course of compliance monitoring and enforcement activities relating to U.S. entities, NERC may obtain information that it will provide to FERC and, if the information pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such provision of information to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure.

3.0 COMPLIANCE MONITORING PROCESSES

NERC, with input from the Regional Entities, stakeholders, and regulators, shall at least annually identify risk elements and related NERC Reliability Standards and Requirements to be considered in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan (Implementation Plan). NERC identifies the risk elements using data including, but not limited to: compliance findings; event analysis experience; data analysis; and the expert judgment of NERC and Regional Entity staff, committees, and subcommittees. NERC uses these risk elements to identify and prioritize continent-wide risks to the reliability of the ~~BPS~~Bulk Power System. These identified risks represent the focus for oversight activities in the

upcoming year, and become inputs for developing oversight plans for individual Registered Entities.

The Compliance Enforcement Authority will monitor Registered Entities' compliance with Reliability Standards using the compliance monitoring processes described in this Section. A Compliance Enforcement Authority will determine the type and frequency of application of the compliance monitoring tools appropriate for a particular Registered Entity based on the Registered Entity's specific risks to the reliability of the Bulk Power System.

If a compliance monitoring process described in this Section reveals a potential noncompliance with a Reliability Standard, the Compliance Enforcement Authority will conduct a Preliminary Screen of the potential noncompliance in accordance with Section 3.8. In addition, if the Compliance Enforcement Authority obtains evidence or information of a potential noncompliance with a Reliability Standard through any other means, including but not limited to an Exception Report or other report of noncompliance that a Registered Entity is required to submit in accordance with the terms of a Reliability Standard, the Compliance Enforcement Authority will conduct a Preliminary Screen of the information in accordance with Section 3.8. If the Preliminary Screen results in an affirmative determination with respect to the Preliminary Screen criteria, a Possible Violation exists and the Compliance Enforcement Authority will proceed in accordance with Section 5.0, Enforcement Actions ~~unless an alternative enforcement process is used, in accordance with Section 3A.0~~except as otherwise authorized in these Rules of Procedure.

Registered Entities found in violation of a Reliability Standard will be required to mitigate the violation regardless of any enforcement actions taken.

The compliance monitoring processes in this Section require timely information, reports and data from Registered Entities to effectively monitor compliance with Reliability Standards. The Compliance Enforcement Authority has authority to collect Documents, data and information in the manner it deems most appropriate, including requesting copies of Documents, data and information to be made and removing those copies from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the Documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. If Documents, data, information or other reports to determine compliance requested from a Registered Entity are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for Documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC general counsel.

Any report or other submission of information by a Registered Entity required by the Compliance Program shall be signed by an officer, employee, attorney or other authorized representative of the Registered Entity. Electronic signatures are permitted in accordance with processes established by NERC and the Regional Entity. NERC or the Compliance Enforcement Authority may require the signer to provide a statement of the basis of his or her authority to sign on behalf of the Registered Entity.

3.1 Compliance Audits

All Registered Entities are subject to audit for compliance with all Reliability Standards applicable to the functions for which the Registered Entity is registered. Compliance Audits are conducted on the Registered Entity's site to the extent required by NERC Rule of Procedure 403.11.2. Compliance Audit processes for Compliance Audits conducted in the United States shall be based on professional auditing standards recognized in the U.S., which may include for example Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards and standards sanctioned by the Institute of Internal Auditors. Compliance Audit processes for Compliance Audits conducted outside the U.S. may be based on Canadian or other international standards. All Compliance Audits shall be conducted in accordance with audit guides established for the Reliability Standards included in the Compliance Audit, consistent with accepted auditing guidelines as approved by NERC. The audit guides will be posted on NERC's website.

3.1.1 Compliance Audit Process Steps

The process steps for a Compliance Audit are as follows:

- The Compliance Enforcement Authority posts the Annual Audit Plan (developed in coordination with NERC). The Compliance Enforcement Authority provides additional information to the Compliance Audit Participants, including Compliance Audit materials, coordinating agendas and changes to the Compliance Audit schedule as required. NERC or the Regional Entity provides the Compliance Audit schedules to FERC and to any other Applicable Governmental Authority based upon the agreements in place with the other Applicable Governmental Authority.

- At least ninety (90) days prior to commencement of a regularly scheduled Compliance Audit, the Compliance Enforcement Authority notifies the Registered Entity of the Compliance Audit and the Reliability Standards to be evaluated, identifies the Compliance Audit team members and their recent employment history, and requests data, including a completed NERC pre-Compliance Audit questionnaire. If the Compliance Audit team members change from the time of the original notification, the Compliance Enforcement Authority will promptly notify the Registered Entity of the change and will allow time for the Registered Entity to object to the new Compliance Audit team member(s) (see Section 3.1.5.4).

- The Registered Entity provides to the Compliance Enforcement Authority the required information in the format and by the Required Date specified in the request.

- The Compliance Audit team reviews the submitted information for conformance with the Requirements of the Reliability Standards.

- The Compliance Audit team conducts an exit briefing with the Registered Entity, provides for a review of the Compliance Audit report with the Registered Entity before it is finalized, and completes a Compliance Audit report in accordance with Section 3.1.6.

- If the Compliance Audit Team identifies evidence of a potential noncompliance with a Reliability Standard Requirement by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

3.1.2 Compliance Enforcement Authority Annual Audit Plan and Schedule

The Compliance Enforcement Authority shall develop an Annual Audit Plan. The Annual Audit Plan of Regional Entities will be included in the Regional Implementation Plans submitted to NERC for review and approval (see Section 4.2). NERC or the Regional Entity provides the Annual Audit Plans to FERC and to any other Applicable Governmental Authority consistent with the agreements in place with the Applicable Governmental Authority.

Prior to October 1 of the year preceding the year covered by the Annual Audit Plan, the Compliance Enforcement Authority shall notify Registered Entities subject to Compliance Audits during the upcoming year of the Compliance Audit schedule. The Compliance Enforcement Authority will give due consideration to any schedule changes requested by Registered Entities for reasonable cause.

Revisions and additions to a Regional Entity Annual Audit Plan shall be communicated to and approved by NERC, and shall be communicated to the Registered Entity in a timely manner (normally sixty (60) days in advance) of changes or revisions to scheduled Compliance Audit dates.

3.1.3 Frequency of Compliance Audits

The Compliance Enforcement Authority will perform comprehensive Compliance Audits as required by the NERC Rules of Procedure and based on criteria established by NERC. In addition to scheduled Compliance Audits, the Compliance Enforcement Authority (i) may initiate an unscheduled Compliance Audit of any Registered Entity at any time if the Compliance Enforcement Authority reasonably determines it to be necessary to ensure the Registered Entity's compliance with Reliability Standards, and (ii) shall initiate an unscheduled Compliance Audit if directed by FERC. The Compliance Enforcement Authority shall notify NERC and FERC prior to or on the same date it notifies the Registered Entity that an unscheduled Compliance Audit is being initiated. If NERC initiates the unscheduled Compliance Audit, it shall notify the appropriate Regional Entity or Entities. The Compliance Enforcement Authority shall provide at least ten (10) business days advance notice to the Registered Entity that an unscheduled Compliance Audit is being initiated, which notice shall include identification of the members of the Compliance Audit team.

3.1.4 Scope of Compliance Audits

3.1.4.1 Reliability Standards

A Compliance Audit shall include those Reliability Standards applicable to the Registered Entity that are ~~identified in the NERC Implementation Plan for the current year~~determined through the NERC approved risk-based processes described herein, and may include other Reliability Standards applicable to the Registered Entity whether or not they are identified in the Regional Entity's Regional Implementation Plan for the current year.

Regional Entities will tailor the final scope of any Compliance Audit based on the results of the Registered Entity's Inherent Risk Assessment and, if applicable, taking into consideration the results of an Internal Controls Evaluation. ~~a Registered Entity's inherent risk and on the evaluation, if applicable, of the Registered Entity's internal controls pertinent to the applicable Reliability Standards.~~ Except as otherwise required in the Rules of Procedure, the Compliance Enforcement Authority may use any process herein, in addition to, or in lieu of a Compliance Audit to monitor compliance with Reliability Standards.

3.1.4.2 Period Covered

The Registered Entity's data and information must show compliance with the Reliability Standards that are the subject of the Compliance Audit for the entire period covered by the Compliance Audit. The Compliance Enforcement Authority will indicate the beginning and End Date of the audit period in its notice of the Compliance Audit. The audit period begins the day after the End Date of the prior Compliance Audit by the Compliance Enforcement Authority (or the later of June 18, 2007 or the date the Registered Entity became subject to Reliability Standards if the Registered Entity has not previously been subject to a Compliance Audit). The audit period will not begin prior to the End Date of the previous Compliance Audit. The Compliance Enforcement Authority may modify the beginning date of the audit period for any given Reliability Standard Requirement based on an intervening compliance monitoring process. The End Date should be a specified date prior to the scheduled start of the Compliance Audit, such as the date of the notification issued to the Registered Entity pursuant to Section 3.1.1 or the date that is thirty (30) days following the date of the notification.

The Registered Entity will be expected to demonstrate compliance for the entire period described above. If a Reliability Standard specifies a document retention period that does not cover the entire period described above, the Registered Entity will not be found in noncompliance solely on the basis of the lack of specific information that has rightfully not been retained based on the retention period specified in the Reliability Standard. However, in such cases, the Compliance Enforcement Authority will require the Registered Entity to demonstrate compliance through other means. In addition, if the Compliance Audit team discovers a potential noncompliance occurring subsequent to the End Date, the potential noncompliance will be subject to a Preliminary Screen pursuant to Section 3.8.

3.1.4.3 Review of Mitigating Activities

The Compliance Audit may include a review of any Mitigating Activities which the Registered Entity has not yet completed, for the purpose of determining whether the Registered Entity is making adequate progress towards completion of the Mitigating Activities.

3.1.5 Conduct of Compliance Audits

3.1.5.1 Composition of Compliance Audit Teams

The Compliance Audit team shall be comprised of members whom the Compliance Enforcement Authority has determined have the requisite knowledge, training and skills to conduct the Compliance Audit. The Compliance Audit team may include (i) contractors and industry subject matter experts, (ii) NERC staff members (which may include contractors to NERC), (iii) compliance staff members of other Regional Entities, and (iv) representatives of FERC and other Applicable Governmental Authorities so long as the Registered Entity is subject to the Applicable Governmental Authority's reliability jurisdiction. The Compliance Audit team leader shall be a staff member from the Compliance Enforcement Authority and is responsible for the conduct of the Compliance Audit and preparation of the Compliance Audit report.

3.1.5.2 Requirements for Compliance Audit Team Members

Each Compliance Audit team member must:

- Be free of conflicts of interests in accordance with the Compliance Enforcement Authority policies. Employees or contractors of the Registered Entity being audited shall not be allowed to participate as auditors in the Compliance Audit of the Registered Entity.

- Comply with the NERC Antitrust Compliance Guidelines and shall have either signed appropriate confidentiality agreements or acknowledgments that the confidentiality agreement signed by the Compliance Enforcement Authority is applicable.

- Successfully complete all NERC or NERC-approved Regional Entity auditor training applicable to the Compliance Audit.

- Prior to the Compliance Audit, the Compliance Enforcement Authority shall provide confirmation to the Registered Entity that all Compliance Audit team members have executed confidentiality agreements or acknowledgements.

3.1.5.3 Compliance Audit Observers and Other Attendees

In any Regional Entity Compliance Audit of a Registered Entity, in addition to the Compliance Audit team members, the following may participate as observers: (i) NERC Staff (which may include contractors to NERC); (ii) other members of the Regional Entity's Compliance Staff; (iii) with the permission of the Regional Entity, Compliance Staff members of other Regional Entities; and (iv) representatives of FERC and of other Applicable Governmental Authorities so long as the Registered Entity is subject to the Applicable Governmental Authority's reliability jurisdiction. Any members of NERC staff, Regional Entity Compliance Staff, or Compliance Staffs of other Regional Entities or representatives of FERC or other Applicable Governmental

Authorities who are not Compliance Audit team members identified pursuant to Section 3.1.1 are observers.

In addition, at the request of the Registered Entity being audited, the Regional Entity may allow attendance at the Compliance Audit by: (1) representatives of corporate affiliates of the Registered Entity being audited that are Registered Entities or that provide compliance services, support or oversight to the Registered Entity being audited, and (2) representatives of Registered Entities whose compliance activities are conducted by the Registered Entity being audited or by the same corporate entity that conducts the compliance activities of the Registered Entity being audited (e.g., representatives of other members of a Joint Registration Organization or of participants in a Coordinated Functional Registration pursuant to Section 500 of the Rules of Procedure). Each such additional attendee must execute a confidentiality agreement approved by the Regional Entity.

Compliance Audit observers and attendees are not Compliance Audit team members and do not participate in conducting the Compliance Audit or in making Compliance Audit findings and determinations.

The Compliance Audit team leader or other staff of the Regional Entity conducting the Compliance Audit will communicate in advance with any observers or other attendees to ensure there are no undue disruptions to the Compliance Audit, such as space limitations, no conflicts of interest, and no other considerations that in the judgment of the Compliance Audit team leader may be detrimental to the conduct and quality of the Compliance Audit. If the Compliance Audit team leader identifies any such issues, he/she shall work with the proposed observers or attendees to facilitate observation in a less disruptive manner; or, alternatively, the Regional Entity Compliance staff will work with the proposed observers or attendees to schedule their participation in, observation of, or attendance at a different Compliance Audit in which such issues are not presented.

3.1.5.4 Registered Entity Objections to Compliance Audit Team

A Registered Entity subject to a Compliance Audit may object to any member of the Compliance Audit team on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties. Any such objections must be provided in writing to the Compliance Enforcement Authority no later than fifteen (15) days prior to the start of on-site Compliance Audit work. This fifteen (15) day requirement shall not apply where a Compliance Audit team member has been appointed less than twenty (20) days prior to the start of on-site Compliance Audit work, in which case the Registered Entity must provide any objections to the Compliance Enforcement Authority within five (5) business days after receiving notice of the appointment of the Compliance Audit team member.

In the case of an unscheduled Compliance Audit pursuant to Section 3.1.3, the Registered Entity must provide any objections to the Compliance Enforcement Authority at least five (5) business days prior to the start of on-site Compliance Audit work for the unscheduled Compliance Audit.

The Compliance Enforcement Authority will make a final determination on whether the member will participate in the Compliance Audit of the Registered Entity. Nothing in Section 3.1 shall be read to limit the participation of NERC staff in the Compliance Audit or to limit the participation of FERC staff in a Compliance Audit of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction.

3.1.6 Compliance Audit Reports

The Compliance Audit team shall develop a draft Compliance Audit report that shall include a description of the objective, scope, and methodology of the Compliance Audit; identify any evidence of potential noncompliance with Reliability Standards by the Registered Entity found by the Compliance Audit team; identify any Remedial Action Directives, Mitigation Plans or other Mitigating Activities which have been completed or pending in the year of the Compliance Audit; and identify if any Confidential Information has been redacted. The report may also state areas of concern and recommendations identified by the Compliance Audit team. The draft report will be provided to the Registered Entity for comment.

The Compliance Audit team considers corrections based on comments of the Registered Entity, finalizes the Compliance Audit report, and provides the Registered Entity with a copy of the final report on or before the date the final report is provided to NERC. The Compliance Enforcement Authority provides the final report to NERC, which in turn provides the report to FERC if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which FERC has jurisdiction and/or to another Applicable Governmental Authority if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which the other Applicable Governmental Authority has jurisdiction. The provision of the final Compliance Audit report to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure. Work papers and other documentation associated with the Compliance Audit shall be maintained by the Compliance Enforcement Authority in accordance with NERC or Regional Entity requirements.

NERC will not publicly post the final Compliance Audit report for at least five (5) business days following receipt. If the Compliance Audit report identifies any Possible Violations of one or more Reliability Standards, the final Compliance Audit report, or pertinent part thereof identifying the Possible Violations, shall not be released to the public by NERC until (i) the Possible Violation is dismissed prior to becoming a Confirmed Violation, or (ii) NERC submits a Notice of Penalty to FERC or other Applicable Governmental Authority, or (iii) the Registered Entity executes a settlement agreement with the Compliance Enforcement Authority pursuant to Section 5.6.

Information deemed by a Compliance Enforcement Authority or the Registered Entity as Critical Energy Infrastructure Information or Confidential Information shall be redacted from any public reports.

3.2 Self-Certifications

The Compliance Enforcement Authority may require Registered Entities to self-certify their compliance with Reliability Standards.

3.2.1 Self-Certification Process Steps

The process steps for the Self-Certification process are as follows:

- The Compliance Enforcement Authority posts and updates the reporting schedule containing the applicable reporting periods and informs Registered Entities. The Compliance Enforcement Authority and NERC will ensure that the appropriate Reliability Standards, compliance procedures, and required submittal forms for the Reliability Standards being evaluated are maintained and available.

- The Compliance Enforcement Authority requests the Registered Entity to make a Self-Certification within the advance notice period specified by the Reliability Standard. If the Reliability Standard does not specify the advance notice period, this request will be issued in a timely manner (normally thirty (30) days advance notice).

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the form and manner, and by the Required Date, specified by the Compliance Enforcement Authority. The Self-Certification response may state that (i) the Registered Entity is in compliance with the Reliability Standard Requirement, (ii) the Registered Entity is not in compliance with the Reliability Standard Requirement, (iii) the Registered Entity does not own Facilities that are subject to the Reliability Standard Requirement, or (iv) the Reliability Standard requirement is not applicable to the Registered Entity.

- At a minimum, the Compliance Enforcement Authority reviews Self-Certifications of non-compliance and Self-Certifications in which the Registered Entity has responded that it does not own Facilities that are subject to the Reliability Standard Requirement or that the Reliability Standard Requirement is not applicable to the Registered Entity and the Compliance Enforcement Authority may request additional data and/or information if necessary.

- If the Compliance Enforcement Authority's review of the Self-Certification indicates a potential noncompliance with a Reliability Standard by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

Receipt of a Self-Certification by the Compliance Enforcement Authority shall not be construed as a finding by the Compliance Enforcement Authority that the Registered Entity is compliant with, not compliant with, subject to, or not subject to, the Reliability Standard Requirement.

3.3 Spot Checks

Spot Checks will be conducted by the Compliance Enforcement Authority. Spot Checks may be initiated at the discretion of the Compliance Enforcement Authority or as directed by NERC at any time to verify or confirm Self-Certifications, Self-Reports, and Periodic Data Submittals. Spot Checks may also be random or may be initiated in response to events, as described in the Reliability Standards, or to operating problems, or system events.

3.3.1 Spot Check Process Steps

The process steps for Spot Checking are as follows:

- The Compliance Enforcement Authority shall issue a notification letter to the Registered Entity that a Spot Check will be performed, the reason for the Spot Check, and the scope of the Spot Check including the Reliability Standard Requirements that will be covered, in accordance with the advance notice period specified by the Reliability Standard. If the Reliability Standard Requirement does not specify an advance notice period, any information submittal request made by the Compliance Enforcement Authority will allow at least twenty (20) days for the Registered Entity to submit the information or make it available for review.

- The Compliance Enforcement Authority, as part of the notification package, shall provide the Registered Entity with the names and employment histories of the persons who will be conducting the Spot Check. The Compliance Enforcement Authority shall provide confirmation to the Registered Entity that the members of the Spot Check team have executed confidentiality agreements or acknowledgements. The Registered Entity may object to inclusion of any individual on the Spot Check team on the grounds specified in Section 3.1.5.4. Any such objections must be submitted to the Compliance Enforcement Authority by the later of (i) five (5) business days before the information being requested by the Compliance Enforcement Authority is submitted and (ii) five (5) business days after the Registered Entity is notified of the persons on the Spot Check team. Nothing in Section 3.1 shall be read to limit the participation of NERC staff in a Spot Check or to limit the participation of FERC staff in a Spot Check of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction.

- The Spot Check may require submission of data, documentation, and information and an on-site review.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date specified in the request.

- The Spot Check Team conducts a review of the information submitted to determine compliance with the Reliability Standards Requirements and may request additional data and/or information if necessary.

- If the Spot Check team's review of the information submitted indicates a potential noncompliance with a Reliability Standard Requirement by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen pursuant to Section 3.8.

- The Spot Check team prepares a draft Spot Check report and provides the Registered Entity ten (10) business days to comment on the draft report.

- The Spot Check team considers any corrections based on the Registered Entity's comments, finalizes the Spot Check report and provides it to the Registered Entity and to NERC.

- If the Compliance Enforcement Authority is a Regional Entity, the Regional Entity provides the final report to NERC. NERC provides the report to FERC if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which FERC has jurisdiction and/or to another Applicable Governmental Authority if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which the other Applicable Governmental Authority has jurisdiction. The provision of the report to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure.

- The report will not be publicly posted, or otherwise made publicly available, by the Regional Entity or by NERC.

3.4 Compliance Investigations

A Compliance Investigation may be initiated at any time by the Compliance Enforcement Authority or NERC in response to a system disturbance, Complaint, or any potential noncompliance with a Reliability Standard identified by any other means.

Compliance Investigations will generally be led by the Regional Entity's staff. NERC reserves the right to assume the leadership of a Compliance Investigation.[1] The Regional Entity shall not be entitled to appeal NERC's decision to lead a Compliance Investigation.

Compliance Investigations are confidential, unless FERC directs that a Compliance Investigation should be public or that certain information obtained in the Compliance Investigation should be publicly disclosed. Confirmed Violations resulting from a Compliance Investigation will be made public.

FERC or another Applicable Governmental Authority may initiate an investigation at any time in response to a system disturbance, Complaint, or potential noncompliance with a Reliability Standard identified by any other means, or for any other purpose authorized by law. Investigations initiated by FERC or another Applicable Governmental Authority shall be governed by and conducted pursuant to the statutory authority and rules of the Applicable Governmental Authority and not the procedures set forth herein. If an Applicable Governmental Authority other than FERC initiates an investigation of a U.S.-related matter, NERC shall provide notice to FERC of the investigation prior to disclosure of any non-public U.S.-related compliance information regarding the matter to be investigated to the other Applicable Governmental Authority. NERC's notice to FERC shall identify the other Applicable Governmental Authority, shall describe the nature of the proposed disclosures to the other Applicable Governmental Authority, and shall state the procedures NERC will utilize in

[1]Examples of situations in which NERC may decide to lead a Compliance Investigation include: (i) to assure consistency in investigative processes, (ii) to coordinate Compliance Investigations into matters that may cross Regional Entity boundaries, (iii) where the potential noncompliance is related to the Regional Entity or one of its affiliates, divisions, committees or subordinate structures, or (iv) where the Regional Entity determines it cannot conduct the Compliance Investigation.

connection with the Compliance Investigation to ensure compliance with the requirements of 18 C.F.R. §39.7(b)(4) concerning nondisclosure of violations and Alleged Violations.

If FERC initiates an investigation of a non-U.S.-related matter, NERC shall provide notice of the investigation to the Applicable Governmental Authority having jurisdiction over the Registered Entity or the portion of the Bulk Power System that is the subject of the investigation prior to disclosure to FERC of any non-public non-U.S.-related compliance information regarding the matter to be investigated. NERC's notice to the other Applicable Governmental Authority shall describe the nature of the proposed disclosures to FERC and shall state the procedures NERC will utilize in connection with the investigation to ensure compliance with regulations of the other Applicable Governmental Authority or other law of the applicable jurisdiction concerning disclosure of non-public compliance information.

3.4.1 Compliance Investigation Process Steps

The process steps for a Compliance Investigation are as follows:

- The Compliance Enforcement Authority becomes aware of circumstances indicating a Reliability Standard may have been or is being violated and determines whether a Compliance Investigation is warranted. Within three (3) business days of the decision to initiate a Compliance Investigation, the Compliance Enforcement Authority: (i) notifies the Registered Entity of the initiation and initial scope of the Compliance Investigation, (ii) instructs the Registered Entity to preserve all records and information relevant to the Compliance Investigation, and (iii) provides a copy of the notice to NERC. The Compliance Investigation may be expanded beyond the initial scope based on information obtained by the Compliance Enforcement Authority after initiation of the Compliance Investigation.

- NERC assigns a NERC staff member to the Compliance Investigation as an observer or team member and to serve as a single point of contact for communications with NERC, and notifies the Registered Entity as to whether the NERC staff member is acting as an observer or as a team member. Within three (3) business days after NERC receives notice of the decision to initiate a Compliance Investigation, NERC will notify FERC and each other Applicable Governmental Authority having jurisdiction over a Registered Entity or a portion of the Bulk Power System to which the Compliance Investigation relates. Any such notice to FERC or to another Applicable Governmental Authority will be provided in accordance with Section 8.0, Reporting and Disclosure.

  The Compliance Enforcement Authority requests data or documentation and provides a list of individuals on the Compliance Investigation team and their recent employment history. Within ten (10) business days of receiving the notification of a Compliance Investigation, a Registered Entity subject to a Compliance Investigation may object to any individual member of the Compliance Investigation team on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties; however, the Registered Entity may not object to participation by NERC, by FERC staff or by staff of another Applicable Governmental Authority having reliability jurisdiction over the Registered Entity in the Compliance Investigation. Such objections must be provided in writing to

the Compliance Enforcement Authority within such ten (10) business day period. The Compliance Enforcement Authority will make a final determination as to whether the individual will participate in the Compliance Investigation of the Registered Entity.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date as specified in the request. If information is not received in the time and format requested, the Compliance Enforcement Authority may initiate the steps in **Process for Non-Submittal of Requested Data in Attachment 1.**

- If necessary, the Compliance Investigation may include an on-site visit with interviews of the appropriate personnel and review of data.

- The Compliance Enforcement Authority may require the Registered Entity to (i) provide a verification under oath by an officer, employee, attorney or other authorized representative of the Registered Entity attesting to the accuracy, completeness and truth of the Registered Entity's responses to the Compliance Enforcement Authority's requests for information; and (ii) produce one or more officers, employees or other authorized representatives of the Registered Entity who are familiar with the matter(s) that are the subject of the Compliance Investigation, to be interviewed or to provide testimony under oath concerning such matters. The Compliance Enforcement Authority shall determine in each case (i) whether representatives of the Registered Entity shall be allowed to be present when an interview is taking place or testimony is being taken, and (ii) whether, and by what method, the interview or testimony shall be recorded; provided, that counsel for the person being interviewed or giving testimony may be present when the interview is being conducted or testimony is being taken (regardless of whether such counsel also represents the Registered Entity).

- The Compliance Enforcement Authority reviews information to determine compliance with the Reliability Standards. The Compliance Enforcement Authority may request additional data and/or information, if necessary.

- The Compliance Enforcement Authority completes the assessment of compliance with the Reliability Standard, which may include review of a Mitigation Plan or Mitigating Activities, and provides a report of the Compliance Investigation to NERC and the Registered Entity.

- If the Compliance Enforcement Authority, at any time during the Compliance Investigation, identifies a potential noncompliance with a Reliability Standard Requirement by a Registered Entity, the Compliance Enforcement Authority shall conduct a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

- If the Compliance Enforcement Authority determines that no violation occurred, it shall send the Registered Entity and NERC a notice that the Compliance Investigation has been completed. NERC will in turn notify FERC and, if the Compliance Investigation pertained to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, will also notify such other

Applicable Governmental Authority. Any such notice to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.

3.5 Self-Reports

Self-Reports are encouraged at the time a Registered Entity becomes aware (i) that it has, or may have, violated a Reliability Standard, or (ii) the Violation Severity Level of a previously reported violation has changed. Self-Reports of a violation of a Reliability Standard are encouraged regardless of whether the Reliability Standard requires reporting on a pre-defined schedule in the Compliance Program or whether the violation is determined outside the pre-defined reporting schedule. If possible, and without delaying the Self-Report, a Self-Report may include the actions that have been taken or will be taken to resolve the violation.

3.5.1 Self-Report Process Steps

The process steps for Self-Reports are as follows:

- The Compliance Enforcement Authority posts the Self-Report submittal forms and ensures they are maintained and available.
- The Registered Entity provides the Self-Report information to the Compliance Enforcement Authority.
- The Compliance Enforcement Authority reviews the information to evaluate compliance with the Reliability Standards and may request that the Registered Entity provide clarification or additional data and/or information.
- The Compliance Enforcement Authority conducts a Preliminary Screen of the Self-Report information in accordance with Section 3.8.

3.5A Self-Logging

Registered Entities found by the Compliance Enforcement Authority to be eligible, after a formal review of internal controls, pursuant to procedures adopted by NERC and the Regional Entities and provided to Applicable Governmental Authorities, may be granted approval by the Compliance Enforcement Authority to log noncompliance for subsequent review in lieu of submitting a Self-Report. The log shall be limited to noncompliance posing a minimal risk to the reliability of the Bulk Power System unless otherwise authorized by an Applicable Governmental Authority. Approved Registered Entities shall maintain a log with a detailed description of the noncompliance, the risk assessment, and the mitigating activities completed or to be completed. There is a rebuttable presumption that noncompliance logged in this manner will be resolved as a Compliance Exception. The Compliance Enforcement Authority will periodically review the logs and will make the logs available for review, upon request, by NERC and Applicable Governmental Authorities.

3.6 Periodic Data Submittals

The Compliance Enforcement Authority requires Periodic Data Submittals in accordance with the schedule stated in the applicable Reliability Standard, or as established by the Compliance Enforcement Authority, or on an as-needed basis. The Compliance Enforcement Authority shall issue requests for Periodic Data Submittals to Registered Entities within at least the minimum advance notice period specified by the applicable Reliability Standard. If the Reliability Standard does not specify an advance notice period, the Compliance Enforcement Authority will normally issue this request with no less than twenty (20) days advance notice.

3.6.1 Periodic Data Submittals Process Steps

The process steps for Periodic Data Submittal are as follows:

- The Compliance Enforcement Authority posts the current data reporting schedule on its website and informs Registered Entities of changes and/or updates. The Compliance Enforcement Authority ensures that the required submittal forms for the Reliability Standards being evaluated are maintained and available.

- The Compliance Enforcement Authority makes a request for a Periodic Data Submittal.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date specified in the request.

- The Compliance Enforcement Authority reviews the data submittal to determine compliance with the Reliability Standards and may request additional data and/or information if necessary.

- If the Compliance Enforcement Authority's review of the data submittal indicates a potential noncompliance with a Reliability Standard Requirement by the Registered Entity, the Compliance Enforcement Authority performs a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

Receipt of a Periodic Data Submittal by the Compliance Enforcement Authority shall not be construed as a finding by the Compliance Enforcement Authority that the Registered Entity is compliant with, not compliant with, subject to, or not subject to, the Reliability Standard Requirement.

3.7 Complaints

Either NERC or Regional Entities may receive Complaints alleging violations of a Reliability Standard. The Compliance Enforcement Authority will conduct a review of each Complaint it receives to determine if the Complaint provides sufficient basis for initiating another compliance monitoring or enforcement process, except that NERC will review any Complaint where the Compliance Enforcement Authority determines it cannot conduct the review, or if the complainant wishes to remain anonymous or specifically requests NERC to conduct the review of the Complaint.

If the Complaint is submitted to NERC, NERC will forward the information to the Regional Entity, as appropriate.

All anonymous Complaints will be reviewed and any resulting compliance monitoring or enforcement processes conducted by NERC will be conducted in accordance with Section 3.7.2 to prevent disclosure of the identity of the complainant.

The Compliance Enforcement Authority conducting the review will determine if the Complaint may be closed as a result of the initial review and assessment or if it provides sufficient basis for initiating another compliance monitoring or enforcement process. The Compliance Enforcement Authority will report the results of its review of the Complaint to NERC. If, as a result of the initial review of the Complaint, the Compliance Enforcement Authority determines that initiating another compliance monitoring or enforcement process is warranted, the Compliance Enforcement Authority shall conduct that compliance monitoring or enforcement process in accordance with the applicable provisions of Section 3.0.

3.7.1 Complaint Process Steps

The detailed process steps for the Complaint process are as follows:

- The complainant notifies NERC or a Regional Entity using the NERC compliance hotline, submitting a NERC Complaint reporting form, or by other means. NERC and the Regional Entity shall post a link to the Complaint reporting form on their respective websites. The Complaint should include sufficient information to enable NERC or the Regional Entity to make an assessment regarding whether the initiation of another compliance monitoring or enforcement process is warranted. NERC or the Regional Entity may not act on a Complaint if the Complaint is incomplete and does not include sufficient information.

- If the Compliance Enforcement Authority determines that initiation of another compliance monitoring or enforcement process is warranted, it initiates the compliance monitoring or enforcement process in accordance with the applicable provisions of Section 3.0 or Section 5.0; otherwise it takes no further action. The Compliance Enforcement Authority notifies the complainant, the Registered Entity, and NERC of the initiation of the compliance monitoring or enforcement process. If the Compliance Enforcement Authority determines that initiation of another compliance monitoring or enforcement process is not warranted, it will notify the complainant, NERC, and the Registered Entity that no further action will be taken.

- The Compliance Enforcement Authority fully documents the Complaint and the Complaint review, and whether another compliance monitoring or enforcement process is warranted.

3.7.2 Anonymous Complainant Notification Procedure

A complainant who believes, or has information indicating, there has been a violation of a Reliability Standard, and wishes to remain anonymous, can report the information and request

that the complainant's identity not be disclosed.[2] All Complaints lodged by a person or entity requesting that the complainant's identity not be disclosed shall be investigated by NERC following the procedural steps described in Section 3.7.1. Anonymous Complaints received by a Regional Entity will either be directed to NERC or the Regional Entity will collect and forward the information to NERC, at the Regional Entity's discretion. Neither NERC nor the Regional Entity shall disclose the identity of any person or entity reporting information indicating violations of Reliability Standards to NERC or to a Regional Entity that requests that his/her/its identity not be revealed. The identity of the complainant will only be known by NERC and in the case where a Regional Entity collects the information, by NERC and the Regional Entity. If the Compliance Enforcement Authority determines that initiation of another compliance monitoring and enforcement process is not warranted, it will notify the complainant, NERC, and the Registered Entity that no further action will be taken.

3.8 Preliminary Screen

If the Compliance Enforcement Authority obtains information, through one of the compliance monitoring processes described in this Section 3.0 or by any other means, that indicates a potential noncompliance with a Reliability Standard Requirement, the Compliance Enforcement Authority shall conduct a Preliminary Screen of the potential noncompliance. The Preliminary Screen shall be conducted within five (5) business days after the Compliance Enforcement Authority identifies the potential noncompliance, except that (i) if the Compliance Enforcement Authority identifies the potential noncompliance during a Compliance Audit, the Preliminary Screen shall be conducted immediately following the exit briefing of the Registered Entity, and (ii) if the Compliance Enforcement Authority identifies the potential noncompliance during a Compliance Investigation, the Preliminary Screen shall be conducted immediately after the Registered Entity is first notified of the potential noncompliance identified by the Compliance Investigation.

A Preliminary Screen shall be limited to determining whether:

(1) the entity allegedly involved in the potential noncompliance is a Registered Entity;

(2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to the entity, has been approved by the Applicable Governmental Authority, and is in effect at the time of the potential noncompliance; and

(3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation that is currently being processed.

If the Preliminary Screen results in an affirmative determination with respect to the above criteria, a Possible Violation exists and the Compliance Enforcement Authority shall proceed in

[2]NERC has established a Compliance Hotline that may be used for the submission of Complaints by persons or entities that do not want his/her/its identity disclosed (see www.nerc.com for additional information).

accordance with Section 5.0, unless ~~an alternative enforcement~~the Compliance Exception ~~p~~Process is used in accordance with Section 3A.0.

The Compliance Enforcement authority shall maintain records of all Preliminary Screens.

3A.0 ENFORCEMENT DISCRETION

Not all instances of noncompliance with Reliability Standards require the same type of processing and documentation. Noncompliance that does not pose a serious or substantial risk to the reliability of the Bulk Power System may be resolved through streamlined processes, when appropriate, consistent with processes approved by NERC and Applicable Governmental Authorities.

Absolute adherence to the enforcement process set out in section 5.0 may not be the most appropriate, efficient, or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the Compliance Enforcement Authority, and the Registered Entity.

The Find, Fix, Track, and Report and the Compliance Exception processes are alternatives to the process outlined in section 5.0. ~~The Find, Fix, Track, and Report process may be used to address noncompliance posing a minimal or moderate risk to the reliability of the Bulk Power System.~~

3A.1 Compliance Exception Process

The Compliance Exception~~s~~ process may be used to address noncompliance posing a minimal risk to the reliability of the Bulk Power System, unless an Applicable Governmental Authority authorizes expansion of the program. Compliance Exceptions are not included in a Registered Entity's compliance history for penalty purposes. However, a Compliance Enforcement Authority must (a) consider a history of C~~c~~ompliance E~~e~~xceptions where the failure to fully remediate the underlying compliance matter contributes to a subsequent serious or substantial noncompliance and (b) assess subsequent noncompliance to determine whether a Registered Entity should continue to qualify for Compliance Exception treatment.

The Compliance Exception process requires that:

(1) The Registered Entity mitigates the noncompliance; and

(2) The facts and circumstances of the noncompliance, including those associated with the determination of the level of risk and the related mitigation, are available for review by NERC and Applicable Governmental Authorities; and

(3) The noncompliance is tracked and analyzed as necessary and appropriate to identify emerging risks and other pertinent trends; and

(4) The Registered Entity is provided the opportunity to object to the use of the ~~alternative approach~~Compliance Exception Process to resolution of the noncompliance.

Changes to the processes and principles articulated in this section must be approved by Applicable Governmental Authorities.

~~**3A.2 Find, Fix, Track and Report Process**~~

~~The Find, Fix, Track and Report process may be used to address noncompliance posing a minimal or moderate risk to the reliability of the Bulk Power System.~~

~~The Find, Fix, Track, and Report process and the Compliance Exception process requires that:~~

- ~~The Registered Entity mitigates the noncompliance; and~~
- ~~The facts and circumstances of the noncompliance, including those associated with the determination of the level of risk and the related mitigation, are available for review by NERC and Applicable Governmental Authorities; and~~
- ~~The noncompliance is tracked and analyzed as necessary and appropriate to identify emerging risks and other pertinent trends; and~~
- ~~The Registered Entity is provided the opportunity to object to the use of the alternative approach to resolution of the noncompliance.~~

~~Changes to the processes and principles articulated in this section must be approved by Applicable Governmental Authorities.~~

4.0 ANNUAL IMPLEMENTATION PLANS

4.1 NERC Compliance Monitoring and Enforcement Program Implementation Plan

NERC will maintain and update the NERC Implementation Plan, to be carried out by Compliance Enforcement Authorities in the performance of their responsibilities and duties in implementing the NERC Compliance Monitoring and Enforcement Program. The NERC Implementation Plan will be provided to the Regional Entities on or about September 1 of each year and will ~~specify~~ identify risk elements related to the Reliability Standards ~~requiring reporting by Registered Entities~~to be considered for compliance oversight ~~to~~ by the Compliance Enforcement Authority ~~to provide verification of compliance through one of the monitoring methods described in this Compliance Program~~. The NERC Implementation Plan will be posted on the NERC website. NERC may update and revise the NERC Implementation Plan during the course of the year as necessary. Regional Entities have discretion to make modifications to the NERC Implementation Plan with respect to individual Registered Entities.

4.2 Regional Implementation Plan

By on or about October 1 of each year, each Regional Entity will submit a Regional Implementation Plan for the following calendar year to NERC for review and approval. The Regional Implementation Plan and the Regional Entity's other relevant Compliance Program documents shall be posted on the Regional Entity's website. The Regional Entity may update

and revise the Regional Entity Implementation Plan during the course of the year as necessary, with NERC approval, or as required by NERC. Regional Entities have discretion to make modifications to the Regional Entity Implementation Plan with respect to individual Registered Entities.

5.0 ENFORCEMENT ACTIONS

The Compliance Enforcement Authority shall determine (i) whether there have been violations of Reliability Standards by Registered Entities within the Compliance Enforcement Authority's Area of Responsibility, and (ii) if so, the appropriate Mitigating Activities, and Penalties and sanctions, as prescribed in the NERC *Sanction Guidelines* (Appendix 4B to the NERC Rules of Procedure). NERC will work to achieve consistency in the application of the *Sanction Guidelines* by Regional Entities by direct oversight and review of Penalties and sanctions, and each Regional Entity shall provide to NERC such information as is requested by NERC concerning any Penalty, sanction, or Mitigating Activities imposed by the Regional Entity.

The imposition and acceptance of Penalties and sanctions shall not be considered an acceptable alternative to any Registered Entity's continuing obligation to comply with the Reliability Standards.

The Compliance Enforcement Authority has authority to collect Documents, data and information in the manner it deems most appropriate, including requesting copies be made of Documents, data and information and removing those copies from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the Documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for Documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC general counsel. If Documents, data or information requested from a Registered Entity in connection with an enforcement process are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

The following enforcement process is undertaken by the Compliance Enforcement Authority following identification of a Possible Violation of a Reliability Standard Requirement by a Registered Entity. However, under the circumstances presented by some Possible Violations, Alleged Violations or Confirmed Violations, absolute adherence to the following enforcement process, to the exclusion of other approaches, may not be the most appropriate, efficient or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the Compliance Enforcement Authority and the Registered Entity. In such circumstances, other approaches may be considered and employed. The Registered Entity shall be entitled to object to the use of any such other approach.

5.1 Notice of Possible Violation

If a Preliminary Screen conducted in accordance with Section 3.8 results in an affirmative determination with respect to the Preliminary Screen criteria, a Possible Violation exists. Unless the Compliance Exception process in Section 3A.0 is used to address the Possible Violation, ~~T~~the Compliance Enforcement Authority shall issue a Notice of Possible Violation to the Registered Entity. The Notice of Possible Violation shall:

(i) state that a Possible Violation by the Registered Entity has been identified;

(ii) provide a brief description of the Possible Violation, including the Reliability Standard requirement(s) and, if known, the date(s) involved; and

(iii) instruct the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

Upon issuing a Notice of Possible Violation, the Compliance Enforcement Authority reports the Possible Violation to NERC. NERC reports the Possible Violation to the Board of Trustees Compliance Committee and submits a Notice of Possible Violation, on a confidential basis, to FERC and to other Applicable Governmental Authorities, as applicable. Any such notice to FERC or to other Applicable Governmental Authorities shall be provided in accordance with Section 8.0, Reporting and Disclosure.

5.2 Assessment of Possible Violation

After issuing a Notice of Possible Violation, the Compliance Enforcement Authority shall conduct an assessment of the facts and circumstances surrounding the Possible Violation to determine whether evidence exists to indicate the Registered Entity has violated the Reliability Standard Requirement(s) identified in the Notice of Possible Violation, or whether the Possible Violation should be dismissed. The Compliance Enforcement Authority may consider any additional information to demonstrate that the Possible Violation should be dismissed or modified or resolved through the Find, Fix, Track and Report (FFT) process in section 5.2A.

5.2A FFT Process

The Find, Fix, Track and Report process may be used to address noncompliance posing a minimal or moderate risk to the reliability of the Bulk Power System.

The FFT process requires that:

(1) The Registered Entity mitigates the noncompliance; and

(2) The facts and circumstances of the noncompliance, including those associated with the determination of the level of risk and the related mitigation, are available for review by NERC and Applicable Governmental Authorities; and

(3) FFTs are tracked and analyzed as necessary by NERC as appropriate to identify emerging risks and other pertinent trends; and

(4) The Registered Entity is provided the opportunity to object to the use of the FFT process to resolution of the noncompliance.

5.3 Notification to Registered Entity of Alleged Violation

If the Compliance Enforcement Authority determines, based on an assessment of the facts and circumstances surrounding a Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard, the Compliance Enforcement Authority shall notify the Registered Entity of the determination of the Alleged Violation, through issuance of a Notice of Alleged Violation and Proposed Penalty or Sanction or similar notification, and shall report the Alleged Violation to NERC The notification of Alleged Violation shall be transmitted by the Compliance Enforcement Authority to the Registered Entity by electronic mail and shall be effective as of the date of the electronic mail message from the Compliance Enforcement Authority transmitting the notification. The notification of Alleged Violation shall include, at a minimum:

(i) the Reliability Standard and Requirement(s) thereof the Registered Entity has allegedly violated,

(ii) the date and time the Alleged Violation occurred (or is occurring),

(iii) the facts the Compliance Enforcement Authority believes demonstrate or constitute the Alleged Violation,

(iv) the proposed Penalty or sanction, if any, determined by the Compliance Enforcement Authority to be applicable to the Alleged Violation in accordance with the NERC *Sanction Guidelines*, including an explanation of the basis on which the particular Penalty or sanction was determined to be applicable,

(v) notice that the Registered Entity shall, within thirty (30) days, elect one of the following options or the Compliance Enforcement Authority will deem the Registered Entity to have accepted the determination of violation and proposed Penalty or sanction:

1. agree with the Alleged Violation and proposed Penalty or sanction, and agree to submit and implement a Mitigation Plan or other Mitigating Activities to correct the violation and its underlying causes, and may provide a response in accordance with Section 5.4, or

2. agree with the Alleged Violation and agree to submit and implement a Mitigation Plan or other Mitigating Activities to eliminate the violation and its underlying causes, but contest the proposed Penalty or sanction, and may provide a response in accordance with Section 5.4, or

3. contest both the Alleged Violation and proposed Penalty or sanction,

(vi) notice that the Registered Entity may elect to submit a Mitigation Plan while contesting the Alleged Violation and/or the proposed Penalty or sanction, and that submission of a Mitigation Plan will not waive the Registered Entity's right to contest the Alleged Violation and/or the proposed Penalty or sanction;

(vii) notice that if the Registered Entity elects to contest the Alleged Violation and/or the proposed Penalty or sanction, the Registered Entity may elect to have a hearing conducted pursuant to either (i) the short-form procedure in Section 1.3.4, or (ii) the general hearing procedure, in **Attachment 2, Hearing Procedures**, and

(viii) required procedures to submit the Registered Entity's Mitigation Plan.

NERC shall notify FERC of the Alleged Violation and, if the Alleged Violation pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, shall notify such other Applicable Governmental Authority of the Alleged Violation, within two (2) business days of receipt from the Compliance Enforcement Authority. Any such notice to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.

5.4 Registered Entity Response

If the Registered Entity agrees with, does not contest, or does not respond to the notification of Alleged Violation within thirty (30) days following the date of the notification of Alleged Violation by electronic mail, it shall be deemed to have accepted the Compliance Enforcement Authority's determination of violation and Penalty or sanction, and the Compliance Enforcement Authority shall issue a Notice of Confirmed Violation or similar notification to the Registered Entity and shall report the Confirmed Violation to NERC. At the time of notifying the Registered Entity of the Confirmed Violation, the Compliance Enforcement Authority shall also provide notice to the Registered Entity that it may provide a written explanatory statement to accompany the filing with FERC and public posting of the Confirmed Violation. The Registered Entity's statement must include the name, title, and signature of an officer, employee, attorney or other authorized representative of the Registered Entity.

If the Registered Entity contests the Alleged Violation or the proposed Penalty or sanction, the Registered Entity shall submit to the Compliance Enforcement Authority, within thirty (30) days following the date of the notification of the Alleged Violation, a response explaining its position, signed by an officer, employee, attorney or other authorized representative together with any supporting information and documents. The Compliance Enforcement Authority shall schedule a conference with the Registered Entity within ten (10) business days after receipt of the response. If the Compliance Enforcement Authority and the Registered Entity are unable to resolve all issues within forty (40) days after the Registered Entity's response, the Registered Entity may request a hearing. The Compliance Enforcement Authority and the Registered Entity may agree in writing to extend the forty (40) day period. If no hearing request is made prior to the end of the forty (40) day period, the violation will be become a Confirmed Violation.

If a hearing is requested the Compliance Enforcement Authority shall initiate the hearing process in accordance with **Attachment 2, Hearing** Procedures.

5.5 Hearing Process for Compliance Hearings

The Compliance Enforcement Authority hearing process is set forth in **Attachment 2**.

5.6 Settlement Process

The Registered Entity can request settlement negotiations at any time, including prior to the issuance of notification of an Alleged Violation; however, the Compliance Enforcement Authority may decline to engage in or to continue settlement negotiations after a Possible Violation or Alleged Violation becomes a Confirmed Violation in accordance with Section 5.4. The Registered Entity or the Compliance Enforcement Authority may terminate settlement negotiations at any time. Where the Compliance Enforcement Authority has agreed top engage in settlement negotiations, the running of the time period specified in Section 5.4 for the Registered Entity to respond to the notification of Alleged Violation is suspended until settlement negotiations are concluded or terminate. NERC shall be notified of all settlement negotiations and may participate in any settlement negotiations. All settlement negotiations will be confidential until such time as the settlement is approved by NERC. For all settlement discussions, the Compliance Enforcement Authority shall require the Registered Entity to designate an individual(s) authorized to negotiate on its behalf.

The Compliance Enforcement Authority may consider all relevant facts in settlement negotiations. A settlement agreement must ensure that the reliability of the Bulk Power System will not be compromised by the settlement and that a violation of a Reliability Standard will not occur as a result of the settlement. All settlement agreements must provide, if the settlement is approved, for waiver of the Registered Entity's right to further hearings and appeal.

The Compliance Enforcement Authority and the Registered Entity will execute a settlement agreement setting forth the final settlement terms including all Penalties, sanctions and mitigation requirements provided for in the final settlement.

The Compliance Enforcement Authority shall report the terms of all settlements of compliance matters to NERC. NERC will review the settlement for the purpose of evaluating its consistency with other settlements entered into for similar violations or under other, similar circumstances. The Registered Entity may submit an explanatory statement, conforming to the requirements of Section 5.4, to be included in the settlement agreement and which shall be subject to consent of the Compliance Enforcement Authority as part of the settlement agreement. The settlement agreement may state that the Registered Entity (i) admits the Alleged Violation, or (ii) does not contest the Alleged Violation, or (iii) neither admits nor denies the Alleged Violation, but may not state that the Registered Entity denies the Alleged Violation. Based on this review, NERC will either approve the settlement or reject the settlement and notify the Compliance Enforcement Authority of any changes to the settlement that would result in approval, and within five (5) business days the Compliance Enforcement Authority will in turn notify the Registered Entity. If NERC rejects the settlement, the Compliance Enforcement Authority will attempt to negotiate a revised settlement agreement with the Registered Entity including any changes to the settlement specified by NERC.

NERC will report the approved settlement of the violation to FERC and, if the settlement relates to a Registered Entity or to a portion of the Bulk Power System over which another Applicable

Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such report shall be provided in accordance with Section 8.0, Reporting and Disclosure. NERC will also publicly post the violation settled (regardless of whether the settlement includes or does not include an admission of a violation) and the resulting Penalty or sanction provided for in the settlement. This posting shall include a copy of the settlement or a description of the terms of the settlement, and a copy of any Mitigation Plan that is agreed to as part of the settlement, with any Critical Energy Infrastructure Information and Confidential Information redacted. The Compliance Enforcement Authority will issue a letter setting forth the final settlement terms including all Penalties, sanctions and mitigation requirements provided for in the final settlement. Postings of Notices of Confirmed Violations are addressed in Section 8.0.

5.7 NERC Appeal Process

A Registered Entity or the Compliance Enforcement Authority may appeal the decision of a Regional Entity Hearing Body to NERC, as provided for in NERC Rules of Procedure, Section 409.

On appeal, NERC shall either affirm the decision or remand to the Compliance Enforcement Authority with reasons for its remand, which may include a direction to the Compliance Enforcement Authority to revise the decision. If NERC affirms the decision, the Compliance Enforcement Authority shall issue a Notice of Confirmed Violation to the Registered Entity. If NERC directs the Compliance Enforcement Authority to revise the decision, a Registered Entity that was the subject of the decision or the Compliance Enforcement Authority may reopen the proceeding on any issue whose resolution is affected by NERC's directive, irrespective of whether the issue was previously litigated, settled or unopposed.

5.8 Notification of Confirmed Violation

A Notice or other notification of Confirmed Violation issued to a Registered Entity pursuant to Sections 5.4 or 5.7 shall include a detailed record of the enforcement action, including the facts and circumstances analyzed and the information on which the Compliance Enforcement Authority relied in proposing a Penalty or sanction.

After NERC receives a notification of Confirmed Violation from the Compliance Enforcement Authority, NERC shall review the notification of Confirmed Violation and utilize the information therein to prepare a Notice of Penalty. NERC shall advise the Compliance Enforcement Authority of any additional detail or further development of the factual findings that NERC deems necessary before the Notice of Penalty can be issued.

NERC may direct the Compliance Enforcement Authority to revise a Penalty determination, in which case the Registered Entity subject to the Penalty, or the Compliance Enforcement Authority, as applicable, may reopen the proceedings on any issue on which the Penalty was based, irrespective of whether the issue was previously litigated, settled or unopposed.

5.9 Notice of Penalty

If (i) the Registered Entity accepts the Notice of Alleged Violation and Proposed Penalty or Sanction or other notification of enforcement action from the Compliance Enforcement

Authority, or (ii) a decision has been entered affirming an Alleged Violation and all appeals have been concluded, or (iii) a settlement agreement has been reached addressing the Possible Violation or Alleged Violation, NERC shall submit a Notice of Penalty to the Applicable Governmental Authority and provide a copy to the Compliance Enforcement Authority. The Compliance Enforcement Authority shall inform the Registered Entity that a Notice of Penalty is pending public filing, at least five (5) business days prior to the public filing and posting. NERC will file the Notice of Penalty with FERC and any other Applicable Governmental Authority no sooner than five (5) business days after NERC approves the Notice of Confirmed Violation or settlement agreement.

NERC shall file the Notice of Penalty with FERC and, if the Possible Violation or Alleged Violation pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such filing with FERC or with another Applicable Governmental Authority shall be made in accordance with Section 8.0, Reporting and Disclosure. NERC will include with the Notice of Penalty any statement provided by the Registered Entity as set forth in Sections 5.4 or 5.6.

The Penalty or sanction will be effective upon expiration of the thirty (30) day period following filing with FERC of the Notice of Penalty (or such longer period as ordered by FERC) or, if FERC decides to review the Penalty or sanction, upon final determination by FERC.

5.10 Completion of Enforcement Action

Following FERC approval of, or expiration of the period for action by FERC on, a Notice of Penalty filed by NERC, the Compliance Enforcement Authority shall issue a payment due notice and invoice to the Registered Entity. The payment due notice and invoice shall state the payment due date which shall be thirty (30) days from the date of the payment due notice and invoice. Upon payment of all monetary Penalties by the Registered Entity, the Compliance Enforcement Authority shall issue a notice confirming payment to the Registered Entity, and provide a copy of the notice confirming payment to NERC. Following the completion by the Registered Entity of all requirements set forth in the Notice of Penalty and any settlement agreement, the Compliance Enforcement Authority shall issue the Registered Entity a Notice of Completion of Enforcement Action.

If the Compliance Enforcement Authority dismisses or disposes of a Possible Violation or Alleged Violation that does not become a Confirmed Violation, the Compliance Enforcement Authority shall issue a Notice of Completion of Enforcement Action to the Registered Entity.

A copy of the Notice of Completion of Enforcement Action shall also be provided to NERC by the Compliance Enforcement Authority.

The Notice of Completion of Enforcement Action shall include a release of any data retention directives that were previously issued to the Registered Entity in connection with the matter. Upon issuance of a Notice of Completion of Enforcement Action, tracking of the violation is completed, and the enforcement action shall be closed.

5.11 Special Procedures for an Enforcement Action Against an ISO/RTO Where the Monetary Penalty May be Allocated by the ISO/RTO to Other Entities

A Registered Entity that is an ISO/RTO may have authority to allocate, pursuant to a proceeding under section 205 of the Federal Power Act, some or all of a monetary Penalty imposed on the ISO/RTO for violation of a Reliability Standard, to another entity(ies) that the Compliance Enforcement Authority, NERC or FERC determines was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation of the Reliability Standard. This section sets forth the procedures to be followed when an ISO/RTO that has received a Notice of Possible Violation requests a determination by the Compliance Enforcement Authority that another entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation.

The procedures in this section apply only where an ISO/RTO requests a determination that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in a Notice of Possible Violation issued to the ISO/RTO, and shall not apply where the ISO/RTO anticipates or is entitled to allocate or assign a monetary Penalty among all, or an identified segment of, its members, customers or users, pursuant to general cost recovery provisions in the ISO/RTO's tariffs, agreements or governance documents and regardless of actual fault or responsibility of the entities to whom the monetary Penalty is issued for the violation.

5.11.1 ISO/RTO's Request for Determination and Notice to Other Entity(ies)

In order to request the Compliance Enforcement Authority to make a determination in an enforcement action that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation (if confirmed) of a Reliability Standard for which the ISO/RTO has received a Notice of Possible Violation, the ISO/RTO shall, no later than ten (10) business days after receiving the Notice of Possible Violation or such additional period as the Compliance Enforcement Authority may permit for good cause shown (i) submit a written request to the Compliance Enforcement Authority and (ii) issue a notice to the specified other entity(ies), each conforming to the requirements of the following two paragraphs of this section.

The ISO/RTO's written request to the Compliance Enforcement Authority shall contain:

(1) the Compliance Enforcement Authority's identification number for the Notice of Possible Violation;

(2) a statement that the ISO/RTO is requesting that the Compliance Enforcement Authority make a determination that a specified other entity(ies) was responsible, in whole or in part, for actions and omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation;

(3) the name(s) of, and contact information for, the specified other entity(ies), including name(s) and address(es) of the entity(ies) and name(s), telephone number(s) and e-mail address(es) of the contact person(s) for the other entity(ies);

(4) a statement that the ISO/RTO has authority to allocate some or all of the monetary Penalty to the specified other entity(ies), including citations to any supporting tariffs, agreements, orders, or governance documents, and a brief explanation to show that the specified other entity(ies) are subject to the tariffs, agreements, orders and/or other governance documents; and

(5) a brief statement of the factual basis on which the ISO/RTO contends in good faith that the specified other entity(ies) was responsible for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. As the enforcement action proceeds, the ISO/RTO may supplement, expand or modify this explanation as additional information becomes available during the course of the enforcement action.

The ISO/RTO's notice to the specified other entity(ies) shall contain the following information:

(1) The name of the specified other entity, and the name, telephone number and e-mail address of the specified other entity's contact person (person to whom the notice is being sent);

(2) A statement that the ISO/RTO has received a Notice of Possible Violation from the Compliance Enforcement Authority, the Compliance Enforcement Authority's identification number for the Notice of Possible Violation, and contact information for the Compliance Enforcement Authority;

(3) A statement that the ISO/RTO has requested the Compliance Enforcement Authority to determine that the specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, and that the ISO/RTO intends to seek to allocate to the specified other entity all or a portion of any monetary Penalty that is imposed on the ISO/RTO for the violation (if confirmed), if the Compliance Enforcement Authority determines the specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation.

(4) A statement that the specified other entity should promptly contact the Compliance Enforcement Authority for further information and to request to participate in the enforcement action relating to the Notice of Possible Violation.

The ISO/RTO shall cause its notice to the specified other entity(ies) to be delivered to the other entity(ies) by next-business-day delivery using a delivery service that provides verification of delivery. The ISO/RTO shall provide the Compliance Enforcement Authority with (i) a copy of the notice sent to each specified other entity, and (ii) a copy of the delivery service's verification of delivery of the notice to each specified other entity.

5.11.2 Responses of the Compliance Enforcement Authority and the Specified Other Entity(ies) to ISO/RTO's Request for Determination and Notice

If (i) the ISO/RTO's written request meets the requirements of Section 5.11.1, the Compliance Enforcement Authority shall provide the specified other entity(ies) with a copy of a non-disclosure agreement (which shall include the specified other entity's agreement to comply with the confidentiality requirements of the Compliance Program and of Section 1500 of the NERC Rules of Procedure) that must be executed to obtain a copy of the Notice of Possible Violation and a copy of the ISO/RTO's written request to the Compliance Enforcement Authority for a determination that the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. In addition, the Compliance Enforcement Authority shall advise the specified other entity(ies) that: (i) the specified other entity(ies) may elect not to participate in the enforcement action, and may submit a written statement to the Compliance Enforcement Authority stating why the specified other entity is not participating and providing any facts or information the other entity wishes to provide concerning the occurrence(s) that are the subject of the Notice of Possible Violation, and (ii) whether or not the specified other entity elects to participate in the enforcement action, the Compliance Enforcement Authority may determine that the specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation.

If the ISO/RTO's written request meets the requirements of Section 5.11.1, then the specified other entity(ies) shall be permitted to participate in the enforcement action concerning the Notice of Possible Violation if the other entity(ies) submits a written request to participate to the Compliance Enforcement Authority and executes a non-disclosure agreement in the form provided by the Compliance Enforcement Authority. The specified other entity must submit its written request to participate prior to, as applicable (i) the date of execution of a settlement agreement between the Compliance Enforcement Authority and the ISO/RTO, or (ii) the date that the Compliance Enforcement Authority issues a Notice of Confirmed Violation to the ISO/RTO. The Compliance Enforcement Authority is not required to suspend or delay the enforcement process pending receipt of a request to participate from the specified other entity(ies), nor to revisit or redo any aspect of the enforcement process that has already occurred prior to receipt of the specified other entity(ies)'s written request to participate; however, upon receipt of a written request to participate and executed nondisclosure agreement from the specified other entity(ies), the Compliance Enforcement Authority shall suspend activity in the enforcement action until it has acted on the request to participate.

Upon receiving the specified other entity's written request to participate in the enforcement action and the other entity's executed nondisclosure agreement, the Compliance Enforcement Authority shall issue a notice to the ISO/RTO and to the specified other entity stating that the specified other entity is allowed to participate in the enforcement action. The Compliance Enforcement Authority's notice that the specified other entity is allowed to participate in the enforcement action shall include a copy of the Notice of Possible Violation originally issued to the ISO/RTO and, if a Notice of Alleged Violation and Proposed Penalty or Sanction or similar notification has been issued to the ISO/RTO, a copy of the latter Notice or notification. Upon receiving notice from the Compliance Enforcement Authority that it is allowed to participate in the enforcement action, the specified other entity may participate in the same manner as the ISO/RTO and shall be subject to all applicable requirements and deadlines specified in the NERC Compliance Program.

If the ISO/RO fails to meet the requirements of Section 5.11.1, the Compliance Enforcement Authority shall issue a notice to the ISO/RTO and to the specified other entity(ies) stating that the Compliance Enforcement Authority will not make the determination requested by the ISO/RTO and therefore the specified other entity will not be allowed to participate in the enforcement action relating to the Notice of Possible Violation.

5.11.3 Compliance Enforcement Authority's Notices to NERC

(a) Within five (5) business days after receiving an ISO/RTO's written request for a determination that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation identified in the Notice of Possible Violation issued to the ISO/RTO, the Compliance Enforcement Authority shall provide to NERC (i) a copy of the ISO/RTO's written request for a determination that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, and (ii) the ISO/RTO's notice to the specified other entity(ies).

(b) On the same day that the Compliance Enforcement Authority issues a notice pursuant to Section 5.11.2 stating, as applicable, that (i) it will or will not make the determination requested by the ISO/RTO or (ii) the specified other entity(ies) are or are not allowed to participate in the enforcement action, the Compliance Enforcement Authority shall provide a copy of the notice to NERC and shall send a copy of the notice to any other entities that have been allowed to participate in the enforcement action.

5.11.4 Compliance Enforcement Authority's Determination

After issuing a notice pursuant to Section 5.11.3 that it will make a determination as to whether the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation that is the subject of the Notice of Possible Violation issued to the ISO/RTO, then, if the enforcement action is not resolved by a settlement agreement stating whether or not the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, the Compliance Enforcement Authority shall make, and include in its proposed Notice of Penalty, its determination of whether or not the specified other entity(ies) were responsible, in whole or in part, for actions or omissions that caused or contributed to the violation. The Compliance Enforcement Authority's determination shall only address whether or not the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, and shall not address whether all or a part of any monetary Penalty imposed on the ISO/RTO for the violation should be allocated or assigned to the specified other entity(ies).

The specified other entity(ies) shall be entitled to request a hearing on the Compliance Enforcement Authority's determination pursuant to Section 1.3.1 of Attachment 2 of this Appendix 4C, and to appeal the Hearing Body's decision pursuant to Section 1.7.10 of Attachment 2 to this Appendix 4C, as though the specified other entity(ies) were a Registered Entity(ies).

5.11.5 Procedure Where ISO/RTO Members Are Allowed to Directly Assign Monetary Penalties for Violations of Reliability Standards to the ISO/RTO

If an ISO/RTO's tariffs, agreement or other relevant governance documents establish procedures that allow members of the ISO/RTO to directly assign to the ISO/RTO monetary Penalties imposed on the ISO/RTO member(s) for violations of Reliability Standards, then the ISO/RTO members may follow the same requirements of Sections 5.11.1 and 511.2 as are applicable to an ISO/RTO under those sections, and the ISO/RTO shall be afforded the same rights to participate in the enforcement action as a specified other entity under Sections 5.11.1, 5.11.2, and 5.11.4, subject to the same requirements and conditions specified in those sections. In such circumstances, the ISO/RTO shall be deemed to be a "specified other entity" for purposes of this Section.

5.11.6 Obligation to Pay Monetary Penalty

(a) The ISO/RTO shall be obligated and responsible to pay any monetary Penalty imposed by the Compliance Enforcement Authority on the ISO/RTO for violation of a Reliability Standard, in accordance with Section 5.10, (i) regardless of whether the Compliance Enforcement Authority has made a determination that a specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, (ii) without regard to the timing of any separate proceeding(s) in which the ISO/RTO seeks to allocate some or all of the monetary Penalty to a specified other entity(ies), and (iii) without regard to whether or when the ISO/RTO receives payment from the specified other entity(ies).

(b) In an enforcement action subject to Section 5.11.5, the ISO/RTO member(s) shall be obligated and responsible to pay any monetary Penalty imposed by the Compliance Enforcement Authority on the ISO/RTO member(s) for violation of a Reliability Standard, regardless of whether or when the ISO/RTO members receive payment or reimbursement from the ISO/RTO.

6.0 MITIGATION OF VIOLATIONS OF RELIABILITY STANDARDS

The Compliance Enforcement Authority has authority to collect Documents, data and information in the manner it deems most appropriate, including requesting copies be made of Documents, data and information and removing those copies from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the Documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for Documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC general counsel. If

Documents, data, information or other reports requested from a Registered Entity in connection with development of a Mitigation Plan or other Mitigating Activities are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

6.1 Requirement for Submission of Mitigation Plans

A Registered Entity found to be in violation of a Reliability Standard shall file with the Compliance Enforcement Authority (i) a proposed Mitigation Plan to correct the violation, or (ii) a description of how the violation has been mitigated, and any requests for extensions of Mitigation Plans or a report of completed mitigation. A Registered Entity may also submit a proposed Mitigation Plan at any other time, including with a Self-Report, or, without admitting it has committed a violation, in response to a Notice of Possible Violation or notification of Alleged Violation.

6.2 Contents of Mitigation Plans

A Mitigation Plan shall include the following information:

- The Registered Entity's point of contact for the Mitigation Plan, who shall be a person (i) responsible for filing the Mitigation Plan, (ii) technically knowledgeable regarding the Mitigation Plan, and (iii) authorized and competent to respond to questions regarding the status of the Mitigation Plan. This person may be the Registered Entity's point of contact described in Section 2.0.

- The Possible, Alleged or Confirmed Violation(s) of Reliability Standard(s) the Mitigation Plan will correct.

- The cause of the Possible, Alleged or Confirmed Violation(s).

- The Registered Entity's action plan to correct the Possible, Alleged or Confirmed Violation(s).

- The Registered Entity's action plan to correct the cause of the Possible, Alleged or Confirmed Violation.

- The Registered Entity's action plan to prevent recurrence of the Possible, Alleged or Confirmed Violation(s).

- The anticipated impact of the Mitigation Plan on the Bulk Power System reliability and an action plan to mitigate any increased risk to the reliability of the Bulk Power System while the Mitigation Plan is being implemented.

- A timetable for completion of the Mitigation Plan including the completion date by which the Mitigation Plan will be fully implemented and the Possible, Alleged or Confirmed Violation(s) corrected.

- Implementation milestones no more than three (3) months apart for Mitigation Plans with

expected completion dates more than three (3) months from the date of submission. Additional violations could be determined for not completing work associated with accepted milestones.

- Any other information deemed necessary or appropriate.

The Mitigation Plan shall be signed by an officer, employee, attorney or other authorized representative of the Registered Entity.

6.3 Timetable for Completion of Mitigation Plans

The Mitigation Plan shall be completed in accordance with its terms. At the Compliance Enforcement Authority's discretion, the completion deadline may be extended for good cause including, but not limited to: (i) operational issues such as the inability to schedule an outage to complete Mitigating Activities, and (ii) construction requirements in the Mitigation Plan that require longer to complete than originally anticipated. If the Mitigation Plan extends beyond the next applicable reporting/assessment period, sanctions for any violation of the applicable Reliability Standard(s) occurring during the implementation period will be held in abeyance and will be waived if the Mitigation Plan is satisfactorily completed.

Any violations assessed during the period of time the accepted Mitigation Plan is being implemented will be recorded by the Compliance Enforcement Authority with associated sanctions or Penalties. Regional Entities will report any findings of violations recorded during this time period to NERC with the notation that the Registered Entity is working under an accepted Mitigation Plan with an extended completion date with Penalties and sanctions held in abeyance until completion of the Mitigation Plan. Upon completion of the accepted Mitigation Plan in accordance with Section 6.6, the Compliance Enforcement Authority will notify the Registered Entity that any findings of violations of the applicable Reliability Standard during the period that the accepted Mitigation Plan was being implemented have been waived and no Penalties or sanctions will apply. Regional Entities will also notify NERC of any such waivers of violations of Reliability Standards.

A request for an extension of any milestone or the completion date of the accepted Mitigation Plan by a Registered Entity must be received by the Compliance Enforcement Authority at least five (5) business days before the original milestone or completion date. The Compliance Enforcement Authority may accept a request for an extension or modification of a Mitigation Plan if the Compliance Enforcement Authority determines the request is justified, and shall notify NERC of the extension or modification within five (5) business days.

If a Mitigation Plan submitted by a Registered Entity is rejected by the Regional Entity acting as Compliance Enforcement Authority or the Hearing Body in accordance with Section 6.5, the Registered Entity shall be subject to any findings of violation of the applicable Reliability Standards during the period the Mitigation Plan was under consideration and to imposition of any Penalties or sanctions imposed for such violations.

6.4 Submission of Mitigation Plans

A Mitigation Plan may be submitted at any time but shall have been submitted by the Registered Entity within thirty (30) days after being served the notification of Alleged Violation, if the Registered Entity does not contest the Alleged Violation and Penalty or sanction, or shall be reflected in a settlement agreement or Notice of Penalty. If the Registered Entity disputes the Alleged Violation or the Penalty or sanction, the Registered Entity shall submit its Mitigation Plan within ten (10) business days following issuance of the written decision of the Hearing Body, unless the Registered Entity elects to appeal the Hearing Body's determination to NERC. The Registered Entity may choose to submit a Mitigation Plan while it contests an Alleged Violation or Penalty or sanction or in response to a Notice of Possible Violation; such submission shall not be deemed an admission of a violation or the appropriateness of a Penalty or sanction. If the Registered Entity has not yet submitted a Mitigation Plan, or the Registered Entity submits a Mitigation Plan but it is rejected by the Regional Entity acting as Compliance Enforcement Authority or the Hearing Body in accordance with Section 6.5, any subsequent violations of the Reliability Standard identified by the Compliance Enforcement Authority before the Hearing Body renders its decision will not be held in abeyance and will be considered as repeat violations of the Reliability Standard.

6.5 Review and Acceptance or Rejection of Proposed Mitigation Plans

Unless the time period is extended by the Compliance Enforcement Authority, it will complete its review of the Mitigation Plan, and will issue a written statement accepting or rejecting the Mitigation Plan, within thirty (30) days of receipt; otherwise the Mitigation Plan will be deemed accepted. In order to extend the initial or an extended period for review of the Mitigation Plan, the Compliance Enforcement Authority shall, within the initial or extended review period, notify the Registered Entity (and NERC if NERC is not the Compliance Enforcement Authority) that the review period is being extended and identify the date by which the Compliance Enforcement Authority will complete its review of the Mitigation Plan. The Compliance Enforcement Authority's extension notice shall also state that if the Compliance Enforcement Authority has not issued a notice by the end of the extended review period either stating that the Compliance Enforcement Authority accepts or rejects the proposed Mitigation Plan or further extending the Compliance Enforcement Authority's period for review of the Mitigation Plan, the Mitigation Plan will be deemed accepted.

If the Compliance Enforcement Authority rejects a Mitigation Plan, the Compliance Enforcement Authority will provide the Registered Entity with a written statement describing the reasons for the rejection, and will require the Registered Entity to submit a revised Mitigation Plan by the Required Date. The Compliance Enforcement Authority will notify the Registered Entity within ten (10) business days after receipt of a revised Mitigation Plan whether the Compliance Enforcement Authority will accept or reject the revised Mitigation Plan and provide a written statement describing the reasons for rejection and the Required Date for the second revised Mitigation Plan. If the second review results in rejection of the Mitigation Plan, the Registered Entity may request a hearing in accordance with the Hearing Procedures, by submitting to the Compliance Enforcement Authority a written request for hearing including an explanation of why the Mitigation Plan should be accepted. After the hearing is completed, the Compliance Enforcement Authority will issue a written statement accepting a Mitigation Plan it deems as appropriate.

Within five (5) business days after a Regional Entity accepts a Mitigation Plan, the Regional Entity (i) will notify NERC and the Registered Entity of the acceptance of the Mitigation Plan and (ii) will provide the accepted Mitigation Plan to NERC. NERC will review the accepted Mitigation Plan and, within thirty (30) days following its receipt of the Mitigation Plan from the Regional Entity, will notify the Regional Entity and the Registered Entity, on a contemporaneous basis, as to whether the Mitigation Plan is approved or disapproved by NERC. If NERC disapproves a Mitigation Plan that was accepted by the Regional Entity, NERC shall state its reasons for the rejection, and may state the changes to the Mitigation Plan that would result in approval by NERC. The Registered Entity shall not be subject to findings of violations of the specific Requirements of Reliability Standards that are the subject of the Mitigation Plan or to imposition of Penalties or sanctions for such violations with respect to the period of time the Mitigation Plan was under consideration by NERC and for a reasonable period following NERC's disapproval of the Mitigation Plan, so long as the Registered Entity promptly submits a modified Mitigation Plan that addresses the concerns identified by NERC.

If a Registered Entity submits a Mitigation Plan prior to issuance of a notification of Confirmed Violation or entry into a settlement, such as with a Self-Report or in response to a Notice of Possible Violation, the Regional Entity may provisionally accept the proposed Mitigation Plan. If the Regional Entity subsequently determines, upon completing its assessment of the Possible Violation, that the facts and circumstances are different than those on which the accepted Mitigation Plan was based, the Regional Entity may, by notice to the Registered Entity and to NERC, require the Registered Entity to submit a revised Mitigation Plan that fully addresses the facts and circumstances of the violation. The Regional Entity's notice shall state the additional or different facts and circumstances that need to be addressed in the revised Mitigation Plan. The Registered Entity shall submit a revised Mitigation Plan in response to the notice within thirty (30) days following the date of the notice, unless the Regional Entity specifies or allows a longer time period. The Registered Entity's revised Mitigation Plan shall be subject to review and acceptance or rejection by the Regional Entity and by NERC in accordance with this Section 6.5. If the Regional Entity issues a notification of Confirmed Violation or enters into a settlement with the Registered Entity and does not identify a need to request modifications to the provisionally-accepted Mitigation Plan based on additional or different facts and circumstances, the Regional Entity shall issue a notice to the Registered Entity, with a copy to NERC, stating that the "provisional" nature of the acceptance is terminated and the acceptance is final. The Regional Entity shall issue such notice within five (5) business days of issuance of the Notice of Confirmed Violation or entry into the settlement.

NERC will submit to FERC, as non-public information, an approved Mitigation Plan relating to violations of Reliability Standards within seven (7) business days after NERC approves the Mitigation Plan. NERC shall publicly post the approved Mitigation Plan as part of the public posting of the related Notice of Penalty in accordance with Section 8.0 or settlement in accordance with Section 5.6.

6.6 Completion/Confirmation of Implementation of Mitigation Plans

The Registered Entity shall provide updates at least quarterly to the Compliance Enforcement Authority on the progress of the Mitigation Plan. The Compliance Enforcement Authority will track the Mitigation Plan to completion and may conduct on-site visits and review status during Compliance Audit to monitor Mitigation Plan implementation.

Upon completion of the Mitigation Plan, the Registered Entity shall provide to the Compliance Enforcement Authority certification, signed by an officer, employee, attorney or other authorized representative of the Registered Entity, that all required actions described in the Mitigation Plan have been completed and shall include data or information sufficient for the Compliance Enforcement Authority to verify completion. The Compliance Enforcement Authority shall request such data or information and conduct follow-up assessments, on-site or other Spot Checks, or Compliance Audits as it deems necessary to verify that all required actions in the Mitigation Plan have been completed.

In the event all required actions in the Mitigation Plan are not completed within the applicable deadline including any extensions of the original deadline granted under Section 6.3, any violation(s) of a Reliability Standard subject to the Mitigation Plan that occurred during the originally scheduled time period for completion will be enforced immediately and a new Mitigation Plan must be submitted for acceptance by the Compliance Enforcement Authority. In addition, the Compliance Enforcement Authority may conduct a Compliance Audit of, or issue a Remedial Action Directive to, the Registered Entity.

Upon request by NERC, the Regional Entity will provide to NERC the quarterly status reports and such other information as NERC requests. The Regional Entity will notify NERC when each Mitigation Plan is verified to have been completed.

6.7 Recordkeeping

The Compliance Enforcement Authority will maintain a record containing the following information for each Mitigation Plan:

- Name of Registered Entity.
- The date of the violation.
- Monitoring method by which the violation was detected, i.e., Self-Certification, Self-Report, Compliance Audit, Compliance Investigation, Complaint, etc.
- Date(s) of Notice of Possible Violation and notification of Alleged Violation (if applicable).
- Expected and actual completion date of the Mitigation Plan and major milestones.
- Expected and actual completion date for each required action.
- Accepted changes to milestones, completion dates, or scope of Mitigation Plan.
- Registered Entity's completion notice and data submitted as evidence of completion.

7.0 REMEDIAL ACTION DIRECTIVES

The Compliance Enforcement Authority may issue a Remedial Action Directive when such action is immediately necessary to protect the reliability of the Bulk Power System from an

imminent or actual threat. A Remedial Action Directive may include, but is not limited to, any of the following: specifying operating or planning criteria, limits, or limitations; requiring specific system studies; defining operating practices or guidelines; requiring confirmation of data, practices, or procedures through inspection testing or other methods; requiring specific training for personnel; requiring development of specific operating plans; directing a Registered Entity to develop and comply with a plan to remediate a violation; imposing increased auditing or additional training requirements; and requiring a Registered Entity to cease an activity that may constitute a violation of a Reliability Standard.

A Remedial Action Directive may be issued to a Registered Entity at any time, including during any procedures relating to a Possible Violation or an Alleged Violation of a Reliability Standard. The Compliance Enforcement Authority will specify whether a Remedial Action Directive obviates the need for a Mitigation Plan.

Prior to issuing a Remedial Action Directive, the Compliance Enforcement Authority shall consult the Reliability Coordinator for the Registered Entity.

Any Remedial Action Directive must be provided in a notice to the Registered Entity and shall include: (i) a list of the Possible Violation(s) or Alleged Violation(s) of Reliability Standards that are the basis for issuance of the Remedial Action Directive; (ii) a discussion of the factual basis for the Remedial Action Directive; (iii) the requirements the Compliance Enforcement Authority is imposing to remove the imminent or actual threat to the reliability of the Bulk Power System; (iv) a deadline for compliance and a schedule for specific periodic updates to the Compliance Enforcement Authority; and (v) notice to the Registered Entity that failure to comply with the directive by the Required Date may result in further Remedial Action Directives or significantly increased sanctions.

The Compliance Enforcement Authority will cause the notice of the Remedial Action Directive to be delivered to the Registered Entity by (i) electronic mail to the Registered Entity's CEO or equivalent and copied to the Registered Entity's designated contact person for reliability matters and (ii) by a recognized express courier service that provides tracking and verification of delivery to the recipient. The notice will be deemed received on the earlier of the actual date of receipt of the electronic submission or receipt of the express courier delivery as specified by the express courier service's verification of delivery. The Compliance Enforcement Authority will monitor implementation of Remedial Action Directives as necessary to verify compliance.

The Compliance Enforcement Authority will notify NERC within two (2) business days after issuing a Remedial Action Directive and will copy NERC on all correspondence sent to the Registered Entity.

Once the Compliance Enforcement Authority has given the Registered Entity notice of the Remedial Action Directive, the Registered Entity may contest the Remedial Action Directive by giving written notice to the Compliance Enforcement Authority within two (2) business days following the date of actual receipt of notice of the Remedial Action Directive. Due to the urgency of resolving any objections to a Remedial Action Directive, the hearing shall be conducted under the expedited hearing process set forth in Section 1.9 of **Attachment 2, Hearing Procedures**. Notice to contest the Remedial Action Directive and participation in the hearing process set forth in Section 1.9 of **Attachment 2, Hearing Procedures** shall constitute

the Registered Entity's right to appeal the Remedial Action Directive. The Registered Entity may elect not to implement the Remedial Action Directive until the hearing process is completed, or may proceed with implementing the Remedial Action Directive even if it is contesting the Remedial Action Directive.

8.0 REPORTING AND DISCLOSURE

8.1 Information to be Reported

Regional Entities shall promptly submit to NERC electronic reports containing current information concerning the information listed below. NERC will work with Regional Entities to specify form, content, timing, and method of submitting reports and notices.

(1) The status of the review and assessment of all Possible Violations, Alleged Violations and Confirmed Violations of Reliability Standards by Registered Entities,

(2) The potential impact of any Alleged Violation or Confirmed Violation on the reliability of the Bulk Power System,

(3) Sanctions and Penalties,

(4) Remedial Action Directives imposed,

(5) Mitigation Plans, and

(6) The name of a Regional Entity staff person knowledgeable about the information to serve as a point of contact.

8.2 Reporting to Applicable Governmental Authorities and Public Disclosure

Within two (2) business days of receiving a report from a Regional Entity of a Possible Violation, Alleged Violation, or Confirmed Violation, NERC shall notify FERC of the Possible Violation, Alleged Violation or Confirmed Violation.

Where the report pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, NERC shall notify such other Applicable Governmental Authority, within two (2) business days of receiving a report of a Possible Violation, Alleged Violation or Confirmed Violation from the Regional Entity; provided, that NERC will not disclose any non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to an Applicable Governmental Authority other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure. Likewise, NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.

In any notice to, and request for permission to disclose compliance information from, FERC or another Applicable Governmental Authority pursuant to any provision of this Compliance Program, NERC will identify each Applicable Governmental Authority to which it proposes to disclose the information and the specific procedures that will be used for protecting from public disclosure any non-public compliance information that will be transferred to the other Applicable Governmental Authority or Authorities. The provisions of this paragraph do not apply to the provision by NERC to an Applicable Governmental Authority of information that is not directly related to a specific Registered Entity's compliance with a requirement of a Reliability Standard. NERC will publicly post on its website each Notice of Penalty, with any Critical Energy Infrastructure Information or other Confidential Information redacted (unless posting of the Critical Energy Infrastructure Information or Confidential Information has been determined to be permissible in accordance with Section 1500 of the Rules of Procedure), with the identity of the violator, together with any statement submitted by the Registered Entity, when NERC files the Notice of Penalty with FERC pursuant to Section 5.9.

NERC will provide reports quarterly to FERC and, where a report contains information pertaining to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority, on the status of all Possible, Alleged and Confirmed Violations for which mitigation activities have not been completed. All such reports to FERC and to other Applicable Governmental Authorities shall be provided in accordance with this Section.

9.0 DATA RETENTION AND CONFIDENTIALITY

9.1 Records Management

The Compliance Enforcement Authority records management policy shall provide for a routine and orderly process for the retention and disposal of electronic and paper records related to the Compliance Program, ensure verification of compliance with appropriate business, regulatory, and legal requirements and at a minimum conform to the data retention requirements of the Reliability Standards. The policy shall allow for the maintenance of records as required to implement the Compliance Program.

9.2 Retention Requirements

The Compliance Enforcement Authority records management policy will require that information and data generated or received pursuant to Compliance Program activities, including Compliance Audits, Self-Certifications, Spot Checks, Compliance Investigations, Self-Reports, Periodic Data Submittals, Exception Reporting, and Complaints, as well as a hearing process, will be retained for the longer of (i) five (5) years or (ii) any retention period specified in a Reliability Standard or by FERC or another Applicable Governmental Authority. The obligation to retain information and data commences upon the initiation of the Compliance Program activity that produces the data or information. If the information or data is material to the resolution of a controversy, the retention period for such data shall not commence until after the controversy is resolved.

Upon request from NERC, Regional Entities will provide to NERC copies of such information and data. NERC will retain the information and data in order to maintain a record of activity under the Compliance Program. In providing the information and data to NERC, the Regional Entity shall preserve any mark of confidentiality.

9.3 Confidentiality and Critical Energy Infrastructure Information

9.3.1 Definitions

Information or data generated or received pursuant to Compliance Program activities, including a hearing process, shall be treated in a confidential manner pursuant to the provisions of Section 1500 of the NERC Rules of Procedure. The terms "Confidential Information," "Confidential Business and Market Information," "Critical Energy Infrastructure Information," and "Critical Infrastructure" shall have the meanings stated in Appendix 2 to the NERC Rules of Procedure.

9.3.2 Protection of Confidential Information

The Compliance Enforcement Authority personnel (including any contractors, consultants and industry subject matter experts) and committee members, and participants in Compliance Program activities shall be informed of, and agree to comply with, Section 1500 of the NERC Rules of Procedure concerning Confidential Information.

9.3.3 Critical Energy Infrastructure Information

The Compliance Enforcement Authority will keep confidential all Critical Energy Infrastructure Information in accordance with Section 1500 of the NERC Rules of Procedures. Information deemed to be Critical Energy Infrastructure Information shall be redacted, in accordance with Section 1500 of the NERC Rules of Procedure, and shall not be released publicly.

ATTACHMENT 1

PROCESS FOR NON-SUBMITTAL OF REQUESTED DATA

FERC's regulations at 18 C.F.R §39.2(d) provide that each user, owner or operator of the Bulk Power System within the United States (other than Alaska and Hawaii) shall provide FERC, the ERO and the applicable Regional Entity such information as is necessary to implement section 215 of the Federal Power Act as determined by FERC and set out in the rules of the ERO and each Regional Entity. In order to enforce this requirement, if data, information, or other reports (including Mitigation Plans) requested from a Registered Entity in connection with a compliance monitoring process or enforcement process are not received by the Required Date, the Compliance Enforcement Authority may sequentially execute the following steps for each Reliability Standard Requirement for which the Compliance Enforcement Authority has requested data, information, or other reports. However, upon a request from the Registered Entity submitted prior to the Required Date stating in reasonable detail the basis for the Registered Entity's need for additional time, the Compliance Enforcement Authority may afford the Registered Entity reasonable additional time to submit the data, information or report due to the scope or difficulty of the request or requirement for data, information or reports, the amount of the data, information or reports requested or required, or the form in which the data, information, or other reports has been requested or is required to be provided.

Step 1: The Compliance Enforcement Authority will issue a notification to the Registered Entity's designated contact for reliability matters, identifying the data, information or report that were requested or required and the Required Date and stating that the Required Date has passed and the Registered Entity should, within five (5) business days, either provide the data, information or report, or contact the Compliance Enforcement Authority with a proposed date by which the Registered Entity will provide the data, information or report. If the Compliance Enforcement Authority agrees with the Registered Entity on a revised date by which the Registered Entity will provide the data, information or report, the agreed revised date shall become the Revised Required Date.

Step2: If the Registered Entity does not provide a response to the notification in, and in accordance with, Step 1, within five (5) business days, or by a revised date as agreed to in Step 1, the Compliance Enforcement Authority will issue a notification to the Registered Entity's designated contact for reliability matters, with a copy to the Registered Entity's chief executive officer or equivalent, stating that if the data, information or report is not received within ten (10) business days, the Compliance Enforcement Authority may (i) implement a compliance monitoring process directed to the Registered Entity, or (ii) issue a Notice or other notification of Alleged Violation and Proposed Penalty or Sanction at the Severe Violation Severity Level to the Registered Entity for the Reliability Standard Requirement to which the requested or required

data, information or report relates.

Step 3: If the Registered Entity fails to produce the requested or required data, information or report in response to the notification in Step 2 within the ten (10) business day cure period set forth in the Step 2 notification, the Compliance Enforcement Authority may take any action of which the Registered Entity was notified in the Step 2 notification, including issuing a Notice or other notification of Alleged Violation and Proposed Penalty or Sanctionat the Severe Violation Severity Level for the Reliability Standard Requirement to which the requested or required data, information or report relates.

The process described in this Attachment 1 is intended to be applied where a Registered Entity does not respond by the Required Date to an initial request for data, information or reports in connection with a compliance monitoring and enforcement process and does not respond to subsequent requests (Steps 1 and 2 above) by the stated deadline. This process is not intended to apply where the Registered Entity responds, prior to the Required Date, to the initial request or requirement for data, information or reports with requests for clarification, definition of scope, or similar questions concerning the request or requirement for data, information or reports, or requests, prior to the Required Date, additional time to respond based on the scope or difficulty of the request or requirement for data, information or reports, the amount or extent of the data, information or reports requested or required, or the form in which the data, information or report is to be provided, and works with the Compliance Enforcement Authority in good faith to respond to the request or requirement for data, information or reports, as modified if appropriate by the Compliance Enforcement Authority based on questions raised by the Registered Entity.

ATTACHMENT 2 - HEARING PROCEDURES

1.1 Applicability, Definitions and Interpretation

1.1.1 Procedure Governed

(a) The provisions set forth in this **Attachment 2** ("Hearing Procedures") shall apply to and govern practice and procedure before the Compliance Enforcement Authority in hearings in the United States conducted into:

(1) whether Registered Entities within the Compliance Enforcement Authority's Area of Responsibility have violated Reliability Standards, and

(2) if so, to determine the appropriate Mitigation Plans as well as any Remedial Action Directives, Penalties and/or sanctions in accordance with the NERC *Sanction Guidelines* and other applicable Penalty guidelines approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2).

(b) Any hearing conducted pursuant to these Hearing Procedures shall be conducted before a Hearing Officer and a Hearing Body established by the Compliance Enforcement Authority. Where the Hearing Body is comprised, in whole or in part, of industry stakeholders, the composition of the Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision by the Hearing Body on any matter brought before it for decision. Where the Hearing Body is comprised solely of independent members and an independent hearing Officer, decisions shall require a majority vote.

(c) The standard of proof in any proceeding under these Hearing Procedures shall be by a preponderance of the evidence. The burden of persuasion on the merits of the proceedings shall rest upon the Compliance Staff alleging noncompliance with a Reliability Standard, proposing a Penalty, opposing a Registered Entity's Mitigation Plan, or requiring compliance with a Remedial Action Directive.

(d) If a final order has been entered by the Hearing Body, or the Hearing Body has issued a ruling determining that there are no issues to be decided regarding the Alleged Violation, proposed Penalty amount, proposed Mitigation Plan or proposed Remedial Action Directive, or the Registered Entity and the Compliance Enforcement Authority have entered into a settlement agreement resolving the matters that are the subject of the hearing, the hearing shall be terminated by the Hearing Body and no further proceedings shall be conducted before the Hearing Body.

1.1.2 Deviation

To the extent permitted by law, any provision in these Hearing Procedures may be waived, suspended or modified by the Hearing Officer or the Hearing Body, for good cause shown, either upon the Hearing Officer's or the Hearing Body's own motion or upon the motion of any Participant.

1.1.3 Standards for Discretion

The Compliance Enforcement Authority's discretion under these Hearing Procedures shall be exercised to accomplish the following goals:

(a) Integrity of the Fact-Finding Process - The principal goal of the hearing process is to assemble a complete factual record to serve as a basis for a correct and legally sustainable ruling, decision or order.

(b) Fairness - Persons appearing in Compliance Enforcement Authority proceedings should be treated fairly. To this end, Participants should be given fair notice and opportunity to present explanations, factual information, documentation and legal argument. Action shall be taken as necessary to eliminate any disadvantage or prejudice to a Participant that would otherwise result from another Participant's failure to act diligently and in good faith.

(c) Independence - The hearing process should be tailored to protect against undue influence from any Person, Participant or interest group.

(d) Balanced Decision-Making - Decisions should be based solely on the facts and arguments of record in a proceeding and by individuals who satisfy the Compliance Enforcement Authority's conflict of interest policy.

(e) Impartiality - Persons appearing before the Hearing Body should not be subject to discriminatory or preferential treatment. Registered Entities should be treated consistently unless a reasonable basis is shown in any particular proceeding to depart from prior rulings, decisions or orders.

(f) Expedition - Proceedings shall be brought to a conclusion as swiftly as is possible in keeping with the other goals of the hearing process.

1.1.4 Interpretation

(a) These Hearing Procedures shall be interpreted in such a manner as will aid in effectuating the Standards for Discretion set forth in Section 1.1.3, and so as to require that all practices in connection with the hearings shall be just and reasonable.

(b) Any ruling, order or decision of the Hearing Officer referenced in these Hearing Procedures shall be made by the Hearing Body where the composition of the Hearing Body consists of independent members and an independent Hearing Officer.

(c) Unless the context otherwise requires, the singular of a term used herein shall include the plural and the plural of a term shall include the singular.

(d) To the extent that the text of a rule is inconsistent with its caption, the text of the rule shall control.

1.1.5 Definitions

Unless otherwise defined, as used in these Hearing Procedures, definitions in Appendix 2 of the NERC Rules of Procedure shall apply. For ease of reference, the following defined terms used in these Hearing Procedures are also set forth below:

"Clerk" shall mean an individual assigned by the Compliance Enforcement Authority to perform administrative tasks relating to the conduct of hearings as described in these Hearing Procedures.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that: (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

"Cyber Security Incident" means any malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, or other individual designated by the Compliance Enforcement Authority, who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"ERO" or "Electric Reliability Organization" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Evidentiary Hearing" means a hearing at which one or more Participants submits evidence for the record. A Testimonial Hearing is an Evidentiary Hearing, but an Evidentiary Hearing does not necessarily include the presentation of testimony by witnesses in person.

"FERC" means the Federal Energy Regulatory Commission.

"Hearing Body" means the body established or designated by the Compliance Enforcement Authority to conduct hearings and issue decisions concerning disputed compliance matters in accordance with these Hearing Procedures.

"Hearing Officer" means an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to these Hearing Procedures.

"Participant" means a Respondent and any other Person who is allowed or required by the Hearing Body or by FERC to participate as an intervenor in a proceeding conducted pursuant to these Hearing Procedures, and as used in these Hearing Procedures shall include the members of the Compliance Staff of the Compliance Enforcement Authority that participate in a proceeding.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.

"Respondent" means the Registered Entity who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies the Compliance Enforcement Authority's conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body.

"Testimonial Hearing" means an Evidentiary Hearing at which the witness or witnesses on behalf of one or more Participants appears in person to present testimony and be subject to cross-examination.

1.2 General Provisions including Filing, Service, Transcription and Participation

1.2.1 Contents of Filings

All filings made with the Hearing Body must contain:

(a) A caption that sets forth the title of the proceeding and the designated docket number or, if the filing initiates a proceeding, a space for the docket number;

(b) A heading that describes the filing and the Participant on whose behalf the filing is made;

(c) The full name, address, telephone number and email address of the Participant or the representative of the Participant making the filing;

(d) A plain and concise statement of any facts upon which the filing is based, which facts shall be supported by citations to the record of the hearing, if available, or other evidence; and

(e) The specific relief sought, which may be in the alternative, and the authority that provides for or otherwise allows the relief sought.

1.2.2 Form of Filings

(a) All filings shall be typewritten, printed, reproduced or prepared using a computer or other word or data processing equipment on white paper 8½ inches by 11 inches with inside text margins of not less than one inch. Page numbers shall be centered and have a bottom margin of not less than ½ inch. Line numbers, if any, shall have a left-hand margin of not less than ½ inch. The impression shall be on one side of the paper only and shall be double spaced; footnotes may be single spaced and quotations may be single spaced and indented.

(b) All pleadings shall be composed in either Arial or Times New Roman font, black type on white background. The text of pleadings or documents shall be at least 12-point. Footnotes shall be at least 10-point. Other material not in the body of the text, such as schedules, attachments and exhibits, shall be at least 8-point.

(c) Reproductions may be by any process provided that all copies are clear and permanently legible.

(d) Testimony prepared for the purpose of being entered into evidence shall include line numbers on the left-hand side of each page of text. Line numbers shall be continuous.

(e) Filings may include schedules, attachments or exhibits of a numerical or documentary nature which shall, whenever practical, conform to these requirements; however, any log,

graph, map, drawing, chart or other such document will be accepted on paper larger than prescribed in subparagraph (a) if it cannot be provided legibly on letter size paper.

1.2.3 Submission of Documents

(a) Where to File

Filings shall be made with the Clerk of the Compliance Enforcement Authority located at its principal office. The office will be open during the Compliance Enforcement Authority's regular business hours each day except Saturday, Sunday, legal holidays and any other day declared by the Compliance Enforcement Authority.

(b) When to File

Filings shall be made within the time limits set forth in these Hearing Procedures or as otherwise directed by the Hearing Officer or the Hearing Body. Filings will be considered made when they are date stamped received by the Clerk. To be timely, filings must be received no later 5:00 P.M. local time on the date specified.

(c) How to File

Filings may be made by personal delivery, mailing documents that are properly addressed with first class postage prepaid, or depositing properly addressed documents with a private express courier service with charges prepaid or payment arrangements made. Alternatively, filing by electronic means will be acceptable upon implementation of a suitable and secure system by the Compliance Enforcement Authority.

(d) Number of Copies to File

One original and five exact copies of any document shall be filed. The Clerk will provide each member of the Hearing Body with a copy of each filing.

(e) Signature

The original of every filing shall be signed by the Participant on whose behalf the filing is made, either by an attorney of the Participant or, by the individual if the Participant is an individual, by an officer of the Participant if the Participant is not an individual, or if the Participant is Staff, by a designee authorized to act on behalf of Staff.

(f) Verification

The facts alleged in a filing need not be verified unless required by these Hearing Procedures, the Hearing Officer or the Hearing Body. If verification is required, it must be under oath by a person having knowledge of the matters set forth in the filing. If any verification is made by an individual other than the signer, a statement must be included in or attached to the verification explaining why a person other than the signer is providing verification.

(g) Certificate of Service

Filings shall be accompanied by a certificate of service stating the name of the individuals served, the Participants whose interests the served individuals represent, the date on which service is made, the method of service and the addresses to which service is made. The certificate shall be executed by the individual who caused the service to be made.

1.2.4 Service

(a) Service List

For each proceeding, the Clerk shall prepare and maintain a list showing the name, address, telephone number, and facsimile number and email address, if available, of each individual designated for service. The Hearing Officer, Director of Compliance and the Registered Entity's compliance contact as registered with the Compliance Enforcement Authority, shall automatically be included on the service list. Participants shall identify all other individuals whom they would like to designate for service in a particular proceeding in their appearances or other filings. Participants may change the individuals designated for service in any proceeding by filing a notice of change in service list in the proceeding. Participants are required to update their service lists to ensure accurate service throughout the course of the proceeding. Copies of the service list may be obtained from the Clerk.

b) By Participants

Subject to the provisions of Section 1.5.10, any Participant filing a Document in a proceeding must serve a copy of the Document on each individual whose name is on the service list for the proceeding. Unless otherwise provided, service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made.

(c) By the Clerk

The Clerk shall serve all issuances of the Hearing Officer and Hearing Body upon the members of the Hearing Body and each individual whose name is on the service list for the proceeding. Service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made. The Clerk shall transmit a copy of the record of a proceeding to the ERO at the time the Compliance Enforcement Authority transmits to the ERO either (1) a Notice of Penalty, or (2) a Hearing Body final order that includes a Notice of Penalty.

(d) Effective Date of Service

Service by personal delivery or email is effective immediately. Service by mail or registered mail is effective upon mailing; service by a private express courier service is effective upon delivery to the private express courier service. Unless otherwise provided, whenever a Participant has the right or is required to do some act within a prescribed period after the service

of a document upon the Participant, four (4) days shall be added to the prescribed period when the document is served upon the Participant by mail or registered mail.

1.2.5 Computation of Time

The time in which any action is required to be done shall be computed by excluding the day of the act or event from which the time period begins to run, and by including the last day of the time period, unless the last day is a Saturday, Sunday, legal holiday or any other day upon which the office of the Compliance Enforcement Authority is closed, in which event it also shall be excluded and the date upon which the action is required shall be the first succeeding day that is not a Saturday, Sunday, legal holiday, or day upon which the office of the Compliance Enforcement Authority is closed.

1.2.6 Extensions of Time

Except as otherwise provided by law, the time by which a Participant is required or allowed to act may be extended by the Hearing Officer or Hearing Body for good cause upon a motion made before the expiration of the period prescribed. If any motion for extension of time is made after the expiration of the period prescribed, the Hearing Officer or Hearing Body may permit performance of the act if the movant shows circumstances sufficient to justify the failure to act in a timely manner.

1.2.7 Amendments

Amendments to any documents filed in a proceeding may be allowed by the Hearing Officer or the Hearing Body upon motion made at any time on such terms and conditions as are deemed to be just and reasonable.

1.2.8 Transcripts

(a) A full and complete record of all hearings, including any oral argument, shall be transcribed verbatim by a certified court reporter, except that the Hearing Officer may allow off-the-record discussion of any matter provided the Hearing Officer states the ruling on any such matter, and the Participants state their positions or agreement in relation thereto, on the record. The court reporter shall file a copy of each transcript with the Clerk. Upon receipt of a transcript from the court reporter, the Clerk shall send notice to the Participants stating that a transcript has been filed by the court reporter, the date or dates of the hearing that the transcript records, and the date the transcript was filed with the Clerk.

(b) Unless otherwise prescribed by the Hearing Officer, a Participant may file and serve suggested corrections to any portion of a transcript within fourteen (14) days from the date of the Clerk's notice that the transcript has been filed with the Clerk, and any responses shall be filed within ten (10) days after service of the suggested corrections. The Hearing Officer shall determine what changes, if any, shall be made, and shall only allow changes that conform the transcript to the statements being transcribed and ensure the accuracy of the record.

(c) The Compliance Enforcement Authority will pay for transcription services, for a copy of the transcript for the record and for a copy of the transcript for Staff. Any other Participant shall pay for its own copy of the transcript if it chooses to obtain one and, should any Participant seek to obtain a copy of the transcript on an expedited basis, it shall pay for the expedited transcription services.

1.2.9 Rulings, Notices, Orders and Other Issuances

Any action taken by the Hearing Officer or the Hearing Body shall be recorded in a ruling, notice, order or other applicable issuance, or stated on the record for recordation in the transcript, and is effective upon the date of issuance unless otherwise specified by the Hearing Officer or the Hearing Body. All notices of hearings shall set forth the date, time and place of hearing.

1.2.10 Location of Hearings and Conferences

All hearings and oral arguments shall be held at the principal office of the Compliance Enforcement Authority unless the Hearing Officer or Hearing Body designates a different location.

1.2.11 Participant Participation

Participants may appear at any hearing via teleconference subject to the approval of the Hearing Officer and, in the event of oral argument, the Hearing Body, except as required by Section 1.6.6. Staff may participate and be represented by counsel in hearings, and shall have the rights and duties of any Participant.

1.2.12 Interventions

(a) The Respondent(s) and Staff shall be Participants to the proceeding. Unless otherwise authorized by the Hearing Body or by FERC, no other Persons shall be permitted to intervene or otherwise become a Participant to the proceeding.

(b) The Hearing Body may allow a Person to intervene only if the Hearing Body determines that the Person seeking intervention has a direct and substantial interest in the outcome of the Alleged Violation, proposed Penalty or sanction, Mitigation Plan, or Remedial Action Directive that is the subject of the proceeding. Examples of a direct and substantial interest in the outcome shall include

(1) that the Person seeking intervention has received a Notice of Alleged Violation or a Remedial Action Directive involving the same Reliability Standard requirement(s) and arising out of the same event or occurrence as the existing Respondent(s) that is the subject of the proceeding, or

(2) that the Person seeking intervention will or may be contractually or legally liable to the original Respondent(s) for payment of all or a portion of the proposed Penalty or sanction that is the subject of the proceeding, provided, that after the Person seeking intervention sufficiently demonstrates it will or may be contractually or legally liable for payment of all or a portion of the proposed Penalty or sanction to be granted intervention, the Person granted intervention and

the existing Respondents will not be allowed to litigate in the proceeding whether the Person granted intervention is contractually or legally liable for payment of all or a portion of the proposed Penalty or sanction or the amount of the proposed Penalty or Sanction for which the Person granted intervention is or may be liable.

That the Person seeking intervention has received a Notice of Alleged Violation for the same Reliability Standard Requirement(s) as the original Respondent(s) but arising out of a different event or occurrence; or seeks to intervene to advocate an interpretation of the Reliability Standard Requirement(s) or provision(s) of the *Sanction Guidelines*, that are at issue in the proceeding, without more, shall not constitute a direct and substantial interest in the outcome and shall not be grounds on which the Hearing Body may allow the Person to intervene.

(c) A Person seeking intervention shall do so by filing a motion to intervene with the Clerk. The motion shall state the Person's interest in sufficient factual detail to demonstrate that the Person should be allowed to intervene pursuant to Section 1.2.12(b). The motion to intervene shall also state the Person's agreement to maintain the confidential and non-public nature of the hearing, including all pleadings and other Documents filed or exchanged in connection with the request for intervention. Any facts alleged in, or offers of proof made in, the motion to intervene shall be supported by affidavit or verification.

(d) The Clerk shall promptly provide copies of the motion to intervene to the Hearing Officer and the Participants. The Hearing Officer shall promptly set a time period, not to exceed seven (7) days, within which the Participants may file responses to the motion to intervene. Within seven (7) days following the end of the response period, the Hearing Officer shall issue a recommendation to the Hearing Body as to whether or not the motion to intervene should be granted.

(e) The Hearing Body may, within seven (7) days following the date of the Hearing Officer's recommendation, issue a decision granting or denying the motion to intervene. If the Hearing Body does not issue a decision granting or denying the motion to intervene within seven (7) days following the date of the Hearing Officer's recommendation, the Hearing Officer's recommendation shall become the decision of the Hearing Body and the motion to intervene shall be deemed granted or denied by the Hearing Body in accordance with the Hearing Officer's recommendation.

(f) The Hearing Officer, on motion of a Participant or on his or her own motion, or the Hearing Body, on recommendation by the Hearing Officer or its own motion, may stay or suspend the proceeding while a request to intervene, including a request to intervene filed directly with FERC, and including any appeal of the grant or denial of the request to intervene, is being resolved.

(g) A Person allowed to intervene and become a Participant to a proceeding shall be designated as a Respondent and deemed to be aligned with the existing Respondent(s), unless the Hearing Body, in the decision granting intervention, states that the Person allowed to intervene shall be deemed to be aligned with another Participant to the proceeding.

(h) A Person allowed to intervene and become a Participant to a proceeding is required to take the record and the procedural status of the proceeding as it stands on the date the Person's motion to intervene is granted by the Hearing Body.

(i) A Person may appeal a decision of the Hearing Body denying the Person's motion to intervene, and the Compliance Staff, the Respondent or any other Participant may appeal a decision granting or denying a motion to intervene, in accordance with Section 414 of the NERC Rules of Procedure. A notice of appeal shall be filed with the NERC director of enforcement no later than seven (7) days following the date of the decision of the Hearing Body granting or denying the motion to intervene.

1.2.13 Proceedings Closed to the Public

No hearing, oral argument or meeting of the Hearing Body shall be open to the public, and no notice, ruling, order or any other issuance of the Hearing Officer or Hearing Body, or any transcript, made in any proceeding shall be publicly released unless the ERO (within the U.S., in accordance with the authorization previously granted by FERC to release information about a non-public proceeding) or FERC (in the case of U.S.-related information) or another Applicable Governmental Authority (in the case of non-U.S.-related information) determine that public release is appropriate. Only the members of the Hearing Body, the Participants, the Hearing Officer and the Technical Advisors, if any, shall be allowed to participate in or obtain information relating to a proceeding.

1.2.14 Docketing System

The Clerk shall maintain a system for docketing proceedings. A docketed proceeding shall be created upon the filing of a request for a hearing. Unless NERC provides a different docketing system that will be used uniformly by the Compliance Enforcement Authorities, docket numbers shall be assigned sequentially beginning with a two digit number that relates to the last two digits of the year in which the docket is initiated, followed by a dash ("-"), followed by the letters "[RE]", followed by a dash ("-"), followed by a four digit number that will be "0001" on January 1 of each calendar year and ascend sequentially until December 31 of the same calendar year.

1.2.15 Representations Deemed to be Made in All Pleadings

A Participant presenting any pleading to the Hearing Officer or Hearing Body shall be deemed to certify that to the best of the Participant's knowledge, information and belief, formed after and based on an inquiry that is reasonable under the circumstances:

(a) the factual allegations set forth in the pleading have or will have support in the evidence or the Participant believes they will have support in the evidence after reasonable opportunity for further investigation or discovery;

(b) the denials in the pleading of factual allegations made by another Participant are warranted by or will be warranted by the evidence or, if specifically so identified, are reasonably based on belief or on a lack of information;

(c) the claims, defenses and other contentions set forth in the pleading are warranted based on the applicable Reliability Standard Requirement(s) or Rules of Procedure provisions; and

(d) the pleading is not being presented for any improper purpose, such as to harass, cause unnecessary delay, or needlessly increase the cost of the hearing or the cost incurred by any Participant.

1.2.16 Hold Harmless

A condition of a Participant invoking these Hearing Procedures and participating in a hearing is that the Participant agrees that the Compliance Enforcement Authority, including without limitation its members, board of directors or trustees, compliance committee, any other committees or subcommittees, Staff, contracted employees, Hearing Body members, Hearing Officers and Technical Advisors, shall not be liable, and shall be held harmless against the consequences of, or any action or inaction arising out of, the hearing process, or of any agreement reached in resolution of a dispute or any failure to reach agreement as a result of a proceeding. This "hold harmless" provision does not extend to matters constituting gross negligence, intentional misconduct or breach of confidentiality.

1.3 Initiation of the Hearing Process

1.3.1 Registered Entity's Option to Request a Hearing

(a) Except when contesting a Remedial Action Directive pursuant to Section 1.9 of these Hearing Procedures, a Registered Entity may file a statement, in accordance with Section 1.3.1(e), with the Compliance Enforcement Authority requesting a hearing if either:

(1) The Registered Entity files a response to a Notice of Alleged Violation that contests either the Alleged Violation, the proposed Penalty, or both; or

(2) The Compliance Staff submits to the Registered Entity a statement rejecting the Registered Entity's proposed revised Mitigation Plan submitted after Compliance Staff rejected the Registered Entity's initial proposed Mitigation Plan.

(b) A Registered Entity must file its hearing request within forty (40) days after

(1) the Registered Entity files its response to the Notice of Alleged Violation; or

(2) the Compliance Staff submits to the Registered Entity its statement identifying a disagreement with the Registered Entity's proposed Mitigation Plan, whichever is applicable.

(c) If the Registered Entity does not file a hearing request within the time period set forth in this Section, then the Registered Entity will be deemed to have agreed and waived any objection to the proposed Penalty, the Alleged Violation or the Compliance Staff's rejection of the revised Mitigation Plan, whichever is applicable.

(d) In accordance with Section 5.3 of the Compliance Program, a Notice of Alleged Violation issued to a Registered Entity or a Staff statement setting forth its rejection of a Registered Entity's proposed revised Mitigation Plan shall clearly state that the Registered Entity has the option to contest the Alleged Violation, proposed Penalty, or both, or the Compliance Staff's rejection of the proposed revised Mitigation Plan, using either the shortened hearing procedure pursuant to Section 1.3.4 or the general hearing procedure described in Sections 1.4 to 1.7.

(e) The Registered Entity's statement requesting a hearing shall:

(1) contain a plain and concise statement of the facts and arguments supporting the Registered Entity's position, as applicable, that it did not violate the Reliability Standard Requirement(s) set forth in the Notice of Alleged Violation, that the proposed Penalty or sanction is too high and should be reduced, or that the Registered Entity's proposed Mitigation Plan should be approved;

(2) state the relief that the Registered Entity requests the Hearing Body to grant; and

(3) state whether the Registered Entity requests the shortened hearing procedure or the general hearing procedure.

The Registered Entity's statement may set forth two or more alternative grounds on which the Registered Entity bases its position, as applicable, that it did not violate the Reliability Standard Requirement(s) set forth in the Notice of Alleged Violation, that the proposed Penalty or sanction is too high and should be reduced, or that the Registered Entity's proposed Mitigation Plan should be approved.

(f) If the Registered Entity (or any Respondent if there are more than one Respondent) requests the general hearing procedure, the general hearing procedure shall apply. If the Registered Entity (or all Respondents if there are more than one Respondent) requests the shortened hearing procedure, Compliance Staff and any other Participants shall submit a filing within five (5) days of the Registered Entity's hearing request that states whether Staff or such other Participant agrees to use the shortened hearing procedure. If Staff or another Participant makes a filing requesting the general hearing procedure, then the general hearing procedure shall apply; otherwise the shortened hearing procedure requested by the Registered Entity or Entities shall be used. Once either the general or shortened hearing procedure has been selected, the Participants shall not be allowed to revert to the non-selected hearing procedure unless the Participants mutually agree.

(g) A Registered Entity shall attach to a request for hearing whichever of the following are applicable:

(1) The Registered Entity's Self-Report of a violation;

(2) The Notice of Alleged Violation and the Registered Entity's response thereto; and/or

(3) The Registered Entity's proposed revised Mitigation Plan and the Compliance Staff's statement rejecting the proposed revised Mitigation Plan.

1.3.2 Compliance Staff's Response to Request for Hearing

(a) If the Registered Entity's request for hearing requests that the shortened hearing procedure be used, the Compliance Staff shall file a response stating whether it agrees to the use of the shortened hearing procedure.

(b) If the Registered Entity's request for hearing requests that the Registered Entity's proposed revised Mitigation Plan should be approved, the Compliance Staff shall file a response stating the Compliance Staff's position as to why the Registered Entity's proposed revised Mitigation Plan should not be approved and setting forth any additional terms that the Compliance Staff believes should be included in the Mitigation Plan.

(c) If the Registered Entity's request for hearing does not request that the shortened hearing procedure be used and does not request that the Registered Entity's proposed revised Mitigation Plan should be approved, the Compliance Staff may, but is not required to, file a response stating, as applicable, the basis for the Compliance Staff's position that the Registered Entity violated the Reliability Standard Requirement(s) specified in the Notice of Alleged Violation or that the proposed Penalty or sanction is appropriate under the *Sanction Guidelines* and should not be reduced.

(d) Any response by the Compliance Staff required or permitted by this Section shall be filed within fifteen (15) days after the date the request for hearing was filed, unless the Hearing Officer or Hearing Body allows a longer time to file the response.

1.3.3 Notice of Hearing

(a) The Clerk shall issue a notice of hearing not less than sixteen (16) days, and not more than twenty-one (21) days, after the Registered Entity files its request for hearing.

(b) The notice of hearing shall state whether the shortened hearing procedure or the general hearing procedure will be used.

(c) The notice of hearing shall identify the Hearing Officer and the date, time and place for the initial prehearing conference.

(1) If the shortened hearing procedure is to be used, the initial prehearing conference shall be set for a date within seven (7) days following the date of the notice of hearing.

(2) If the general hearing procedure is to be used, the initial prehearing conference shall be set for a date within fourteen (14) days following the date of the notice of hearing.

1.3.4 Shortened Hearing Procedure

The shortened hearing procedure shall be as set forth in this Section. The rules applicable to the general hearing procedure shall apply to the shortened hearing procedure unless the context of such a rule is inconsistent with the procedure set forth in this Section or otherwise renders it inapplicable to the shortened hearing procedure. The rules concerning ex parte communications

in Section 1.4.7 are hereby expressly made applicable to the shortened hearing procedure under this Section.

The Hearing Body shall utilize a Hearing Officer to preside over the shortened hearing procedure in accordance with Section 1.4.2. But, no Testimonial Hearing will be held in the shortened hearing procedure and the Participants will not present witness testimony or file briefs, except that briefs on exceptions and briefs in reply to exceptions may be allowed pursuant to subsection (g). Instead, the following events shall take place within the following periods:

(a) The initial prehearing conference shall be held within seven (7) days after the date on which the notice of hearing is issued. In addition to any other matters set forth in Section 1.5.2 that may apply, the initial prehearing conference will be used to develop a schedule for the preparation and submission of comments in accordance with subsections (c) through (e).

(b) Within ten (10) days after the date on which the notice of hearing is issued, Staff shall make Documents available to the Registered Entity for inspection and copying pursuant to Section 1.5.7.

(c) Within twenty-one (21) days after the initial prehearing conference, the Staff shall file:

(1) initial comments stating Staff's position on all issues and the rationale in support of its position, including all factual and legal argument;

(2) all Documents that Staff seeks to introduce in support of its position that have not already been submitted in the proceeding; and

(3) a verification attesting to the truthfulness of the facts alleged in the filing.

(d) Within fourteen (14) days of Staff's initial comment filing pursuant to subsection (c), the Registered Entity shall file:

(1) responsive comments stating the Registered Entity's position on all issues and the rationale in support of its position, including all factual and legal argument, which comment also may respond to Staff's initial comments;

(2) all Documents that the Registered Entity seeks to introduce in support of its position that have not already been submitted in the proceeding; and

(3) a verification attesting to the truthfulness of the facts alleged in the filing.

(e) Within seven (7) days after the Registered Entity's responsive comment filing pursuant to subsection (d), Staff shall file reply comments that shall be limited in scope to responding to the Registered Entity's responsive comments and be supported by a verification attesting to the truthfulness of the facts alleged in the filing. Staff shall not submit any additional Documents in support of its position as part of this filing except upon motion and good cause shown. If Staff is allowed to file additional Documents in support of its position based upon such a

motion, the Registered Entity shall have the right to file additional Documents in support of its position that are responsive to the additional Documents that Staff is allowed to file provided that any additional Registered Entity filing also shall be verified.

(f) The Hearing Officer shall issue an initial opinion within twenty-one (21) days after the Staff's reply comments filing or any additional filing by the Registered Entity pursuant to subsection (e).

(g) If either Participant requests, the Hearing Officer shall allow each Participant to file, within seven (7) days after the Hearing Officer's initial opinion, exceptions to the Hearing Officer's initial opinion in a brief designated "brief on exceptions" in accordance with Section 1.7.5 and within seven (7) days thereafter, a reply brief designated "brief in reply to exceptions."

(h) The Hearing Body shall strive, but is not required, to issue a final order within one hundred twenty (120) days of the notice of hearing.

The Hearing Officer or Hearing Body may modify any time period set forth within this Paragraph as warranted by the circumstances but it will be the objective of the Hearing Body to issue the final order within one hundred twenty (120) days of the notice of hearing.

1.4 General Hearing Procedure

1.4.1 [Intentionally Left Blank]

[Blank.]

1.4.2 Hearing Officer

(a) The Compliance Enforcement Authority shall utilize a Hearing Officer to preside over each hearing conducted pursuant to these Hearing Procedures, provided that the Hearing Officer's actions shall be subject to the authority of the Hearing Body as set forth in Section 1.4.3. Members of the Hearing Body may attend any aspect of the hearing.

(b) The Hearing Officer is responsible for the conduct of the hearing, including administering the hearing from the initial prehearing conference through the issuance of the Hearing Officer's initial opinion, any administrative hearing functions thereafter, and submission of the matter to the Hearing Body for final decision through the presentation to the Hearing Body of an initial opinion. The Hearing Officer shall have those duties and powers necessary to those ends, consistent with and as further enumerated in these Hearing Procedures, including the following:

(1) To administer oaths and affirmations;

(2) To schedule and otherwise regulate the course of the hearing, including the ability to call to recess, reconvene, postpone or adjourn a hearing;

(3) Consistent with any timing or deadline requirements imposed by these Hearing Procedures or by applicable law, to separate any issue or group of issues from other issues in a proceeding and treat such issue(s) as a separate phase of the proceeding;

(4) Consistent with any timing or deadline requirements imposed by these Hearing Procedures or by applicable law, to modify any time period, if such modification is in the interest of justice and will result in no undue prejudice to any other Participant;

(5) To supervise and issue orders concerning discovery;

(6) To conduct prehearing conferences, status hearings and Evidentiary Hearings;

(7) To hear argument on all objections, motions and other requests, and to rule upon all objections, motions and other requests that do not result in the final determination of the proceeding;

(8) To rule on and receive evidence;

(9) To call upon a Participant to produce further evidence that is material and relevant to any issue;

(10) To issue protective orders pursuant to Section 1.5.10;

(11) To issue initial opinions; and

(12) To ensure that hearings are conducted in a full, fair and impartial manner, that order is maintained and that unnecessary delay is avoided in the disposition of the proceedings.

(c) The Compliance Enforcement Authority shall disclose the employment history and professional affiliations of the Hearing Officer within two (2) days of the Hearing Officer's assignment to the proceeding, and Participants to the hearing may raise objections to the Hearing Officer's participation in accordance with Section 1.4.5.

1.4.3 Hearing Body

(a) The composition of the Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision of the Hearing Body on any matter brought before it for decision.

(b) The Hearing Body is vested with the authority to issue a final order resolving the issue(s) in all cases. To that end:

(1) Upon receiving a filing by a Participant, the Clerk shall promptly send a notice to the members of the Hearing Body identifying the date of the filing and the Participant making the filing and briefly describing the nature of the filing. Any member of the Hearing Body may request of, and shall receive from, the Clerk, a

copy of any filing by a Participant. The Hearing Body shall not receive Documents made available by Staff for inspection and copying by the Respondent, or other responses to discovery between the Participants, unless such Documents are placed into the record pursuant to Section 1.6.7.

(2) The Clerk shall send all issuances of the Hearing Officer to the members of the Hearing Body.

(3) The Hearing Body or any individual member thereof may, but is not required to, attend any prehearing conference, status hearing or Evidentiary Hearing, and/or to submit questions to the Hearing Officer to submit to a Participant or any witness at any hearing. At any prehearing conference or hearing attended by a member of the Hearing Body, any member of the Hearing Body may ask questions directly of any Participant or witness.

(4) The Hearing Body shall have the same authority as the Hearing Officer, as set forth in these Hearing Procedures, to require the Participants or any individual Participant to: (i) address a specific issue in testimony, evidence or briefs; (ii) present oral argument on an issue; (iii) file pre-Evidentiary Hearing memorandums; or (iv) produce further evidence that is material and relevant to any issue. To this end, the Hearing Body shall be entitled to issue questions or requests for information to any Participant or any witness at any time until the issuance of a final order.

(5) To the extent that the Hearing Body disagrees with any issuance or ruling of the Hearing Officer, it may, on its own motion or upon petition for interlocutory review meeting the requirements of Section 1.4.4, reverse or modify the issuance or ruling in whole or in part, or take any other action as may be appropriate.

(6) The Hearing Body shall resolve the issue(s) in every hearing through the issuance of a final order. In issuing a final order, the Hearing Body shall consider the Hearing Officer's initial opinion but shall have the authority to reject, modify or approve the initial opinion in whole or in part.

1.4.4 Interlocutory Review

(a) A Participant shall be allowed to seek interlocutory review by the Hearing Body of any ruling of the Hearing Officer where the ruling for which interlocutory review is sought presents an extraordinary circumstance which makes prompt review necessary to prevent prejudice to a Participant's ability to present its position in the proceeding. Failure to seek such review shall not operate as a waiver of any objection to such ruling.

(b) Unless good cause is shown or unless otherwise ordered by the Hearing Officer or the Hearing Body, the Participant seeking review shall file a petition for interlocutory review within fourteen (14) days after the date of the action that is the subject of the petition. The petition shall contain, in a separately identified section, a demonstration that the ruling for which interlocutory review is sought presents an extraordinary circumstance which makes prompt review necessary to prevent prejudice to the Participant's ability to present its position in the proceeding. The

petition shall be filed with any offer of proof and supported by references to the record, or by affidavit if based on facts that do not appear in the record. Responses to petitions for interlocutory review shall be filed within seven (7) days after service of the petition. No replies to responses shall be allowed.

(c) The Hearing Officer shall file a report to the Hearing Body within fourteen (14) days from the filing of the petition. The Hearing Officer's report shall set forth the relevant facts and other background information relating to the ruling on which interlocutory review is sought, the basis for the Hearing Officer's ruling, a summary of the Participants' arguments on the petition for interlocutory review, and the recommendation of the Hearing Officer for the disposition of the petition by the Hearing Body.

(d) On review of a Hearing Officer's ruling, the Hearing Body may affirm or reverse the ruling in whole or in part, and may take any other just and reasonable action with respect to the ruling, such as declining to act on an interlocutory basis. The Hearing Body may reject the petition for interlocutory review on the grounds that the ruling for which review is sought does not present an extraordinary circumstance which makes prompt review necessary to prevent prejudice to a Participant's ability to present its position in the proceeding, without considering or ruling on the substance of the petitioner's arguments.

(e) Issuance of a ruling on a petition for interlocutory review shall require (i) a quorum (as defined in Section 1.7.8) of the Hearing Body, and (ii) majority vote of the members of the Hearing Body voting on the final order (which number of members voting shall not be less than a quorum). Petitions to rehear or reconsider the Hearing Body's action taken on interlocutory review shall not be allowed. Filing and disposition of a petition for interlocutory review of a ruling of the Hearing Officer shall not suspend or otherwise delay a hearing or any other scheduled dates in the proceeding except as authorized by the Hearing Officer or the Hearing Body based on a finding of exceptional circumstances.

(f) A non-Participant that has been ordered by the Hearing Officer pursuant to Section 1.5.8 to produce or provide Documents, information or testimony, and has failed to obtain the relief sought from the Hearing Officer through filing objections to or a motion to quash the order, shall also be entitled to seek interlocutory review by the Hearing Body of the Hearing Officer's order, with respect to (i) whether the non-Participant is within the class of Persons subject to such orders pursuant to Section 1.5.8, and (ii) the reasonableness of the Hearing Officer's order to produce or provide Documents, information or testimony.

1.4.5 Disqualification

(a) A Hearing Officer, Technical Advisor or member of the Hearing Body shall recuse himself or herself from a proceeding if participation would violate the Compliance Enforcement Authority's applicable conflict of interest policy.

(b) Any Participant may file a motion to disqualify or for recusal of a Hearing Officer, Technical Advisor or member of the Hearing Body from a proceeding on grounds of a conflict of interest, an ex parte communication prohibited by section 1.4.7, or the existence of other circumstances that could interfere with the impartial performance of his or her duties. The Participant shall set forth and support its alleged grounds for disqualification by affidavit. A

motion for disqualification shall be filed within fifteen (15) days after the later of: (1) the time when the Participant learns of the facts believed to constitute the basis for disqualification; or (2) the time when the Participant is notified of the assignment of the Hearing Officer or Technical Advisor.

(c) The Hearing Officer shall issue a proposed ruling for the Hearing Body's consideration upon the filing of a motion for disqualification unless the Hearing Officer is the subject of the motion. The Hearing Body, without the participation of any member who is the subject of the motion, shall issue a final ruling on the motion. If the Hearing Officer recuses himself or herself or is disqualified, the Hearing Body will appoint a replacement Hearing Officer. To ensure fairness to the Participants and expedite completion of the proceeding when a replacement Hearing Officer is appointed after a hearing has commenced, the replacement Hearing Officer may recall any witness or may take other steps necessary to ensure familiarity with any part or all of the record.

(d) If a quorum (as defined in Section 1.7.8) of the Hearing Body does not remain after any recusals and rulings on motions for disqualification, then the Compliance Enforcement Authority shall appoint at least the number of new members to the Hearing Body necessary to create a quorum. The new member(s) shall serve on the Hearing Body through the conclusion of the proceeding but not thereafter. Any new member of the Hearing Body shall be subject to the provisions applicable herein to all Hearing Body members.

1.4.6 Technical Advisor

(a) The Hearing Officer and/or the Hearing Body may elect to use one or more Technical Advisors to assist in any proceeding. Such an election may be made at any time during the course of a proceeding. Any Staff member who serves as a Technical Advisor shall not have been involved in or consulted at any time in regard to any Compliance Staff investigation, determination of a Possible Violation, Alleged Violation or Penalty, or assessment of a Registered Entity's proposed Mitigation Plan that resulted in the proceeding in which technical advice would be rendered, and shall not be a member of Staff participating in the proceeding on which such technical advice would be rendered.

(b) If the Hearing Officer or Hearing Body uses a Technical Advisor to assist in any hearing, the Hearing Officer or Hearing Body shall disclose the identity, employment history and professional affiliations of the Technical Advisor within two (2) days of the Technical Advisor's assignment to the proceeding, and Participants to the hearing may raise objections to the Technical Advisor's participation in accordance with Section 1.4.5.

1.4.7 No Ex Parte Communications

(a) Once a Registered Entity requests a hearing pursuant to Section 1.3.1:

(1) neither the Hearing Body, the Hearing Officer, nor the Technical Advisor(s), if any, may communicate either directly or indirectly with any Person concerning any issue in the proceeding outside of the hearing process; except that

(2) the Hearing Body, the Hearing Officer, and the Technical Advisor(s), if any, may communicate outside of the hearing process either directly or indirectly with a Participant or a Participant's representative:

(A) in writing if the writing is simultaneously provided to all Participants; or

(B) orally if a representative for every Participant is present in person or by telephone;

(C) subject to the requirement that the substance of any ruling on any issue discussed shall be memorialized on the record or by the issuance of a notice or ruling, and that any Participant objecting to the ruling shall have the opportunity to state its objection on the record.

(b) Exceptions

(1) The proscription in subsection (a)(1) does not prohibit members of the Compliance Staff from communicating with the Registered Entity, and representatives, agents or employees thereof on any topic, provided that any member of the Compliance Staff involved in any such communication relating to the subject matter of the proceeding may not be, and may not subsequently serve as, a Technical Advisor.

(2) The proscription in subsection (a)(1) does not prohibit communications between or among members of the Hearing Body, the Hearing Officer and any Technical Advisor.

(3) The proscription in subsection (a)(1) does not prohibit communications between the Hearing Officer or members of the Hearing Body to the Clerk for the purpose of transmitting documents, giving instructions to the Clerk, or discussing scheduling and other procedural matters relating to the proceeding.

(4) The proscription in subsection (a)(1) does not prohibit communications between or among the Clerk, the Hearing Body and representatives of the Compliance Enforcement Authority for purposes of establishing the hearing forum.

(c) Any member of the Hearing Body, the Hearing Officer or any Technical Advisor who receives or who makes or knowingly allows a communication prohibited by this Section shall, within seven (7) days of the communication, file and serve on the Participants in the proceeding a notice of ex parte communication setting forth the date, time and place of communication, a summary of the substance and nature of the communication and all responses thereto, and a list of each Person who made or received the communication and, if the communication or any response thereto was in writing, a copy of the written communication shall be attached.

1.4.8 Appearances

(a) Participants shall file written appearances within seven (7) days after the notice of hearing is issued. A Participant's written appearance shall identify the name(s) of each

individual authorized to represent the Participant in the proceeding exclusive of witnesses. An individual may appear on his or her own behalf. A corporation, limited liability company, association, partnership or governmental body may appear by any bona fide officer or designee who has the authority to act on behalf of the Participant. A Participant also may appear by an attorney.

(b) A Participant's written appearance shall state, with respect to each individual that the Participant identifies for service, the individual's name, address, telephone number, and facsimile number and email address, if available, where service shall be made.

A Participant may withdraw any individual from the Participant's representation or otherwise change the identity of individuals authorized to represent the Participant in a proceeding by filing a notice of a change in service list.

(c) Any attorney appearing on behalf of a Participant shall be licensed to practice law and in good standing before the Supreme Court of the United States or the highest court of any State, territory of the United States or the District of Columbia. All representatives appearing before the Hearing Body or Hearing Officer shall conform to the standards of ethical conduct required of practitioners before the courts of the United States.

(d) Individuals representing Participants in any hearing also shall enter their appearances at the beginning of the hearing by stating their names, addresses, telephone numbers and email addresses orally on the record.

1.4.9 Failure to Appear or Exercise Diligence

The failure of any Participant to appear during any hearing without good cause and without notification may be grounds for dismissal or deciding against the interests of such Participant.

1.4.10 Consolidation of Proceedings

(a) In the event that more than one Registered Entity receives a Notice of Alleged Violation for the same event or occurrence, and each Registered Entity selects the general hearing procedure described in Sections 1.4 to 1.7, the Hearing Body on its own motion or on motion of a Participant may exercise its discretion to examine the actions of all such Registered Entities in a single proceeding as long as an initial opinion has not been rendered by the Hearing Officer pursuant to Section 1.7.4 in any proceeding to be consolidated.

(b) A Participant may file a motion to consolidate into a single proceeding Alleged Violations of different Reliability Standards against a single Respondent, and related contests of Penalties or Mitigation Plans, arising out of the same event or occurrence. Such consolidation may be allowed in the discretion of the Hearing Officer or Hearing Body, as applicable.

1.5 Prehearing Procedure

1.5.1 [Intentionally left blank]

1.5.2 Prehearing Conference

(a) The Hearing Officer shall hold at least one prehearing conference, which may be the initial prehearing conference or a subsequently scheduled prehearing conference, for the following purposes:

(1) Preliminarily identify the issues and discuss the anticipated form of the hearing;

(2) Discuss a schedule for any discovery to be conducted and address any discovery issues that are raised at that time;

(3) Explore the possibility of obtaining admissions of fact and of the authenticity of Documents that would avoid unnecessary proof;

(4) Develop a schedule for the preparation and submission of evidence and witness testimony, including the disclosure of witnesses and exhibits and whether the use of pre-filed testimony may not be appropriate, in advance of the Evidentiary Hearing;

(5) Develop a schedule or schedules for any anticipated motions;

(6) Schedule a date(s) for the Evidentiary Hearing, which shall be within ninety (90) days of the prehearing conference described in this subsection, unless a different date or dates is specified by the Hearing Officer or the Hearing Body and with the consent of all Participants or for good cause shown; and

(7) Address such other matters as may aid in the simplification of the evidence and disposition of the proceeding.

(b) The Hearing Officer shall also hold a final prehearing conference prior to the Evidentiary Hearing, for the purpose of discussing:

(1) the anticipated duration of the hearing;

(2) the scheduling of witnesses' appearances to testify;

(3) the issues anticipated to be presented at the hearing;

(4) whether prehearing memoranda should be filed and if so, the schedule; and

(5) any other matters identified by the Hearing Officer for the management of the Evidentiary Hearing.

Participants may submit to the Hearing Officer, at least ten (10) days prior to the scheduled date of the final prehearing conference, a proposed list or lists of matters to be discussed at the final prehearing conference.

1.5.3 Summary Disposition

(a) Availability

A Hearing Officer, on the Hearing Officer's own motion or on the motion of a Participant, may issue an initial opinion granting, in whole or in part, summary disposition if it appears that there are no issues of material fact and a Participant is entitled to issuance of a final order in its favor.

(b) Motion for Summary Disposition and Responses

(1) A Participant moving for summary disposition must clearly identify the material facts that are not in dispute, demonstrate that there are no other material facts in dispute, and demonstrate that on the basis of the undisputed material facts, the Participant is entitled to issuance of a final order in its favor.

(2) A Participant opposing a motion for summary disposition must clearly identify in its response to the motion the material facts that the Participant contends remain in dispute, and/or explain why the moving Participant is not entitled to issuance of a final order in its favor even though there are no disputed issues of material fact.

(c) Summary Disposition on the Hearing Officer's Own Motion

If the Hearing Officer is considering summary disposition in the absence of a Participant motion, the Hearing Officer shall request the Participants to identify in writing any issues of material fact and to comment on the proposed disposition. Factual information in the Participants' comments shall be supported by affidavit. Following review of the Participants' comments, if it still appears to the Hearing Officer that there are no genuine issues of material fact, the Hearing Officer may proceed without an Evidentiary Hearing. The Hearing Officer shall, however, allow the Participants the opportunity to file briefs.

(d) Hearing Officer's Initial Opinion Granting Summary Disposition

When the Hearing Officer issues an initial opinion granting summary disposition in whole or in part, the ruling shall set forth the rationale for the grant. An initial opinion of the Hearing Officer granting summary disposition shall be confirmed, rejected or modified in a final order issued by the Hearing Body.

1.5.4 Status Hearings

Any Participant may request, and the Hearing Officer may call, a status hearing at any time subsequent to the initial prehearing conference to address issues that have arisen between the Participants or other matters relevant to the conduct of the hearing. Such issues may include, but are not limited to, discovery disputes and scheduling matters. A Participant requesting a status hearing to resolve a dispute shall include in its request a certification that it has made a good faith effort to resolve the dispute with the other Participant(s) before requesting the status hearing. The Hearing Officer shall direct the Clerk to issue a notice of status hearing that sets forth the date, time and place for the hearing, and identifies the matters to be addressed at the hearing.

1.5.5 Motions and Responses

(a) Unless otherwise provided in these Hearing Procedures or by the procedural schedule established by the Hearing Officer or Hearing Body, a Participant may file a motion at any time requesting any relief as may be appropriate. Unless the Hearing Officer allows a motion to be made orally on the record, motions shall be filed in writing. Motions based on facts that do not appear of record shall be supported by affidavit.

(b) Unless otherwise specified by the Hearing Officer or Hearing Body, responses to motions shall be filed within fourteen (14) days after service of the motion, and replies to responses shall be filed within seven (7) days after service of the responses. A Hearing Officer or Hearing Body may deny dilatory, repetitive, or frivolous motions without awaiting a response. Unless otherwise ordered by a Hearing Officer or Hearing Body, the filing of a motion does not stay the proceeding or extend any scheduled dates in the proceeding.

1.5.6 Experts

(a) A Participant may employ an expert(s) to testify or consult in a proceeding. Any expert utilized in either capacity shall sign an agreement evidencing the expert's understanding and acknowledgement of the non-public nature of the proceeding and that unauthorized public disclosure of information obtained in connection with the expert's participation in the proceeding is prohibited.

(b) The Participant employing the expert shall propose the agreement for approval by a motion, and its approval shall be subject, in addition to consideration of any objections by other Participants, to ensuring that appropriate safeguards are maintained to protect the confidentiality of the proceeding and the information disclosed therein.

1.5.7 Inspection and Copying of Documents in Possession of Staff

(a) Documents to be Available for Inspection and Copying

(1) Within twenty-five (25) days after the date the request for hearing is filed, Staff shall make available for inspection and copying by the other Participants, all Documents prepared or obtained by Staff through or in connection with any compliance monitoring processes that led to the institution of proceedings. Such Documents shall include but are not limited to:

(A) requests for information to the Respondent;

(B) every written request, including e-mail, directed to persons not employed by the Compliance Enforcement Authority to provide information or Documents or to be interviewed;

(C) the Documents provided in response to any such requests described in (A) and (B) above;

(D) all transcripts of testimony recorded during the Staff investigation and all exhibits to the transcript;

(E) all other Documents obtained from the Respondent; and

(F) all other Documents obtained from persons not employed by the Compliance Enforcement Authority.

The sole grounds on which Staff is authorized to withhold Documents from inspection and copying are the bases set forth in subsection 1.5.7(b); provided, however, that the Documents made available for inspection and copying need not include (i) exact copies of Documents the Respondent previously provided to Staff, and (ii) any Documents provided to the Respondent with or as part of the Notice of Alleged Violation, Notice of Penalty, assessment of proposed Mitigation Plan or Remedial Action Directive.

(2) Where there are Participants in a proceeding in addition to a single Respondent and Compliance Staff, the Hearing Officer or Hearing Body shall oversee the Staff's designation of Documents to be produced to such other Participants and the development, execution and enforcement of any protective order deemed necessary.

(3) Staff shall promptly inform the Hearing Officer and each other Participant if, after the issuance of a notice of hearing, requests for information are issued by Staff related to the same compliance monitoring process(es) that led to the institution of the proceeding. If Staff receives Documents pursuant to a request for information after Staff has made Documents available for inspection and copying as set forth in subsection (a)(1), the additional Documents shall be made available to the Participants not later than fourteen (14) days after Staff receives such Documents. If a date for the Evidentiary Hearing has been scheduled, Staff shall make the additional Documents available to the other Participants not less than ten (10) days before the Evidentiary Hearing. If Staff receives such Documents ten or fewer days before the Evidentiary Hearing is scheduled to begin or after the Evidentiary Hearing begins, Staff shall make the additional Documents available immediately to the other Participants.

(4) Nothing in subsection (a)(1) shall limit the discretion of the Compliance Enforcement Authority to make any other Document available to the Participants or the authority of the Hearing Officer to order the production of any other Documents or information by any Participant.

(b) Documents That May Be Withheld by Staff

(1) Staff may withhold a Document from inspection and copying by a Participant if:

(A) the Document is privileged to the Compliance Enforcement Authority or constitutes attorney work product of counsel for the Compliance

Enforcement Authority (in applying this provision, the attorney-client privilege shall be recognized as absolute and any demand for production of attorney work product shall be granted only after a showing of substantial need by the Respondent or other Participant);

(B) the Document is an examination or inspection report, an internal memorandum, or other note or writing prepared by a Staff member that will not be offered in evidence or otherwise relied on by Staff in the hearing;

(C) the Document would disclose

(i) an examination, investigatory or enforcement technique or guideline not otherwise made public of the Compliance Enforcement Authority, a federal, state, or foreign regulatory authority, or a self-regulatory organization;

(ii) the identity of a source, including a federal, state, or foreign regulatory authority or a self-regulatory organization, that furnished information or was furnished information on a confidential basis regarding an investigation, an examination, an enforcement proceeding, or any other type of civil or criminal enforcement action; or

(iii) an examination, an investigation, an enforcement proceeding, or any other type of civil or criminal enforcement action under consideration by, or initiated by, the Compliance Enforcement Authority, a federal, state, or foreign regulatory authority, or a self-regulatory organization; or

(D) the Hearing Officer grants leave to withhold a Document or category of Documents as not relevant to the subject matter of the proceeding, or for other good cause shown.

Provided, that where a Document contains information of the type listed in subsections (A), (B), (C) or (D) that is capable of being redacted, Staff shall make the Document available for inspection and copying by the other Participants in redacted form.

(2) Nothing in subsections (b)(1)(B), (C) or (D) authorizes Staff to withhold a Document, or a part thereof, that contains exculpatory evidence. Nothing in subsection (b)(1) requires Staff to withhold a Document from disclosure.

(c) Withheld Document List

At the time it is required to make Documents available for inspection and copying, Staff shall also provide to the Hearing Officer, the Respondent and any other Participant to which Documents are being made available, a list of Documents withheld by Staff pursuant to

subsection (b)(1), with a statement of the grounds that support withholding the Document. Upon review, for good cause shown, the Hearing Officer may order Staff to make any Document withheld, other than a Document that is subject to the attorney-client privilege, available to the other Participants for inspection and copying.

(d) Timing of Inspection and Copying

Except as set forth in this Section, the Hearing Officer shall determine the schedule of production of Documents for inspection and copying, provided that the Hearing Officer may modify any time period for production set forth in this Section as warranted by the circumstances.

(e) Place and Time of Inspection and Copying

Documents subject to inspection and copying pursuant to this Section shall be made available to the Respondent and other Participants for inspection and copying at the Compliance Enforcement Authority office where the Documents are ordinarily maintained, or at such other office as the Hearing Officer, in his or her discretion, shall designate, or as the Participants otherwise agree. A Participant shall be given access to the Documents at the Compliance Enforcement Authority's offices during normal business hours. A Participant shall not be given custody of the Documents or be permitted to remove the Documents from the Compliance Enforcement Authority's offices, other than copies of Documents made available by the Compliance Enforcement Authority for that purpose.

(f) Copying Costs

A Participant may obtain a photocopy of all Documents made available for inspection. A Participant shall be responsible for the cost of photocopying. Unless otherwise ordered by the Hearing Officer, charges for copies made at the request of a Participant shall be at a rate to be established by the Compliance Enforcement Authority.

(g) Failure to Make Documents Available — Harmless Error

In the event that a Document required to be made available to a Participant pursuant to this Section is not made available by Staff, no rehearing or amended decision of a proceeding already heard or decided shall be required where the failure to make the Document available was harmless error. Should a dispute arise as to whether a rehearing or amended decision is required due to the failure of Staff to produce a Document, the burden shall be on Staff to show that such failure was harmless error. The Hearing Officer, or, upon review, the Hearing Body shall determine whether the failure to make the Document available was harmless error.

1.5.8 Other Discovery Procedures

(a) In addition to the production of Documents by Staff for inspection and copying by Respondent and other Participants pursuant to Section 1.5.7, the Participants shall be entitled to utilize all other discovery methods provided for in Rules 402 through 409 of the FERC Rules of Practice and Procedure, 18 C.F.R. §385.402 through 385.409, including data requests, written interrogatories and requests for production of Documents or things, depositions by oral

examination, requests for inspection of Documents and other property, requests for admissions, and requests for issuance of orders to one or more Registered Entities to produce Documents for inspection and copying or at the hearing or to provide testimony by an authorized representative in deposition or at the hearing.

(b) Unless otherwise directed by the Hearing Officer or Hearing Body upon motion by a Participant, or by the Hearing Officer, or by the Hearing Body on its own motion, such discovery, and the resolution of any disputes concerning such discovery, shall be conducted in accordance with the provisions of Rules 402 through 410 and 510(e) of the FERC Rules of Practice and Procedure, 18 C.F.R. §385.402 through 385.410 and 385.510(e), which are hereby incorporated by reference into these Hearing Procedures, subject to the following limitations and modifications to such Rules:

(1) The provisions of subsections (d), (e) and (f) of Section 1.5.7 shall apply to any such discovery.

(2) Rule 403(b)(2) (18 C.F.R. §385.403(b)(2)) and Rule 410(d)(2) (18 C.F.R. §385.410(d)(2)) shall not be applicable.

(3) The Hearing Officer and the Hearing Body have the authority to issue orders to compel the appearance by or production of Documents or information by, only a Person that (i) is a Participant or (ii) is a Registered Entity (including an authorized representative thereof) that is not a Participant. The Hearing Officer and the Hearing Body do not have authority to require a United States marshal or deputy marshal to serve an order to produce or provide Documents, information or testimony.

(4) References to "subpoena" in Rules 404, 409, 410 and 510(e) shall be deemed to be to an order to a non-Participant Registered Entity to produce or provide Documents, information or testimony.

(5) References to the "Commission" in Rules 402 through 410 and 510(e) shall be to FERC except as follows:

(i) the references in Rules 402(a), 404(b)(1) and 405(b), the second reference in Rule 410(d), and the references in Rule 510(e)(1) and (2) shall be deemed to be to the Hearing Body,

(ii) the reference in Rule 385.406(b)(4) to "Commission trial staff" shall be deemed to be to Compliance Staff, and

(iii) the reference in Rule 510(e)(3) shall be deemed to be to the Hearing Officer or Hearing Body.

(6) Unless otherwise ordered by the Hearing Officer or Hearing Body, a data request, set of interrogatories, request for production of Documents or things, request for inspection of Documents or other property, request for admissions, or order to

produce or provide Documents, information or testimony, shall not specify a due date or response date that is fewer than 21 days from the date of service of the request or date of the order.

(7) A list of withheld Documents, if any, shall be provided by any Participant required to produce Documents, at the time the Documents are required to be produced, to the Hearing Officer and to each Participant entitled to receive production of the Documents. Upon review, for good cause shown, the Hearing Officer may order the Participant to make any Document withheld available to any other Participant or Participants for inspection and copying.

(8) In the event a Document or information required to be produced or provided by a Participant pursuant to discovery is not produced or provided by the Participant, no rehearing or amended decision of a proceeding already heard or decided shall be required where the failure to produce or provide the Document or information was harmless error. Should a dispute arise as to whether a rehearing or amended decision is required due to the failure of a Participant to produce or provide a Document or information, the burden shall be on the Participant that failed to produce or provide the Document or information to show that such failure was harmless error. The Hearing Officer or, upon review, the Hearing Body shall determine whether the failure to make the Document available was harmless error.

(9) Unless otherwise ordered by the Hearing Officer or Hearing Body, all such discovery shall be requested, scheduled and conducted so as to be completed within six (6) months following the date the request for hearing was filed.

(10) Notwithstanding subsections (b)(6) and (b)(9), however, if the shortened hearing procedure in Section 1.3.4 is used in a proceeding, the Hearing Officer, on his or her own motion or on motion of a Participant, shall establish a schedule for discovery, including response periods for responding to discovery requests, that are consistent with the expedited nature of the proceeding contemplated by the shortened hearing procedure.

(c) The Hearing Officer's ruling on all motions relating to disputes concerning such discovery shall consider the following objectives:

(1) full disclosure of all relevant Documents and information;

(2) the exercise of due diligence in the conduct of discovery by a Participant; and

(3) disallowing use of discovery as a means to delay the proceeding or to harass or burden any other Participant.

1.5.9 Pre-Evidentiary Hearing Submission of Testimony and Evidence

(a) Unless the Hearing Officer orders otherwise and with the exception of (i) any adverse Participant examination pursuant to Section 1.6.16 and (ii) the testimony and Documents of a non-Participant provided pursuant to an order to produce or provide Documents, information or testimony, all witness direct testimony to be submitted in an Evidentiary Hearing must be prepared in written form, may have exhibits, schedules and attachments thereto, and shall be filed in advance of the Evidentiary Hearing pursuant to a schedule determined by the Hearing Officer, as it may be amended.

(b) Where a Participant intends to use a Document or other demonstrative evidence that has not been filed as part of written testimony in the conduct of cross-examination (other than Documents that are to be produced by a non-Participant at the hearing pursuant to an order to produce Documents), the Participant intending to use such Document or demonstrative evidence shall provide it to the other Participants and the Hearing Officer at least three (3) business days prior to the date at which the witness will be cross-examined at a Testimonial Hearing.

(c) Compliance Staff shall file the Documents it intends to offer into evidence as its direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, first. The Registered Entity shall file the Documents it intends to offer into evidence as its direct case, which also may be responsive to Staff's direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, second. Staff shall file as its rebuttal case the Documents it intends to offer into evidence in response to the Registered Entity's direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, third.

(d) If appropriate due to the number and/or complexity of the issues, the Hearing Officer may allow for the Registered Entity to submit a rebuttal case that responds to Staff's rebuttal case, in which event the Hearing Officer shall also allow Staff to submit a surrebuttal case that responds to the Registered Entity's rebuttal case.

(e) Each round of evidence shall be limited in scope to responding to the preceding round of evidence, except that the Registered Entity's direct case may exceed the scope of Staff's direct case if necessary for the Registered Entity to set forth its direct case fully.

(f) The Participants shall file the Documents they intend to offer into evidence in accordance with the Hearing Officer's schedule, as it may be amended. Such filings of written testimony and other evidence in advance of the Evidentiary Hearing shall not entitle the Documents to be admitted into the evidentiary record. The Participants must offer their witnesses' testimony and other proposed evidence for admission into the evidentiary record during the Evidentiary Hearing.

(g) Any Participant who fails, without good cause shown, to comply with the Hearing Officer's schedule for the filing of written testimony and other evidence in advance of the Evidentiary Hearing may be limited in the presentation of its evidence during the Evidentiary Hearing or have its participation in the Evidentiary Hearing otherwise restricted by the Hearing Officer to avoid undue prejudice and delay.

1.5.10 Protective Orders

(a) All proceedings conducted pursuant to these Hearing Procedures, and any written testimony, exhibits, other evidence, transcripts, comments, briefs, rulings and other issuances, shall be non-public and shall be held in confidence by all Participants, except as the ERO (within the U.S., in accordance with the authorization previously granted by FERC to release information about a non-public proceeding) or FERC (in the case of U.S.-related information) or another Applicable Governmental Authority (in the case of non-U.S.-related information) authorizes or directs public disclosure of any portion of the record. In addition to this general proscription, at any time during a proceeding, the Hearing Officer, on his or her own motion or on the motion of any Participant or of any non-Participant ordered to produce Documents, information or testimony, may enter a protective order to designate as proprietary and protect the confidential, proprietary or trade secret nature of any data, information or studies, or any other information the public release of which may cause a security risk or harm to a Participant.

(b) The following types of information will be considered entitled to protection through a protective order:

(1) Confidential Business and Market Information, including information that is proprietary, commercially valuable, or competitively sensitive;

(ii) Critical Energy Infrastructure Information;

(iii) information related to a Cyber Security Incident;

(iv) personnel information that identifies or could be used to identify a specific individual, or that reveals personnel, financial, medical or other personal information;

(v) audit work papers;

(vi) investigative files or Documents that would disclose investigative techniques of Staff, any Compliance Enforcement Authority, the ERO or any federal, state or foreign regulatory authority.

Nothing in this subsection 1.5.10(b) shall require Staff to produce any Documents it is entitled to withhold under subsection 1.5.7(b).

(c) A motion for a protective order shall specify the proposed expiration date for the proprietary status of the data, Documents or information, if any, and shall propose requirements or safeguards to be met for individuals participating in the proceeding to review the protected information while maintaining its proprietary status.

(d) A Document submitted and marked as proprietary, or a statement made at a hearing and identified as proprietary, shall be afforded proprietary treatment pending the timely submission of a motion to protect the confidential, proprietary or trade secret nature of that Document or statement and a ruling on such a motion by the Hearing Officer.

(e) The protective order shall identify the data, Documents or information that will be accorded proprietary treatment; the individuals participating in the proceeding, by category or otherwise, entitled to view the proprietary information; and the requirements, conditions or safeguards that must be met before an individual may view the information.

(f) A public redacted version of each Document and transcript that contains information that is protected pursuant to this Section must be filed with the proprietary version and must be served on each Participant for distribution to those individuals participating in the proceeding who are not entitled to view the proprietary information.

(g) Should it be necessary to address proprietary information during a hearing, the Hearing Officer shall, while the information is being addressed, close the hearing to all individuals other than those entitled to view or hear the proprietary information in accordance with the protective order.

1.5.11 Pre-Evidentiary Hearing Memorandum

(a) The Hearing Officer or the Hearing Body may request the submission of memoranda prior to the Evidentiary Hearing that set forth each Participant's position on the issue(s) in dispute, the key facts and arguments, the applicable Reliability Standard, rules, orders or other authority, and such other matters as may be directed by the Hearing Officer or the Hearing Body.

(b) The purpose of such memoranda will be to aid the Hearing Officer and Hearing Body in preparation for the Evidentiary Hearing. A Participant will not be deemed to have waived any issue, fact or argument that is not set forth in a pre-Evidentiary Hearing memorandum.

(c) The Hearing Officer may establish word limitations on such submissions.

1.5.12 Certification of Questions to the NERC Board of Trustees

(a) Should a hearing present a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the proceeding in whole or in part, and as to which there are other extraordinary circumstances that make prompt consideration of the question by the NERC Board of Trustees appropriate, the Hearing Officer, on his or her own motion or on motion of a Participant, may recommend to the Hearing Body that it certify, or the Hearing Body on its own motion may decide to certify, the question to the Board of Trustees for determination pursuant to Section 412 of the Rules of Procedure.

(b) If the Hearing Officer, on his or her own motion, or the Hearing Body, on its own motion, wishes to present a question to the Hearing Body for certification to the NERC Board of Trustees, the Hearing Officer shall first provide the Participants the opportunity to submit memoranda addressing whether the question should be certified and the precise terms of the question to be certified.

(c) If a Participant files a motion requesting, or the Hearing Officer determines on his or her own motion, that a question should be certified to the Board of Trustees, the Hearing Officer shall submit a written recommendation on the matter to the Hearing Body. If the request for certification is based on the motion of a Participant, the Hearing Officer shall also submit to the Hearing Body the motion and any answers to the motion that were filed. If the request for

certification is on the Hearing Officer's own motion, the Hearing Officer shall also submit to the Hearing Body the Participants' memoranda that were filed pursuant to subsection (b).

(d) Questions of fact presented by the particular matter in dispute in a hearing shall not be the subject of a certification to the Board of Trustees.

(e) The Hearing Body shall determine, based on the criteria specified in subsection (a), whether the proposed question shall be certified to the Board of Trustees for determination. To certify the proposed question, the Hearing Body must determine that the question is a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the proceeding, in whole or in part, and that there are extraordinary circumstances that make prompt consideration of the question by the Board of Trustees appropriate. If the Hearing Body determines that the proposed question should be certified to the Board of Trustees, the Hearing Body shall also determine whether the hearing should be suspended, in whole or in part, while the question is pending before the Board of Trustees for determination.

(f) As provided in Rule of Procedure Section 412, the Board of Trustees may decide to reject a proposed certification from a Hearing Body.

(f) If the Board of Trustees accepts certification of a question and issues a determination on the question, the hearing shall proceed following the determination in accordance with the Board of Trustees' decision.

1.6 Procedure at Evidentiary Hearing

1.6.1 Purpose of Evidentiary Hearing

The purpose of the Evidentiary Hearing shall be to admit the Participants' evidence into the record, and for each Participant to have the opportunity to cross-examine the other Participant's witnesses. A schedule for briefs, unless waived by the Participants, shall be set at the conclusion of the Evidentiary Hearing.

1.6.2 Order of Receiving Evidence

In all proceedings Compliance Staff shall open and close.

1.6.3 Opening and Closing Statements

Opening and closing statements will not be made during the Evidentiary Hearing as a matter of course except that such statements may be allowed when requested by a Participant, and shall be required when requested by the Hearing Officer or the Hearing Body. Any Participant's request for such statements, or a Hearing Officer or Hearing Body notice requiring such statements, shall be made at least ten (10) days in advance of the start of the Evidentiary Hearing.

1.6.4 Right of Participant to Present Evidence

Subject to compliance with the requirements of these Hearing Procedures concerning the timing of submission of written testimony and other evidence, a Participant has the right to present such

evidence, to make such objections and arguments, and to conduct such cross-examination as may be necessary to assure the true and full disclosure of the facts.

1.6.5 Exhibits

(a) All material offered in evidence, except oral testimony allowed by the Hearing Officer or the testimony of a non-Participant pursuant to an order to produce or provide Documents, information or testimony, shall be offered in the form of an exhibit.

(B) Each exhibit must be marked for identification. A Participant must provide the court reporter with two (2) copies of every exhibit that the Participant offers into evidence, and will provide copies of any exhibit not served in advance of the Evidentiary Hearing to the Participants and the Hearing Officer.

1.6.6 Witness Attendance at Testimonial Hearing

(a) Each witness shall attend the Testimonial Hearing in person unless a Participant has been informed in advance of the Testimonial Hearing that all other Participants waive cross-examination of the witness and neither the Hearing Officer nor the members of the Hearing Body have any questions for the witness, in which event the witness does need not be present at the Testimonial Hearing.

(b) A person compelled to appear, voluntarily testifying, or making a statement may be accompanied, represented and advised by an attorney.

(c) All testimony offered at a Testimonial Hearing is to be under oath or affirmation. If a witness is not required to attend the Testimonial Hearing, then the Participant on whose behalf the witness prepared testimony shall submit an affidavit of the witness attesting to the veracity of the witness' testimony, and the Participant shall be allowed to introduce the witness' testimony, and the exhibits, schedules and attachments thereto, into the evidentiary record based on such affidavit.

1.6.7 Admission of Evidence

(a) Compliance Staff shall offer its exhibits into evidence first and the Registered Entity second, unless the Participants agree otherwise.

(b) Except for witnesses who are not required to attend the Testimonial Hearing, the Participants shall call each witness in turn. Following the witness' swearing in, the witness shall attest to the veracity of his or her written testimony. The witness may identify any language and/or figures in his or her written testimony or exhibits that the witness would like to change or correct. Subject to objection, such changes or corrections may be allowed at the Hearing Officer's discretion for the purpose of obtaining a full, accurate and complete record without imposing undue delay or prejudice on any Participant. The Participant whose witness has made changes or written corrections to written testimony and exhibits shall file corrected copies with the Clerk and provide corrected copies to the Hearing Officer and other Participant.

(c) Once a witness has attested to the veracity of his or her testimony, the Participant on whose behalf the witness is testifying shall move for admission of the witness' testimony,

including all exhibits, schedules and attachments thereto, into evidence. Other Participants may object to the introduction of the witness' testimony, or any part thereof, as set forth in Section 1.6.11. Subject to the Hearing Officer's ruling on the objection, the witness' testimony shall be admitted into evidence.

(d) The witness shall then be turned over for cross-examination by other Participants, and for any questions by the Hearing Officer or any member of the Hearing Body, in accordance with Section 1.6.14, and then for redirect examination in accordance with Section 1.6.15. Witnesses shall be cross-examined on all previously-served testimony (direct, rebuttal or surrebuttal) when they first take the witness stand.

(e) Except (i) in exceptional cases and upon a showing of good cause and (ii) witnesses testifying pursuant to an order to produce or provide Documents, information or testimony issued to a non-Participant, no witness shall be allowed to testify unless a Participant has served the witness' written testimony in advance of the Testimonial Hearing in accordance with the schedule established by the Hearing Officer. Due to the undue prejudice such surprise witness testimony would impose on other Participants, it is the Compliance Enforcement Authority's policy to discourage witness testimony at a Testimonial Hearing when a Participant has not served the witness' written testimony in advance of the Testimonial Hearing. If such testimony is allowed, sufficient procedural steps shall be taken by the Hearing Officer to provide the other Participants with a fair opportunity for response and cross-examination.

1.6.8 Evidence that is Part of a Book, Paper or Document

(a) When relevant and material matter offered in evidence is embraced in a book, paper or Document containing other matter that is not material or relevant, the Participant offering the same must plainly designate the matter offered as evidence, and segregate and exclude the material not offered to the extent practicable.

(b) If the material not offered is in such volume as would unnecessarily encumber the record, such book, papers or Document will not be received in evidence but may be marked for identification and, if properly authenticated, the relevant or material matter may be read into the record, or, if the Hearing Officer so directs, a separate copy of such matter in proper form shall be offered as an exhibit.

(c) All other Participants shall be afforded an opportunity to examine the book, paper or Document and to offer in evidence in like manner other portions thereof if found to be material and relevant.

1.6.9 Stipulations

The Participants may stipulate to any relevant fact or the authenticity of any relevant Document. Stipulations may be made in writing or entered orally in the record. Notwithstanding stipulation, the Hearing Officer may require evidence of the facts stipulated in order to provide a complete evidentiary record on which to base the final order.

1.6.10 Official Notice

(a) Where relevant and material to the subject matter of the proceeding, the Hearing Officer may, upon request of a Participant, take official notice of any of the following:

(1) Rules, regulations, administrative rulings and orders, written policies of governmental bodies, and rulings and orders of other Compliance Enforcement Authorities.

(2) The orders, transcripts, exhibits, pleadings or any other matter contained in the record of other docketed proceedings of the Compliance Enforcement Authority.

(3) State, provincial and federal statutes and municipal and local ordinances.

(4) The decisions of state, provincial and federal courts.

(5) Generally recognized scientific or technical facts within the specialized knowledge of the Compliance Enforcement Authority.

(6) All other matters of which the courts of the United States may take judicial notice.

(b) All requests to take official notice shall be submitted in advance of the Evidentiary Hearing in accordance with a schedule established by the Hearing Officer. Before ruling on a request to take official notice, the Hearing Officer shall afford the other Participant opportunity to object or to show the contrary to the matter for which official notice is requested.

(c) An accurate copy of any item officially noticed shall be introduced into the record in the form of an exhibit presented by the Participant requesting official notice unless waived by the Participants and approved by the Hearing Officer. Any information officially noticed and not presented as an exhibit shall be set forth in a statement on the record.

1.6.11 Admissibility of Evidence

(a) Any evidence offered, including that included in a book, paper or Document pursuant to Section 1.6.8, shall be subject to appropriate and timely objections. Any Participant objecting to the admission or exclusion of evidence must state the grounds for objection.

(b) The admission of evidence shall not be limited by the generally recognized rules of evidence as applied in the courts of the United States or of the states, although the Hearing Officer may take such rules of evidence into consideration in ruling on the admissibility of evidence. The Hearing Officer will exercise discretion in the admission of evidence based upon arguments advanced by the Participants, and shall admit evidence if it is of a type commonly relied upon by reasonably prudent persons in the conduct of their affairs. The Hearing Officer may only exclude material from the record in response to a motion or objection by a Participant.

(c) Formal exception to a ruling on admissibility of evidence need not be taken to be preserved.

1.6.12 Offer of Proof

Any Participant who has had evidence excluded may make an offer of proof on the record. The offer of proof may consist of a statement made on the record of the substance of the evidence that the Participant claims would have been adduced, or any written or documentary exhibit that the Participant sought to introduce. Any such exhibit shall be retained as part of the record.

1.6.13 Reservation of Evidentiary Ruling

(a) The Hearing Officer shall rule upon any objection to the admissibility of evidence at the time the objection is made; provided that the Hearing Officer has discretion to reserve such a ruling or to require the Participants to file written arguments in relation thereto.

(b) If the Hearing Officer reserves the ruling, appropriate steps shall be taken during the Evidentiary Hearing to ensure a full, complete and accurate record in relation to the objected to evidence in the event the objection to the evidence's admissibility is overruled.

1.6.14 Cross-Examination

(a) Each witness shall be tendered for cross-examination subsequent to the admission of the witness' testimony into the evidentiary record. Each Participant shall have the right to cross-examine each witness of any other Participants. A Participant may waive cross-examination of any witness. Leading questions are permitted on cross-examination.

(b) The credibility of a witness may be attacked by any Participant, including the Participant calling the witness.

(c) The Hearing Officer and any member of the Hearing Body may ask the witness questions following the conclusion of the witness' cross-examination by the other Participant, and prior to the witness' redirect examination pursuant to Section 1.6.15.

1.6.15 Redirect Examination

A Participant shall be entitled to conduct redirect examination of each of the Participant's witnesses who are subject to cross-examination or questions of the Hearing Officer or a member of the Hearing Body. Any redirect examination shall be limited in scope to the witness' cross-examination and questions of the Hearing Officer and members of the Hearing Body.

1.6.16 Examination of Adverse Participant

(a) Any Participant may call any adverse Participant, or any employee or agent thereof, during the Testimonial Hearing to provide oral testimony on the Participant's behalf, and may conduct such oral examination as though the witness were under cross-examination.

(b) If a Participant intends to call an adverse Participant for examination, it shall give notice to the Hearing Officer and all other Participants setting forth the grounds for such examination at least fourteen (14) days in advance of the Testimonial Hearing, and the Participant who, or whose employee or agent, is sought to be called shall file any objection at least seven (7) days in advance of the Testimonial Hearing.

(c) Any Participant may conduct oral examination of a witness testifying pursuant to an order to produce or provide Documents, information or testimony issued to a non-Participant, as though the witness were under cross-examination.

1.6.17 Close of the Evidentiary Record

(a) The Hearing Officer shall designate the time at which the evidentiary record will be closed, which will typically be at the conclusion of the Evidentiary Hearing.

(b) Evidence may not be added to the evidentiary record after it is closed, provided that, prior to issuance of the Hearing Body's final order, the Hearing Officer may reopen the evidentiary record for good cause shown by any Participant. For the purpose of reopening the evidentiary record, newly discovered evidence that is material to the issues in dispute and could not, by due diligence, have been discovered prior to or during the Evidentiary Hearing, shall constitute good cause.

1.7 Post- Evidentiary Hearing Procedure

1.7.1 Briefs

(a) At the close of the Evidentiary Hearing, Participants may file initial and reply briefs.

(b) Briefs shall be concise, and, if in excess of twenty (20) pages, excluding appendices, shall contain a table of contents. Statements of fact should be supported by record citations.

(c) The Hearing Officer will prescribe the time for filing briefs, giving due regard to the nature of the proceeding, the extent of the record, the number and complexity of the issues, and the objective of expedition.

(d) Unless the Hearing Officer prescribes otherwise, all Participants shall file initial and reply briefs simultaneously.

(e) Participants' reply briefs shall be limited in scope to responding to arguments and issues raised in other Participants' initial briefs.

(f) The Hearing Officer may allow oral closing statements to be made on the record in lieu of briefs.

(g) The Hearing Officer may establish reasonable word limitations applicable to briefs.

1.7.2 Other Pleadings

Post-hearing pleadings other than briefs are permitted, but, absent good cause shown, such pleadings may not seek to introduce additional evidence into the record.

1.7.3 Draft Initial Opinions

The Hearing Officer may permit or require Participants to file draft initial opinions that set forth the Participants' proposed findings of fact and conclusions.

1.7.4 Hearing Officer's Initial Opinion

(a) At the conclusion of the Evidentiary Hearing, and following the submission of initial and reply briefs and draft orders, if any, the Hearing Officer shall prepare an initial opinion for the Hearing Body's review and consideration.

(b) The initial opinion shall include a statement of each finding and conclusion, and the reasons or basis therefore, for all material issues presented on the record. The initial opinion also shall contain the appropriate orders to dispose of the proceeding, including any Penalty, Mitigation Plan or Remedial Action Directive that the Hearing Officer proposes the Hearing Body require.

(c) The initial opinion shall note if the subject of the proceeding has been deemed to involve a Cyber Security Incident, if any information in the proceeding was deemed to be Critical Energy Infrastructure Information, or if any information in the proceeding is the subject of a protective order pursuant to Section 1.5.10.

1.7.5 Exceptions

(a) Within twenty-one (21) days after service of the initial opinion, or such other time as is fixed by the Hearing Officer, any Participant may file exceptions to the initial opinion in a brief designated "brief on exceptions" and, within fourteen (14) days after the time for filing briefs on exceptions or such other time as is set by the Hearing Officer, any Participant may file as a reply, a "brief in reply to exceptions."

(b) Exceptions and replies thereto with respect to statements, findings of fact or conclusion in the initial opinion must be specific and must be stated and numbered separately in the brief. With regard to each exception, the Participant must specify each error asserted, and include a concise discussion of any policy considerations applicable and any other evidence and arguments in support of the Participant's position. Suggested replacement language for all statements to which exception is taken must be provided. Exceptions and arguments may be filed (1) together in one brief; or (2) in two separate documents, one designated as the brief containing arguments, and the other designated "Exceptions," containing the suggested replacement language.

(c) Arguments in briefs on exceptions and replies thereto shall be concise and, if in excess of twenty (20) pages, shall contain a table of contents.

(d) Participants shall not raise arguments in their briefs in reply to exceptions that are not responsive to any argument raised in any other Participant's brief on exceptions.

(e) Statements of fact should be supported by citation to the record.

(f) The Hearing Officer may establish reasonable word limitations applicable to arguments included in briefs on exception and briefs in reply to exceptions. Such word limitations shall not apply to a Participant's proposed replacement language.

(g) Unless good cause is shown, if a Participant does not file a brief on exceptions, or if a Participant filed a brief on exceptions that does not object to a part of the initial opinion,

the Participant shall be deemed to have waived any objection to the initial opinion in its entirety, or to the part of the initial opinion to which the Participant did not object, whichever applies. This provision shall not prohibit the Participant, in its brief in reply to exceptions, from responding to another Participant's exceptions to such part of the initial opinion or from proposing alternative replacement language to the replacement language proposed by the other Participant for such part of the initial opinion.

1.7.6 Oral Argument

(a) The Hearing Body may elect to hear oral argument. If oral argument is held without briefs having been filed, Participants will be given the opportunity to present argument on all issues.

(b) If oral argument is held where briefs have been filed, argument may be limited to issues identified by the Hearing Body. The Hearing Body will direct the Clerk to issue a notice of oral argument that identifies the date, time, place and issues for the argument.

(c) The presentation of written materials or visual aids is permitted at oral argument. To the extent such materials or aids contain factual information, they shall be supported by the record, and contain accurate citations to the record. Such materials or aids may not contain new calculations or quantitative analyses not presented in the record, unless they are based on underlying data contained in the record. Copies of all written materials or visual aids to be presented at oral argument shall be served on all Participants not less than forty-eight (48) hours prior to the time and date of oral argument.

1.7.7 Additional Hearings

After the evidentiary record has been closed but before issuance of the Hearing Body's final order, the Hearing Officer may reopen the evidentiary record and hold additional hearings. Such action may be taken on the Hearing Officer's or the Hearing Body's own motion if there is reason to believe that reopening is warranted by any changes in conditions, or by the need to compile a complete evidentiary record on which to base the final order. Any Participant may file a motion to reopen the record, which shall contain the reasons for reopening, including material changes in conditions or the identification of additional evidence that should be included in the record, and a brief statement of proposed additional evidence and an explanation why such evidence was not previously adduced.

1.7.8 Hearing Body Final Order

(a) Following the receipt of the initial opinion, any exceptions and replies thereto, and oral argument, if any, the Hearing Body shall issue its final order.

(b) Issuance of a final order shall require (i) a quorum of the Hearing Body, which shall be (after any recusals, disqualifications and appointments of replacement members) at least fifty (50) percent of the number of members normally assigned to the Hearing Body, and (ii) majority vote of the members of the Hearing Body voting on the final order (which number of members voting shall not be less than a quorum).

(c) The Hearing Body shall strive, but shall not be required, to issue its final order within thirty (30) days following the last to occur of the initial opinion, exceptions or replies thereto, or oral argument. The final order may adopt, modify, amend or reject the initial opinion in its entirety or in part. The final order shall include a statement of each finding and conclusion, and the reasons or basis therefore, for all material issues presented on the record.

(d) The Hearing Body will base its determinations in the final order on the record. The final order also shall contain the appropriate orders to dispose of the proceeding, including any Penalty, Remedial Action Directive or Mitigation Plan required.

(e) The final order shall note if the subject of the proceeding has been deemed to involve a Cyber security Incident, if any information in the proceeding was deemed to be Critical Energy Infrastructure Information, or if any information in the proceeding is the subject of a protective order issued pursuant to Section 1.5.10.

(f) The service of the final order shall include a notice informing the Participants of their appeal rights to the ERO or to FERC, as applicable.

1.7.9 The Record

The Clerk shall maintain the record for all dockets. The record shall include any of the following, including all attachments thereto and Documents filed therewith, that exist in any docket:

(1) Notice of Alleged Violation and Registered Entity's response thereto;

(2) Registered Entity's proposed Mitigation Plan and Staff's statement identifying its disagreement(s) therewith;

(3) Remedial Action Directives and the Registered Entity's notice contesting the Remedial Action Directive;

(4) Registered Entity's request for a hearing;

(5) Participant filings, motions, and responses;

(6) Notices, rulings, orders and other issuances of the Hearing Officer and Hearing Body;

(7) Transcripts;

(8) Evidence received;

(9) Written comments submitted in lieu of written testimony;

(10) Matters officially noticed;

(11) Offers of proof, objections and rulings thereon, and any written or documentary evidence excluded from the evidentiary record;

(12) Pre-Evidentiary Hearing memorandums, briefs, and draft opinions;

(13) Post-hearing pleadings other than briefs;

(14) The Hearing Officer's initial opinion;

(15) Exceptions to the Hearing Officer's initial opinion, and any replies thereto;

(16) The Hearing Body's final order and the Clerk's notice transmitting the final order to the Participants;

(17) All notices of ex parte communications; and

(18) Any notifications of recusal and motions for disqualification of a member of the Hearing Body or Hearing Officer or Technical Advisor and any responses or replies thereto.

1.7.10 Appeal

A Participant or a Regional Entity acting as the Compliance Enforcement Authority, may appeal a final order of the Hearing Body to NERC in accordance with Rule of Procedure Section 409.

1.8 Settlement

Settlements may be entered into at any time pursuant to Section 5.6 of the NERC Compliance Monitoring and Enforcement Program and the Compliance Enforcement Authority's settlement procedures, provided, that (i) the Compliance Enforcement Authority may decline to engage in or continue settlement negotiations after a Possible Violation or Alleged Violation becomes a Confirmed Violation, and (ii) the Compliance Enforcement Authority, the Registered Entity or any other Participant may terminate settlement negotiations at any time.

1.9 Remedial Action Directives

1.9.1 Initiation of Remedial Action Directive Hearing

(a) Staff may issue a Remedial Action Directive to a Registered Entity at any time, including during any proceeding related to an Alleged Violation of a Reliability Standard. The Remedial Action Directive shall be delivered to the Registered Entity in accordance with Section 7.0 of the NERC Compliance Monitoring and Enforcement Program. The Compliance Enforcement Authority will notify NERC within two (2) business days after its Staff issues a Remedial Action Directive.

(b) The Registered Entity may contest the Remedial Action Directive by filing a written notice with the Clerk of the Compliance Enforcement Authority that states that the Registered Entity contests the Remedial Action Directive and that the Registered Entity requests a Remedial Action Directive hearing. The Registered Entity shall attach a copy of the Remedial Action Directive to its written notice. The Registered Entity must provide such notice within two (2) business days following the date of actual receipt (as defined in Section 7.0 of the NERC Compliance Monitoring and Enforcement Program) of the Remedial Action Directive. If the

Registered Entity does not give written notice to the Compliance Enforcement Authority within the required time period, the Registered Entity shall be deemed to have waived its right to contest the Remedial Action Directive.

(c) The Clerk shall assign a docket number, and issue a notice of hearing that sets forth the date, time and place at which the hearing will convene.

1.9.2 Remedial Action Directive Hearing Procedure

(a) Hearings to address Remedial Action Directives shall be conducted only under the expedited hearing process set forth in this Section 1.9.2. The general hearing procedures described in Sections 1.4 to 1.7 are applicable to the Remedial Action Directive hearing unless the context of a provision is inconsistent with or otherwise renders it inapplicable to the procedures set forth in this Section.

(b) The Remedial Action Directive hearing shall be presided over by a Hearing Officer and will be conducted according to the following guidelines:

(1) The Hearing Officer or the Hearing Body will hold a prehearing conference within two (2) business days after receipt of the Registered Entity's request for a hearing.

(2) A Testimonial Hearing will be conducted on the matter, in person or by teleconference, within seven (7) business days after the prehearing conference.

(3) At the Testimonial Hearing, Staff shall present oral witness testimony and evidence to show why the Remedial Action Directive should be complied with, and the Registered Entity shall present oral witness testimony and evidence to show why the Remedial Action Directive is not necessary or should be modified. All witness testimony shall be rendered under oath.

(4) At the Testimonial Hearing, the Participants shall have the opportunity to make opening statements. In addition, the Participants shall have the opportunity to make closing arguments, and Staff shall have the opportunity to make a rebuttal to the Registered Entity's closing argument.

(5) The Participants may file initial briefs and reply briefs, and/or draft opinions, on an expedited schedule set by the Hearing Officer or the Hearing Body. Oral argument shall not be held.

(c) The Hearing Body shall issue a summary written decision within ten (10) days following submission of the last brief, stating whether the Registered Entity shall or shall not be required to comply with the Remedial Action Directive and identifying any modifications to the Remedial Action Directive that the Hearing Body finds appropriate. Upon issuance of the summary written decision, the Registered Entity is required to comply with the Remedial Action Directive as specified in the summary written decision.

(d) Within thirty (30) days following issuance of its summary written decision, the Hearing Body shall issue a full written decision. The written decision shall state the conclusions of the

Hearing Body with respect to the Remedial Action Directive, and shall explain the reasons for the Hearing Body's conclusions.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Rules of Procedure

Effective: ~~March 19, 2015~~DATE

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509…...…102

SECTION 100 — APPLICABILITY OF RULES OF PROCEDURE

NERC and NERC Members shall comply with these Rules of Procedure. Each Regional Entity shall comply with these Rules of Procedure as applicable to functions delegated to the Regional Entity by NERC or as required by an Applicable Governmental Authority or as otherwise provided.

Each Bulk Power System owner, operator, and user shall comply with all Rules of Procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Any entity that is unable to comply or that is not in compliance with a NERC Rule of Procedure shall immediately notify NERC in writing, stating the Rule of Procedure of concern and the reason for not being able to comply with the Rule of Procedure.

NERC shall evaluate each case and inform the entity of the results of the evaluation. If NERC determines that a Rule of Procedure has been violated, or cannot practically be complied with, NERC shall notify the Applicable Governmental Authorities and take such other actions as NERC deems appropriate to address the situation.

NERC shall comply with each approved Reliability Standard that identifies NERC or the Electric Reliability Organization as a responsible entity. Regional Entities shall comply with each approved Reliability Standard that identifies Regional Entities as responsible entities. A violation by NERC or a Regional Entity of such a Reliability Standard shall constitute a violation of these Rules of Procedure.

SECTION 200 — DEFINITIONS OF TERMS

Definitions of terms used in the NERC Rules of Procedure are set forth in **Appendix 2**, *Definitions Used in the Rules of Procedure*.

SECTION 300 — RELIABILITY STANDARDS DEVELOPMENT

301. General

NERC shall develop and maintain Reliability Standards that apply to Bulk Power System owners, operators, and users and that enable NERC and Regional Entities to measure the reliability performance of Bulk Power System owners, operators, and users; and to hold them accountable for Reliable Operation of the Bulk Power Systems. The Reliability Standards shall be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.

302. Essential Attributes for Technically Excellent Reliability Standards

1. **Applicability** — Each Reliability Standard shall clearly identify the functional classes of entities responsible for complying with the Reliability Standard, with any specific additions or exceptions noted. Such functional classes[1] include: Reliability Coordinators, Balancing Authorities, Transmission Operators, Transmission Owners, Generator Operators, Generator Owners, Transmission Service Providers, market operators, Planning Authorities, Transmission Planners, Resource Planners, ~~Load-Serving Entities,~~ and Distribution Providers. Each Reliability Standard shall also identify the geographic applicability of the Reliability Standard, such as the entire North American Bulk Power System, an Interconnection, or within a Region. A Reliability Standard may also identify any limitations on the applicability of the Reliability Standard based on electric Facility characteristics.

2. **Reliability Objectives** — Each Reliability Standard shall have a clear statement of purpose that shall describe how the Reliability Standard contributes to the reliability of the Bulk Power System. The following general objectives for the Bulk Power System provide a foundation for determining the specific objective(s) of each Reliability Standard:

   2.1 **Reliability Planning and Operating Performance**— Bulk Power Systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

   2.2 **Frequency and Voltage Performance**— The frequency and voltage of Bulk Power Systems shall be controlled within defined limits through the balancing of Real and Reactive Power supply and demand.

[1] These functional classes of entities are derived from NERC's Reliability Functional Model. When a Reliability Standard identifies a class of entities to which it applies, that class must be defined in the Glossary of Terms Used in NERC Reliability Standards.

2.3 **Reliability Information** — Information necessary for the planning and operation of reliable Bulk Power Systems shall be made available to those entities responsible for planning and operating Bulk Power Systems.

2.4 **Emergency Preparation** — Plans for emergency operation and system restoration of Bulk Power Systems shall be developed, coordinated, maintained, and implemented.

2.5 **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of Bulk Power Systems.

2.6 **Personnel** — Personnel responsible for planning and operating Bulk Power Systems shall be trained and qualified, and shall have the responsibility and authority to implement actions.

2.7 **Wide-Area View** — The reliability of the Bulk Power Systems shall be assessed, monitored, and maintained on a Wide-Area basis.

2.8 **Security** —Bulk Power Systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome**— Each Reliability Standard shall state one or more performance Requirements, which if achieved by the applicable entities, will provide for a reliable Bulk Power System, consistent with good utility practices and the public interest. Each Requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for Bulk Power System reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance Requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that Requirement. Each performance Requirement shall have one or more associated measures used to objectively evaluate compliance with the Requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations**— Each Reliability Standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.

6. **Completeness** — Reliability Standards shall be complete and self-contained. The Reliability Standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for Penalties and sanctions, as well as other ERO and Regional Entity compliance documents, the consequences of violating a Reliability Standard are clearly presented to the entities responsible for complying with the Reliability Standards.

8. **Clear Language** — Each Reliability Standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

9. **Practicality** — Each Reliability Standard shall establish Requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, Reliability Standards shall use a set of standard terms and definitions that are approved through the NERC Reliability Standards development process.

303. Relationship between Reliability Standards and Competition

To ensure Reliability Standards are developed with due consideration of impacts on competition, to ensure Reliability Standards are not unduly discriminatory or preferential, and recognizing that reliability is an essential requirement of a robust North American economy, each Reliability Standard shall meet all of these market-related objectives:

1. **Competition** — A Reliability Standard shall not give any market participant an unfair competitive advantage.

2. **Market Structures** — A Reliability Standard shall neither mandate nor prohibit any specific market structure.

3. **Market Solutions** — A Reliability Standard shall not preclude market solutions to achieving compliance with that Reliability Standard.

4. **Commercially Sensitive Information** — A Reliability Standard shall not require the public disclosure of commercially sensitive information or other Confidential Information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with Reliability Standards.

5. **Adequacy** — NERC shall not set Reliability Standards defining an adequate amount of, or requiring expansion of, Bulk Power System resources or delivery capability.

304. Essential Principles for the Development of Reliability Standards

NERC shall develop Reliability Standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these Rules of Procedure as **Appendix 3A**. Appeals in connection with the development of a Reliability Standard shall also be conducted in accordance with the NERC *Standard Processes Manual*. Any amendments or revisions to the *Standard Processes Manual* shall be consistent with the following essential principles:

1. **Openness** — Participation shall be open to all Persons and who are directly and materially affected by the reliability of the North American Bulk Power System. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

2. **Transparency** — The process shall be transparent to the public.

3. **Consensus-building** —The process shall build and document consensus for each Reliability Standard, both with regard to the need and justification for the Reliability Standard and the content of the Reliability Standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any two Segments as defined in **Appendix 3D**, *Development of the Registered Ballot Body*, of these Rules of Procedure, and no single Segment, individual or organization shall be able to defeat a matter.

5. **Due Process** — Development of Reliability Standards shall provide reasonable notice and opportunity for any Person with a direct and material interest to express views on a proposed Reliability Standard and the basis for those views, and to have that position considered in the development of the Reliability Standards.

6. **Timeliness** — Development of Reliability Standards shall be timely and responsive to new and changing priorities for reliability of the Bulk Power System.

305. Registered Ballot Body

NERC Reliability Standards shall be approved by a Registered Ballot Body prior to submittal to the Board and then to Applicable Governmental Authorities for their approval, where authorized by applicable legislation or agreement. This Section 305 sets forth the rules pertaining to the composition of, and eligibility to participate in, the Registered Ballot Body.

1. **Eligibility to Vote on Reliability Standards** — Any person or entity may join the Registered Ballot Body to vote on Reliability Standards, whether or not such person or entity is a Member of NERC.

2. **Inclusive Participation** — The Segment qualification guidelines are inclusive; i.e., any entity with a legitimate interest in the reliability of the Bulk Power System that can meet any one of the eligibility criteria for a Segment is entitled to belong to and vote in each Segment for which it qualifies, subject to limitations defined in Sections 305.3 and 305.5.

3. **General Criteria for Registered Ballot Body Membership** — The general criteria for membership in the Segments are:

    3.1 **Multiple Segments** — A corporation or other organization with integrated operations or with affiliates that qualifies to belong to more than one Segment (e.g., Transmission Owners and Load-Serving Entities) may join once in each Segment for which it qualifies, provided that each Segment constitutes a separate membership and the organization is represented in each Segment by a different representative. Affiliated entities are collectively limited to one membership in each Segment for which they are qualified.

    3.2 **Withdrawing from a Segment or Changing Segments** — After its initial registration in a Segment, each registered participant may elect to withdraw from a Segment or apply to change Segments at any time.

    3.3 **Review of Segment Criteria** — The Board shall review the qualification guidelines and rules for joining Segments at least every three years to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

4. **Proxies for Voting on Reliability Standards** — Any registered participant may designate an agent or proxy to vote on its behalf. There are no limits on how many proxies an agent may hold. However, for the proxy to be valid, NERC must have in its possession written documentation signed by the representative of the registered participant that the voting right by proxy has been transferred from the registered participant to the agent.

5. **Segments** — The specific criteria for membership in each Registered Ballot Body Segment are defined in the *Development of the Registered Ballot Body* in **Appendix 3D.**

6. **Review of Segment Entries** — NERC shall review all applications for joining the Registered Ballot Body, and shall make a determination of whether the applicant's self-selection of a Segment satisfies at least one of the guidelines to

belong to that Segment. The entity shall then become eligible to participate as a voting member of that Segment. The Standards Committee shall resolve disputes regarding eligibility for membership in a Segment, with the applicant having the right of appeal to the Board.

306. Standards Committee

The Standards Committee shall provide oversight of the Reliability Standards development process to ensure stakeholder interests are fairly represented. The Standards Committee shall not under any circumstance change the substance of a draft or approved Reliability Standard.

1. **Membership** — The Standards Committee is a representative committee comprising representatives of two members of each of the Segments in the Registered Ballot Body and two officers elected to represent the interests of the industry as a whole.

2. **Elections** — Standards Committee members are elected for staggered (one per Segment per year) two-year terms by the respective Segments in accordance with the *Procedure for the Election of Members of the NERC Standards Committee*, which is incorporated into these Rules of Procedure as **Appendix 3B**. Segments may use their own election procedure if such a procedure is ratified by two-thirds of the members of a Segment and approved by the Board.

3. **Canadian Representation**

   The Standards Committee will include Canadian representation as provided in **Appendix 3B**, *Procedure for the Election of Members of the NERC Standards Committee*.

4. **Open Meetings** — All meetings of the Standards Committee shall be open and publicly noticed on the NERC website.

307. Standards Process Management

NERC shall assign a standards process manager to administer the development of continent-wide Reliability Standards and a regional standards manager to administer the development of Regional Reliability Standards. The standards process manager shall be responsible for ensuring that the development and revision of Reliability Standards are in accordance with the NERC *Standard Processes Manual*. The standards process manager and the regional standards manager shall work to achieve the highest degree of integrity and consistency of quality and completeness of the Reliability Standards. The regional standards manager shall coordinate with any Regional Entities that develop Regional Reliability Standards to ensure those Regional Reliability Standards are effectively integrated with the NERC Reliability Standards.

308. Steps in the Development of Reliability Standards

1. **Procedure** — NERC shall develop Reliability Standards through the process set forth in the NERC *Standard Processes Manual* (**Appendix 3A**). The *Standard Processes Manual* includes provisions for developing Reliability Standards that can be completed using expedited processes, including a process to develop Reliability Standards to address national security situations that involve confidential issues.

2. **Board Adoption** — Reliability Standards or revisions to Reliability Standards approved by the ballot pool in accordance with the *Standard Processes Manual* shall be submitted for adoption by the Board. No Reliability Standard or revision to a Reliability Standard shall be effective unless adopted by the Board.

3. **Governmental Approval** — After Board adoption, a Reliability Standard or revision to a Reliability Standard shall be submitted to all Applicable Governmental Authorities in accordance with Section 309. No Reliability Standard or revision to a Reliability Standard shall be effective within a geographic area over which an Applicable Governmental Authority has jurisdiction unless it is approved by such Applicable Governmental Authority or is otherwise made effective pursuant to the laws applicable to such Applicable Governmental Authority.

309. Filing of Reliability Standards for Approval by Applicable Governmental Authorities

1. **Filing of Reliability Standards for Approval** — Where authorized by applicable legislation or agreement, NERC shall file with the Applicable Governmental Authorities each Reliability Standard, modification to a Reliability Standard, or withdrawal of a Reliability Standard that is adopted by the Board. Each filing shall be in the format required by the Applicable Governmental Authority and shall include: a concise statement of the basis and purpose of the Reliability Standard; the text of the Reliability Standard; the implementation plan for the Reliability Standard; a demonstration that the Reliability Standard meets the essential attributes of Reliability Standards as stated in Section 302; the drafting team roster; the ballot pool and final ballot results; and a discussion of public comments received during the development of the Reliability Standard and the consideration of those comments.

2. **Remanded Reliability Standards and Directives to Develop Standards** — If an Applicable Governmental Authority remands a Reliability Standard to NERC or directs NERC to develop a Reliability Standard, NERC shall within five (5) business days notify all other Applicable Governmental Authorities, and shall within thirty (30) calendar days report to all Applicable Governmental Authorities

a plan and timetable for modification or development of the Reliability Standard. Reliability Standards that are remanded or directed by an Applicable Governmental Authority shall be modified or developed using the *Standard Processes Manual*. NERC shall, during the development of a modification for the remanded Reliability Standard or directed Reliability Standard, consult with other Applicable Governmental Authorities to coordinate any impacts of the proposed Reliability Standards in those other jurisdictions. The expedited standards development process may be applied if necessary to meet a timetable for action required by the Applicable Governmental Authorities, respecting to the extent possible the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interest in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply.

3. **Directives to Develop Reliability Standards under Extraordinary Circumstances** — An Applicable Governmental Authority may, on its own initiative, determine that extraordinary circumstances exist requiring expedited development of a Reliability Standard. In such a case, the Applicable Governmental Authority may direct the development of a Reliability Standard within a certain deadline. NERC staff shall prepare the Standards Authorization Request. The proposed Reliability Standard will then proceed through the Reliability Standards development process, using the expedited action process described in the *Standard Processes Manual* as necessary to meet the specified deadline. The timeline will be developed to respect, to the extent possible, the provisions in the Reliability Standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards. If the Board of Trustees determines that the process did not result in a Reliability Standard that addresses a specific matter that is identified in a directive issued by an Applicable Governmental Authority, then Rule 321 of these Rules of Procedure shall apply, with appropriate modification of the timeline.

310. Annual Reliability Standards Development Plan

NERC shall develop and provide an annual Reliability Standards Development Plan for development of Reliability Standards to the Applicable Governmental Authorities. NERC shall consider the comments and priorities of the Applicable Governmental Authorities in developing and updating the annual Reliability Standards Development Plan. Each annual Reliability Standards Development Plan shall include a progress report comparing results achieved to the prior year's Reliability Standards Development Plan.

311. Regional Entity Standards Development Procedures

1. **NERC Approval of Regional Entity Reliability Standards Development Procedure** — To enable a Regional Entity to develop Regional Reliability Standards that are to be recognized and made part of NERC Reliability Standards, a Regional Entity may request NERC to approve a Regional Reliability Standards development procedure.

2. **Public Notice and Comment on Regional Reliability Standards Development Procedure** — Upon receipt of such a request, NERC shall publicly notice and request comment on the proposed Regional Reliability Standards development procedure, allowing a minimum of 45 days for comment. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the Regional Reliability Standards development procedure and request another posting for comment, or submit the Regional Reliability Standards development procedure, along with its consideration of any objections received, for approval by NERC.

3. **Evaluation of Regional Reliability Standards Development Procedure** — NERC shall evaluate whether a Regional Reliability Standards development procedure meets the criteria listed below and shall consider stakeholder comments, any unresolved stakeholder objections, and the consideration of comments provided by the Regional Entity, in making that determination. If NERC determines the Regional Reliability Standards development procedure meets these requirements, the Regional Reliability Standards development procedure shall be submitted to the Board for approval. The Board shall consider the recommended action, stakeholder comments, any unresolved stakeholder comments, and the Regional Entity consideration of comments in determining whether to approve the Regional Reliability Standards development procedure.

   3.1 **Evaluation Criteria** — The Regional Reliability Standards development procedure shall be:

      3.1.1 **Open** — The Regional Reliability Standards development procedure shall provide that any person or entity who is directly and materially affected by the reliability of the Bulk Power Systems within the Regional Entity shall be able to participate in the development and approval of Reliability Standards. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in the Regional Entity, a Regional Entity or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

      3.1.2 **Inclusive** — The Regional Reliability Standards development procedure shall provide that any Person with a direct and material

interest has a right to participate by expressing an opinion and its basis, having that position considered, and appealing through an established appeals process if adversely affected.

3.1.3 **Balanced** — The Regional Reliability Standards development procedure shall have a balance of interests and shall not permit any two interest categories to dominate a matter or any single interest category to defeat a matter.

3.1.4 **Due Process** — The Regional Reliability Standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the Regional Reliability Standards development procedure shall include public notice of the intent to develop a Regional Reliability Standard, a public comment period on the proposed Regional Reliability Standard, due consideration of those public comments, and a ballot of interested stakeholders.

3.1.5 **Transparent** — All actions material to the development of Regional Reliability Standards shall be transparent. All Regional Reliability Standards development meetings shall be open and publicly noticed on the Regional Entity's website.

3.1.6 **Accreditation of Regional Standards Development Procedure** — A Regional Entity's Regional Reliability Standards development procedure that is accredited by the American National Standards Institute shall be deemed to meet the criteria listed in this Section 311.3.1, although such accreditation is not a prerequisite for approval by NERC.

3.1.7 **Use of NERC Procedure** — A Regional Entity may adopt the NERC *Standard Processes Manual* as the Regional Reliability Standards development procedure, in which case the Regional Entity's Regional Reliability Standards development procedure shall be deemed to meet the criteria listed in this Section 311.3.1.

4. **Revisions of Regional Reliability Standards Development Procedures** — Any revision to a Regional Reliability Standards development procedure shall be subject to the same approval requirements set forth in Sections 311.1 through 311.3.

5. **Duration of Regional Reliability Standards Development Procedures** — The Regional Reliability Standards development procedure shall remain in effect until such time as it is replaced with a new version approved by NERC or it is withdrawn by the Regional Entity. The Regional Entity may, at its discretion, withdraw its Regional Reliability Standards development procedure at any time.

312. Regional Reliability Standards

1. **Basis for Regional Reliability Standards** — Regional Entities may propose Regional Reliability Standards that set more stringent reliability requirements than the NERC Reliability Standard or cover matters not covered by an existing NERC Reliability Standard. Such Regional Reliability Standards shall in all cases be submitted to NERC for adoption and, if adopted, made part of the NERC Reliability Standards and shall be enforceable in accordance with the delegation agreement between NERC and the Regional Entity or other instrument granting authority over enforcement to the Regional Entity. No entities other than NERC and the Regional Entity shall be permitted to develop Regional Reliability Standards that are enforceable under statutory authority delegated to NERC and the Regional Entity.

2. **Regional Reliability Standards That are Directed by a NERC Reliability Standard** — Although it is the intent of NERC to promote uniform Reliability Standards across North America, in some cases it may not be feasible to achieve a reliability objective with a Reliability Standard that is uniformly applicable across North America. In such cases, NERC may direct Regional Entities to develop Regional Reliability Standards necessary to implement a NERC Reliability Standard. Such Regional Reliability Standards that are developed pursuant to a direction by NERC shall be made part of the NERC Reliability Standards.

3. **Procedure for Developing an Interconnection-wide Regional Standard** — A Regional Entity organized on an Interconnection-wide basis may propose a Regional Reliability Standard for approval as a NERC Reliability Standard to be made mandatory for all applicable Bulk Power System owners, operators, and users within that Interconnection.

    3.1 **Presumption of Validity** — An Interconnection-wide Regional Reliability Standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities, shall be adopted as a NERC Reliability Standard. NERC shall rebuttably presume that a Regional Reliability Standard developed, in accordance with a Regional Reliability Standards development process approved by NERC, by a Regional Entity organized on an Interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities.

    3.2 **Notice and Comment Procedure for Interconnection-wide Regional Reliability Standard** — NERC shall publicly notice and request comment on the proposed Interconnection-wide Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability

Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to resolve any objections identified in the comments and may choose to comment on or withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for approval by NERC.

3.3 **Adoption of Interconnection-wide Regional Reliability Standard by NERC** — NERC shall evaluate and recommend whether a proposed Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections that could serve as a basis for rebutting the presumption of validity of the Regional Reliability Standard. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning the proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for adoption as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, NERC's recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to adopt the Regional Reliability Standard as a NERC Reliability Standard.

3.4 **Applicable Governmental Authority Approval** — An Interconnection-wide Regional Reliability Standard that has been adopted by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

3.5 **Enforcement of Interconnection-wide Regional Reliability Standard** — An Interconnection-wide Regional Reliability Standard that has been adopted by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

4. **Procedure for Developing Non-Interconnection-Wide Regional Reliability Standards** — Regional Entities that are not organized on an Interconnection-wide basis may propose Regional Reliability Standards to apply within their respective Regions. Such Regional Reliability Standards may be developed through the NERC Reliability Standards development procedure, or alternatively, through a Regional Reliability Standards development procedure that has been approved by NERC.

4.1 **No Presumption of Validity** — Regional Reliability Standards that are not proposed to be applied on an Interconnection-wide basis are not presumed to be valid but may be demonstrated by the proponent to be valid.

4.2 **Notice and Comment Procedure for Non-Interconnection-wide Regional Reliability Standards** — NERC shall publicly notice and request comment on the proposed Regional Reliability Standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed Regional Reliability Standard concurrent with similar steps in the Regional Entity's Regional Reliability Standards development process. The Regional Entity shall have an opportunity to comment on or resolve any objections identified in the comments and may choose to withdraw the request, revise the proposed Regional Reliability Standard and request another posting for comment, or submit the proposed Regional Reliability Standard along with its consideration of any objections received, for adoption by NERC.

4.3 **NERC Adoption of Non-Interconnection-wide Regional Reliability Standards** — NERC shall evaluate and recommend whether a proposed non-Interconnection-wide Regional Reliability Standard has been developed in accordance with all applicable procedural requirements and whether the Regional Entity has considered and resolved stakeholder objections. The Regional Entity, having been notified of the results of the evaluation and recommendation concerning proposed Regional Reliability Standard, shall have the option of presenting the proposed Regional Reliability Standard to the Board for adoption as a NERC Reliability Standard. The Board shall consider the Regional Entity's request, the recommendation for action on the Regional Reliability Standard, any unresolved stakeholder comments, and the Regional Entity's consideration of comments, in determining whether to adopt the Regional Reliability Standard as a NERC Reliability Standard.

4.4 **Applicable Governmental Authority Approval** — A non-Interconnection-wide Regional Reliability Standard that has been adopted by the Board shall be filed with the Applicable Governmental Authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such Applicable Governmental Authorities or on a date set by the Applicable Governmental Authorities.

4.5 **Enforcement of Non-Interconnection-wide Regional Reliability Standards** — A non-Interconnection-wide Regional Reliability Standard that has been adopted by the Board and by the Applicable Governmental Authorities or is otherwise made effective within Canada as mandatory

within a particular Region shall be applicable and enforced as a NERC Reliability Standard within the Region.

5. **Appeals** — A Regional Entity shall have the right to appeal NERC's decision not to adopt a proposed Regional Reliability Standard or Variance to the Commission or other Applicable Governmental Authority.

313. Other Regional Criteria, Guides, Procedures, Agreements, Etc.

1. **Regional Criteria** — Regional Entities may develop Regional Criteria that are necessary to implement, to augment, or to comply with NERC Reliability Standards, but which are not Reliability Standards. Regional Criteria may also address issues not within the scope of Reliability Standards, such as resource adequacy. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents used to enhance the reliability of the Bulk Power System in the Region. These documents typically provide benefits by promoting more consistent implementation of the NERC Reliability Standards within the Region. These documents are not NERC Reliability Standards, Regional Reliability Standards, or regional Variances, and therefore are not enforceable under authority delegated by NERC pursuant to delegation agreements and do not require NERC approval.

2. **Catalog of Regional Criteria** — NERC shall maintain a current catalog of Regional Criteria. Regional Entities shall provide a catalog listing of Regional Criteria to NERC and shall notify NERC of changes to the listing. Regional Entities shall provide any listed document to NERC upon written request.

314. Conflicts with Statutes, Regulations, and Orders

Notice of Potential Conflict — If a Bulk Power System owner, operator, or user determines that a NERC or Regional Reliability Standard may conflict with a function, rule, order, tariff, rate schedule, legislative requirement or agreement that has been accepted, approved, or ordered by a governmental authority affecting that entity, the entity shall expeditiously notify the governmental authority, NERC, and the relevant Regional Entity of the conflict.

1. **Determination of Conflict —** NERC, upon request of the governmental authority, may advise the governmental authority regarding the conflict and propose a resolution of the conflict, including revision of the Reliability Standard if appropriate.

2. **Regulatory Precedence** — Unless otherwise ordered by a governmental authority, the affected Bulk Power System owner, operator, or user shall continue to follow the function, rule, order, tariff, rate schedule, legislative requirement, or agreement accepted, approved, or ordered by the governmental authority until the

governmental authority finds that a conflict exists and orders a remedy and such remedy is affected.

315. Revisions to NERC Standard Processes Manual

Any person or entity may submit a written request to modify NERC *Standard Processes Manual*. Consideration of the request and development of the revision shall follow the process defined in the NERC *Standard Processes Manual*. Upon approval by the Board, the revision shall be submitted to the Applicable Governmental Authorities for approval. Changes shall become effective only upon approval by the Applicable Governmental Authorities or on a date designated by the Applicable Governmental Authorities or as otherwise applicable in a particular jurisdiction.

316. Accreditation

NERC shall seek and maintain accreditation of the NERC Reliability Standards development process by the American National Standards Institute.

317. Five-Year Review of Reliability Standards

NERC shall complete a review of each NERC Reliability Standard at least once every five years, or such longer period as is permitted by the American National Standards Institute, from the effective date of the Reliability Standard or the latest revision to the Reliability Standard, whichever is later. The review process shall be conducted in accordance with the NERC *Standard Processes Manual*. The standards process manager shall be responsible for administration of the five-year review of Reliability Standards. As a result of this review, the NERC Reliability Standard shall be reaffirmed, revised, or withdrawn. If the review indicates a need to revise or withdraw the Reliability Standard, a request for revision or withdrawal shall be prepared, submitted and addressed in accordance with the NERC *Standard Processes Manual*.

318. Coordination with the North American Energy Standards Board

NERC shall maintain a close working relationship with the North American Energy Standards Board and ISO/RTO Council to ensure effective coordination of wholesale electric business practice standards and market protocols with the NERC Reliability Standards.

319. Archived Standards Information

NERC shall maintain a historical record of Reliability Standards information that is no longer maintained on-line. For example, Reliability Standards that have been retired may be removed from the on-line system. Archived information shall be retained indefinitely

as practical, but in no case less than six years or one complete Reliability Standards review cycle from the date on which the Reliability Standard was no longer in effect. Archived records of Reliability Standards information shall be available electronically within 30 days following the receipt by the NERC standards information manager of a written request.

320. Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels

1. **Development of Violation Risk Factors and Violation Severity Levels** — NERC shall follow the process for developing Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) as set forth in the *Standard Processes Manual*, **Appendix 3A** to these Rules of Procedure.

2. **Remands of Directed Revision of VRFs and VSLs by Applicable Governmental Authorities** — If an Applicable Governmental Authority remands or directs a revision to a Board-approved VRF or VSL assignment, the NERC director of standards, after consulting with the standard drafting team, Standards Committee, and the NERC director of compliance operations, will recommend to the Board one of the following actions: (1) filing a request for clarification; (2) filing for rehearing or for review of the Applicable Governmental Authority decision; or (3) approval of the directed revisions to the VRF or VSL. If and to the extent time is available prior to the deadline for the Board's decision, an opportunity for interested parties to comment on the action taken will be provided.

3. **Alternative Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels** — In the event the Reliability Standards development process fails to produce Violation Risk Factors or Violation Severity Levels for a particular Reliability Standard in a timely manner, the Board of Trustees may approve Violation Risk Factors or Violation Severity Levels for that Reliability Standard after notice and opportunity for comment. In approving VRFs and VSLs, the Board shall consider the inputs of the Member Representatives Committee, affected stakeholders and NERC staff.

321. Special Rule to Address Certain Regulatory Directives

In circumstances where this Rule 321 applies, the Board of Trustees shall have the authority to take one or more of the actions set out below. The Board of Trustees shall have the authority to choose which one or more of the actions are appropriate to the circumstances and need not take these actions in sequential steps.

1. The Standards Committee shall have the responsibility to ensure that standards drafting teams address specific matters that are identified in directives issued by Applicable Governmental Authorities. If the Board of Trustees is presented with a proposed Reliability Standard that fails to address such directives, the Board of Trustees has the authority to remand, with instructions (including establishing a

timetable for action), the proposed Reliability Standard to the Standards Committee.

2. Upon a written finding by the Board of Trustees that a ballot pool has failed to approve a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to remand the proposed Reliability Standard to the Standards Committee, with instructions to (i) convene a public technical conference to discuss the issues surrounding the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with NERC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the proposed Reliability Standard one additional time, with such adjustments in the schedule as are necessary to meet the deadline contained in paragraph 2.1 of this Rule.

   2.1 Such a re-ballot shall be completed within forty-five (45) days of the remand. The Standards Committee memorandum shall be included in the materials made available to the ballot pool in connection with the re-ballot.

   2.2 In any such re-ballot, negative votes without comments related to the proposal shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the proposal shall be counted for purposes of determining the number of votes cast and whether the proposed Reliability Standard has been approved.

3. If the re-balloted proposed Reliability Standard achieves at least an affirmative two-thirds majority vote of the weighted Segment votes cast, with a quorum established, then the proposed Reliability Standard shall be deemed approved by the ballot pool and shall be considered by the Board of Trustees for approval.

4. If the re-balloted proposed Reliability Standard fails to achieve at least an affirmative two-thirds majority vote of the weighted Segment votes cast, but does achieve at least a sixty percent affirmative majority of the weighted Segment votes cast, with a quorum established, then the Board of Trustees has the authority to consider the proposed Reliability Standard for approval under the following procedures:

   4.1 The Board of Trustees shall issue notice of its intent to consider the proposed Reliability Standard and shall solicit written public comment particularly focused on the technical aspects of the provisions of the proposed Reliability Standard that address the specific matter identified in the regulatory directive, including whether or not the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, in

the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified.

4.2 The Board of Trustees may, in its discretion, convene a public technical conference to receive additional input on the matter.

4.3 After considering the developmental record, the comments received during balloting and the additional input received under paragraphs 4.1 and 4.2 of this Rule, the Board of Trustees has authority to act on the proposed Reliability Standard.

4.3.1 If the Board of Trustees finds that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to approve the proposed Reliability Standard and direct that it be filed with Applicable Governmental Authorities with a request that it be made effective.

4.3.2 If the Board of Trustees is unable to find that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to treat the proposed Reliability Standard as a draft Reliability Standard and direct that the draft Reliability Standard and complete developmental record, including the additional input received under paragraphs 4.1 and 4.2 of this Rule, be filed with the Applicable Governmental Authorities as a compliance filing in response to the order giving rise to the regulatory directive, along with a recommendation that the Reliability Standard not be made effective and an explanation of the basis for the recommendation.

5. Upon a written finding by the Board of Trustees that standard drafting team has failed to develop, or a ballot pool has failed to approve, a proposed Reliability Standard that contains a provision to address a specific matter identified in a directive issued by an Applicable Governmental Authority, the Board of Trustees has the authority to direct the Standards Committee (with the assistance of stakeholders and NERC staff) to prepare a draft Reliability Standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the Standards Committee fails to prepare such draft Reliability Standard, the Board of Trustees may direct NERC management to prepare such draft Reliability Standard.

5.1 The Board of Trustees may, in its discretion, convene a public technical conference to receive input on the matter. The draft Reliability Standard shall be posted for a 45-day public comment period.

5.2 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees finds that the draft Reliability Standard, with such modifications as the Board of Trustees determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to approve the draft Reliability Standard and direct that the proposed Reliability Standard be filed with Applicable Governmental Authorities with a request that the proposed Reliability Standard be made effective.

5.3 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees is unable to find that the draft Reliability Standard, even with modifications, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System, then the Board of Trustees has the authority to direct that the draft Reliability Standard and complete developmental record be filed as a compliance filing in response to the regulatory directive with the Applicable Governmental Authority issuing the regulatory directive, with a recommendation that the draft Reliability Standard not be made effective.

5.4 The filing of the Reliability Standard under either paragraph 5.2 or paragraph 5.3 of this Rule shall include an explanation of the basis for the decision by the Board of Trustees.

5.5 A Reliability Standard approved under paragraph 5 of this Rule shall not be eligible for submission as an American National Standard.

6. NERC shall on or before March 31st of each year file a report with Applicable Governmental Authorities on the status and timetable for addressing each outstanding directive to address a specific matter received from an Applicable Governmental Authority.

SECTION 400 — COMPLIANCE ENFORCEMENT

401. Scope of the NERC Compliance Monitoring and Enforcement Program

1. **Components of the NERC Compliance Monitoring and Enforcement Program** — NERC shall develop and implement a NERC Compliance Monitoring and Enforcement Program to promote the reliability of the Bulk Power System by enforcing compliance with approved Reliability Standards in those regions of North American in which NERC and/or a Regional Entity (pursuant to a delegation agreement with NERC that has been approved by the Applicable Governmental Authority) has been given enforcement authority. There are four distinct parts of the NERC Compliance Monitoring and Enforcement Program: (1) NERC's oversight of the Regional Entity Compliance Monitoring and Enforcement Programs (Section 402), (2) the definition of the required Regional Entity Compliance Monitoring and Enforcement Program attributes (Section 403), (3) NERC's monitoring of Regional Entity compliance with Reliability Standards (Section 404), and (4) the monitoring of compliance with Reliability Standards that are applicable to NERC (Sections 405–406).

2. **Who Must Comply** — Where required by applicable legislation, regulation, rule or agreement, all Bulk Power System owners, operators, and users, Regional Entities, and NERC, are required to comply with all approved NERC Reliability Standards at all times. Regional Reliability Standards and Variances approved by NERC and the Applicable Governmental Authority shall be considered NERC Reliability Standards and shall apply to all Bulk Power System owners, operators, or users responsible for meeting those Reliability Standards within the Regional Entity boundaries, whether or not the Bulk Power System owner, operator, or user is a member of the Regional Entity.

3. **Data Access** — All Bulk Power System owners, operators, and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards. NERC and the applicable Regional Entity will define the data retention and reporting requirements in the Reliability Standards and compliance reporting procedures.

4. **Role of Regional Entities in the Compliance Monitoring and Enforcement Program** — Each Regional Entity that has been delegated authority through a delegation agreement or other legal instrument approved by the Applicable Governmental Authority shall, in accordance with the terms of the approved delegation agreement, administer a Regional Entity Compliance Monitoring and Enforcement program to meet the NERC Compliance Monitoring and Enforcement Program goals and the requirements in this Section 400.

5. **Program Continuity** — NERC will ensure continuity of compliance monitoring and enforcement within the geographic boundaries of a Regional Entity in the event that NERC does not have a delegation agreement, or the Regional Entity withdraws from the agreement or does not operate its Compliance Monitoring and Enforcement Program in accordance with the delegation agreement or other applicable requirements.

5.1 Should NERC not have a delegation agreement with a Regional Entity covering a geographic area, or a Regional Entity withdraws from an existing delegation agreement or the delegation agreement is otherwise terminated, NERC will directly administer the Compliance Monitoring and Enforcement Program applicable to owners, operators and users of the Bulk Power System within that geographic area.

1. This monitoring and enforcement will be accomplished by NERC and Compliance Staff from another approved Regional Entity.

2. If an existing delegation agreement with a Regional Entity is terminating, the Regional Entity shall promptly provide to NERC all relevant compliance information regarding Registered Entities, contacts, prior compliance information and actions, Mitigation Plans, and Remedial Action Directives for the period in which the Regional Entity was responsible for administering the Compliance Monitoring and Enforcement Program.

3. NERC will levy and collect all Penalties directly and will utilize any Penalty monies collected to offset the expenses of administering the Compliance Monitoring and Enforcement Program for the geographic area.

5.2 Should a Regional Entity seek to withdraw from its delegation agreement, NERC will seek agreement from another Regional Entity to amend its delegation agreement with NERC to extend that Regional Entity's boundaries for compliance monitoring and enforcement. In the event no Regional Entity is willing to accept this responsibility, NERC will administer the Compliance Monitoring and Enforcement Program within the geographical boundaries of the Regional Entity seeking to withdraw from the delegation agreement, in accordance with Section 401.5.1.

6. **Actively Monitored Requirements** — NERC, with input from the Regional entities, stakeholders, and regulators, shall annually select a subset of the NERC Reliability Standards and Requirements to be actively monitored and audited in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan. Compliance is required, and NERC and the Regional Entities have authority to monitor compliance, with all NERC Reliability Standards whether or not they are included in the subset of Reliability Standards and Requirements designated to be actively monitored and audited in the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan.

7. **Penalties, Sanctions, and Remedial Action Directives** — NERC and Regional Entities will apply Penalties, sanctions, and Remedial Action Directives that bear a reasonable relation to the seriousness of a violation and take into consideration timely remedial efforts as defined in the NERC *Sanction Guidelines*, which is incorporated into these rules as **Appendix 4B**.

8. **Multiple Enforcement Actions** – A Registered Entity shall not be subject to an enforcement action by NERC and a Regional Entity, or by more than one

Regional Entity (unless the Registered Entity is registered in more than one Region in which the violation occurred), for the same violation.

9. **Records** — NERC shall maintain a record of each compliance submission, including Self-Reported, Possible, Alleged, and Confirmed Violations of approved Reliability Standards; associated Penalties, sanctions, Remedial Action Directives and settlements; and the status of mitigation actions.

10. **Confidential Information** — NERC will treat all Possible and Alleged Violations of Reliability Standards and matters related to a Compliance Monitoring and Enforcement Program process, including the status of any Compliance Investigation or other Compliance Monitoring and Enforcement Program process, as confidential in accordance with Section 1500.

    The types of information that will be considered confidential and will not (subject to statutory and regulatory requirements) be disclosed in any public information reported by NERC are identified in Section 1500. Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident, will be identified and protected from public disclosure as Critical Energy Infrastructure Information in accordance with Section 1500.

    The Regional Entity and NERC shall give Bulk Power System owners, operators, and users a reasonable opportunity to demonstrate that information concerning a violation is confidential before such report is disclosed to the public.

11. **Public Posting** — When the affected Bulk Power System owner, operator, or user either agrees with a Possible or Alleged Violation(s) of a Reliability Standard(s) or a report of a Compliance Audit or Compliance Investigation, or enters into a settlement agreement concerning a Possible or Alleged Violation(s), or the time for submitting an appeal is passed, or all appeals processes are complete, NERC shall, subject to the confidentiality requirements of these Rules of Procedure, publicly post each Confirmed Violation, Penalty or sanction, settlement agreement, and final Compliance Audit or Compliance Investigation report, on its website.

    11.1 Each Bulk Power System owner, operator, or user may provide NERC with a statement to accompany the Confirmed Violation or report to be posted publicly. The statement must be on company letterhead and include a signature, as well as the name and title of the person submitting the information.

    11.2 In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information (*NERC Security Guidelines for the Electricity Sector — Protecting Potentially Sensitive Information* may be used as a guide) or other Confidential Information shall be redacted in accordance with Section 1500 and not be released publicly.

11.3 Subject to redaction of Critical Energy Infrastructure Information or other Confidential Information, for each Confirmed Violation or settlement relating to a Possible Violation or an Alleged Violation, the public posting shall include the name of any relevant entity, the nature, time period, and circumstances of such Possible, Alleged or Confirmed Violation, any Mitigation Plan or other Mitigating Activities to be implemented by the Registered Entity in connection with the Confirmed Violation or settlement, and sufficient facts to assist owners, operators and users of the Bulk Power System to evaluate whether they have engaged in or are engaging in similar activities.

12. **Violation Information Review** — NERC Compliance Staff shall periodically review and analyze all reports of Possible, Alleged and Confirmed Violations to identify trends and other pertinent reliability issues.

402. NERC Oversight of the Regional Entity Compliance Monitoring and Enforcement Programs

1. **NERC Monitoring Program** — NERC shall have a program to monitor the Compliance Monitoring and Enforcement Program of each Regional Entity that has been delegated authority. The objective of this monitoring program shall be to ensure that the Regional Entity carries out its Compliance Monitoring and Enforcement Program in accordance with these Rules of Procedure and the terms of the delegation agreement, and to ensure consistency and fairness of the Regional Entity's Compliance Monitoring and Enforcement Program. Oversight and monitoring by NERC shall be accomplished through an annual Compliance Monitoring and Enforcement Program review, program audits, and regular evaluations of Regional Entity Compliance Monitoring and Enforcement Program performance as described below.

1.1 **NERC Review of Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans** — NERC shall require each Regional Entity to submit for review and approval an annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan. NERC shall review each annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan and shall accept the plan if it meets NERC requirements and the requirements of the delegation agreement.

1.2 **Regional Entity Compliance Monitoring and Enforcement Program Evaluation** — NERC shall annually evaluate the goals, tools, and procedures of each Regional Entity Compliance Monitoring and Enforcement Program to determine the effectiveness of each Regional Entity Compliance Monitoring and Enforcement Program, using criteria developed by the NERC Compliance and Certification Committee.

1.3 **Regional Entity Compliance Monitoring and Enforcement Program Audit** — At least once every five years, NERC shall conduct an audit to evaluate how each Regional Entity Compliance Monitoring and

Enforcement Program implements the NERC Compliance Monitoring and Enforcement Program. The evaluation shall be based on these Rules of Procedure, including Appendix 4C, the delegation agreement, directives in effect pursuant to the delegation agreement, approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plans, required Compliance Monitoring and Enforcement Program attributes, and the NERC Compliance Monitoring and Enforcement Program procedures. These evaluations shall be provided to the Applicable Governmental Authorities to demonstrate the effectiveness of each Regional Entity. In addition, audits of Cross-Border Regional Entities shall cover applicable requirements imposed on the Regional Entity by statute, regulation, or order of, or agreement with, provincial governmental and/or regulatory authorities for which NERC has auditing responsibilities over the Regional Entity's compliance with such requirements within Canada or Mexico. Participation of a representative of an Applicable Governmental Authority shall be subject to the limitations of sections 3.1.6 and 8.0 of Appendix 4C of these Rules of Procedure regarding disclosures of non-public compliance information related to other jurisdictions. NERC shall maintain an audit procedure containing the requirements, steps, and timelines to conduct an audit of each Regional Entity Compliance Monitoring and Enforcement Program. The current procedure is contained in the NERC Audit of Regional Entity Compliance Programs, which is incorporated into these rules as **Appendix 4A**.

1.3.1. NERC shall establish a program to audit bulk power system owners, operators, and users operating within a regional entity to verify the findings of previous compliance audits conducted by the regional entity to evaluate how well the regional entity compliance enforcement program is meeting its delegated authority and responsibility.

1.4 Applicable Governmental Authorities will be allowed to participate as an observer in any audit conducted by NERC of a Regional Entity's Compliance Monitoring and Enforcement Program. A representative of the Regional Entity being audited will be allowed to participate in the audit as an observer.

2. **Consistency Among Regional Compliance Monitoring and Enforcement Programs** — To provide for a consistent Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users required to comply with approved Reliability Standards, NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program, which is incorporated into these rules of procedure as **Appendix 4C**. Any differences in Regional Entity Compliance Monitoring and Enforcement Program methods, including determination of violations and Penalty assessment, shall be justified on a case-by-case basis and fully documented in each Regional Entity delegation agreement.

2.1 NERC shall ensure that each of the Regional Entity Compliance Monitoring and Enforcement Programs meets these Rules of Procedure, including **Appendix 4C**, and follows the terms of the delegation agreement and the approved annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan.

2.2 NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program in **Appendix 4C** containing the procedures to ensure the consistency and fairness of the processes used to determine Regional Entity Compliance Monitoring and Enforcement Program findings of compliance and noncompliance, and the application of Penalties and sanctions.

2.3 NERC shall periodically conduct Regional Entity compliance manager forums. These forums shall use the results of Regional Entity Compliance Monitoring and Enforcement Program audits and findings of NERC Compliance Staff to identify and refine Regional Entity Compliance Monitoring and Enforcement Program differences into a set of best practices over time.

3. **Information Collection and Reporting** — NERC and the Regional Entities shall implement data management procedures that address data reporting requirements, data integrity, data retention, data security, and data confidentiality.

4. **Violation Disclosure** — NERC shall disclose all Confirmed Violations and maintain as confidential Possible Violations and Alleged Violations, according to the reporting and disclosure process in **Appendix 4C**.

5. **Authority to Determine Noncompliance, Levy Penalties and Sanctions, and Issue Remedial Action Directives** — NERC and Regional Entity Compliance Staff shall have the authority and responsibility to make initial determinations of compliance or noncompliance, and where authorized by the Applicable Governmental Authorities or where otherwise authorized, to determine Penalties and sanctions for noncompliance with a Reliability Standard, and issue Remedial Action Directives. Regional Entity boards or a compliance panel reporting directly to the Regional Entity board will be vested with the authority for the overall Regional Entity Compliance Monitoring and Enforcement Program and have the authority to impose Penalties and sanctions on behalf of NERC, where authorized by applicable legislation or agreement. Remedial Action Directives may be issued by NERC or a Regional Entity that is aware of a Bulk Power System owner, operator, or user that is, or is about to engage in an act or practice that would result, in noncompliance with a Reliability Standard, where such Remedial Action Directive is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat. If, after receiving such a Remedial Action Directive, the Bulk Power System owner, operator, or user does not take appropriate action to avert a violation of a Reliability Standard,

NERC may petition the Applicable Governmental Authority to issue a compliance order.

6. **Due Process** — NERC shall establish and maintain a fair, independent, and nondiscriminatory appeals process. The appeals process is set forth in Sections 408-410. The process shall allow Bulk Power System owners, operators, and users to appeal the Regional Entity's findings of noncompliance and to appeal Penalties, sanctions, and Remedial Action Directives that are levied by the Regional Entity. Appeals beyond the NERC process will be heard by the Applicable Governmental Authority.

   The appeals process will also allow for appeals to NERC of any findings of noncompliance issued by NERC to a Regional Entity for Reliability Standards and Requirements where the Regional Entity is monitored for compliance to a Reliability Standard. No monetary Penalties will be levied in these matters; however sanctions, remedial actions, and directives to comply may be applied by NERC.

7. **Conflict Disclosure** — NERC shall disclose to the appropriate governmental authorities any potential conflicts between a market rule and the enforcement of a Regional Reliability Standard.

8. **Confidentiality** — To maintain the integrity of the NERC Compliance Monitoring and Enforcement Program, NERC and Regional Entity staff, Compliance Audit team members, and committee members shall maintain the confidentiality of information obtained and shared during compliance monitoring and enforcement processes including Compliance Investigations, Compliance Audits, Spot Checks, drafting of reports, appeals, and closed meetings.

   8.1 NERC and the Regional Entity shall have in place appropriate codes of conduct and confidentiality agreements for staff and other Compliance Monitoring and Enforcement Program participants.

   8.2 Individuals not bound by NERC or Regional Entity codes of conduct who serve on compliance-related committees or Compliance Audit teams shall sign a NERC confidentiality agreement prior to participating on the committee or Compliance Audit team.

   8.3 Information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall not be distributed outside of a committee or team, nor released publicly. Other information subject to confidentiality is identified in Section 1500.

   8.4 In the event that a staff, committee, or Compliance Audit team member violates any of the confidentiality rules set forth above, the staff, committee, or Compliance Audit team member and any member organization with which the individual is associated may be subject to

appropriate action by the Regional Entity or NERC, including prohibiting participation in future Compliance Monitoring and Enforcement Program activities.

9. **Auditor Training** — NERC shall develop and provide training in auditing skills to all people who participate in NERC and Regional Entity Compliance Audits. Training for NERC and Regional Entity personnel and others who serve as Compliance Audit team leaders shall be more comprehensive than training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

403. Required Attributes of Regional Entity Compliance Monitoring and Enforcement Programs

Each Regional Entity Compliance Monitoring and Enforcement Program shall promote excellence in the enforcement of Reliability Standards. To accomplish this goal, each Regional Entity Compliance Monitoring and Enforcement Program shall (i) conform to and comply with the NERC uniform Compliance Monitoring and Enforcement Program, **Appendix 4C** to these Rules of Procedure, except to the extent of any deviations that are stated in the Regional Entity's delegation agreement, and (ii) meet all of the attributes set forth in this Section 403.

Program Structure

1. **Independence** — Each Regional Entity's governance of its Compliance Monitoring and Enforcement Program shall exhibit independence, meaning the Compliance Monitoring and Enforcement Program shall be organized so that its compliance monitoring and enforcement activities are carried out separately from other activities of the Regional Entity. The Compliance Monitoring and Enforcement Program shall not be unduly influenced by the Bulk Power System owners, operators, and users being monitored or other Regional Entity activities that are required to meet the Reliability Standards. Regional Entities must include rules providing that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

2. **Exercising Authority** — Each Regional Entity Compliance Monitoring and Enforcement Program shall exercise the responsibility and authority in carrying out the delegated functions of the NERC Compliance Monitoring and Enforcement Program in accordance with delegation agreements and **Appendix 4C**. These functions include but are not limited to: data gathering, data reporting, Compliance Investigations, Compliance Audit activities, evaluating compliance and noncompliance, imposing Penalties and sanctions, and approving and tracking mitigation actions.

3. **Delegation of Authority** — To maintain independence, fairness, and consistency in the NERC Compliance Monitoring and Enforcement Program, a Regional Entity shall not sub-delegate its Compliance Monitoring and Enforcement Program duties to entities or persons other than the Regional Entity Compliance Staff, unless (i) required by statute or regulation in the applicable jurisdiction, or

(ii) by agreement with express approval of NERC and of FERC or other Applicable Governmental Authority, to another Regional Entity.

4. **Hearings of Contested Findings or Sanctions —** The Regional Entity board or compliance panel reporting directly to the Regional Entity board (with appropriate recusal procedures) will be vested with the authority for conducting compliance hearings in which any Bulk Power System owner, operator, or user provided a Notice of Alleged Violation may present facts and other information to contest a Notice of Alleged Violation or any proposed Penalty, sanction, any Remedial Action Directive, or any Mitigation Plan component. Compliance hearings shall be conducted in accordance with the Hearing Procedures set forth in Attachment 2 to **Appendix 4C**. If a stakeholder body serves as the Hearing Body, no two industry sectors may control any decision and no single segment may veto any matter related to compliance after recusals.

Program Resources

5. **Regional Entity Compliance Staff** — Each Regional Entity shall have sufficient resources to meet delegated compliance monitoring and enforcement responsibilities, including the necessary professional staff to manage and implement the Regional Entity Compliance Monitoring and Enforcement Program.

6. **Regional Entity Compliance Staff Independence** — The Regional Entity Compliance Staff shall be capable of and required to make all determinations of compliance and noncompliance and determine Penalties, sanctions, and Remedial Action Directives and to review and accept Mitigation Plans and other Mitigating Activities.

    6.1 Regional Entity Compliance Staff shall not have a conflict of interest, real or perceived, in the outcome of compliance monitoring and enforcement processes, reports, or sanctions. The Regional Entity shall have in effect a conflict of interest policy.

    6.2 Regional Entity Compliance Staff shall have the authority and responsibility to carry out compliance monitoring and enforcement processes (with the input of industry subject matter experts), make determinations of compliance or noncompliance, and levy Penalties and sanctions without interference or undue influence from Regional Entity members and their representative or other industry entities.

    6.3 Regional Entity Compliance Staff may call upon independent technical subject matter experts who have no conflict of interest in the outcome of the compliance monitoring and enforcement process to provide technical advice or recommendations in the determination of compliance or noncompliance.

    6.4 Regional Entity Compliance Staff shall abide by the confidentiality requirements contained in Section 1500 and **Appendix 4C** of these Rules of Procedure, the NERC delegation agreement and other confidentiality

agreements required by the NERC Compliance Monitoring and Enforcement Program.

6.5 Contracting with independent consultants or others working for the Regional Entity Compliance Monitoring and Enforcement Program shall be permitted provided the individual has not received compensation from a Bulk Power System owner, operator, or user being monitored for a period of at least the preceding six months and owns no financial interest in any Bulk Power System owner, operator, or user being monitored for compliance to the Reliability Standard, regardless of where the Bulk Power System owner, operator, or user operates. Any such individuals for the purpose of these Rules of Procedure shall be considered as augmenting Regional Entity Compliance Staff.

7. Use of Industry Subject Matter Experts and Regional Entity Members — Industry experts and Regional Entity members may be called upon to provide their technical expertise in Compliance Monitoring and Enforcement Program activities.

7.1 The Regional Entity shall have procedures defining the allowable involvement of industry subject matter experts and Regional Entity members. The procedures shall address applicable antitrust laws and conflicts of interest.

7.2 Industry subject matter experts and Regional Entity members shall have no conflict of interest or financial interests in the outcome of their activities.

7.3 Regional Entity members and industry subject matter experts, as part of teams or Regional Entity committees, may provide input to the Regional Entity Compliance Staff so long as the authority and responsibility for (i) evaluating and determining compliance or noncompliance and (ii) levying Penalties, sanctions, or Remedial Action Directives shall not be delegated to any person or entity other than the Compliance Staff of the Regional Entity. Industry subject matter experts, Regional Entity members, or Regional Entity committees shall not make determinations of noncompliance or levy Penalties, sanctions, or Remedial Action Directives. Any committee involved shall be organized so that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

7.4 Industry subject matter experts and Regional Entity members shall sign a confidentiality agreement appropriate for the activity being performed.

7.5 All industry subject matter experts and Regional Entity members participating in Compliance Audits and Compliance Investigations shall successfully complete auditor training provided by NERC or the Regional Entity prior to performing these activities

Program Design

8. **Regional Entity Compliance Monitoring and Enforcement Program Content** — All approved Reliability Standards shall be included in the Regional Entity Compliance Monitoring and Enforcement Program for all Bulk Power System owners, operators, and users within the defined boundaries of the Regional Entity. Compliance to approved Regional Reliability Standards is applicable only within the Region of the Regional Entity that submitted those particular Regional Reliability Standards for approval. NERC will identify the minimum set of Reliability Standards and Requirements to be actively monitored by the Regional Entity in a given year.

9. **Antitrust Provisions** — Each Regional Entity's Compliance Monitoring and Enforcement Program shall be structured and administered to abide by U.S. antitrust law and Canadian competition law.

10. **Information Submittal** — All Bulk Power System owners, operators, and users within the Regional Entity responsible for complying with Reliability Standards shall submit timely and accurate information when requested by the Regional Entity or NERC. NERC and the Regional Entities shall preserve any mark of confidentiality on information submitted pursuant to Section 1502.1.

    10.1 Each Regional Entity has the authority to collect the necessary information to determine compliance and shall develop processes for gathering data from the Bulk Power System owners, operators, and users the Regional Entity monitors.

    10.2 The Regional Entity or NERC has the authority to request information from Bulk Power System owners, operators, and users pursuant to Section 401.3 or this Section 403.10 without invoking a specific compliance monitoring and enforcement process in **Appendix 4C**, for purposes of determining whether to pursue one such process in a particular case and/or validating in the enforcement phase of a matter the conclusions reached through the compliance monitoring and enforcement process(es).

    10.3 When required or requested, the Regional Entities shall report information to NERC promptly and in accordance with **Appendix 4C** and other NERC procedures.

    10.4 Regional Entities shall notify NERC of all Possible, Alleged and Confirmed Violations of NERC Reliability Standards by Registered Entities over which the Regional Entity has compliance monitoring and enforcement authority, in accordance with **Appendix 4C**.

    10.5 A Bulk Power System owner, operator, or user found in noncompliance with a Reliability Standard shall submit a Mitigation Plan with a timeline addressing how the noncompliance will be corrected, unless an enforcement process is used that does not require a Mitigation Plan. The

Regional Entity Compliance Staff shall review and accept the Mitigation Plan in accordance with **Appendix 4C**.

10.6 An officer of a Bulk Power System owner, operator, or user shall certify as accurate all compliance data Self-Reported to the Regional Entity Compliance Monitoring and Enforcement Program.

10.7 Regional Entities shall develop and implement procedures to verify the compliance information submitted by Bulk Power System owners, operators, and users.

11. **Compliance Audits of Bulk Power System Owners, Operators, and Users** — Each Regional Entity will maintain and implement a program of proactive Compliance Audits of Bulk Power System owners, operators, and users responsible for complying with Reliability Standards, in accordance with **Appendix 4C**. A Compliance Audit is a process in which a detailed review of the activities of a Bulk Power System owner, operator, or user is performed to determine if that Bulk Power System owner, operator, or user is complying with approved Reliability Standards.

11.1 For an entity registered as a Balancing Authority, Reliability Coordinator, or Transmission Operator, the Compliance Audit will be performed at least once every three years. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, Compliance Audits shall be performed on a schedule established by NERC.

11.2 Compliance Audits of Balancing Authorities, Reliability Coordinators, and Transmission Operators will include a component at the audited entity's site. For other Bulk Power System owners, operators, and users on the NERC Compliance Registry, the Compliance Audit may be either an on-site Compliance Audit or based on review of documents, as determined to be necessary and appropriate by NERC or Regional Entity Compliance Staff.

11.3 Compliance Audits must include a detailed review of the activities of the Bulk Power System owner, operator, or user to determine if the Bulk Power System owner, operator, or user is complying with all approved Reliability Standards identified for audit by NERC. The Compliance Audit shall include a review of supporting documentation and evidence used by the Bulk Power System owner, operator or user to demonstrate compliance for an appropriate period prior to the Compliance Audit.

12. **Confidentiality of Compliance Monitoring and Enforcement Processes** — All compliance monitoring and enforcement processes, and information obtained from such processes, are to be non-public and treated as confidential in accordance with Section 1500 and **Appendix 4C** of these Rules of Procedure, unless NERC, the Regional Entity or FERC or another Applicable Governmental

Authority with jurisdiction determines a need to conduct a Compliance Monitoring and Enforcement Program process on a public basis, provided, that NERC and the Regional Entities shall publish (i) schedules of Compliance Audits scheduled in each year, (ii) a public report of each Compliance Audit, and (iii) Notices of Penalty and settlement agreements. Advance authorization from the Applicable Governmental Authority is required to make public any compliance monitoring and enforcement process or any information relating to a compliance monitoring and enforcement process, or to permit interventions when determining whether to impose a Penalty. This prohibition on making public any compliance monitoring and enforcement process does not prohibit NERC or a Regional Entity from publicly disclosing (i) the initiation of or results from an analysis of a significant system event under Section 807 or of off-normal events or system performance under Section 808, or (ii) information of general applicability and usefulness to owners, operators, and users of the Bulk Power System concerning reliability and compliance matters, so long as specific allegations or conclusions regarding Possible or Alleged Violations of Reliability Standards are not included in such disclosures.

13. **Critical Energy Infrastructure Information** — Information that would jeopardize Bulk Power System reliability, including information relating to a Cyber Security Incident will be identified and protected from public disclosure as Critical Energy Infrastructure Information. In accordance with Section 1500, information deemed by a Bulk Power System owner, operator, or user, Regional Entity, or NERC as Critical Energy Infrastructure Information shall be redacted according to NERC procedures and shall not be released publicly.

14. **Penalties, Sanctions, and Remedial Action Directives** — Each Regional Entity will apply all Penalties, sanctions, and Remedial Action Directives in accordance with the approved *Sanction Guidelines*, **Appendix 4B** to these Rules of Procedure. Any changes to the *Sanction Guidelines* to be used by any Regional Entity must be approved by NERC and submitted to the Applicable Governmental Authority for approval. All Confirmed Violations, Penalties, and sanctions, including Confirmed Violations, Penalties and sanctions specified in a Regional Entity Hearing Body decision, will be provided to NERC for review and filing with Applicable Governmental Authorities as a Notice of Penalty, in accordance with **Appendix 4C**.

15. **Regional Entity Hearing Process** — Each Regional Entity Compliance Monitoring and Enforcement Program shall establish and maintain a fair, independent, and nondiscriminatory process for hearing contested violations and any Penalties or sanctions levied, in conformance with Attachment 2 to **Appendix 4C** to these Rules of Procedure and any deviations therefrom that are set forth in the Regional Entity's delegation agreement. The hearing process shall allow Bulk Power System owners, operators, and users to contest findings of compliance violations, any Penalties and sanctions that are proposed to be levied, proposed Remedial Action Directives, and components of proposed Mitigation Plans. The Regional Entity hearing process shall be conducted before the Regional Entity

board or a balanced committee established by and reporting to the Regional Entity board as the final adjudicator at the Regional Entity level, provided, that Canadian provincial regulators may act as the final adjudicator in their respective jurisdictions. The Regional Entity hearing process shall (i) include provisions for recusal of any members of the Hearing Body with a potential conflict of interest, real or perceived, from all compliance matters considered by the Hearing Body for which the potential conflict of interest exists and (ii) provide that no two industry sectors may control any decision and no single segment may veto any matter brought before the Hearing Body after recusals.

Each Regional Entity will notify NERC of all hearings and NERC may observe any of the proceedings. Each Regional Entity will notify NERC of the outcome of all hearings.

If a Bulk Power System owner, operator, or user or a Regional Entity has completed the Regional Entity hearing process and desires to appeal the outcome of the hearing, the Bulk Power System owner, operator, or user or the Regional Entity shall appeal to NERC in accordance with Section 409 of these Rules of Procedure, except that a determination of violation or Penalty that has been directly adjudicated by an Applicable Governmental Authority shall be appealed with that Applicable Governmental Authority.

16. **Annual Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan** — Each Regional Entity shall annually develop and submit to NERC for approval a Regional Entity Compliance Monitoring and Enforcement Implementation Plan in accordance with **Appendix 4C** that identifies the Reliability Standards and Requirements to be actively monitored (both those required by NERC and any additional Reliability Standards the Regional Entity proposes to monitor), and how each NERC and Regional Entity identified Reliability Standard will be monitored, evaluated, reported, sanctioned, and appealed. These Regional Implementation Plans will be submitted to NERC on the schedule established by NERC, generally on or about October 1 of the preceding year. In conjunction with the annual Regional Implementation Plan, each Regional Entity must report to NERC regarding how it carried out its delegated compliance monitoring and enforcement authority in the previous year, the effectiveness of the Compliance Monitoring and Enforcement Program, and changes expected to correct any deficiencies identified. Each Regional Entity will provide its annual report on the schedule established by NERC, generally on or about February 15 of the following year.

404. NERC Monitoring of Compliance for Regional Entities or Bulk Power Owners, Operator, or Users

NERC shall monitor Regional Entity compliance with NERC Reliability Standards and, if no there is no delegation agreement in effect with a Regional Entity for the geographic area, shall monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards. Industry subject matter experts may be used as appropriate in Compliance Investigations, Compliance Audits, and other Compliance Monitoring and

Enforcement Program activities, subject to confidentiality, antitrust, and conflict of interest provisions.

1. **NERC Obligations** — NERC Compliance Staff shall monitor the compliance of the Regional Entity with the Reliability Standards for which the Regional Entities are responsible, in accordance with **Appendix 4C**. NERC shall actively monitor in its annual Compliance Enforcement and Monitoring Program selected Reliability Standards that apply to the Regional Entities. NERC shall evaluate compliance and noncompliance with all of the Reliability Standards that apply to the Regional Entities and shall impose sanctions, Penalties, or Remedial Action Directives when there is a finding of noncompliance. NERC shall post all violations of Reliability Standards that apply to the Regional Entities as described in the reporting and disclosure process in **Appendix 4C**.

   In addition, NERC will directly monitor Bulk Power System owners, operators, and users for compliance with NERC Reliability Standards in any geographic area for which there is not a delegation agreement in effect with a Regional Entity, in accordance with **Appendix 4C**. In such cases, NERC will serve as the Compliance Enforcement Authority described in **Appendix 4C**. Compliance matters contested by Bulk Power System owners, operators, and users in such an event will be heard by the NERC Compliance and Certification Committee.

2. **Compliance Audit of the Regional Entity** — NERC shall perform a Compliance Audit of each Regional Entity responsible for complying with Reliability Standards at least once every three years. NERC shall make an evaluation of compliance based on the information obtained through the Compliance Audit. After due process is complete, the final Compliance Audit report shall be made public in accordance with the reporting and disclosure process in **Appendix 4C**.

3. **Appeals Process** —Any Regional Entity or Bulk Power System owner, operator or user found by NERC, as opposed to a Regional Entity, to be in noncompliance with a Reliability Standard may appeal the findings of noncompliance with Reliability Standards and any sanctions or Remedial Action Directives that are issued by, or Mitigation Plan components imposed by, NERC, pursuant to the processes described in Sections 408 through 410.

405. Monitoring of Reliability Standards and Other Requirements Applicable to NERC

The NERC Compliance and Certification Committee shall establish and implement a process to monitor NERC's compliance with the Reliability Standards that apply to NERC. The process shall use independent monitors with no conflict of interest, real or perceived, in the outcomes of the process. All violations shall be made public according to the reporting and disclosure process in **Appendix 4C**. The Compliance and Certification Committee will also establish a procedure for monitoring NERC's compliance with its Rules of Procedure for the Standards Development, Compliance Monitoring and Enforcement, and Organization Registration and Certification Programs. Such procedures shall not be used to circumvent the appeals processes established for those programs.

406. Independent Audits of the NERC Compliance Monitoring and Enforcement Program

NERC shall provide for an independent audit of its Compliance Monitoring and Enforcement Program at least once every three years, or more frequently as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board. The independent audit shall meet the following minimum requirements and any other requirements established by the NERC Board.

1. **Effectiveness** — The audit shall evaluate the success and effectiveness of the NERC Compliance Monitoring and Enforcement Program in achieving its mission.

2. **Relationship** — The audit shall evaluate the relationship between NERC and the Regional Entity Compliance Monitoring and Enforcement Programs and the effectiveness of the programs in ensuring reliability.

3. **Final Report Posting** — The final report shall be posted by NERC for public viewing in accordance with **Appendix 4C**.

4. **Response to Recommendations** — If the audit report includes recommendations to improve the NERC Compliance Monitoring and Enforcement Program, the administrators of the NERC Compliance Monitoring and Enforcement Program shall provide a written response and plan to the Board within 30 days of the release of the final audit report.

407. Penalties, Sanctions, and Remedial Action Directives

1. **NERC Review of Regional Entity Penalties and Sanctions —** NERC shall review all Penalties, sanctions, and Remedial Action Directives imposed by each Regional Entity for violations of Reliability Standards, including Penalties, sanctions and Remedial Action Directives that are specified by a Regional Entity Hearing Body final decision issued pursuant to Attachment 2 to **Appendix 4C**, to determine if the Regional Entity's determination is supported by a sufficient record compiled by the Regional Entity, is consistent with the *Sanction Guidelines* incorporated into these Rules of Procedure as **Appendix 4B** and with other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and is consistent with Penalties, sanctions and Remedial Action Directives imposed by the Regional Entity and by other Regional Entities for violations involving the same or similar facts and circumstances.

2. **Developing Penalties and Sanctions** — The Regional Entity Compliance Staff shall use the *Sanction Guidelines*, which are incorporated into these Rules of Procedure as **Appendix 4B**, to develop an appropriate Penalty, sanction, or Remedial Action Directive for a violation, and shall notify NERC of the Penalty, sanction or Remedial Action Directive.

3. **Effective Date of Penalty** — Where authorized by applicable legislation or agreement, no Penalty imposed for a violation of a Reliability Standard shall take effect until the thirty-first day after NERC files, with the Applicable

Governmental Authority, a "Notice of Penalty" and the record of the proceedings in which the violation and Penalty were determined, or such other date as ordered by the Applicable Governmental Authority.

408. Review of NERC Decisions

1. **Scope of Review** — A Registered Entity or a Regional Entity wishing to challenge a finding of noncompliance and the imposition of a Penalty for a compliance measure directly administered by NERC, or a Regional Entity wishing to challenge a Regional Entity Compliance Monitoring and Enforcement Program audit finding, may do so by filing a notice of the challenge with NERC's director of enforcement no later than 21 days after issuance of the notice of finding of violation or audit finding. Appeals by Registered Entities or Regional Entities of decisions of Regional Entity Hearing Bodies shall be pursuant to Section 409.

2. **Contents of Notice** — The notice of challenge shall include the full text of the decision that is being challenged, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief.

3. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of challenge, the NERC director of enforcement may file with the Hearing Panel a response to the issues raised in the notice, with a copy to the Regional Entity.

4. **Hearing by Compliance and Certification Committee** — The NERC Compliance and Certification Committee shall provide representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program an opportunity to be heard and shall decide the matter based upon the filings and presentations made, with a written explanation of its decision.

5. **Appeal** — The Regional Entity or Registered Entity may appeal the decision of the Compliance and Certification Committee by filing a notice of appeal with NERC's director of enforcement no later than 21 days after issuance of the written decision by the Compliance and Certification Committee. The notice of appeal shall include the full text of the written decision of the Compliance and Certification Committee that is being appealed, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not presented to the Compliance and Certification Committee.

6. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of appeal, the NERC Compliance Monitoring and Enforcement Program staff may file its response to the issues raised in the notice of appeal, with a copy to the entity filing the notice.

7. **Reply** — The entity filing the appeal may file a reply within 7 days.

8. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record, the response, and any reply. At its discretion, the Compliance Committee may invite representatives of the Regional Entity or Registered Entity, and the NERC Compliance Monitoring and Enforcement Program to appear before the Compliance Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

9. **Impartiality** — No member of the Compliance and Certification Committee or the Board of Trustees Compliance Committee having an actual or perceived conflict of interest in the matter may participate in any aspect of the challenge or appeal except as a party or witness.

10. **Expenses** — Each party in the challenge and appeals processes shall pay its own expenses for each step in the process.

11. **Non-Public Proceedings —** All challenges and appeals shall be closed to the public to protect Confidential Information.

409. Appeals from Final Decisions of Regional Entity Hearing Bodies

1. **Time for Appeal** — A Regional Entity acting as the Compliance Enforcement Authority, or an owner, operator or user of the Bulk Power System, shall be entitled to appeal from a final decision of a Regional Entity Hearing Body concerning an Alleged Violation of a Reliability Standard, a proposed Penalty or sanction for violation of a Reliability Standard, a proposed Mitigation Plan, or a proposed Remedial Action Directive, by filing a notice of appeal with NERC's director of enforcement, with copies to the Regional Entity and any other Participants in the Regional Entity Hearing Body proceeding, no later than 21 days after issuance of the final decision of the Regional Entity Hearing Body.

2. **Contents** — The notice of appeal shall include the full text of the final decision of the Regional Entity Hearing Body that is being appealed, a concise statement of the error or errors contained in the final decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not first presented during the proceeding before the Regional Entity Hearing Body.

3. **Response to Notice of Appeal** — Within 21 days after the date the notice of appeal is filed, the Regional Entity shall file the entire record of the Regional Entity Hearing Body proceeding with NERC's director of enforcement, with a copy to the Participant filing the notice. Within 35 days after the date of the notice of appeal, all Participants in the proceeding before the Regional Entity Hearing Body, other than the Participant filing the notice of appeal, shall file their responses to the issues raised in the notice of appeal.

4. **Reply** — The Registered Entity filing the appeal may file a reply to the responses within 7 days.

5. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record of the proceeding before the Regional Entity Hearing Body, the responses, and any reply filed with NERC. At its discretion, the Compliance Committee may invite representatives of the entity making the appeal and the other Participants in the proceeding before the Regional Entity Hearing Body to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the Applicable Governmental Authority.

6. **Expenses** — Each party in the appeals process shall pay its own expenses for each step in the process.

7. **Non-Public Proceedings** — All appeals shall be closed to the public to protect Confidential Information.

8. **Appeal of Hearing Body Decisions Granting or Denying Motions to Intervene** — This section is not applicable to an appeal of a decision of a Regional Entity Hearing Body granting or denying a motion to intervene in the Regional Entity Hearing Body proceeding. Appeals of decisions of Regional Entity Hearing Bodies granting or denying motions to intervene in Regional Entity Hearing Body proceedings shall be processed and decided pursuant to Section 414.

410. Hold Harmless

A condition of invoking the challenge or appeals processes under Section 408 or 409 is that the entity requesting the challenge or appeal agrees that neither NERC (defined to include its Members, Board of Trustees, committees, subcommittees, staff and industry subject matter experts), any person assisting in the challenge or appeals processes, nor any company employing a person assisting in the challenge or appeals processes, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the challenge or appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

411. Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards

A Registered Entity that is subject to an Applicable Requirement of a NERC Critical Infrastructure Protection Standard for which Technical Feasibility Exceptions are permitted, may request a Technical Feasibility Exception to the Requirement, and the request will be reviewed, approved or disapproved, and if approved, implemented, in accordance with the NERC *Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standard,* Appendix 4D to these Rules of Procedure.

412. Certification of Questions from Regional Entity Hearing Bodies for Decision by the NERC Board of Trustees Compliance Committee

1. A Regional Entity Hearing Body that is conducting a hearing concerning a disputed compliance matter pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, may certify to the Board of Trustees, for decision, a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the hearing in whole or in part, and as to which there are other extraordinary circumstances that make prompt consideration of the question by the Compliance Committee appropriate, in accordance with Section 1.5.12 of the Hearing Procedures. All questions certified by a Regional Entity Hearing Body to the Board of Trustees shall be considered and disposed of by the Compliance Committee.

2. The Compliance Committee may accept or reject a certification of a question for decision. If the Compliance Committee rejects the certified question, it shall issue a written statement that the certification is rejected.

3. If the Compliance Committee accepts the certification of a question for decision, it shall establish a schedule by which the Participants in the hearing before the Regional Entity Hearing Body may file memoranda and reply memoranda stating their positions as to how the question certified for decision should be decided by the Compliance Committee. The Compliance Committee may also request, or provide an opportunity for, the NERC compliance operations department, the NERC compliance enforcement department, and/or the NERC general counsel to file memoranda stating their positions as to how the question certified for decision should be decided. After receiving such memoranda and reply memoranda as are filed in accordance with the schedule, the Compliance Committee shall issue a written decision on the certified question.

4. Upon receiving the Compliance Committee's written decision on the certified question, the Regional Entity Hearing Body shall proceed to complete the hearing in accordance with the Compliance Committee's decision.

5. The Compliance Committee's decision, if any, on the certified question shall only be applicable to the hearing from which the question was certified and to the Participants in that hearing.

413. Review and Processing of Regional Entity Hearing Body Final Decisions that Are Not Appealed

NERC shall review and process all final decisions of Regional Entity Hearing Bodies issued pursuant to Attachment 2 to Appendix 4C concerning an Alleged Violation, proposed Penalty or sanction, or proposed Mitigation Plan that are not appealed pursuant to Section 409, as though the determination had been made by the Regional Entity Compliance Monitoring and Enforcement Program. NERC shall review and process such final decisions, and may require that they be modified by the Regional Entity, in

accordance with, as applicable to the particular decision, Sections 5.8, 5.9 and 6.5 of Appendix 4C.

414. Appeals of Decisions of Regional Entity Hearing Bodies Granting or Denying Motions to Intervene in Regional Entity Hearing Body Proceedings

1. **Time to Appeal** — An entity may appeal a decision of a Regional Entity Hearing Body under Section 1.4.4 of Attachment 2 of **Appendix C** denying the entity's motion to intervene in a Regional Entity Hearing Body proceeding, and the Regional Entity Compliance Staff or any other Participant in the Regional Entity Hearing Body proceeding may appeal a decision of the Regional Entity Hearing Body under Section 1.4.4 of Attachment 2 of **Appendix C** granting or denying a motion to intervene in the Regional Entity Hearing Body proceeding, in either case by filing a notice of appeal with the NERC director of enforcement, with copies to the Regional Entity Clerk, the Regional Entity Hearing body, the Hearing Officer, the Regional Entity Compliance Staff, and all other Participants in the Regional Entity Hearing Body proceeding, no later than seven (7) days following the date of the Regional Entity Hearing Body decision granting or denying the motion to intervene.

2. **Contents of Notice of Appeal** — The notice of appeal shall set forth information and argument to demonstrate that the decision of the Regional Entity Hearing Body granting or denying the motion to intervene was erroneous under the grounds for intervention specified in Section 1.4.4 of Attachment 2 of **Appendix 4C** and that the entity requesting intervention should be granted or denied intervention, as applicable. Facts alleged in, and any offers of proof made in, the notice of appeal shall be supported by affidavit or verification. The notice of appeal shall include a copy of the original motion to intervene and a copy of the decision of the Regional Entity Hearing Body granting or denying the motion to intervene.

3. **Responses to Notice of Appeal** — Within ten (10) days following the date the notice of appeal is filed, the Regional Entity Clerk shall transmit to the NERC director of enforcement copies of all pleadings filed in the Regional Entity Hearing Body proceeding on the motion to intervene. Within fourteen (14) days following the date the notice of appeal is filed, the Regional Entity Hearing Body, the Regional Entity Compliance Staff, and any other Participants in the Regional Entity Hearing Body proceeding, may each file a response to the notice of appeal with the NERC director of enforcement. Within seven (7) days following the last day for filing responses, the entity filing the notice of appeal, and any Participant in the Regional Entity Hearing Body proceeding that supports the appeal, may file replies to the responses with the NERC director of enforcement.

4. **Disposition of Appeal** — The appeal shall be considered and decided by the Compliance Committee. The NERC director of enforcement shall provide copies of the notice of appeal and any responses and replies to the Compliance Committee. The Compliance Committee shall issue a written decision on the

appeal; provided, that if the Compliance Committee does not issue a written decision on the appeal within forty-five (45) days following the date of filing the notice of appeal, the appeal shall be deemed denied and the decision of the Regional Entity Hearing Body granting or denying the motion to intervene shall stand. The NERC director of enforcement shall transmit copies of the Compliance Committee's decision, or shall provide notice that the forty-five (45) day period has expired with no decision by the Compliance Committee, to the Regional Entity Clerk, the Regional Entity Hearing Body, the entity filing the notice of appeal, the Regional Entity Compliance Staff, and any other Participants in the Regional Entity Hearing Body proceeding that filed responses to the notice of appeal or replies to responses.

5. **Appeal of Compliance Committee Decision to FERC or Other Applicable Governmental Authority** — Any entity aggrieved by the decision of the Compliance Committee on an appeal of a Regional Entity Hearing Body decision granting or denying a motion to intervene in a Regional Entity Hearing Body proceeding (including a denial of such appeal by the expiration of the forty-five (45) day period as provided in Section 414.4) may appeal or petition for review of the decision of the Compliance Committee to FERC or to another Applicable Governmental Authority having jurisdiction over the matter, in accordance with the authorities, rules and procedures of FERC or such other Applicable Governmental Authority. Any such appeal or petition for review shall be filed within the time period, if any, and in the form and manner, specified by the applicable statutes, rules or regulations governing proceedings before FERC or the other Applicable Governmental Authority.

SECTION 500 — ORGANIZATION REGISTRATION AND CERTIFICATION

501. Scope of the Organization Registration and Organization Certification Programs

The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards. Registered Entities are not and do not become Members of NERC or a Regional Entity, by virtue of being listed on the NCR. Membership in NERC is governed by Article II of NERC's Bylaws; membership in a Regional Entity or regional reliability organization is governed by that entity's bylaws or rules.

The purpose of the Organization Certification Program is to ensure that the new entity (i.e., applicant to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has the tools, processes, training, and procedures to demonstrate their ability to meet the Requirements/sub-Requirements of all of the Reliability Standards applicable to the function(s) for which it is applying thereby demonstrating the ability to become certified and then operational.

Organization Registration and Organization Certification may be delegated to Regional Entities in accordance with the procedures in this Section 500; the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into these Rules of Procedure as **Appendix 5A**; and, approved Regional Entity delegation agreements or other applicable agreements.

1. **NERC Compliance Registry** — NERC shall establish and maintain the NCR of the Bulk Power System owners, operators, and users that are subject to approved Reliability Standards.

   1.1 (a) The NCR shall set forth the identity and functions performed for each organization responsible for meeting Requirements/sub-Requirements of the Reliability Standards. Bulk Power System owners, operators, and users (i) shall provide to NERC and the applicable Regional Entity information necessary to complete the Registration, and (ii) shall provide NERC and the applicable Regional Entity with timely updates to information concerning the Registered Entity's ownership, operations, contact information, and other information that may affect the Registered Entity's Registration status or other information recorded in the Compliance Registry.

   (b) A generation or transmission cooperative, a joint-action agency or another organization may register as a Joint Registration Organization (JRO), in lieu of each of the JRO's members or related entities being registered individually for one or more functions. Refer to Section 507.

(c) Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function pursuant to a written agreement for the division of compliance responsibility. Refer to Section 508.

1.2 In the development of the NCR, NERC and the Regional Entities shall determine which organizations should be placed on the NCR based on the criteria provided in the NERC *Statement of Compliance Registry Criteria* which is incorporated into these Rules of Procedure as **Appendix 5B**.

1.3 NERC and the Regional Entities shall use the following rules for establishing and maintaining the NCR based on the Registration criteria as set forth in **Appendix 5B** *Statement of Compliance Registry Criteria*:

1.3.1 NERC shall notify each organization that it is on the NCR. The Registered Entity is responsible for compliance with all the Reliability Standards applicable to the functions for which it is registered from the time it receives the Registration notification from NERC.

1.3.2 Any organization receiving such a notice may challenge its placement on the NCR according to the process in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section V.

1.3.3 The Compliance Committee of the Board of Trustees shall promptly issue a written decision on the challenge, including the reasons for the decision.

1.3.4 The decision of the Compliance Committee of the Board of Trustees shall be final unless, within 21 days of the date of the Compliance Committee of the Board of Trustees decision, the organization appeals the decision to the Applicable Governmental Authority.

1.3.5 Each Registered Entity identified on the NCR shall notify its corresponding Regional Entity(s) of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the Registered Entity's responsibilities with respect to the Reliability Standards. Failure to notify will not relieve the Registered Entity from any responsibility to comply with the Reliability Standards or shield it from any Penalties or sanctions associated with failing to comply with the Reliability Standards applicable to its associated Registration.

1.4 For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall:

1.4.1 Ensure that all areas are under the oversight of one and only one Reliability Coordinator.

1.4.2 Ensure that all Balancing Authorities and Transmission Operator entities[2] are under the responsibility of one and only one Reliability Coordinator.

1.4.3 Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator.

1.4.4 Ensure that all Loads and generators are under the responsibility and control of one and only one Balancing Authority.

1.5 NERC shall maintain the NCR of organizations responsible for meeting the Requirements/sub-Requirements of the Reliability Standards currently in effect on its website and shall update the NCR monthly.

1.6 With respect to: (i) entities to be registered for the first time; (ii) currently-registered entities or (iii) previously-registered entities, for which registration status changes are sought, including availability and composition of a sub-set list of applicable Reliability Standards (which specifies the Reliability Standards and may specify Requirements/sub-Requirements), the registration process steps in Section III of **Appendix 5A** apply.

1.7 NERC shall establish a NERC-led, centralized review panel, comprised of a NERC lead with Regional Entity participants, in accordance with **Appendix 5A**, *Organization Registration and Organization Certification Manual*, Section III.D and **Appendix 5B**, *Statement of Compliance Registry Criteria*.

2. **Entity Certification** — NERC shall provide for Certification of all entities with primary reliability responsibilities requiring Certification. This includes those

[2] Some organizations perform the listed functions (e.g., Balancing Authority, Transmission Operator) over areas that transcend the Footprints of more than one Reliability Coordinator. Such organizations will have multiple Registrations, with each such Registration corresponding to that portion of the organization's overall area that is within the Footprint of a particular Reliability Coordinator.

entities that satisfy the criteria established in the NERC provisional Certification process. The NERC programs shall:

2.1 Evaluate and certify the competency of entities performing reliability functions. The entities presently expected to be certified include Reliability Coordinators, Transmission Operators, and Balancing Authorities.

2.2 Evaluate and certify each applicant's ability to meet the requirements for Certification.

2.3 Maintain process documentation.

2.4 Maintain records of currently certified entities.

2.5 Issue a Certification document to the applicant that successfully demonstrates its competency to perform the evaluated functions.

3. **Delegation and Oversight**

3.1 NERC may delegate responsibilities for Organization Registration and Organization Certification to Regional Entities in accordance with requirements established by NERC. Delegation will be via the delegation agreement between NERC and the Regional Entity or other applicable agreement. The Regional Entity shall administer Organization Registration and Organization Certification Programs in accordance with such delegations to meet NERC's programs goals and requirements subject to NERC oversight.

3.2 NERC shall develop and maintain a plan to ensure the continuity of Organization Registration and Organization Certification within the geographic or electrical boundaries of a Regional Entity in the event that no entity is functioning as a Regional Entity for that Region, or the Regional Entity withdraws as a Regional Entity, or does not operate its Organization Registration and Organization Certification Programs in accordance with delegation agreements.

3.3 NERC shall develop and maintain a program to monitor and oversee the NERC Organization Registration and Organization Certification Programs activities that are delegated to each Regional Entity through a delegation agreement or other applicable agreement.

3.3.1 This program shall monitor whether the Regional Entity carries out those delegated activities in accordance with NERC requirements, and whether there is consistency, fairness of administration, and comparability.

3.3.2 Monitoring and oversight shall be accomplished through direct participation in the Organization Registration and Organization Certification Programs with periodic reviews of documents and records of both programs.

502. Organization Registration and Organization Certification Program Requirements

1. NERC shall maintain the Organization Registration and Organization Certification Programs.

   1.1 The roles and authority of Regional Entities in the programs are delegated from NERC pursuant to the Rules of Procedure through regional delegation agreements or other applicable agreements.

   1.2 Processes for the programs shall be administered by NERC and the Regional Entities. Materials that each Regional Entity uses are subject to review and approval by NERC.

   1.3 The appeals process for the Organization Registration and Organization Certification Programs are identified in **Appendix 5A** *Organization Registration and Organization Certification Manual,* Sections V and VI, respectively.

   1.4 The Certification Team membership is identified in **Appendix 5A** *Organization Registration and Organization Certification Manual*, Section IV.8.d.

2. To ensure consistency and fairness of the Organization Registration and Organization Certification Programs, NERC shall develop procedures to be used by all Regional Entities and NERC in accordance with the following criteria:

   2.1 NERC and the Regional Entities shall have data management processes and procedures that provide for confidentiality, integrity, and retention of data and information collected.

   2.2 Documentation used to substantiate the conclusions of the Regional Entity/ NERC related to Registration and/or Certification must be retained by the Regional Entity for (6) six years, unless a different retention period is otherwise identified, for the purposes of future audits of these programs.

   2.3 To maintain the integrity of the NERC Organization Registration and Organization Certification Programs, NERC, Regional Entities, Certification Team members, program audit team members (Section 506), and committee members shall maintain the confidentiality of information provided by an applicant or entities.

      2.2.1 NERC and the Regional Entities shall have appropriate codes of conduct and confidentiality agreements for staff, Certification

Team, Certification related committees, and Certification program audit team members.

2.2.2 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall maintain the confidentiality of any Registration or Certification-related discussions or documents designated as confidential (see Section 1500 for types of Confidential Information).

2.2.3 NERC, Regional Entities, Certification Team members, program audit team members and committee members shall treat as confidential the individual comments expressed during evaluations, program audits and report-drafting sessions.

2.2.4 Copies of notes, draft reports, and other interim documents developed or used during an entity Certification evaluation or program audit shall be destroyed after the public posting of a final, uncontested report.

2.2.5 Information deemed by an applicant, entity, a Regional Entity, or NERC as confidential, including Critical Energy Infrastructure Information, shall not be released publicly or distributed outside of a committee or team.

2.2.6 In the event that an individual violates any of the confidentiality rules set forth above, that individual and any member organization with which the individual is associated will be subject to immediate dismissal from the audit team and may be prohibited from future participation in Compliance Monitoring and Enforcement Program activities by the Regional Entity or NERC.

2.2.7 NERC shall develop and provide training in auditing skills to all individuals prior to their participation in Certification evaluations. Training for Certification Team leaders shall be more comprehensive than the training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

2.4 An applicant that is determined to be competent to perform a function after completing all Certification requirements shall be deemed certified by NERC to perform that function for which it has demonstrated full competency.

2.4.1 All NERC certified entities shall be included on the NCR.

503. Regional Entity Implementation of Organization Registration and Organization Certification Program Requirements

1. **Delegation** — Recognizing the Regional Entity's knowledge of and experience with their members, NERC may delegate responsibility for Organization Registration and Organization Certification to the Regional Entity through a delegation agreement.

2. **Registration** — The following Organization Registration activities shall be managed by the Regional Entity per the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into the Rules of Procedure as Appendix 5A *Organization Registration and Organization Certification Manual*:

    2.1 Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4).

3. **Certification —** The following Organization Certification activities shall be managed by the Regional Entity in accordance with an approved delegation agreement or another applicable agreement:

    3.1 An entity seeking Certification to perform one of the functions requiring Certification shall contact the Regional Entity for the Region(s) in which it plans to operate to apply for Certification.

    3.2 An entity seeking Certification and other affected entities shall provide all information and data requested by NERC or the Regional Entity to conduct the Certification process.

    3.3 Regional Entities shall notify NERC of all Certification applicants.

    3.4 NERC and/or the Regional Entity shall evaluate the competency of entities requiring Certification to meet the NERC Certification requirements.

    3.5 NERC or the Regional Entity shall establish Certification procedures to include evaluation processes, schedules and deadlines, expectations of the applicants and all entities participating in the evaluation and Certification processes, and requirements for Certification Team members.

        3.5.1 The NERC / Regional Entity Certification procedures will include provisions for on-site visits to the applicant's facilities to review the data collected through questionnaires, interviewing the operations and management personnel, inspecting the facilities and equipment (including requesting a demonstration of all tools identified in the Certification process), reviewing all necessary documents and data (including all agreements, processes, and procedures identified in the Certification process), reviewing Certification documents and projected system operator work schedules, and reviewing any additional documentation needed to

support the completed questionnaire or inquiries arising during the site visit.

3.5.2 The NERC/ Regional Entity Certification procedures will provide for preparation of a written report by the Certification Team, detailing any deficiencies that must be resolved prior to granting Certification, along with any other recommendations for consideration by the applicant, the Regional Entity, or NERC.

504. Appeals

1. NERC shall maintain an appeals process to resolve any disputes related to Registration or Certification activities per the *Organization Registration and Organization Certification Manual,* which is incorporated in these Rules of Procedure as Appendix 5A.

2. The Regional Entity Certification appeals process shall culminate with the Regional Entity board or a committee established by and reporting to the Regional Entity board as the final adjudicator, provided that where applicable, Canadian provincial governmental authorities may act as the final adjudicator in their jurisdictions. NERC shall be notified of all appeals and may observe any proceedings **(Appendix 5A** *Organization Registration and Organization Certification Manual*).

505. Program Maintenance

NERC shall maintain its program materials, including such manuals or other documents as it deems necessary, of the governing policies and procedures of the Organization Registration and Organization Certification Programs.

506. Independent Audit of NERC Organization Registration and Organization Certification Program

1. NERC, through the Compliance and Certification Committee, shall provide for an independent audit of its Organization Registration and Organization Certification Programs at least once every three years, or more frequently, as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board.

2. The audit shall evaluate the success, effectiveness and consistency of the NERC Organization Registration and Organization Certification Programs.

3. The final report shall be posted by NERC for public viewing.

4. If the audit report includes recommendations to improve the program, the administrators of the program shall provide a written response to the Board within 30 days of the final report, detailing the disposition of each and every

recommendation, including an explanation of the reasons for rejecting a recommendation and an implementation plan for the recommendations accepted.

507. Provisions Relating to Joint Registration Organizations (JRO)

1. In addition to registering as the entity responsible for all functions that it performs itself, an entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Any entity seeking to register as a JRO must submit a written agreement with its members or related entities for all Requirements/sub-Requirements for the function(s) for which the entity is registering for and takes responsibility for, which would otherwise be the responsibility of one or more of its members or related entities. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the JRO Registration.

2. The JRO Registration data must include the same Registration information as a normal compliance Registration entry. The JRO is responsible for providing all of the information and data, including submitting reports, as needed by the Regional Entity for performing assessments of compliance.

3. The Regional Entity shall notify NERC of each JRO that the Regional Entity accepts. The notification will identify the point of contact and the functions(s) being registered for on behalf of its members or related entities.

4. For purposes of Compliance Audits, the Regional Entity shall keep a list of all JROs. This document shall contain a list of each JRO's members or related entities and the function(s) for which the JRO is registered for that member(s) or related entity(s). It is the responsibility of the JRO to provide the Regional Entity with this information as well as the applicable JRO agreement(s).

5. The Regional Entity may request clarification of any list submitted to it that identifies the members of the JRO and may request such additional information as the Regional Entity deems appropriate.

6. The Regional Entity's acceptance of a JRO shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the JRO will meet the Registration requirements of Section 501(1.4).

7. NERC shall maintain, and post on its website, a JRO registry listing all JRO Registrations that have been reviewed and accepted by the Regional Entity. The posting shall identify the JRO entity taking compliance responsibilities for itself and its members.

8. The JRO shall inform the Regional Entity of any changes to an existing JRO. The Regional Entity shall promptly notify NERC of each such revision.

9. Nothing in Section 507 shall preclude a member of a JRO, a related entity, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the member or other entity is registering. A JRO member or related entity that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the JRO of its Registration.

508. Provisions Relating to Coordinated Functional Registration (CFR) Entities

1. In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.

2. Each CFR or each individual entity within a CFR must identify a point of contact that is responsible for providing information and data, including submitting reports as needed by the Regional Entity related to the CFR Registration.

3. The Regional Entity shall notify NERC of each CFR that the Regional Entity accepts.

4. NERC or the Regional Entity may request clarification of any list submitted to it that identifies the compliance responsibilities of the CFR and may request such additional information as NERC or the Regional Entity deems appropriate.

5. The Regional Entity's acceptance of that CFR shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the CFR will meet the Registration requirements of Section 501(1.4).

6. NERC shall maintain, and post on its website, a CFR registry listing all CFR Registrations that have been accepted by NERC or by a Regional Entity. The posting shall clearly list all the Reliability Standards or Requirements/sub-Requirements thereof for which each entity of the CFR is responsible for under the CFR.

7. The point of contact shall inform the Regional Entity of any changes to an existing CFR. The Regional Entity shall promptly notify NERC of each such revision.

8. In the event of a violation of a Reliability Standard or of a Requirement/sub-Requirement of a Reliability Standard for which an entity of a CFR is registered, that entity shall be identified in the Notice of Alleged Violation and shall be assessed the sanction or Penalty in accordance with the NERC Sanctions Guidelines. In the event a Regional Entity is not able to determine which entity(ies) is responsible for a particular Reliability Standard, or Requirements/sub-Requirements thereof that has been violated, the Regional Entity shall investigate the noncompliance in accordance with the NERC Rules of Procedure Section 400, *Compliance Enforcement*, to determine the entity(ies) to which the Regional Entity shall to issue the sanction or Penalty for the violation.

9. Nothing in Section 508 shall preclude an entity registered in a CFR, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting Requirements for the Reliability Standards applicable to the function(s) for which the entity is registering. An entity registered in a CFR that registers as responsible for any Reliability Standard or Requirement/sub-Requirement of a Reliability Standard shall inform the point of contact of its Registration.

509. Exceptions to the Definition of the Bulk Electric System

An Element is considered to be (or not be) part of the Bulk Electric System by applying the BES Definition to the Element (including the inclusions and exclusions set forth therein). Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of the Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside of the definition of the Bulk Electric System should be considered part of the Bulk Electric System.

SECTION 600 — PERSONNEL CERTIFICATION

601. Scope of Personnel Certification

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires skilled, trained and qualified system operators. The Personnel Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the Bulk Electric System. The Personnel Certification awards system operator Certification Credentials to individuals who demonstrate that they have attained essential knowledge relating to NERC Reliability Standards as well as principles of Bulk Power System operations. NERC, as the ERO, will ensure skilled, trained, and qualified system operators through the Personnel Certification Program.

Except as necessary to obtain approval of the Rules of Procedure, the NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the policies, sets fees, and monitors the performance of the Personnel Certification Program for system operators.

602. Structure of ERO Personnel Certification Program

1. The NERC Personnel Certification Program shall be international in scope.
2. The PCGC shall (1) be able to independently exercise decision-making for all matters pertaining to Certification, (2) include individuals from the discipline being certified and whose composition addresses the needs of the users of the program (e.g., employers, regulators, etc.), and (3) have representation for each specialty or level within a discipline.
3. NERC shall maintain a nominating process for membership in the governing body. Nominations shall be open to all interested parties and self-nominations shall be accepted. The NERC Board of Trustees shall appoint members to the governing body from among those nominated. The members of the governing body shall serve at the pleasure of the Board.
4. The PCGC shall have control over the matters related to the Personnel Certification and re-Certification Programs listed below, without being subject to approval by any other body.

    4.1 Policies and procedures, including eligibility requirements and application processing.

    4.2 Requirements for personnel Certification, maintaining Certification, and re-Certification.

    4.3 Examination content, development, and administration.

    4.4 Examination cut score.

4.5 Grievance and disciplinary processes.

4.6 Governing body and subgroup(s)' meeting rules including agenda, frequency, and related procedures.

4.7 Subgroup(s) appointments and work assignments.

4.8 Publications about personnel Certification and re-Certification.

4.9 Setting fees for application, and all other services provided as a part of the personnel Certification and re-Certification activities.

4.10 Program funding, spending, and budget authority. Financial matters related to the operation of the program shall be segregated from other NERC activities.

5. The Personnel Certification Program shall utilize written procedures for the selection of members of the governing body that prohibit the governing body from selecting a majority of its successors.

6. The Personnel Certification Program shall be separate from the accreditation and education functions of NERC in related disciplines.

7. No member of the PCGC or staff member working with the Personnel Certification Program governing body shall have or exercise any authority or responsibility for compliance matters related to Reliability Standards concerning personnel Certification.

603. Examination and Maintenance of NERC System Operator Certification Credentials

1. System operators seeking to obtain a Credential must pass an examination to earn the Credential.

2. A certificate will be issued to successful candidates which is valid for three years.

3. A system operator must earn Continuing Education Hours (CE Hours) in NERC-Approved Learning Activities within the three-year period preceding the expiration date of his/her certificate as determined by the PCGC and posted in the NERC System Operator Program Manual. A system operator must request a renewal and submit the appropriate fee for Certification renewal evaluation.

4. The Credential of a certified system operator who does not accumulate the required number and balance of CE Hours within the three-year period will be Suspended. A system operator with a Suspended certificate cannot perform any task that requires an operator to be NERC-certified. The system operator with a Suspended Credential will have up to twelve months to acquire the necessary CE Hours.

4.1 During the time of suspension, the original anniversary date will be maintained. Therefore, should the system operator accumulate the required number of CE Hours within the twelve month suspension period, he/she will be issued a certificate that will be valid for three years from the previous expiration date.

4.2 At the end of the twelve-month suspension period, if the system operator has not accumulated the required number of CE Hours, the Credential will be Revoked and all CE Hours earned will be forfeited. After a Credential is Revoked, the system operator will be required to pass an examination to become certified.

5. Hardship: Due to unforeseen events and extenuating circumstances, a certified system operator may be unable to accumulate the necessary CE Hours in the time frame required by the Personnel Certification Program to maintain the Credential. In such an event, the individual must submit a written request containing a thorough explanation of the circumstances and supporting information to the NERC Personnel Certification Manager. The PCGC retains the right to invoke this hardship clause as it deems appropriate to address such events or circumstances.

604. Dispute Resolution Process

1. Any dispute arising under the NERC agreement establishing the *NERC Personnel Certification Program* or from the establishment of any NERC rules, policies, or procedures dealing with any segment of the Certification process shall be subject to the NERC System Operator Certification Dispute Resolution Process. The Dispute Resolution Process is for the use of persons who hold an operator Certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the Registration process.

2. Dispute Resolution Process consists of three steps.

2.1. Notify NERC Personnel Certification Program Staff: This first step can usually resolve the issues without further actions. It is expected that most disputes will be resolved at this step. If the issue(s) is not resolved to the satisfaction of the parties involved in the first step, the issue can be brought to the PCGC Dispute Resolution Task Force.

2.2. PCGC Dispute Resolution Task Force: If the NERC staff did not resolve the issue(s) to the satisfaction of the parties involved, a written request must be submitted to the chairman of the PCGC through NERC staff explaining the issue(s) and requesting further action. Upon receipt of the letter, the PCGC chairman will present the request to the PCGC Dispute Resolution Task Force for action. This task force consists of three current members of the PCGC. The PCGC Dispute Resolution Task Force will

investigate and consider the issue(s) presented and make a decision. This decision will then be communicated to the submitting party, the PCGC chairman, and the NERC staff within 45 calendar days of receipt of the request.

3. Personnel Certification Governance Committee: If the PCGC Dispute Resolution Task Force's decision did not resolve the issue(s) to the satisfaction of the parties involved, the final step in the process is for the issue(s) to be brought before the PCGC. Within 45 days of the date of the Task Force's decision, the disputing party shall submit a written request to the PCGC chairman through NERC staff requesting that the issue(s) be brought before the PCGC for resolution. The chairman shall see that the necessary documents and related data are provided to the PCGC members as soon as practicable. The PCGC will then meet or conference to discuss the issue(s) and make their decision within 60 calendar days of the chairman's receipt of the request. The decision will be provided to the person bringing the issue(s) and the NERC staff. The PCGC is the governing body of the Certification program and its decision is final.

4. Dispute Resolution Process Expenses: All individual expenses associated with the Dispute Resolution Process, including salaries, meetings, or consultant fees, shall be the responsibility of the individual parties incurring the expense.

5. Decision Process: Robert's Rules of Order shall be used as a standard of conduct for the Dispute Resolution Process. A majority vote of the members present will decide all issues. The vote will be taken in a closed session. No member of the PCGC may participate in the Dispute Resolution Process, other than as a party or witness, if he or she has an interest in the particular matter.

   5.1 A stipulation of invoking the Dispute Resolution Process is that the entity invoking the Dispute Resolution Process agrees that neither NERC (its members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the Dispute Resolution Process, nor any company employing a person assisting in the Dispute Resolution Process, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the Dispute Resolution Process. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

605. Disciplinary Action

1. Disciplinary action may be necessary to protect the integrity of the system operator Credential. The PCGC may initiate disciplinary action should an individual act in a manner that is inconsistent with expectations, including but not limited to:

1.1. Willful, gross, and/or repeated violation of the NERC Reliability Standards as determined by a NERC investigation.

1.2. Willful, gross, and/or repeated negligence in performing the duties of a certified system operator as determined by a NERC investigation.

1.3. Intentional misrepresentation of information provided on a NERC application for a system operator Certification exam or to maintain a system operator Credential using CE Hours.

1.4. Intentional misrepresentation of identification in the exam process, including a person identifying himself or herself as another person to obtain Certification for the other person.

1.5. Any form of cheating during a Certification exam, including, but not limited to, bringing unauthorized reference material in the form of notes, crib sheets, or other methods of cheating into the testing center.

1.6. A certified system operator's admission to or conviction of any felony or misdemeanor directly related to his/her duties as a system operator.

2. Hearing Process: Upon report to NERC of a candidate's or certified system operator's alleged misconduct, the NERC PCGC Credential Review Task Force will convene for the determination of facts. An individual, government agency, or other investigating authority can file a report. Unless the Task Force initially determines that the report of alleged misconduct is without merit, the candidate or certified system operator will be given the right to notice of the allegation. A hearing will be held and the charged candidate or certified system operator will be given an opportunity to be heard and present further relevant information. The Task Force may seek out information from other involved parties. The hearing will not be open to the public, but it will be open to the charged candidate or certified system operator and his or her representative. The Task Force will deliberate in a closed session, but the Task Force cannot receive any evidence during the closed session that was not developed during the course of the hearing.

3. Task Force's decision: The Task Force's decision will be unanimous and will be in writing with inclusion of the facts and reasons for the decision. The Task Force's written decision will be delivered to the PCGC and by certified post to the charged candidate or certified system operator. In the event that the Task Force is unable to reach a unanimous decision, the matter shall be brought to the full committee for a decision.

3.1. No Action: Allegation of misconduct was determined to be unsubstantiated or inconsequential to the Credential.

3.2. Probation: A letter will be sent from NERC to the offender specifying:

3.2.1. The length of time of the probationary period (to be determined by the PCGC).

3.2.2. Credential will remain valid during the probationary period.

3.2.3. The probationary period does not affect the expiration date of the current certificate.

3.2.4. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

3.3. Revoke for Cause: A letter will be sent from NERC to the offender specifying:

3.3.1. The length of time of the probationary period (to be determined by the PCGC).

3.3.2. Credential is no longer valid.

3.3.3. Successfully passing an exam will be required to become recertified.

3.3.4. An exam will not be authorized until the revocation period expires

3.4. Termination of Credential: A letter will be sent from NERC to the offender specifying permanent removal of Credential.

4. Credential Review Task Force: The Credential Review Task Force shall be comprised of three active members of the PCGC assigned by the Chairman of the PCGC on an ad hoc basis. No one on the Credential Review Task Force may have an interest in the particular matter. The Task Force will meet in a venue determined by the Task Force chairman.

5. Appeal Process: The decision of the Task Force may be appealed using the NERC System Operator Certification Dispute Resolution Process.

606. Candidate Testing Mechanisms

1. The Personnel Certification Program shall utilize reliable testing mechanisms to evaluate individual competence in a manner that is objective, fair to all candidates, job-related, and based on the knowledge and skill needed to function in the discipline.

2. The Personnel Certification Program shall implement a formal policy of periodic review of the testing mechanisms to ensure ongoing relevance of the mechanisms to knowledge and skill needed in the discipline.

3. The Personnel Certification Program shall utilize policies and procedures to ensure that all test administration and development materials are secure and demonstrate that these policies and procedures are consistently implemented.

4. The Personnel Certification Program shall establish pass/fail levels that protect the public with a method that is based on competence and generally accepted in the psychometric community as being fair and reasonable.

5. The Personnel Certification Program shall conduct ongoing studies to substantiate the reliability and validity of the testing mechanisms.

6. The Personnel Certification Program shall utilize policies and procedures that govern how long examination records are kept in their original format.

7. The Personnel Certification Program shall demonstrate that different forms of the testing mechanisms assess equivalent content and that candidates are not penalized for taking forms of varying difficulty.

607. Public Information About the Personnel Certification Program

1. The Personnel Certification Program shall maintain and publish publicly a System Operator Certification Program Manual describing the procedures used in examination construction and validation; all eligibility requirements and determination; fees; and examination administration documents, including: reporting of results, re-Certification requirements, and disciplinary and dispute resolution.

2. The Personnel Certification Program shall maintain and publish publicly a comprehensive summary or outline of the information, knowledge, or functions covered by each examination.

3. The Personnel Certification Program shall publish publicly and make available at least annually a summary of Certification activities for the program, including at least the following information: number of examinations delivered, the number passed, the number failed, and the number certified.

608. Responsibilities to Applicants for Certification or Re-Certification

The Personnel Certification Program:

1. Shall not discriminate among applicants as to age, gender, race, religion, national origin, disability, or marital status and shall include a statement of non-discrimination in announcements of the program.

2. Shall comply with all requirements of applicable federal and state/provincial laws with respect to all Certification and re-Certification activities, and shall require compliance of all contractors and/or providers of services.

3. Shall make available to all applicants copies of formalized procedures for application for, and attainment of, personnel Certification and re-Certification and shall uniformly follow and enforce such procedures for all applicants.

4. Shall implement a formal policy for the periodic review of eligibility criteria and application procedures to ensure that they are fair and equitable.

5. Shall provide competently proctored examination sites.

6. Shall uniformly report examination results to applicants in a timely manner.

7. Shall give applicants failing the examination information on general content areas of deficiency.

609. Responsibilities to the Public and to Employers of Certified Practitioners

The Personnel Certification Program:

1. Shall demonstrate that the testing mechanisms adequately measure the knowledge and skill required for entry, maintenance, and/or advancement in the profession for each position to be certified.

2. Shall award Certification and re-Certification only after the skill and knowledge of the individual have been evaluated and determined to be acceptable.

3. Shall maintain, in an electronic format, a current list of those persons certified in the programs and have policies and procedures that delineate what information about a Credential holder may be made public and under what circumstances.

4. Shall have formal policies and procedures for discipline of a Credential holder, including the revocation of the certificate, for conduct deemed harmful to the public or inappropriate to the discipline (e.g., incompetence, unethical behavior, physical or mental impairment affecting performance). These procedures shall incorporate due process.

5. Shall demonstrate that any title or Credential awarded accurately reflects or applies to the practitioner's daily occupational or professional duties and is not confusing to employers, consumers, regulators, related professions, and/or other interested parties.

SECTION 700 — RELIABILITY READINESS EVALUATION AND IMPROVEMENT AND FORMATION OF SECTOR FORUMS

701. Confidentiality Requirements for Readiness Evaluations and Evaluation Team Members

1. All information made available or created during the course of any reliability readiness evaluation including, but not limited to, data, Documents, observations and notes, shall be maintained as confidential by all evaluation team members, in accordance with the requirements of Section 1500.

2. Evaluation team members are obligated to destroy all confidential evaluation notes following the posting of the final report of the reliability readiness evaluation.

3. NERC will retain reliability readiness evaluation-related documentation, notes, and materials for a period of time as defined by NERC.

4. These confidentiality requirements shall survive the termination of the NERC Reliability Readiness Evaluation and Improvement Program.

702. Formation of Sector Forum

1. NERC will form a sector forum at the request of any five members of NERC that share a common interest in the safety and reliability of the Bulk Power System. The members of sector forum may invite such others of the members of NERC to join the sector forum as the sector forum deems appropriate.

2. The request to form a sector forum must include a proposed charter for the sector forum. The Board must approve the charter.

3. NERC will provide notification of the formation of a sector forum to its membership roster. Notices and agendas of meetings shall be posted on NERC's website.

4. A sector forum may make recommendations to any of the NERC committees and may submit a Standards Authorization Request to the NERC *Reliability Standards Development Procedure*.

SECTION 800 — RELIABILITY ASSESSMENT AND PERFORMANCE ANALYSIS

801. Objectives of the Reliability Assessment and Performance Analysis Program

The objectives of the NERC Reliability Assessment and Performance Analysis Program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American Bulk Power Systems, both as existing and as planned; (2) analyze off-normal events on the Bulk Power System; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the Board for publication to the electric industry and the general public.

802. Scope of the Reliability Assessment Program

1. The scope of the Reliability Assessment Program shall include:

   1.1 Review, assess, and report on the overall electric generation and transmission reliability (adequacy and operating reliability) of the interconnected Bulk Power Systems, both existing and as planned.

   1.2 Assess and report on the key issues, risks, and uncertainties that affect or have the potential to affect the reliability of existing and future electric supply and transmission.

   1.3 Review, analyze, and report on Regional Entity self-assessments of electric supply and bulk power transmission reliability, including reliability issues of specific regional concern.

   1.4 Identify, analyze, and project trends in electric customer demand, supply, and transmission and their impacts on Bulk Power System reliability.

   1.5 Investigate, assess, and report on the potential impacts of new and evolving electricity market practices, new or proposed regulatory procedures, and new or proposed legislation (e.g. environmental requirements) on the adequacy and operating reliability of the Bulk Power Systems.

2. The Reliability Assessment Program shall be performed in a manner consistent with the Reliability Standards of NERC including but not limited to those that specify reliability assessment Requirements.

803. Reliability Assessment Reports

The number and type of periodic assessments that are to be conducted shall be at the discretion of NERC. The results of the reliability assessments shall be documented in three reports: the long-term and the annual seasonal (summer) and the annual seasonal (winter) assessment reports. NERC shall also conduct special reliability assessments from time to time as circumstances warrant. The reliability assessment reports shall be reviewed and approved for publication by the Board. The three regular reports are described below.

1. **Long-Term Reliability Assessment Report** — The annual long-term report shall cover a ten-year planning horizon. The planning horizon of the long-term reliability assessment report shall be subject to change at the discretion of NERC. Detailed generation and transmission adequacy assessments shall be conducted for the first five years of the review period. For the second five years of the review period, the assessment shall focus on the identification, analysis, and projection of trends in peak demand, electric supply, and transmission adequacy, as well as other industry trends and developments that may impact future electric system reliability. Reliability issues of concern and their potential impacts shall be presented along with any mitigation plans or alternatives. The long-term reliability assessment reports will generally be published in the fall (September) of each year. NERC will also publish electricity supply and demand data associated with the long-term reliability assessment report.

2. **Summer Assessment Report** — The annual summer seasonal assessment report typically shall cover the four-month (June–September) summer period. It shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected summer peak demands. It shall also identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may include possible mitigation alternatives. The report will generally be published in mid-May for the upcoming summer period.

3. **Winter Assessment Report** — The annual winter seasonal assessment report shall cover the three-month (December–February) winter period. The report shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected winter peak demands. Similar to the summer assessment, the winter assessment shall identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may also include possible mitigation alternatives. The winter assessment report will generally be published in mid-November for the upcoming winter period.

4. **Special Reliability Assessment Reports** — In addition to the long-term and seasonal reliability assessment reports, NERC shall also conduct special reliability assessments on a regional, interregional, and Interconnection basis as conditions warrant, or as requested by the Board or governmental authorities. The teams of reliability and technical experts also may initiate special assessments of key

reliability issues and their impacts on the reliability of a regions, subregions, or Interconnection (or a portion thereof). Such special reliability assessments may include, among other things, operational reliability assessments, evaluations of emergency response preparedness, adequacy of fuel supply, hydro conditions, reliability impacts of new or proposed environmental rules and regulations, and reliability impacts of new or proposed legislation that affects or has the potential to affect the reliability of the interconnected Bulk Power Systems in North America.

804. Reliability Assessment Data and Information Requirements

To carry out the reviews and assessments of the overall reliability of the interconnected Bulk Power Systems, the Regional Entities and other entities shall provide sufficient data and other information requested by NERC in support of the annual long-term and seasonal assessments and any special reliability assessments.

Some of the data provided for these reviews and assessment may be considered confidential from a competitive marketing perspective, a Critical Energy Infrastructure Information perspective, or for other purposes. Such data shall be treated in accordance with the provisions of Section 1500 – Confidential Information.

While the major sources of data and information for this program are the Regional Entities, a team of reliability and technical experts is responsible for developing and formulating its own independent conclusions about the near-term and long-term reliability of the Bulk Power Systems.

In connection with the reliability assessment reports, requests shall be submitted to each of the Regional Entities for required reliability assessment data and other information, and for each Regional Entity's self-assessment report. The timing of the requests will be governed by the schedule for the preparation of the assessment reports.

The Regional Entity self-assessments are to be conducted in compliance with NERC Reliability Standards and the respective regional planning criteria. The team(s) of reliability and technical experts shall also conduct interviews with the Regional Entities as needed. The summary of the Regional Entity self-assessments that are to be included in the assessment reports shall follow the general outline identified in NERC's request. This outline may change from time to time as key reliability issues change.

In general, the Regional Entity reliability self-assessments shall address, among other areas, the following topics: demand and Net Energy for Load; assessment of projected resource adequacy; any transmission constraints that may impact bulk transmission adequacy and plans to alleviate those constraints; any unusual operating conditions that could impact reliability for the assessment period; fuel supply adequacy; the deliverability of generation (both internal and external) to Load; and any other reliability issues in the Region and their potential impacts on the reliability of the Bulk Power Systems.

805. Reliability Assessment Process

Based on their expertise, the review of the collected data, the review of the Regional Entity self-assessment reports, and interviews with the Regional Entities, as appropriate, the teams of reliability and technical experts shall perform an independent review and assessment of the generation and transmission adequacy of each Region's existing and planned Bulk Power System. The results of the review teams shall form the basis of NERC's long-term and seasonal reliability assessment reports. The review and assessment process is briefly summarized below.

1. **Resource Adequacy Assessment** — The teams shall evaluate the regional demand and resource capacity data for completeness in the context of the overall resource capacity needs of the Region. The team shall independently evaluate the ability of the Regional Entity members to serve their obligations given the demand growth projections, the amount of existing and planned capacity, including committed and uncommitted capacity, contracted capacity, or capacity outside of the Region. If the Region relies on capacity from outside of the Region to meet its resource objectives, the ability to deliver that capacity shall be factored into the assessment. The demand and resource capacity information shall be compared to the resource adequacy requirements of the Regional Entity for the year(s) or season(s) being assessed. The assessment shall determine if the resource information submitted represents a reasonable and attainable plan for the Regional Entity and its members. For cases of inadequate capacity or reserve margin, the Regional Entity will be requested to analyze and explain any resource capacity inadequacies and its plans to mitigate the reliability impact of the potential inadequacies. The analysis may be expanded to include surrounding areas. If the expanded analysis indicates further inadequacies, then an interregional problem may exist and will be explored with the applicable Regions. The results of these analyses shall be described in the assessment report.

2. **Transmission Adequacy and Operating Reliability Assessment** — The teams shall evaluate transmission system information that relates to the adequacy and operating reliability of the regional transmission system. That information shall include: regional planning study reports, interregional planning study reports, and/or regional operational study reports. If additional information is required, another data request shall be sent to the Regional Entity. The assessment shall provide a judgment on the ability of the regional transmission system to operate reliably under the expected range of operating conditions over the assessment period as required by NERC Reliability Standards. If sub-areas of the regional system are especially critical to the Reliable Operation of the regional bulk transmission system, these Facilities or sub-areas shall be reviewed and addressed in the assessment. Any areas of concern related to the adequacy or operating reliability of the system shall be identified and reported in the assessment.

3. **Seasonal Operating Reliability Assessment** — The team(s) shall evaluate the overall operating reliability of the regional bulk transmission systems. In areas with potential resource adequacy or system operating reliability problems, operational readiness of the affected Regional Entities for the upcoming season

shall be reviewed and analyzed. The assessment may consider unusual but possible operating scenarios and how the system is expected to perform. Operating reliability shall take into account a wide range of activities, all of which should reinforce the Regional Entity's ability to deal with the situations that might occur during the upcoming season. Typical activities in the assessment may include: facility modifications and additions, new or modified operating procedures, emergency procedures enhancement, and planning and operating studies. The teams shall report the overall seasonal operating reliability of the regional transmission systems in the annual summer and winter assessment reports.

4. **Reporting of Reliability Assessment Results** — The teams of reliability and technical experts shall provide an independent assessment of the reliability of the Regional Entities and the North American interconnected Bulk Power System for the period of the assessment. While the Regional Entities are relied upon to provide the information to perform such assessments, the review team is not required to accept the conclusions provided by the Regional Entities. Instead, the review team is expected, based on their expertise, to reach their own independent conclusions about the status of the adequacy of the generation and bulk power transmission systems of North America.

   The review team also shall strive to achieve consensus in their assessments. The assessments that are made are based on the best information available at the time. However, since judgment is applied to this information, legitimate differences of opinion can develop. Despite these differences, the review team shall work to achieve consensus on their findings.

   In addition to providing long-term and seasonal assessments in connection with the Reliability Assessment Program, the review team of experts shall also be responsible for recommending new and revised Reliability Standards related to the reliability assessments and the reliability of the Bulk Power Systems. These proposals for new or revised Reliability Standards shall be entered into NERC's Reliability Standards development process.

   Upon completion of the assessment, the team shall share the results with the Regional Entities. The Regional Entities shall be given the opportunity to review and comment on the conclusions in the assessment and to provide additional information as appropriate. The reliability assessments and their conclusions are the responsibility of NERC's technical review team and NERC.

   The preparation and approval of NERC's reliability assessment reports shall follow a prescribed schedule including review, comment, and possible approval by appropriate NERC committees. The long-term and seasonal (summer and winter) reliability assessment reports shall be further reviewed for approval by the Board for publication to the electric industry.

806. Scope of the Reliability Performance and Analysis Program

The components of the program will include analysis of large-scale outages, disturbances, and near misses to determine root causes and lessons learned; identification and continuous monitoring of performance indices to detect emerging trends and signs of a decline in reliability performance; and communications of performance results, trends, recommendations, and initiatives to those responsible to take actions; followed with confirmation of actions to correct any deficiencies identified. Within NERC, the reliability performance program will provide performance results to the Reliability Standards Development and Compliance Monitoring and Enforcement Programs to make the necessary adjustments to preserve reliability based on a risk-based approach.

807. Analysis of Major Events

Responding to major events affecting the Bulk Power System such as significant losses of Load or generation, significant Bulk Power System disturbances, or other emergencies on the Bulk Power System, can be divided into four phases: situational assessment and communications; situation tracking and communications; data collection, investigation, analysis, and reporting; and follow-up on recommendations.

1. NERC's role following a major event is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the major event. Working closely with the Regional Entities and Reliability Coordinators, and other appropriate Registered Entities, NERC will coordinate and facilitate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

2. When responding to any major event where physical or cyber security is suspected as a cause or contributing factor to the major event, NERC will immediately notify appropriate government agencies and coordinate its activities with them.

3. To the extent that a Reliability Standard sets forth specific criteria and procedures for reporting the Bulk Power System disturbances and events described in that Reliability Standard, all Registered Entities that are subject to the Requirements of that Reliability Standard must report the information required by that Reliability Standard within the time periods specified. In addition to reporting information as required by applicable Reliability Standards, each user, owner, and operator of the Bulk Power System shall also provide NERC and the applicable Regional Entities with such additional information requested by NERC or the applicable Regional Entity as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

4. During the conduct of NERC analyses, assistance may be needed from government agencies. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; investigations related to possible criminal or terrorist involvement in the major event; resources for initial data gathering immediately after the major

event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies.

5. NERC shall work with all other participants to establish a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the investigation and reporting of findings, conclusions, and recommendations related to major events with the objective of avoiding, to the extent possible, multiple investigations of the same major event. If the major event is confined to a single Regional Entity, NERC representatives will participate as members of the Regional Entity analysis team. NERC will establish, maintain, and revise from time to time as appropriate based on experience, a manual setting forth procedures and protocols for communications and sharing and exchange of information between and among NERC, the affected Regional Entity or Entities, and relevant governmental authorities, industry organizations and Bulk Power System user, owners, and operators concerning the investigation and analysis of major events.

6. NERC and applicable entity(s) will apply, as appropriate to the circumstances of the major event, the NERC *Blackout and Disturbance Response Procedures*, which are incorporated into these Rules of Procedure as **Appendix 8**. These procedures provide a framework to guide NERC's response to major events that may have multiregional, national, or international implications. Experienced industry leadership shall be applied to tailor the response to the specific circumstances of the major event. In accordance with those procedures, the NERC president will determine whether the major event warrants analysis at the NERC level. A Regional Entity may request that NERC elevate any analysis of a major event to the NERC level.

7. NERC will screen and analyze the findings and recommendations from the analysis, and those with generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with Section 810.

808. Analysis of Off-Normal Occurrences, Bulk Power System Performance, and Bulk Power System Vulnerabilities

1. NERC and Regional Entities will analyze Bulk Power System and equipment performance occurrences that do not rise to the level of a major event, as described in Section 807. NERC and Regional Entities will also analyze potential vulnerabilities in the Bulk Power System that they discover or that are brought to their attention by other sources including government agencies. The purpose of these analyses is to identify the root causes of occurrences or conditions that may be precursors of major events or other potentially more serious occurrences, or that have the potential to cause major events or other more serious occurrences, to assess past reliability performance for lessons learned, and to develop reliability performance benchmarks and trends.

2. NERC and Regional Entities will screen and analyze off-normal occurrences, Bulk Power System performance, and potential Bulk Power System vulnerabilities for significance, and information from those indicated as having generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with Section 810.

3. To the extent that a Reliability Standard sets forth specific criteria and procedures for reporting the Bulk Power System disturbances and events described in that Reliability Standard, all Registered Entities that are subject to the Requirements of that Reliability Standard must report the information required by that Reliability Standard within the time periods specified. In addition to reporting information as required by applicable Reliability Standards, each user, owner, and operator, of the Bulk Power System shall provide NERC and the applicable Regional Entities with such additional information requested by NERC or the applicable Regional Entities as is necessary to enable NERC and the applicable Regional Entities to carry out their responsibilities under this section.

809. Reliability Benchmarking

NERC shall identify and track key reliability indicators as a means of benchmarking reliability performance and measuring reliability improvements. This program will include assessing available metrics, developing guidelines for acceptable metrics, maintaining a performance metrics "dashboard" on the NERC website, and developing appropriate reliability performance benchmarks.

810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions

1. Members of NERC and Bulk Power System owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.

2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the Reliability Assessment Program.

3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:

3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the Bulk Power System of findings and lessons learned;

3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of

owners, operators, and users of the Bulk Power System according to each entity's facts and circumstances;

3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the Bulk Power System to take to ensure the reliability of the Bulk Power System. Such Essential Actions require NERC Board approval before issuance.

4. The Bulk Power System owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such Bulk Power System owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.

5. NERC will advise the Commission and other Applicable Governmental Authorities of its intent to issue all Level 1 (Advisories), Level 2 (Recommendations), and Level 3 (Essential Actions) at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other Applicable Governmental Authorities no later than thirty (30) days following the date by which NERC has requested the Bulk Power System owners, operators, and users to which a Level 2 (Recommendation) or Level 3 (Essential Action) issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other Applicable Governmental Authorities will describe the actions taken by the relevant owners, operators, and users of the Bulk Power System and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for Confidential Information or Critical Energy Infrastructure Information.

811. Equipment Performance Data

Through its Generating Availability Data System (GADS), NERC shall collect operating information about the performance of electric generating equipment; provide assistance to those researching information on power plant outages stored in its database; and support equipment reliability as well as availability analyses and other decision-making processes developed by GADS subscribers. GADS data is also used in conducting assessments of generation resource adequacy.

SECTION 900 — TRAINING AND EDUCATION

901. Scope of the Training and Education Program

Maintaining the reliability of the Bulk Electric System through implementation of the Reliability Standards requires informed and trained personnel. The training and education program will provide the education and training necessary for Bulk Power System personnel and regulators to obtain the essential knowledge necessary to understand and operate the Bulk Electric System.

NERC shall develop and maintain training and education programs for the purpose of establishing training requirements, developing materials, and developing training activities. The target audience of the training and education programs shall be Bulk Power System operating personnel including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, training personnel, and other personnel directly responsible for complying with NERC Reliability Standards who, through their actions or inactions, may impact the real-time, or day-ahead reliability of the Bulk Power System.

NERC shall also develop and provide appropriate training and education for industry participants and regulators affected by new or changed Reliability Standards or compliance Requirements.

To accomplish those objectives:

1. NERC shall periodically conduct job task analyses for targeted Bulk Power System personnel to ensure that the training program content is properly aligned to the job tasks performed by those personnel.

2. NERC shall develop and maintain personnel training program curriculum requirements based on valid job-task analysis.

3. NERC shall periodically conduct performance surveys to determine the effectiveness of the training program and identify areas for further training development and improvement.

4. NERC shall develop training and education materials and activities to assist Bulk Power System entities implementing new or revised Reliability Standard Requirements or other NERC-related changes.

5. NERC shall develop and provide training to people who participate in NERC and Regional Entity evaluations, audits, and investigations for the Compliance Monitoring and Enforcement Program, Organization Certification Program, and the continuing education program.

902. Continuing Education Program

NERC shall develop and maintain a continuing education program to foster the improvement of training and to promote quality in the training programs used by and

implemented by Bulk Power System entities. The program shall approve or accredit those activities and entities meeting NERC continuing education requirements.

1. NERC shall develop and implement continuing education program requirements that promote excellence in training programs and advance improved performance for Bulk Power System personnel identified in Section 901.

2. NERC shall develop and maintain a process to approve or accredit continuing education Providers and activities seeking approval or accreditation and meeting NERC-approved continuing education requirements.

3. NERC shall perform periodic audits on continuing education Providers and training activities to ensure that the approved or accredited Providers and training activities satisfy NERC continuing education requirements.

4. NERC shall develop and maintain an appeals process for disputed application reviews, interpretations of guidelines and standards, probation or suspension of NERC-approved Provider status, or Continuing Education Hour disputes.

SECTION 1000 — SITUATION AWARENESS AND INFRASTRUCTURE SECURITY

1001. Situation Awareness

NERC shall through the use of Reliability Coordinators and available tools, monitor present conditions on the Bulk Power System and provide leadership coordination, technical expertise, and assistance to the industry in responding to events as necessary. To accomplish these goals, NERC will:

1. Maintain real-time situation awareness of conditions on the Bulk Power System;

2. Notify the industry of significant Bulk Power System events that have occurred in one area, and which have the potential to impact reliability in other areas;

3. Maintain and strengthen high-level communication, coordination, and cooperation with governments and government agencies regarding real-time conditions; and

4. Enable the Reliable Operation of interconnected Bulk Power Systems by facilitating information exchange and coordination among reliability service organizations.

1002. Reliability Support Services

NERC may assist in the development of tools and other support services for the benefit of Reliability Coordinators and other system operators to enhance reliability, operations and planning. NERC will work with the industry to identify new tools, collaboratively develop requirements, support development, provide an incubation period, and at the end of that period, transition the tool or service to another group or owner for long term operation of the tool or provision of the service. To accomplish this goal, NERC will:

1. Collaborate with industry to determine the necessity of new tools or services to enhance reliability;

2. For those tools that the collaborative process determines should proceed to a development phase, provide a start-up mechanism and development system;

3. Implement the tool either on its own or through an appropriate group or organization; and

4. Where NERC conducts the implementation phase of a new tool or service, develop a transition plan to turn maintenance and provision of the tool or service over to an organization identified in the development stage.

In addition to tools developed as a result of a collaborative process with industry, NERC may develop reliability tools on its own, but will consult with industry concerning the need for the tool prior to proceeding to development.

Tools and services being maintained by NERC as of January 1, 2012, will be reviewed and, as warranted, transitioned to an appropriate industry group or organization. NERC will develop and maintain a strategic reliability tools plan that will list the tools and services being maintained by NERC, and, where applicable, the plans for transition to an appropriate industry group or organization.

1003. Infrastructure Security Program

NERC shall coordinate electric industry activities to promote Critical Infrastructure protection of the Bulk Power System in North America by taking a leadership role in Critical Infrastructure protection of the electricity sector so as to reduce vulnerability and improve mitigation and protection of the electricity sector's Critical Infrastructure. To accomplish these goals, NERC shall perform the following functions.

1. Electric Sector Information Sharing and Analysis Center (ESISAC)

    1.1 NERC shall serve as the electricity sector's sector coordinator and operate its Information Sharing and Analysis Center to gather information and communicate security-related threats and incidents within the sector, with United States and Canadian government agencies, and with other Critical Infrastructure sectors.

    1.2 NERC shall improve the capability of the ESISAC to analyze security threats and incident information and provide situational assessments for the electricity sector and governments.

    1.3 NERC shall work closely with the United States Department of Homeland Security, Department of Energy, Natural Resources Canada, and Public Safety and Emergency Preparedness Canada.

    1.4 NERC shall strengthen and expand these functions and working relationships with the electricity sector, other Critical Infrastructure industries, governments, and government agencies throughout North America to ensure the protection of the infrastructure of the Bulk Power System.

    1.5 NERC shall fill the role of the Electricity Sector Coordinating Council and coordinate with the Government Coordinating Council.

    1.6 NERC shall coordinate with other Critical Infrastructure sectors through active participation with the other Sector Coordinating Councils, the other ISACs, and the National Infrastructure Advisory Committee.

    1.7 NERC shall encourage and participate in coordinated Critical Infrastructure protection exercises, including interdependencies with other Critical Infrastructure sectors.

2. Security Planning

2.1 NERC shall take a risk management approach to Critical Infrastructure protection, considering probability and severity, and recognizing that mitigation and recovery can be practical alternatives to prevention.

2.2 NERC shall keep abreast of the changing threat environment through collaboration with government agencies.

2.3 NERC shall develop criteria to identify critical physical assets and Critical Cyber Assets, assess security threats, identify risk assessment methodologies, and assess effectiveness of physical and cyber protection measures.

2.4 NERC shall enhance and maintain the Bulk Power System critical spare transformer program, encourage increased participation by asset owners, and continue to assess the need to expand this program to include other critical Bulk Power System equipment.

2.5 NERC shall support implementation of the Critical Infrastructure Protection Standards through education and outreach.

2.6 NERC shall review and improve existing security guidelines, develop new security guidelines to meet the needs of the electricity sector, and consider whether any guidelines should be developed into Reliability Standards.

2.7 NERC shall conduct education and outreach initiatives to increase awareness and respond to the needs of the electricity sector.

2.8 NERC shall strengthen relationships with federal, state, and provincial government agencies on Critical Infrastructure protection matters.

2.9 NERC shall maintain and improve mechanisms for the sharing of sensitive or classified information with federal, state, and provincial government agencies on Critical Infrastructure protection matters; work with DOE and DHS to implement the National Infrastructure Protection Plan, as applicable to the electricity sector; and coordinate this work with PSEPC.

2.10 NERC shall improve methods to better assess the impact of a possible physical attack on the Bulk Power System and means to deter, mitigate, and respond following an attack.

2.11 NERC shall assess the results of vulnerability assessments and enhance the security of system control and data acquisition (SCADA) and process control systems by developing methods to detect an emerging cyber attack and the means to mitigate impacts on the Bulk Power Systems.

2.12 NERC shall work with the National SCADA Test Bed and the Process Control Systems Forum to accelerate the development of technology that

will enhance the security, safety, and reliability of process control and SCADA systems.

SECTION 1100 — ANNUAL NERC BUSINESS PLANS AND BUDGETS

1101. Scope of Business Plans and Budgets

The Board shall determine the content of the budgets to be submitted to the Applicable Governmental Authorities with consultation from the members of the Member Representatives Committee, Regional Entities, and others in accordance with the Bylaws. The Board shall identify any activities outside the scope of NERC's statutory reliability functions, if any, and the appropriate funding mechanisms for those activities.

1102. NERC Funding and Cost Allocation

1. In order that NERC's costs shall be fairly allocated among Interconnections and among Regional Entities, the NERC funding mechanism for all statutory functions shall be based on Net Energy for Load (NEL).

2. NERC's costs shall be allocated so that all Load (or, in the case of costs for an Interconnection or Regional Entity, all Load within that Interconnection or Regional Entity) bears an equitable share of such costs based on NEL.

3. Costs shall be equitably allocated between countries or Regional Entities thereof for which NERC has been designated or recognized as the Electric Reliability Organization.

4. Costs incurred to accomplish the statutory functions for one Interconnection, Regional Entity, or group of entities will be directly assigned to that Interconnection, Regional Entity, or group of entities provided that such costs are allocated equitably to end-users based on Net Energy for Load.

1103. NERC Budget Development

1. The NERC annual budget process shall be scheduled and conducted for each calendar year so as to allow a sufficient amount of time for NERC to receive Member inputs, develop the budget, and receive Board and, where authorized by applicable legislation or agreement, Applicable Governmental Authority approval of the NERC budget for the following fiscal year, including timely submission of the proposed budget to FERC for approval in accordance with FERC regulations.

2. The NERC budget submittal to Applicable Governmental Authorities shall include provisions for all ERO functions, all Regional Entity delegated functions as specified in delegation agreements and reasonable reserves and contingencies.

3. The NERC annual budget submittal to Applicable Governmental Authorities shall include description and explanation of NERC's proposed ERO program activities for the year; budget component justification based on statutory or other authorities; explanation of how each budgeted activity lends itself to the accomplishment of the statutory or other authorities; sufficiency of resources

provided for in the budget to carry out the ERO program responsibilities; explanation of the calculations and budget estimates; identification and explanation of changes in budget components from the previous year's budget; information on staffing and organization charts; and such other information as is required by FERC and other Applicable Governmental Authorities having authority to approve the proposed budget.

4. NERC shall develop, in consultation with the Regional Entities, a reasonable and consistent system of accounts, to allow a meaningful comparison of actual results at the NERC and Regional Entity level by the Applicable Governmental Authorities.

1104. Submittal of Regional Entity Budgets to NERC

1. Each Regional Entity shall submit its proposed annual budget for carrying out its delegated authority functions as well as all other activities and funding to NERC in accordance with a schedule developed by NERC and the Regional Entities, which shall provide for the Regional Entity to submit its final budget that has been approved by its board of directors or other governing body no later than July 1 of the prior year, in order to provide sufficient time for NERC's review and comment on the proposed budget and approval of the Regional Entity budget by the NERC Board of Trustees in time for the NERC and Regional Entity budgets to be submitted to FERC and other Applicable Governmental Authorities for approval in accordance with their regulations. The Regional Entity's budget shall include supporting materials in accordance with the budget and reporting format developed by NERC and the Regional Entities, including the Regional Entity's complete business plan and organization chart, explaining the proposed collection of all dues, fees, and charges and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

2. NERC shall review and approve each Regional Entity's budget for meeting the requirements of its delegated authority. Concurrent with approving the NERC budget, NERC shall review and approve, or reject, each Regional Entity budget for filing.

3. NERC shall also have the right to review from time to time, in reasonable intervals but no less frequently than every three years, the financial books and records of each Regional Entity having delegated authority in order to ensure that the documentation fairly represents in all material aspects appropriate funding of delegated functions.

1105. Submittal of NERC and Regional Entity Budgets to Governmental Authorities for Approval

1. NERC shall file for approval by the Applicable Governmental Authorities at least 130 days in advance of the start of each fiscal year. The filing shall include: (1) the complete NERC and Regional Entity budgets including the business plans and organizational charts approved by the Board, (2) NERC's annual funding requirement (including Regional Entity costs for delegated functions), and (3) the

mechanism for assessing charges to recover that annual funding requirement, together with supporting materials in sufficient detail to support the requested funding requirement.

2. NERC shall seek approval from each Applicable Governmental Authority requiring such approval for the funding requirements necessary to perform ERO activities within their jurisdictions.

1106. NERC and Regional Entity Billing and Collections

1. NERC shall request the Regional Entities to identify all Load-Serving Entities[3] within each Regional Entity and the NEL assigned to each Load-Serving Entity, and the Regional Entities shall supply the requested information. The assignment of a funding requirement to an entity shall not be the basis for determining that the entity must be registered in the Compliance Registry.

2. NERC shall accumulate the NEL by Load-Serving Entities for each Applicable Governmental Authority and submit the proportional share of NERC funding requirements to each Applicable Governmental Authority for approval together with supporting materials in sufficient detail to support the requested funding requirement.

3. NEL reported by Balancing Authorities within a Region shall be used to rationalize and validate amounts allocated for collection through Regional Entity processes.

4. The billing and collection processes shall provide:

   4.1 A clear validation of billing and application of payments.

   4.2 A minimum of data requests to those being billed.

   4.3 Adequate controls to ensure integrity in the billing determinants including identification of entities responsible for funding NERC's activities.

   4.4 Consistent billing and collection terms.

5. NERC will bill and collect all budget requirements approved by Applicable Governmental Authorities (including the funds required to support those functions assigned to the Regional Entities through the delegation agreements) directly from the Load-Serving Entities or their designees or as directed by particular Applicable Governmental Authorities, except where the Regional Entity is required to collect the budget requirements for NERC, in which case the Regional Entity will collect directly from the Load-Serving Entities or as otherwise

[3] A Regional Entity may allocate funding obligations using an alternative method approved by NERC and by FERC and other Applicable Governmental Authorities, as provided for in the regional delegation agreement.

provided by agreement and submit funds to NERC. Alternatively, a load-serving entity may pay its allocated ERO costs through a Regional Entity managed collection mechanism.

6. NERC shall set a minimum threshold limit on the billing of small LSEs to minimize the administrative burden of collection.

7. NERC shall pursue any non-payments and shall request assistance from Applicable Governmental Authorities as necessary to secure collection.

8. In the case where a Regional Entity performs the collection for ERO, the Regional Entity will not be responsible for non-payment in the event that a user, owner or operator of the Bulk Power System does not pay its share of dues, fees and charges in a timely manner, provided that such a Regional Entity shall use reasonably diligent efforts to collect dues, fees, and other charges from all entities obligated to pay them. However, any revenues not paid shall be recovered from others within the same Region to avoid cross-subsidization between Regions.

9. Both NERC and the Regional Entities also may bill members or others for functions and services not within statutory requirements or otherwise authorized by the Applicable Governmental Authorities. Costs and revenues associated with these functions and services shall be separately identified and not commingled with billings associated with the funding of NERC or of the Regional Entities for delegated activities.

1107. Penalty Applications

1. Where NERC or a Regional Entity initiates a compliance monitoring and enforcement process that leads to imposition of a Penalty, the entity that initiated the process shall receive any Penalty monies imposed and collected as a result of that process, unless a different disposition of the Penalty monies is provided for in the delegation agreement, or in a contract or a disposition of the violation that is approved by NERC and FERC.

2. All funds from financial Penalties assessed in the United States received by the entity initiating the compliance monitoring and enforcement process shall be applied as a general offset to the entity's budget requirements for the subsequent fiscal year, if received by July 1, or for the second subsequent fiscal year, if received on or after July 1. Funds from financial Penalties shall not be directly applied to any program maintained by the entity conducting the compliance monitoring and enforcement process. Funds from financial Penalties assessed against a Canadian entity shall be applied as specified by legislation or agreement.

3. In the event that a compliance monitoring and enforcement process is conducted jointly by NERC and a Regional Entity, the Regional Entity shall receive the Penalty monies and offset the Regional Entity's budget requirements for the subsequent fiscal year.

4. Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC or any other Applicable Governmental Authority.

1108. Special Assessments

On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next funding cycle, NERC shall file with the Applicable Governmental Authorities, where authorized by applicable legislation or agreement, for authorization for an amended or supplemental budget for NERC or a Regional Entity and, if necessary under the amended or supplemental budget, to collect a special or additional assessment for statutory functions of NERC or the Regional Entity. Such filing shall include supporting materials to justify the requested funding, including any departure from the approved funding formula or method.

SECTION 1200 — REGIONAL DELEGATION AGREEMENTS

1201. Pro Forma Regional Delegation Agreement

NERC shall develop and maintain a pro forma Regional Entity delegation agreement, which shall serve as the basis for negotiation of consistent agreements for the delegation of ERO functions to Regional Entities.

1202. Regional Entity Essential Requirements

NERC shall establish the essential requirements for an entity to become qualified and maintain good standing as a Regional Entity.

1203. Negotiation of Regional Delegation Agreements

NERC shall, for all areas of North America that have provided NERC with the appropriate authority, negotiate regional delegation agreements for the purpose of ensuring all areas of the North American Bulk Power Systems are within a Regional Entity Region. In the event NERC is unable to reach agreement with Regional Entities for all areas, NERC shall provide alternative means and resources for implementing NERC functions within those areas. No delegation agreement shall take effect until it has been approved by the Applicable Governmental Authority.

1204. Conformance to Rules and Terms of Regional Delegation Agreements

NERC and each Regional Entity shall comply with all applicable ERO Rules of Procedure and the obligations stated in the regional delegation agreement.

1205. Sub-delegation

The Regional Entity shall not sub-delegate any responsibilities and authorities delegated to it by its regional delegation agreement with NERC except with the approval of NERC and FERC and other Applicable Governmental Authorities. Responsibilities and authorities may only be sub-delegated to another Regional Entity. Regional Entities may share resources with one another so long as such arrangements do not result in cross-subsidization or in any sub-delegation of authorities.

1206. Nonconformance to Rules or Terms of Regional Delegation Agreement

If a Regional Entity is unable to comply or is not in compliance with an ERO Rule of Procedure or the terms of the regional delegation agreement, the Regional Entity shall immediately notify NERC in writing, describing the area of nonconformance and the reason for not being able to conform to the Rule of Procedure. NERC shall evaluate each case and inform the affected Regional Entity of the results of the evaluation. If NERC determines that a Rule of Procedure or term of the regional delegation agreement has been violated by a Regional Entity or cannot practically be implemented by a Regional Entity, NERC shall notify the Applicable Governmental Authorities and take any actions necessary to address the situation.

1207. Regional Entity Audits

Approximately every five years and more frequently if necessary for cause, NERC shall audit each Regional Entity to verify that the Regional Entity continues to comply with NERC Rules of Procedure and the obligations of NERC delegation agreement. Audits of Regional Entities shall be conducted, to the extent practical, based on professional auditing standards recognized in the U.S., including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, and if applicable to the coverage of the audit, may be based on Canadian or other international standards. The audits required by this Section 1207 shall not duplicate the audits of Regional Entity Compliance Monitoring and Enforcement Programs provided for in **Appendix 4A**, Audit of Regional Compliance Programs, to these Rules of Procedure.

1208. Process for Considering Registered Entity Requests to Transfer to Another Regional Entity

1. A Registered Entity that is registered in the Region of one Regional Entity and believes its registration should be transferred to a different Regional Entity may submit a written request to both Regional Entities requesting that they process the proposed transfer in accordance with this section. The Registered Entity's written request shall set forth the reasons the Registered Entity believes justify the proposed transfer and shall describe any impacts of the proposed transfer on other Bulk Power System owners, operators, and users.

2. After receiving the Registered Entity's written request, the two Regional Entities shall consult with each other as to whether they agree or disagree that the requested transfer is appropriate. The Regional Entities may also consult with affected Reliability Coordinators, Balancing Authorities and Transmission Operators as appropriate. Each Regional Entity shall post the request on its website for public comment period of 21 days. In evaluating the proposed transfer, the Regional Entities shall consider the location of the Registered Entity's Bulk Power System facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators; and users, the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments to other Load-Serving Entities of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity would be transitioned from the current Regional Entity to the transferee Regional Entity; along with any other reasons for the proposed transfer stated by the Registered Entity and any other reasons either Regional Entity considers relevant. The Regional Entities may

request that the Registered Entity provide additional data and information concerning the proposed transfer for the Regional Entities' use in their evaluation. The Registered Entity's current Regional Entity shall notify the Registered Entity in writing as to whether (i) the two Regional Entities agree that the requested transfer is appropriate, (ii) the two Regional Entities agree that the requested transfer is not appropriate and should not be processed further, or (iii) the two Regional Entities disagree as to whether the proposed transfer is appropriate.

3. If the two Regional Entities agree that the requested transfer is appropriate, they shall submit a joint written request to NERC requesting that the proposed transfer be approved and that the delegation agreement between NERC and each of the Regional Entities be amended accordingly. The Regional Entities' joint written submission to NERC shall describe the reasons for the proposed transfer; the location of the Registered Entity's Bulk Power System Facilities in relation to the geographic and electrical boundaries of the respective Regions; the impacts of the proposed transfer on other Bulk Power System owners, operators, and users; the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments of each Regional Entity, including the sufficiency of the proposed transferee Regional Entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the Registered Entity; the Registered Entity's compliance history with its current Regional Entity; and the manner in which pending compliance monitoring and enforcement matters concerning the Registered Entity will be transitioned from the current Regional Entity to the transferee Regional Entity. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

4. If the two Regional Entities do not agree with each other that the proposed transfer is appropriate, the Regional Entity supporting the proposed transfer shall, if requested by the Registered Entity, submit a written request to NERC to approve the transfer and the related delegation agreement amendments. The Regional Entity's written request shall include the information specified in Section 1208.3. The Regional Entity that does not believe the proposed transfer is appropriate will be allowed to submit a written statement to NERC explaining why the Regional Entity believes the transfer is not appropriate and should not be approved. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the Regional Entities and any other information the Board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC Board may request that the Regional Entities provide additional information, or obtain additional

information from the Registered Entity, for the use of the NERC Board in making its decision. If the NERC Board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

5. Prior to action by the NERC Board of Trustees on a proposed transfer of registration under Section 1208.3 or 1208.4, NERC shall post information concerning the proposed transfer, including the submissions from the Regional Entities, on its website for at least twenty-one (21) days for the purpose of receiving public comment.

6. If the NERC Board of Trustees disapproves a proposed transfer presented to it pursuant to either Section 1208.3 or 1208.4, the Regional Entity or Regional Entities that believe the transfer is appropriate may, if requested to do so by the Registered Entity, file a petition with FERC pursuant to 18 C.F.R. section 39.8(f) and (g) requesting that FERC order amendments to the delegation agreements of the two Regional Entities to effectuate the proposed transfer.

7. No transfer of a Registered Entity from one Regional Entity to another Regional Entity shall be effective (i) unless approved by FERC, and (ii) any earlier than the first day of January of the second calendar year following approval by FERC, unless an earlier effective date is agreed to by both Regional Entities and NERC and approved by FERC.

SECTION 1300 — COMMITTEES

1301. Establishing Standing Committees

The Board may from time to time create standing committees. In doing so, the Board shall approve the charter of each committee and assign specific authority to each committee necessary to conduct business within that charter. Each standing committee shall work within its Board-approved charter and shall be accountable to the Board for performance of its Board-assigned responsibilities. A NERC standing committee may not delegate its assigned work to a member forum, but, in its deliberations, may request the opinions of and consider the recommendations of a member forum.

1302. Committee Membership

Each committee shall have a defined membership composition that is explained in its charter. Committee membership may be unique to each committee, and can provide for balanced decision-making by providing for representatives from each Sector or, where Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area. Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate Net Energy for Load. All committees and other subgroups (except for those organized on other than a Sector basis because Sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area) must ensure that no two stakeholder Sectors are able to control the vote on any matter, and no single Sector is able to defeat a matter. With regard to committees and subgroups pertaining to development of, interpretation of, or compliance with Reliability Standards, NERC shall provide a reasonable opportunity for membership from Sectors desiring to participate. Committees and subgroups organized on other than a Sector basis shall be reported to the NERC Board and the Member Representatives Committee, along with the reasons for constituting the committee or subgroup in the manner chosen. In such cases and subject to reasonable restrictions necessary to accomplish the mission of such committee or subgroup, NERC shall provide a reasonable opportunity for additional participation, as members or official observers, for Sectors not represented on the committee or subgroup.

1303. Procedures for Appointing Committee Members

Committee members shall be nominated and selected in a manner that is open, inclusive, and fair. Unless otherwise stated in these Rules of Procedure or approved by the Board, all committee member appointments shall be approved by the board, and committee officers shall be appointed by the Chairman of the Board.

1304. Procedures for Conduct of Committee Business

1. Notice to the public of the dates, places, and times of meetings of all committees, and all nonconfidential material provided to committee members, shall be posted

on NERC's website at approximately the same time that notice is given to committee members. Meetings of all standing committees shall be open to the public, subject to reasonable limitations due to the availability and size of meeting facilities; provided that the meeting may be held in or adjourn to closed session to discuss matters of a confidential nature, including but not limited to personnel matters, compliance enforcement matters, litigation, or commercially sensitive or Critical Energy Infrastructure Information of any entity.

2. NERC shall maintain a set of procedures, approved by the Board, to guide the conduct of business by standing committees.

1305. Committee Subgroups

Standing committees may appoint subgroups using the same principles as in Section 1302.

SECTION 1400 — AMENDMENTS TO THE NERC RULES OF PROCEDURE

1401. Proposals for Amendment or Repeal of Rules of Procedure

In accordance with the Bylaws of NERC, requests to amend or repeal the Rules of Procedure may be submitted by (1) any fifty Members of NERC, which number shall include Members from at least three membership Sectors, (2) the Member Representatives Committee, (3) a committee of NERC to whose function and purpose the Rule of Procedure pertains, or (4) an officer of NERC.

1402. Approval of Amendment or Repeal of Rules of Procedure

Amendment to or repeal of Rules of Procedure shall be approved by the Board after public notice and opportunity for comment in accordance with the Bylaws of NERC. In approving changes to the Rules of Procedure, the Board shall consider the inputs of the Member Representatives Committee, other ERO committees affected by the particular changes to the Rules of Procedure, and other stakeholders as appropriate. After Board approval, the amendment or repeal shall be submitted to the Applicable Governmental Authorities for approval, where authorized by legislation or agreement. No amendment to or repeal of the Rules of Procedure shall be effective until it has been approved by the Applicable Governmental Authorities.

SECTION 1500 — CONFIDENTIAL INFORMATION

1501. Definitions

1. **Confidential Information** means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition.

2. **Confidential Business and Market Information** means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

3. **Critical Energy Infrastructure Information** means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.

4. **Critical Infrastructure** means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

5. **Cyber Security Incident Information** means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

1502. Protection of Confidential Information

1. **Identification of Confidential Information** — An owner, operator, or user of the Bulk Power System and any other party (the "Submitting Entity") shall mark as confidential any information that it submits to NERC or a Regional Entity (the "Receiving Entity") that it reasonably believes contains Confidential Information as defined by these Rules of Procedure, indicating the category or categories defined in Section 1501 in which the information falls. If the information is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the Submitting Entity shall so indicate and provide supporting references and details.

2. **Confidentiality** — Except as provided herein, a Receiving Entity shall keep in confidence and not copy, disclose, or distribute any Confidential Information or

any part thereof without the permission of the Submitting Entity, except as otherwise legally required.

3. **Information no longer Confidential –** If a Submitting Entity concludes that information for which it had sought confidential treatment no longer qualifies for that treatment, the Submitting Entity shall promptly so notify NERC or the relevant Regional Entity.

1503. Requests for Information

1. **Limitation** — A Receiving Entity shall make information available only to one with a demonstrated need for access to the information from the Receiving Entity.

2. **Form of Request** — A person with such a need may request access to information by using the following procedure:

   2.1 The request must be in writing and clearly marked "Request for Information."

   2.2 The request must identify the individual or entity that will use the information, explain the requester's need for access to the information, explain how the requester will use the information in furtherance of that need, and state whether the information is publicly available or available from another source or through another means. If the requester seeks access to information that is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the requester shall describe how it qualifies to receive such information.

   2.3 The request must stipulate that, if the requester does not seek public disclosure, the requester will maintain as confidential any information received for which a Submitting Party has made a claim of confidentiality in accordance with NERC's rules. As a condition to gaining access to such information, a requester shall execute a non-disclosure agreement in a form approved by NERC's Board of Trustees.

3. **Notice and Opportunity for Comment** — Prior to any decision to disclose information marked as confidential, the Receiving Entity shall provide written notice to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed. Failure to provide such comments or otherwise respond is not deemed waiver of the claim of confidentiality.

4. **Determination by ERO or Regional Entity** — Based on the information provided by the requester under Rule 1503.2, any comments provided by the Submitting Entity, and any other relevant available information, the chief

executive officer or his or her designee of the Receiving Entity shall determine whether to disclose such information.

5. **Appeal** — A person whose request for information is denied in whole or part may appeal that determination to the President of NERC (or the President's designee) within 30 days of the determination. Appeals filed pursuant to this Section must be in writing, addressed to the President of NERC (or the President's designee), and clearly marked "Appeal of Information Request Denial."

   NERC will provide written notice of such appeal to the Submitting Entity and an opportunity for the Submitting Entity to either waive objection to disclosure or provide comments as to why the Confidential Information should not be disclosed; provided that any such comments must be received within 30 days of the notice and any failure to provide such comments or otherwise respond is not deemed a waiver of the claim of confidentiality.

   The President of NERC (or the President's designee) will make a determination with respect to any appeal within 30 days. In unusual circumstances, this time limit may be extended by the President of NERC (or the President's designee), who will send written notice to the requester setting forth the reasons for the extension and the date on which a determination on the appeal is expected.

6. **Disclosure of Information** — In the event the Receiving Entity, after following the procedures herein, determines to disclose information designated as Confidential Information, it shall provide the Submitting Entity no fewer than 21 days' written notice prior to releasing the Confidential Information in order to enable such Submitting Entity to (a) seek an appropriate protective order or other remedy, (b) consult with the Receiving Entity with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Section. Should a Receiving Entity be required to disclose Confidential Information, or should the Submitting Entity waive objection to disclosure, the Receiving Entity shall furnish only that portion of the Confidential Information which the Receiving Entity's counsel advises is legally required.

7. **Posting of Determinations on Requests for Disclosure of Confidential Information** — Upon making its determination on a request for disclosure of Confidential Information, NERC or the Regional Entity, as applicable, shall (i) notify the requester that the request for disclosure is granted or denied, (ii) publicly post any determination to deny the request to disclose Confidential Information, including in such posting an explanation of the reasons for the denial (but without in such explanation disclosing the Confidential Information), and (iii) publicly post any determination that information claimed by the Submitting Entity to be Confidential Information is not Confidential Information (but without in such posting disclosing any information that has been determined to be Confidential Information).

1504. Employees, Contractors and Agents

A Receiving Entity shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom Confidential Information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

1505. Provision of Information to FERC and Other Governmental Authorities

1. **Request** — A request from FERC for reliability information with respect to owners, operators, and users of the Bulk Power System within the United States is authorized by Section 215 of the Federal Power Act. Other Applicable Governmental Authorities may have similar authorizing legislation that grants a right of access to such information. Unless otherwise directed by FERC or its staff or the other Applicable Governmental Authority requesting the information, upon receiving such a request, a Receiving Entity shall provide contemporaneous notice to the applicable Submitting Entity. In its response to such a request, a Receiving Entity shall preserve any mark of confidentiality and shall notify FERC or other Applicable Governmental Authorities that the Submitting Entity has marked the information as confidential.

2. **Continued Confidentiality** — Each Receiving Entity shall continue to treat as confidential all Confidential Information that it has submitted to NERC or to FERC or another Applicable Governmental Authority, until such time as FERC or the other Applicable Governmental Authority authorizes disclosure of such information.

1506. Permitted Disclosures

1. **Confirmed Violations** — Nothing in this Section 1500 shall prohibit the disclosure of a violation at the point when the matter is filed with an Applicable Governmental Authority as a Notice of Penalty, the "violator" admits to the violation, or the alleged violator and NERC or the Regional Entity reach a settlement regarding the violation.

2. **Compliance Information** — NERC and the Regional Entities are authorized to exchange Confidential Information related to evaluations, Compliance Audits, and Compliance Investigations in furtherance of the Compliance Monitoring and Enforcement Program, on condition they continue to maintain the confidentiality of such information.

1507. Remedies for Improper Disclosure

Any person engaged in NERC or Regional Entity activity under Section 215 of the Federal Power Act or the equivalent laws of other Applicable Governmental Authorities who improperly discloses information determined to be confidential may lose access to Confidential Information on a temporary or permanent basis and may be subject to adverse personnel action, including suspension or termination. Nothing in Section 1500

precludes an entity whose information was improperly disclosed from seeking a remedy in an appropriate court.

SECTION 1600 — REQUESTS FOR DATA OR INFORMATION

1601. Scope of a NERC or Regional Entity Request for Data or Information

Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these Rules of Procedure and as may be granted by Applicable Governmental Authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to Requirements contained in any Reliability Standard to provide data or information; the Requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.

1602. Procedure for Authorizing a NERC Request for Data or Information

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in Section 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with Section 1602.2 or issuing the request or modification to Reporting Entities following approval by the Board of Trustees.

2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.

    2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("Reporting Entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "Confidential Information," "Critical Energy Infrastructure Information,"

"aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the Reporting Entities to accommodate the data or information request.

2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the Reporting Entities to accommodate the modified data or information request, and (iii) any other items from Section 1602.2.1 that require updating as a result of the modifications.

3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.

4. In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.

5. NERC may make minor changes to an authorized request for data or information without Board approval. However, if a Reporting Entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.

6. Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the Applicable Governmental Authority.

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the Bulk Power System registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a Reporting Entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the Reporting Entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1604. Requests by Regional Entity for Data or Information

1. A Regional Entity may request that NERC seek authorization for a request for data or information to be applicable within the Region of the Regional Entity, either as a freestanding request or as part of a proposed NERC request for data or information. Any such request must be consistent with this Section 1600.

2. A Regional Entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural elements as are included in this Section 1600. Any such Regional Entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other Applicable Governmental Authorities applicable to the Regional Entity. The Regional Entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other Applicable Governmental Authority.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the Bulk Power System, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is

reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.

4. The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the Applicable Governmental Authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's website.

SECTION 1700 — CHALLENGES TO DETERMINATIONS

1701. Scope of Authority

Section 1702 sets forth the procedures to be followed for Registered Entities to challenge determinations made by Planning Coordinators under Reliability Standard PRC-023. Section 1703 sets forth the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

1702. Challenges to Determinations by Planning Coordinators Under Reliability Standard PRC-023

1. This Section 1702 establishes the procedures to be followed when a Registered Entity wishes to challenge a determination by a Planning Coordinator of the sub-200 kV circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers (defined as "Registered Entities" for purposes of this Section 1702) must comply with the requirements of Reliability Standard PRC-023.

2. Planning Coordinator Procedures

    2.1 Each Planning Coordinator shall establish a procedure for a Registered Entity to submit a written request for an explanation of a determination made by the Planning Coordinator under PRC-023.

    2.2 A Registered Entity shall follow the procedure established by the Planning Coordinator for submitting the request for explanation and must submit any such request within 60 days of receiving the determination under PRC-023 from the Planning Coordinator.

    2.3 Within 30 days of receiving a written request from a Registered Entity, the Planning Coordinator shall provide the Registered Entity with a written explanation of the basis for its determination under PRC-023, unless the Planning Coordinator provided a written explanation of the basis for its determination when it initially informed the Registered Entity of its determination.

3. A Registered Entity may challenge the determination of the Planning Coordinator by filing with the appropriate Regional Entity, with a copy to the Planning Coordinator, within 60 days of receiving the written explanation from the Planning Coordinator. The challenge shall include the following: (a) an explanation of the technical reasons for its disagreement with the Planning Coordinator's determination, along with any supporting documentation, and (b) a copy of the Planning Coordinator's written explanation. Within 30 days of receipt of a challenge, the Planning Coordinator may file a response to the Regional Entity, with a copy to the Registered Entity.

4. The filing of a challenge in good faith shall toll the time period for compliance with PRC-023 with respect to the subject facility until such time as the challenge is withdrawn, settled or resolved.

5. The Regional Entity shall issue its written decision setting forth the basis of its determination within 90 days after it receives the challenge and send copies of the decision to the Registered Entity and the Planning Coordinator. The Regional Entity may convene a meeting of the involved entities and may request additional information. The Regional Entity shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

6. A Planning Coordinator or Registered Entity affected by the decision of the Regional Entity may, within 30 days of the decision, file an appeal with NERC, with copies to the Regional Entity and the Planning Coordinator or Registered Entity. The appeal shall state the basis of the objection to the decision of the Regional Entity and shall include the Regional Entity decision, the written explanation of the Planning Coordinator's determination under PRC-023, and the documents and reasoning filed by the Registered Entity with the Regional Entity in support of its objection. The Regional Entity, Planning Coordinator or Registered Entity may file a response to the appeal within 30 days of the appeal.

7. The Board of Trustees shall appoint a panel to decide appeals from Regional Entity decisions under Section 1702.5. The panel, which may contain alternates, shall consist of at least three appointees, one of whom must be a member of the NERC staff, who are knowledgeable about PRC-023 and transmission planning and do not have a direct financial or business interest in the outcome of the appeal. The panel shall decide the appeal within 90 days of receiving the appeal from the decision of the Regional Entity and shall affirm the determination of the Planning Coordinator if it is supported by substantial evidence.

8. The Planning Coordinator or Registered Entity affected by the decision of the panel may request that the Board of Trustees review the decision by filing its request for review and a statement of reasons with NERC's Chief Reliability Officer within 30 days of the panel decision. The Board of Trustees may, in its discretion, decline to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. Within 90 days of the request for review under this Section 1702.8, the Board of Trustees may either (a) issue a decision on the merits, which shall be the final NERC decision, or (b) issue a notice declining to review the decision of the panel, in which case the decision of the panel shall be the final NERC decision. If no written decision or notice declining review is issued within 90 calendar days, the appeal shall be deemed to have been denied by the Board of Trustees and this will have the same effect as a notice declining review.

9. The Registered Entity or Planning Coordinator may appeal the final NERC decision to the Applicable Governmental Authority within 30 days of receipt of

the Board of Trustees' final decision or notice declining review, or expiration of the 90-day review period without any action by NERC.

10. The Planning Coordinator and Registered Entity are encouraged, but not required, to meet to resolve any dispute, including use of mutually agreed to alternative dispute resolution procedures, at any time during the course of the matter. In the event resolution occurs after the filing of a challenge, the Registered Entity and Planning Coordinator shall jointly provide to the applicable Regional Entity a written acknowledgement of withdrawal of the challenge or appeal, including a statement that all outstanding issues have been resolved.

1703. Challenges to NERC Determinations of BES Exception Requests Under Section 509

1. This Section 1703 establishes the procedures to be followed when a Submitting Entity or Owner wishes to challenge a determination by NERC to approve or to disapprove an Exception Request or to terminate an Exception under Section 509.

2. A Submitting Entity (or Owner if different) aggrieved by the decision of NERC to approve or disapprove an Exception Request or to terminate an Exception with respect to any Element may, within 30 days following the date of the decision, file a written challenge to the decision with the NERC director of compliance operations, with copies to the Regional Entity and the Submitting Entity or Owner if different. The challenge shall state the basis of the objection to the decision of NERC. The Regional Entity, and the Submitting Entity or Owner if different, may file a response to the challenge within 30 days following the date the challenge is filed with NERC.

3. The challenge shall be decided by the Board of Trustees Compliance Committee. Within 90 days of the date of submission of the challenge, the Board of Trustees Compliance Committee shall issue its decision on the challenge. The decision of the Board of Trustees Compliance Committee shall be the final NERC decision; provided, that the Board of Trustees Compliance Committee may extend the deadline date for its decision to a date more than 90 days following submission of the challenge, by issuing a notice to the Submitting Entity, the Owner (if different) and the Regional Entity stating the revised deadline date and the reason for the extension.

4. The Submitting Entity, or Owner if different, may appeal the final NERC decision to, or seek review of the final NERC decision by, the Applicable Governmental Authority(ies), in accordance with the legal authority and rules and procedures of the Applicable Governmental Authority(ies). Any such appeal shall be filed within thirty (30) days following the date of the decision of the Board of Trustees Compliance Committee, or within such other time period as is provided for in the legal authority, rules or procedures of the Applicable Governmental Authority.

Section I — Executive Summary

Overview

The purpose of this document is twofold: (1) to define the process utilized in the Organization Registration Program for identifying which functional entities must register as owners, operators, and users of the Bulk Power System (BPS) for compliance with Reliability Standards; and (2) to define the process utilized in the Organization Certification Program for certifying the following entities: Reliability Coordinator (RC), Balancing Authority (BA), and Transmission Operator (TOP). The North American Electric Reliability Corporation (NERC) Compliance and Certification Committee (CCC) is responsible for approving and forwarding these processes to the NERC Board of Trustees (Board) for its approval. Where a proposal for revisions to these processes comes to the Board from sources other than the CCC, the Board will seek the concurrence of the CCC before taking action on the proposal.

To Whom Does This Document Apply?

All industry participants responsible for or intending to be responsible for, the following functions must register with NERC through the Organization Registration process. The entities are defined in the NERC *Statement of Compliance Registry Criteria*, set forth in **Appendix 5B** to the NERC Rules of Procedure (ROP), with responsibilities designated by the individual Reliability Standards or by a sub-set list of the otherwise applicable Reliability Standards. Such sub-set list will specify the Reliability Standards and may specify Requirements/sub-Requirements by NERC, in which case the entity will be responsible for compliance with only such sub-set list, in accordance with **Appendix 5B** to the NERC ROP.

	Entities that Must Register	Entities that Need to be Certified
Reliability Coordinator (RC)	√	√
Transmission Operator (TOP)	√	√
Balancing Authority (BA)	√	√
Planning Authority (PA)	√	
Transmission Planner (TP)	√	
Transmission Service Provider (TSP)	**√**	
Transmission Owner (TO)	**√**	
Resource Planner (RP)	**√**	
Distribution Provider (DP)	**√**	
Generator Owner (GO)	**√**	
Generator Operator (GOP)	**√**	
~~Load-Serving Entity (LSE)~~	~~**√**~~	
Reserve Sharing Group (RSG)	√	

When did These Processes Begin?

The initial Registration process began in January of 2006. Registration of new entities is an ongoing process. If a Registered Entity's information changes, these changes must be submitted to the applicable Regional Entity(s).

Certification is ongoing for new entities in accordance with Section IV of this manual.

Where to Access and Submit Form(s)?

Registration and Certification forms are provided on each Regional Entity's website. Completed forms are to be sent electronically to the Compliance and Certification Manager of the applicable Regional Entity(s). It is desirable

that entities operate within a single Regional Entity Region; however, if an entity operates in more than one Region, separate Registration applications must be completed and submitted to each of the Regional Entities.

Service

Unless otherwise provided, service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made.

Roles and Responsibilities

The following is a high-level overview of the roles and responsibilities in the Registration and Certification processes:

NERC

1. Oversight of entity processes performed by the Regional Entities, including:
   a. Governance per the Regional Entity's delegation agreement with NERC.
   b. Coordination of process execution when an entity is registering and/or certifying with multiple Regional Entities.
2. Manage each entity's NERC Compliance Registry identification number (NERC ID) including:
   a. Sending a Registration or Certification letter that contains the NERC ID to the applicable Regional Entity(ies) for review and approval. If the Regional Entity(ies) agrees with all the information provided, it will notify NERC to issue the NERC ID to the Registered Entity and will send a copy of the notification being provided to the Regional Entity(ies).
   b. Ensuring each Registered Entity has only one NERC ID for all Regional Entities in which registered.
3. Make modeling changes based on Registration information.
4. Maintain accurate Registration and Certification records including granting Certification certificates for the Registered Entity(ies) responsible for compliance (including Joint Registration Organization (JRO)/Coordinated Functional Registration (CFR)).
5. Maintain published up-to-date list of Registered Entities (i.e. the NERC Compliance Registry (NCR)) on the NERC website. NERC maintains the NCR, which identifies each Registered Entity and the applicable functional categories for which it is registered.
6. Lead panel reviews in accordance with **Appendix 5A,** *Organization Registration and Organization Certification Manual*, Section III.D and **Appendix 5B**, *Statement of Compliance Registry Criteria*.

Regional Entity

1. Performs data collection and Mapping of BPS Facilities and those Facilities that have a material impact on the BPS within its Regional Entity defined reliability Region boundaries.
2. Approves or disapproves entity Registration applications.
3. Reviews entity Certification applications for completeness.
4. Notifies NERC of entities registered with the Regional Entity.
5. Approves or denies Certification Team (CT) recommendations and notifies the entity and NERC of the decision.

6. Provides leadership to the CT throughout the Certification process.

Entity Submitting the Application

1. Completes and submits Registration and/or Certification application.
2. Submits updates to Registration and/or Certification information as necessary and/or requested.
3. Responds to Regional Entity and/or NERC questions pertaining to Registration and/or Certification.
4. Provides documentation or other evidence requested or required to verify compliance with Certification requirements.

Section II — Introduction to Organization Registration and Organization Certification Processes

The processes utilized to implement the Organization Registration and Organization Certification Programs are administered by each Regional Entity. Pursuant to its delegation agreement with NERC, each Regional Entity is responsible for registering and certifying industry participants within its Regional Entity reliability Region boundaries. Each Regional Entity must use the following NERC processes.

Organization Registration — Entities Required to Register

All industry participants responsible for one or more of the functions below must register for each function through the Organization Registration Program. These entities are defined in the NERC *Statement of Compliance Registry Criteria*.

- RC
- TOP
- BA
- PA
- TP
- TSP
- TO
- RP
- DP
- GO
- GOP
- ~~LSE~~
- RSG

The Registration procedure is in Section III of this manual.

Organization Certification

All Registered Entities registered in the NCR for the RC, TOP, and/or BA functions shall be certified. Certification requires the Registered Entity to start operation within 12 months of being NERC certified. This Certification process is described in Section IV of this manual.

Section III — Organization Registration Process

Purpose and Scope

The purpose and scope of this process is to provide guidance on how a user, owner, and/or operator of the BPS should be registered in the NCR.

Overview

Section 39.2 of the Commission's regulations, and Title 18 of the C.F.R. § 39.2, requires each owner, operator, and user of the BPS to be registered with NERC and to comply with approved Reliability Standards.

Owners, operators, and users of the BPS will be registered by function(s) and are:

1. Responsible for compliance with all applicable Requirements/sub-Requirements within Reliability Standards approved by Applicable Governmental Authorities, for the applicable functions for which the Registered Entity is registered, except to the extent that an entity is granted a sub-set list of applicable Reliability Standards, which specifies the Reliability Standards and may specify Requirements/sub-Requirements by NERC, in which case the entity will be responsible for compliance with only such sub-set list; and,
2. Subject to the compliance monitoring and enforcement requirements of Section 400 of the ROP.

See Figure 1A Organization Registration Process Overview.

A. Organization Registration Process

1. Applicable entities shall begin the Registration process by submitting a completed Registration application to the Regional Entity(ies) of the reliability Region(s) where the entity intends to perform its function(s) (Registration forms are provided on each Regional Entity's website).
    a. At any time, an entity may recommend in writing, with supporting documentation, to the Regional Entity(ies) that an entity be added to or removed from the Compliance Registry.
    b. The Registration process for an entity may also be initiated by a Regional Entity, NERC, or Applicable Governmental Authority.
    c. With respect to: (i) entities to be registered for the first time; (ii) currently-registered entities or (iii) previously-registered entities, for which registration status changes are sought, including availability and composition of a sub-set list of applicable Reliability Standards (which specifies the Reliability Standards and may specify Requirements/sub-Requirements), the registration process steps in Section III of **Appendix 5A** apply.
    d. At any time, an entity whose registration is at issue may request expedited treatment and waiver of applicable timelines. NERC, in its sole discretion, shall determine if such a request will be granted and alternative timelines. NERC's decision is not a final decision that is subject to appeal.
2. NERC shall coordinate Registration of entities that are required to register with multiple Regional Entities in order to ensure consistency of the Registration process.
3. For entities that are required to be certified, the applicable Regional Entity(ies) shall ensure that the Registration information provided is accurate for updating the NCR per items 4 through 12 below and notifies the entity to initiate the Certification process per Section IV of this manual.
4. Entities that have a NERC ID shall use it on the form.

a. If an entity does not have a NERC ID, NERC shall assign one.

b. An entity responsible for more than one function will use a single NERC ID.

5. Regional Entities shall evaluate the submitted information and determine if the information is complete/correct. If the information is not complete/correct, the entity will be notified to complete/correct or clarify the Registration information.

6. A single entity must register for all functions that it performs itself. In addition, that entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for all Requirements/sub-Requirements of Reliability Standards applicable to that function or those functions including reporting requirements.(ROP Section 507)

7. Multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function.(ROP Section 508)

8. In completing the Regional Entity responsibilities for the Registration process, the following are key items the Regional Entity must verify:

   a. That Regional Entity registrations meet the geographical and electrical Registration boundaries requirements of the ROP Section 501(1.4).

   b. The Registration submission includes all data requested by NERC that is necessary for accurately identifying and contacting the Registered Entity.

9. The Regional Entity shall forward all Registration information to NERC for inclusion of an entity on the NCR:

   a. If the Registration determination involves (i) the materiality test set forth in the notes in **Appendix 5B**, *Statement of Compliance Registry Criteria*; (ii) a sub-set list of Reliability Standards (which specifies Requirements and may specify sub-Requirements);[1] or (iii) a dispute by an entity whose registration status is at issue regarding the Regional Entity's application of **Appendix 5B**, *Statement of Compliance Registry Criteria*, a NERC-led review panel will be convened in accordance with **Appendix 5A**, *Organization Registration and Organization Certification Manual*, Section III.D.

   b. Within five business Days of a Registration determination by NERC or the NERC-led review panel, as applicable, NERC will forward the proposed additions or changes to the NCR to the Regional Entity for review and comment.

   c. The Regional Entity has five business Days to respond to the proposed changes.

   d. If NERC does not receive any comments, the NCR will be revised. If NERC does receive comments, NERC will work with the Regional Entity to the extent changes are needed to the NCR and will revise the NCR accordingly.

10. NERC updates the NCR and notifies the applicable Registered Entity(ies) within five business Days of the update.

[1] If NERC has established clearly defined criteria for eligibility for a sub-set list of applicable Reliability Standards and has identified the sub-set list that may apply to similarly situated entities, such criteria shall govern the applicability of such sub-set list and such a matter shall not proceed to the NERC-led review panel, unless there is a dispute by the entity whose sub-set list treatment is at issue. (See, e.g., UFLS-Only DPs.)

11. The Registered Entity may appeal the final registration determination by NERC in accordance with the ROP Section 500 and Section V of **Appendix 5A**.

12. The NCR shall be dynamic and will be revised as necessary to take account of changing circumstances such as corrections, revisions, and or deletions. Per the Regional Entity's delegation agreement, the Regional Entity will take any recommendation received under Section 1.a, and other applicable information, under advisement as it determines whether an entity should be on the NCR.

    a. Each Registered Entity identified in the NCR shall notify its corresponding Regional Entity and/or NERC of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the Registered Entity's responsibilities with respect to the Reliability Standards. Failure to notify will not relieve the Registered Entity from any responsibility to comply with the Reliability Standards or shield it from any Penalties or sanctions associated with failing to comply with the Reliability Standards. (ROP Section 400).

    b. Each Regional Entity has an independent obligation, even in the absence of a notification by a Registered Entity, to review and submit updates to the NCR to NERC, consistent with the procedures in this Section III, with appropriate notification to the affected entities, to the extent the Regional Entity is aware of, or possesses information that the NCR should be updated. These updates include, but are not limited to, conditions on which the sub-set list are no longer applicable, or where a new and emerging risk to reliability is identified that changes the basis upon which the entity was deactivated, deregistered, or upon which a sub-set list of requirements was made applicable, in addition to deactivation[2] of entities that no longer meet the applicable registration thresholds. This does not excuse the Registered Entity from its obligation to provide such required notifications.

13. Entities registered or subject to registration as a DP that qualify as Underfrequency Load Shedding (UFLS)-Only DPs shall submit Registration information to the Regional Entity. The UFLS-Only DP shall be subject only to the sub-set list of Reliability Standards identified in **Appendix 5B**. Within 50 Days of the entity's submission of the Registration information to the Regional Entity, the Regional Entity shall issue a decision as to whether UFLS-Only DP treatment is appropriate. If the Regional Entity concludes that it is, then the Regional Entity shall forward the information to NERC and NERC will forward the proposed additions or changes to the NCR to the Regional Entity for review and comment. The Regional Entity has five business Days to respond to the proposed changes. If NERC does not receive any comments, the NCR will be revised. If NERC receives comments, NERC will work with the Regional Entity to the extent changes are needed to the NCR and will revise the NCR accordingly. NERC updates the NCR and notifies the applicable Registered Entity(ies) within five business Days of the update. If the entity whose registration is at issue does not agree with the Regional Entity's decision regarding UFLS-Only DP treatment, the entity may, within 30 Days of issuance of the decision, seek review by the NERC-led review panel in **Appendix 5A**, *Organization Re*gistration *and Organization Certification Manual*, Section III.D. If the entity whose registration is at issue does not agree with the determination of the NERC-led review panel, the entity may file an appeal with the NERC Board Compliance Committee (BOTCC) in accordance with the provisions set forth in Section V of this **Appendix 5A**.

13. The Registered Entity may file a registration appeal with the NERC BOTCC in accordance with the provisions set forth in Section V of **Appendix 5A** if it does not agree with the determination of the NERC-led review panel.

14. NERC may extend the timelines for good cause shown. Requests should be sent to the Director of Compliance.[3] NERC shall notify the Registered Entity and the Regional Entity of such time extensions.

[2] See Figure 1B: Deactivation Process Overview

[3] References to the term Director of Compliance in the NERC ROP should be read to include an equivalent position.

B. Deactivation Process

1. The term Deactivation refers to removal of an entity from the NCR for a specific functional category.
2. As a result of Deactivation, the entity is no longer subject to any prospective compliance obligations with respect to Reliability Standards applicable to that functional category.
3. If all functional categories have been deactivated for a given entity, such entity would be deregistered and removed from the NCR. However, the entity's compliance history will be retained. In its letter notifying the entity of its Deactivation or deregistration, as applicable, NERC will notify the entity of the required retention period, in accordance with the NERC ROP.
4. A Registered Entity may submit a request for Deactivation and supporting information to the Regional Entity at any time. Such information shall include:
    a. Entity name and NCR ID number;
    b. Functions for which Deactivation is requested; and
    c. The basis on which Deactivation is requested, including supporting documentation, which may be limited to an attestation, if appropriate.
5. The Regional Entity shall request any additional information from the Registered Entity within 10 Days of receipt of the request for Deactivation.
6. The Registered Entity shall provide the additional information within 20 Days of its request for Deactivation.
7. The Regional Entity will issue a decision within 50 Days of the date of receipt of all requested information from the Registered Entity.
8. If the Regional Entity agrees with the request for Deactivation, it shall forward its Deactivation determination to NERC within five business Days of issuance of the decision.
9. If NERC accepts the Deactivation determination and the Registered Entity agrees with the determination, NERC will forward within five business Days of receipt of the Deactivation determination from the Regional Entity, the proposed additions or changes to the NCR to the Regional Entity for review and comment.
    a. The Regional Entity has five business Days to respond to the proposed changes.
    b. If NERC does not receive any comments, the NCR will be revised. If NERC receives comments, NERC will work with the Regional Entity to the extent changes are needed to the NCR and will revise the NCR accordingly.
10. If the Regional Entity or NERC does not agree with the request for Deactivation, the Registered Entity may seek review by the NERC-led review panel in **Appendix 5A**, *Organization Registration and Organization Certification Manual,* Section III.D.
11. If the Deactivation determination involves (i) the materiality test set forth in the notes in **Appendix 5B**, *Statement of Compliance Registry Criteria*; (ii) a determination that a sub-set list of Reliability Standards (which will specify Reliability Standards and may specify Requirements/sub-Requirements) should apply as an alternative to Deactivation;[4] or (iii) the Registered Entity disagrees with the Regional Entity determination, the determination will be submitted to the NERC-led review panel process in **Appendix**

[4] If NERC has established clearly defined criteria for eligibility for a sub-set list of applicable Reliability Standards and has identified the sub-set list that may apply to similarly situated entities, such criteria shall govern the applicability of such sub-set list and such a matter shall not proceed to the NERC-led review panel, unless there is a dispute by the entity whose sub-set list treatment is at issue. (See, e.g., UFLS-Only DPs.)

5A, *Organization Registration and Organization Certification Manual,* Section III.D within 30 Days after issuance of the determination.

12. If the NERC-led review panel approves the request for Deactivation, NERC will forward within five business Days of the panel decision, the proposed additions or changes to the NCR to the Regional Entity for review and comment.

    a. The Regional Entity has five business Days to respond to the proposed changes.

    b. If NERC does not receive any comments, the NCR will be revised. If NERC receives comments, NERC will work with the Regional Entity to the extent changes are needed to the NCR and will revise the NCR accordingly.

13. The Registered Entity may file a registration appeal with the NERC BOTCC in accordance with the provisions set forth in Section V of **Appendix 5A** if it does not agree with the determination of the NERC-led review panel.

14. NERC may extend the timelines for good cause shown. Requests should be sent to the Director of Compliance. NERC shall notify the Registered Entity and the Regional Entity of such time extensions.

C. Reactivation Process

1. NERC maintains the NCR, which identifies each Registered Entity and the applicable functional categories for which it is registered.

2. The term Reactivation refers to re-registration pursuant to the NERC ROP Section 500 and **Appendices 5A and 5B** of an entity to the NCR for a specific functional category or the revocation of, or additions to, a sub-set list of Reliability Standards (which specifies Reliability Standards and may specify Requirements/sub-Requirements) that has been granted to an entity. Reactivation may be initiated by NERC, a Regional Entity or an entity with respect to such entity's own functional categories or sub-set list of Reliability Standards (which specifies Reliability Standards and may specify Requirements/sub-Requirements).

3. Reactivation shall be governed by the procedures in the NERC ROP Section 500 and Section III.A and, as applicable, Section III.D of this **Appendix 5A**.

4. As a result of Reactivation, and consistent with the implementation plan to be developed pursuant to this paragraph, the entity shall prospectively comply with all Reliability Standards applicable to that functional category, or with the sub-set list specified in the Reactivation determination, unless otherwise notified. Within 30 days of a final Reactivation determination, the entity shall submit a proposed implementation plan to the Regional Entity detailing the schedule for complying with any Reliability Standards applicable to the Reactivation. The Regional Entity and Registered Entity shall confer to agree upon such schedule. If the Regional Entity and Registered Entity are unable to agree on the implementation plan, the Regional Entity shall notify the NERC Director of Compliance of the disagreement, and shall provide statements of the Regional Entity's and the Registered Entity's positions, and NERC shall specify a reasonable implementation schedule.

5. The entity's prior compliance history will be retained and shall apply with respect to the Reactivation. In its letter notifying the entity of its Reactivation, NERC will notify the entity of its registration in accordance with the NERC ROP.

6. The Registered Entity may file a registration appeal with the NERC BOTCC in accordance with the provisions set forth in Section V of **Appendix 5A** if it does not agree with the determination of the NERC-led review panel.

7. NERC may extend the timelines for good cause shown. Requests should be sent to the Director of Compliance. NERC shall notify the Registered Entity and the Regional Entity of such time extensions.

D. NERC-led Review Panel

1. NERC shall establish a NERC-led, centralized review panel, comprised of a NERC lead with Regional Entity participants, to vet requests for Deactivation of, or decisions not to register, an entity that meets Sections I through IV of the Registry Criteria or requests to add an entity that does not meet (i.e., falls below) Sections I through IV of the Registry Criteria, as well as disputes regarding the application of Sections I through IV of the Registration Criteria and requests for a sub-set list of applicable Reliability Standards (which may specify the Requirements/sub-Requirements).

    a. The NERC-led review panel will be comprised of a standing pool of individuals with relevant expertise from NERC and each of the Regional Entities. Individuals with relevant expertise shall be appointed by the Regional Entity senior executive (CEO, President, General Manager, etc.) and individuals with relevant expertise shall be appointed by the NERC senior executive (CEO, President, General Manager, etc.). NERC shall select the panel members for a given matter from the standing pool.

    b. Panel members for a given matter shall comply with Subsection 7 of Section 403 of the NERC ROP, shall not be employed by the Regional Entity whose determination is being reviewed or have otherwise participated in the review of the registration matter, and shall have the required technical background to evaluate registration matters.

2. With respect to review of the application of the criteria contained in the Statement of Compliance Registry Criteria Sections I through IV, the burden of proof is on NERC and the Regional Entity to demonstrate that an entity meets the Registry Criteria for registration.

3. The burden of proof with respect to the materiality test, set forth in **Appendix 5B**, *Statement of Compliance Registry Criteria*, is on the entity making the request, i.e., the entity asking to be excluded from the NCR (despite satisfying the threshold criteria)[5] and the Regional Entity seeking to include an entity in the NCR (that does not satisfy the threshold criteria).

4. The burden of proof with respect to a determination as to whether an entity's compliance obligations should be limited to only a specified sub-set of otherwise applicable Reliability Standards is on the entity requesting such treatment, provided, however, that where NERC has established clearly defined criteria for eligibility for a sub-set of applicable Reliability Standards (which may specify Requirements/sub-Requirements) and has identified the sub-set list that may apply to similarly situated entities (e.g., UFLS-Only DPs), the burden of proof to demonstrate that an entity does not meet the criteria for such a sub-set list is on the Regional Entity and NERC.

5. The entity who bears the burden of proof with respect to application of the materiality test, or a sub-set list of applicable Reliability Standards (which may specify Requirements/sub-Requirements) must submit to NERC, in writing, details of the issues and identification of the Responding Entity,[6] and the applicable Regional Entity(ies), RC, BA, PA and TOP that have (or will have upon registration of the entity) the entity whose registration status is at issue within their respective Scope of Responsibility. NERC will send a

[5] By way of example, the Registered Entity whose Deactivation request was denied by the Regional Entity bears the burden of proof (i.e., on materiality) and both requests panel review and makes the submissions required, under 6(a) and (c), unless the issue involves the Regional Entity's application of the threshold criteria. If the issue involves the Regional Entity's application of the threshold criteria, then the Regional Entity bears the burden of proof and makes the submissions required by sections 6(a) and (c), although it is the Registered Entity who makes the request for panel review.

[6] By way of example, if a Registered Entity is seeking to be deactivated based on the materiality test and therefore bears the burden of proof, then the Responding Entity is the Regional Entity. If a Regional Entity bears the burden of proof in a materiality test case, then the entity whose registration status is at issue is the Responding Entity.

notification to the Regional Entity(ies), the entity whose registration status or sub-set list treatment is at issue, and the referenced RC, BA, PA and TOP acknowledging receipt of the notification of panel review.

a. To ensure there is no confusion with respect to the rights and responsibilities of a Registered Entity during the panel review process, the notification will confirm whether the Registered Entity will remain on the NCR and will be responsible for compliance with approved Reliability Standards applicable to the function under review.

6. The panel review process timelines with respect to application of the materiality test, or sub-set list treatment of applicable Reliability Standards (which may specify Requirements/sub-Requirements) are as follows:

   a. Within 10 Days of the date of the NERC-led review panel notification, the entity with the burden of proof will provide any additional data supporting its request to NERC (who will forward to the NERC-led review panel), the Responding Entity, the applicable Regional Entity(ies), and the RC, BA, PA and TOP that has (or will have upon registration of the entity) the entity whose registration status at issue within their respective Scope of Responsibility.

   b. The Responding Entity will provide a copy of its assessment directly to all parties, as well as to NERC, within 20 Days of the date of the NERC panel review notification. If the RC, BA, PA and TOP provide an assessment, they must provide a copy to all parties, as well as NERC, within 20 Days of the date of the NERC panel review notification.

   c. The entity with the burden of proof may submit a response to the Responding Entity assessment, and any assessment submitted by the RC, BA, PA and TOP, with copies to all parties and NERC, within 30 Days of the date of the NERC panel review notification.

   d. The standard of proof in any proceeding under these procedures shall be by a preponderance of the evidence.

   e. The NERC-led review panel will render its decision within 60 Days of the final submission to the panel.

7. With respect to threshold disputes regarding application of Sections I through IV of **Appendix 5B**, *Statement of Compliance Registry Criteria*, the entity whose registration status is at issue must submit to NERC, in writing, details of the issues and identification of the applicable Regional Entity(ies), RC, BA, PA and TOP that have (or will have upon registration of the entity) the entity whose registration status is at issue within their respective Scope of Responsibility, NERC will send a notification to the Regional Entity(ies), the entity whose registration status is at issue, and the referenced RC, BA, PA and TOP acknowledging receipt of the notification of panel review.

   a. To ensure there is no confusion with respect to the rights and responsibilities of a Registered Entity during the panel review process, the notification will confirm whether the Registered Entity will remain on the NCR and will be responsible for compliance with approved Reliability Standards applicable to the function under review.

8. The panel review process timelines for threshold disputes regarding application off Sections I through IV of **Appendix 5B**, *Statement of Compliance Registry Criteria* are as follows:

   a. The entity whose registration status is at issue will provide NERC (who will forward to the NERC-led review panel), the applicable Regional Entity(ies), and the RC, BA, PA and TOP that has (or will have upon registration of the entity) the entity whose registration status at issue within their respective Scope of Responsibility, any additional data supporting its request within 10 Days of the date of the NERC panel review notification. In such a case, the Regional Entity has the burden of proof on application of the threshold criteria.

   b. The Regional Entity will provide a copy of its assessment directly to all parties, as well as to NERC, within 20 Days of the date of the NERC panel review notification. If the RC, BA, PA and TOP provide

an assessment, they must provide a copy to all parties, as well as NERC, within 20 Days of the date of the NERC panel review notification.

c. The entity whose registration status is at issue may submit a response to the Regional Entity assessment, and any assessment submitted by the RC, BA, PA and TOP, with copies to all parties and NERC, within 30 Days of the date of the NERC panel review notification.

d. The standard of proof in any proceeding under these procedures shall be by a preponderance of the evidence.

e. The NERC-led review panel will render its decision within 60 Days of the final submission to the panel.

9. In reaching a decision, the NERC-led review panel will apply the materiality test and other criteria and notes, as applicable, set forth in **Appendix 5B**, *Statement of Compliance Registry Criteria*. The NERC-led review panel ~~may~~ shall also include a review of individual and aggregate system-wide risks to, and considerations of, reliability of the BPS, as well as the BES Definition, as applicable.

10. NERC may extend the timelines for good cause shown. Requests should be sent to the Director of Compliance. NERC shall notify the entity whose registration status or sub-set list treatment is at issue and the Regional Entity of such time extensions, as well as the RC, BA, PA and TOP, of such time extensions.

11. Once a decision is made, it will be issued to the entity whose registration status or sub-set list treatment is at issue, the Regional Entity and the referenced RC, BA, PA and TOP. The decision (including its basis) will be posted on the NERC website, with confidential information redacted in accordance with Section 1500 of the NERC ROP.

12. NERC will forward within five business Days the proposed additions or changes to the NCR to the Regional Entity for review and comment.

    a. The Regional Entity has 5 business Days to respond to the proposed changes.

    b. If NERC does not receive any comments, the NCR will be revised. If NERC receives comments, NERC will work with the Regional Entity to the extent changes are needed to the NCR and will revise the NCR accordingly.

13. The BOTCC will resolve appeals of registration disputes in accordance with NERC ROP Section 500 and **Appendix 5A,** *Organization Registration and Organization Certification Manual*, Section V.

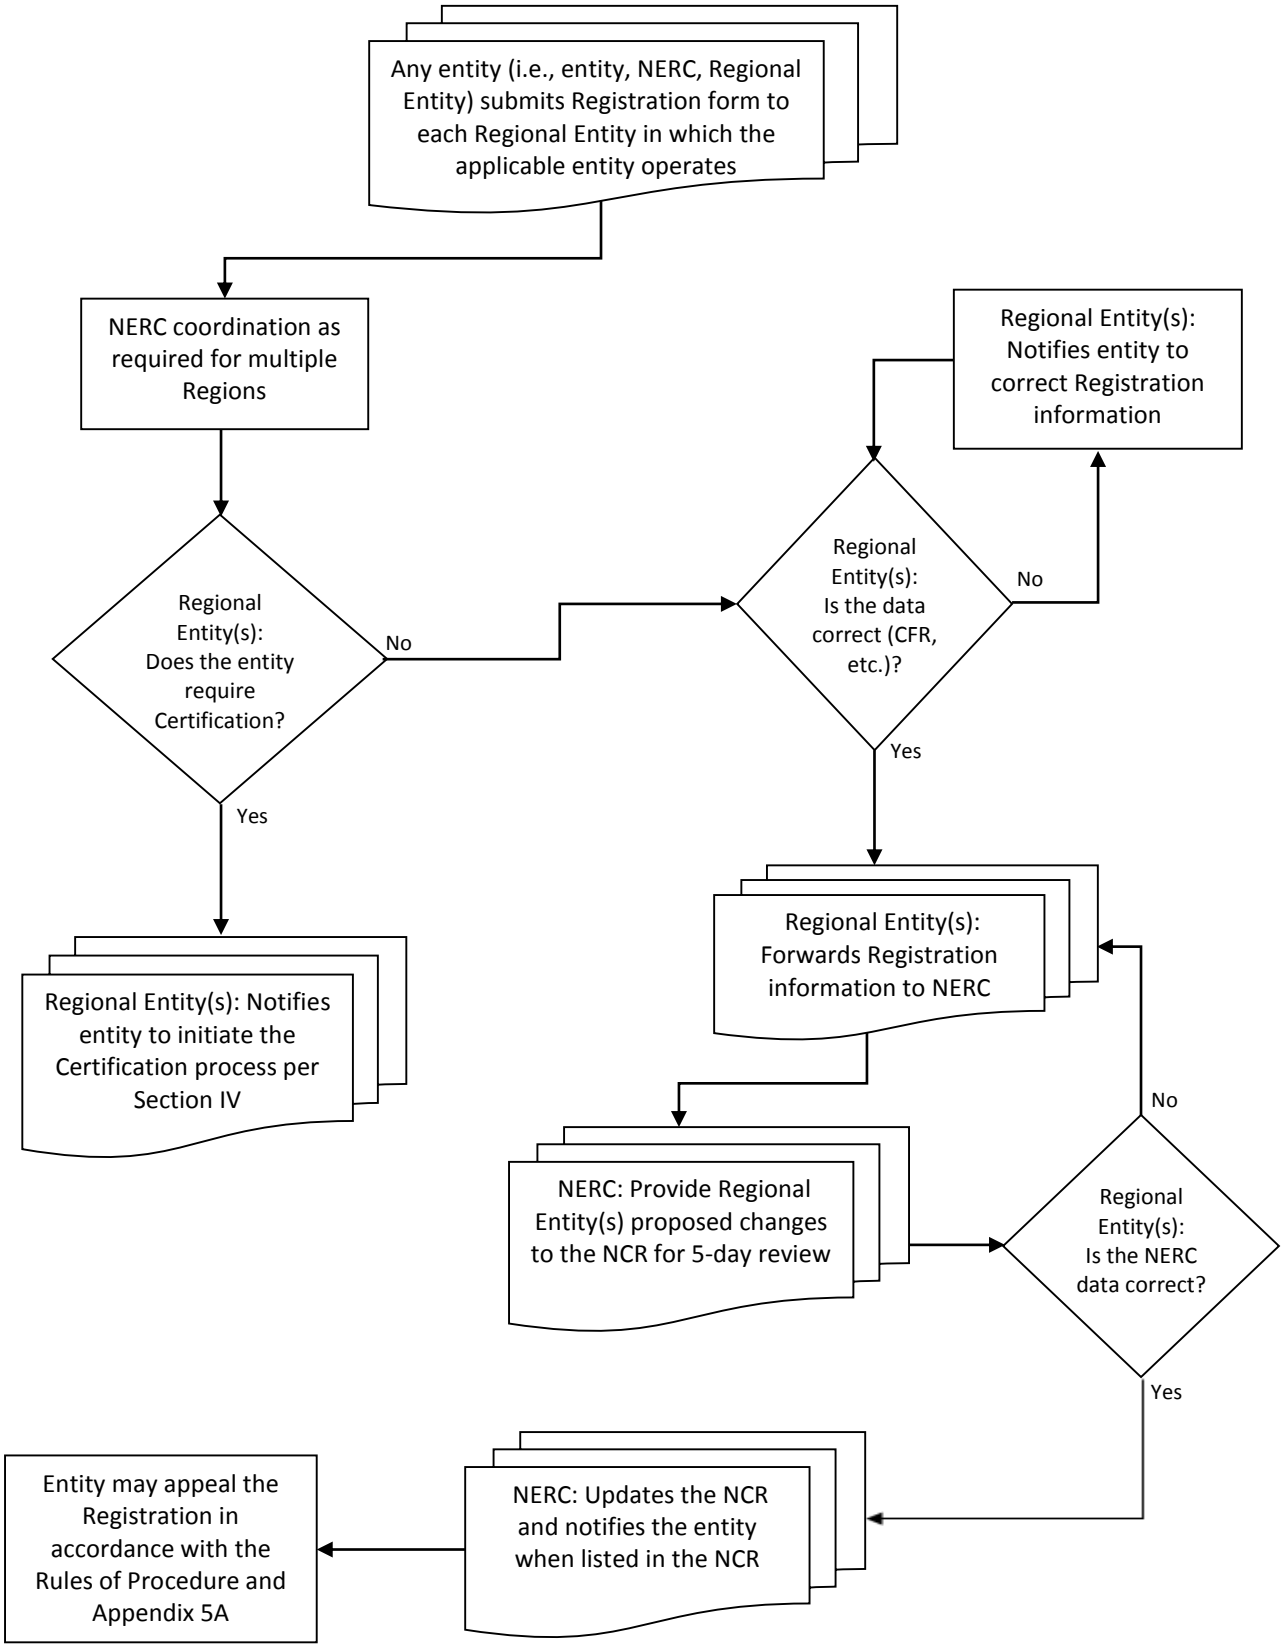

Figure 1A: Organization Registration Process Overview

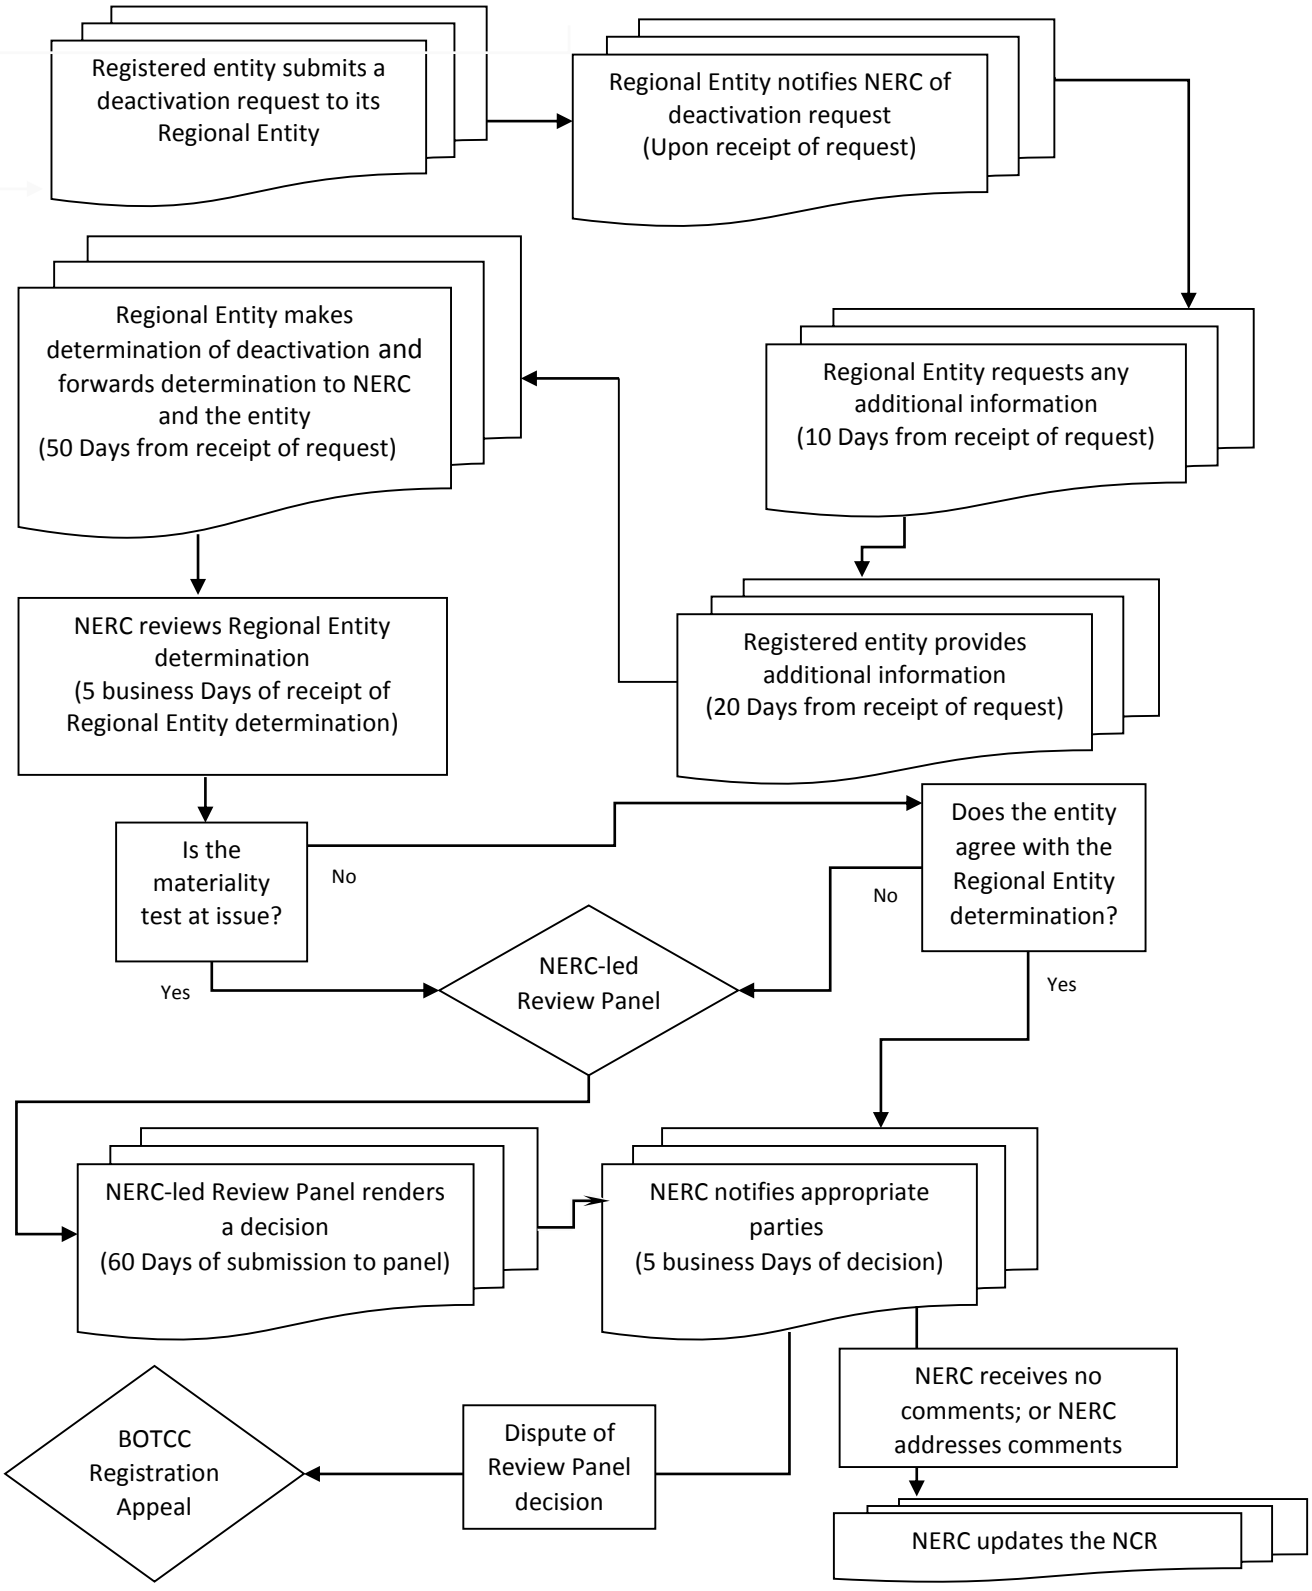

Figure 1B: Deactivation Process Overview

Section IV — Organization Certification Process

Purpose and Scope

The purpose and scope of this process is to provide guidance for completing the Certification of a new entity that will become NERC certified and registered as an RC, TOP, or BA.

Overview

See Figure 2 *Organization Certification Process Overview* for an overview of the Certification process.

Organization Certification Process

1. Certification:

   a. An entity in a single Regional Entity reliability Region shall initiate the Certification process by completing a Certification application (Certification applications are provided on each Regional Entity's website) and sending it to the Regional Entity which will manage the Certification process.

   b. An entity in multiple Regional Entity reliability Regions shall initiate the Certification process by completing a Certification application (Certification applications are provided on each Regional Entity's website) and sending it to the Regional Entities in those reliability Regions. Each Regional Entity will inform NERC of the request. The Regional Entities will determine which Regional Entity will provide the leadership to manage the Certification process.

   c. Provisional Certification Process - All RCs, BAs, and/or TOPs that were already registered and operating on June 18, 2007 become "NERC Certified" upon completion of (1) a NERC readiness evaluation (on site activities completed by the evaluation team); and (2) a CMEP Compliance Audit (on site activities completed by the Compliance Audit team) after June 18, 2007. Recertification on a periodic basis of these Registered Entities will not be required. Demonstration of ongoing satisfactory performance of applicable RC, BA, and TOP functional Requirements shall be accomplished by completion of a CMEP Compliance Audit every three years per the requirements of the NERC ROP.

2. For an entity that is not required to be certified, the Regional Entity(ies) shall reject the application and notify the entity that Certification is not required.

3. If the application is not complete or accurate, the Regional Entity will notify the entity to revise the application as needed. When the application is deemed complete and accurate, it will be accepted. The entity and the Regional Entity shall agree to a timeline including specific milestones for the Certification process.

4. The decision to certify changes to an already operating and certified Registered Entity is a collaborative decision between the affected Regional Entity(s) and NERC. NERC has the final authority regarding this decision. Items to consider for this decision include one or more of the following:

   a. Changes to a Registered Entity's Footprint or operational challenges (i.e., TLRs) due to the changes

   b. Organizational restructuring that could impact the BPS reliability

   c. Relocation of the control center

   d. Changes to Registered Entity ownership requiring major operating procedure changes

   e. Significant changes to JRO/CFR assignments or agreements changes

   f. Addition or removal of member JRO/CFR utilities or entities

g. Complete replacement of a Supervisory, Control and Data Acquisition (SCADA)/Energy Management System (EMS) system

5. The Certification process shall be completed within nine months of the date of acceptance of the application unless agreed to by all parties involved in the process and approved by NERC.

6. The Regional Entity(ies) shall notify NERC that the Certification process has begun to enable NERC to carry out its roles and responsibilities.

7. The Regional Entity will send a questionnaire with a submission deadline and a statement of expectations to all entities participating in the Certification process. These questionnaires and other related documents are located on the NERC website. The Regional Entity shall distribute questionnaires and other related documents to the following entities, as required:

   a. Entity seeking Certification.

   b. Participating BAs, RCs, and TOPs in Footprints in which the entity intends to operate or with which the entity intends to interconnect transmission Facilities.

   c. Participating TOs, TSPs, PAs, GOs, GOPs, TPs, DPs, and/or other applicable entities.

8. The Regional Entity shall assemble a CT that will be responsible for performing the activities included in the Certification process.

   a. The CT members shall adhere to NERC's confidentiality agreements for any data or information made available to the CT member through the Certification process. Team members shall not be employees of or have a direct financial interest in the entity or any of its affiliates.

   b. The Regional Entity, with concurrence of NERC, may increase or decrease the distribution of the questionnaires and other related documents based upon the complexity of the Certification.

   c. If the entity objects to any member of the CT, the entity must make that known, in writing, to the Regional Entity listing the reasons for the objection. The Regional Entity will either replace the team member or respond with written justification for keeping the member on the team.

   d. CT composition

      i. The BA CT shall consist of representatives from an existing BA, the entity's proposed RC, TOP, each affected Regional Entity, and NERC.

      ii. The RC CT shall consist of representatives from an existing RC, a BA and a TOP in the proposed RC Area, each affected Regional Entity, and NERC.

      iii. The TOP CT shall consist of representatives from an existing TOP, the entity's proposed RC, each affected Regional Entity, and NERC.

      iv. Additional CT members with expertise in the any of the NERC Compliance Registry functional areas can be added as necessary.

      v. Additional CT members from NERC or Regional Entity staff may be added as necessary.

      vi. Entities such as government representatives or other stakeholders may be observers in the Certification process.

9. Each CT member must complete the NERC auditor training prior to participation.

10. The CT will review the entity's submitted documentation and address any issues prior to the site visit.

11. The CT shall inform the entity before the on-site visit of any documentation or clarification that is necessary to support the questionnaires.

12. The entity shall identify to the CT prior to the on-site visit all Reliability Standards or Requirements/sub-Requirements which have been delegated to another entity.
    a. The CT will review the entity(ies) ability to perform those delegated Requirements/sub-Requirements or Reliability Standards.
13. The CT shall conduct at least one on-site visit to the entity's Facilities. At a minimum, the team will:
    a. Review with the entity the data collected through the questionnaires, and such data that is available only onsite;
    b. Interview the operations and management personnel;
    c. Inspect the Facilities and equipment associated with the applicable Reliability Standards referenced in the questionnaire;
    d. Request demonstration of all tools identified in the Certification process;
    e. Review documents and data including agreements, processes, and procedures identified in the Certification process;
    f. Verify operating personnel NERC Certification documents and proposed work schedules; and,
    g. Review any additional documentation resulting from inquiries arising during the site-visit.
14. The entity, in conjunction with the CT, shall attempt to resolve any deficiencies prior to issuance of the draft report.
15. The draft report is provided to the entity for review for 14 Days and any resulting comments will be assessed by the CT for possible inclusion in the report.
16. The Regional Entity(ies) may grant a time extension, not to exceed 180 Days, to the entity to allow the entity to resolve any open Certification issues.
17. The CT shall provide a Certification recommendation and identification of audit deficiencies in the final written report. All members of the CT shall have an equal voice in the Certification recommendation. This allows for a minority opinion if the review team cannot reach a consensus. The final written Certification report is distributed to NERC, the entity, and the other affected Regional Entities, as applicable.
18. The following is the format for the final report:
    - Title page
    - Table of Contents
    - Introduction – A brief discussion on the Regional Entity(ies) involved, the entity being certified, a description of the function the entity(ies) are being certified for, and a brief timeline of the Certification project.
    - CT – Provide the CT makeup.
    - Objective and Scope – Discussion on entity application (who, what, when, & how).
    - Overall Conclusion – Recommendation being made by the CT.
    - CT Findings – Any item(s) needing to be closed prior to operation that do not hinder the CT from making a recommendation.
    - Positive Observations.
    - Company History – Discussion on the applicant's company history.

- Company Details – Specific details regarding why the entity is being certified and its relationship with other entities (BAs, RCs, and TOPs etc.).
- Documentation List – Provide a list of critical documentation reviewed by the CT used to make the CT's conclusion and the documentation retention requirements.
- Attachments – Describe those attachments that are for public viewing and those that are separated from the report due to confidentiality issues such as Critical Infrastructure documentation.

19. Certification recommendation and approval.
    a. If the entity intends to operate in a single Regional Entity's reliability Region, the CT shall make a Certification recommendation to that Regional Entity. The Regional Entity shall approve or disapprove the recommendation. The Regional Entity shall notify the entity and NERC of the Certification decision.
    b. If the entity intends to operate in multiple Regional Entities, the CT shall make a Certification recommendation to all applicable Regional Entities in a single report. Certification recommendation by the Regional Entities must be unanimous. The Regional Entities shall notify the entity and NERC of the Certification decision.
    c. NERC shall approve or disapprove all final Certification recommendations and notify the entity of the decision.
20. The entity may appeal the decision in accordance with the NERC ROP and Section VI of this manual.
21. If the entity is approved for Certification, NERC shall provide the entity a Certification letter and a NERC certificate indicating that that entity is NERC certified as a BA, RC, and/or TOP as applicable.
    a. For those CFR entities that agree upon a division of compliance responsibilities for one or more Reliability Standards or Requirements/sub-Requirements, NERC shall provide all entities responsible for BA, RC and/or TOP Requirements/sub-Requirements and approved for Certification as BA, RC and/or TOP a NERC certificate indicating that those entities are NERC certified as a BA, RC, and/or TOP.
    b. NERC shall update the Compliance Registry prior to the entity(s) going operational.
22. After the entity has been awarded Certification, the Regional Entity(ies) shall notify all applicable entities as to the date that the entity may begin its operation as a certified entity. The entity must commence operation within 12 months of Certification. Failure to begin operation within the 12-month period shall require the entity to reapply for Certification.

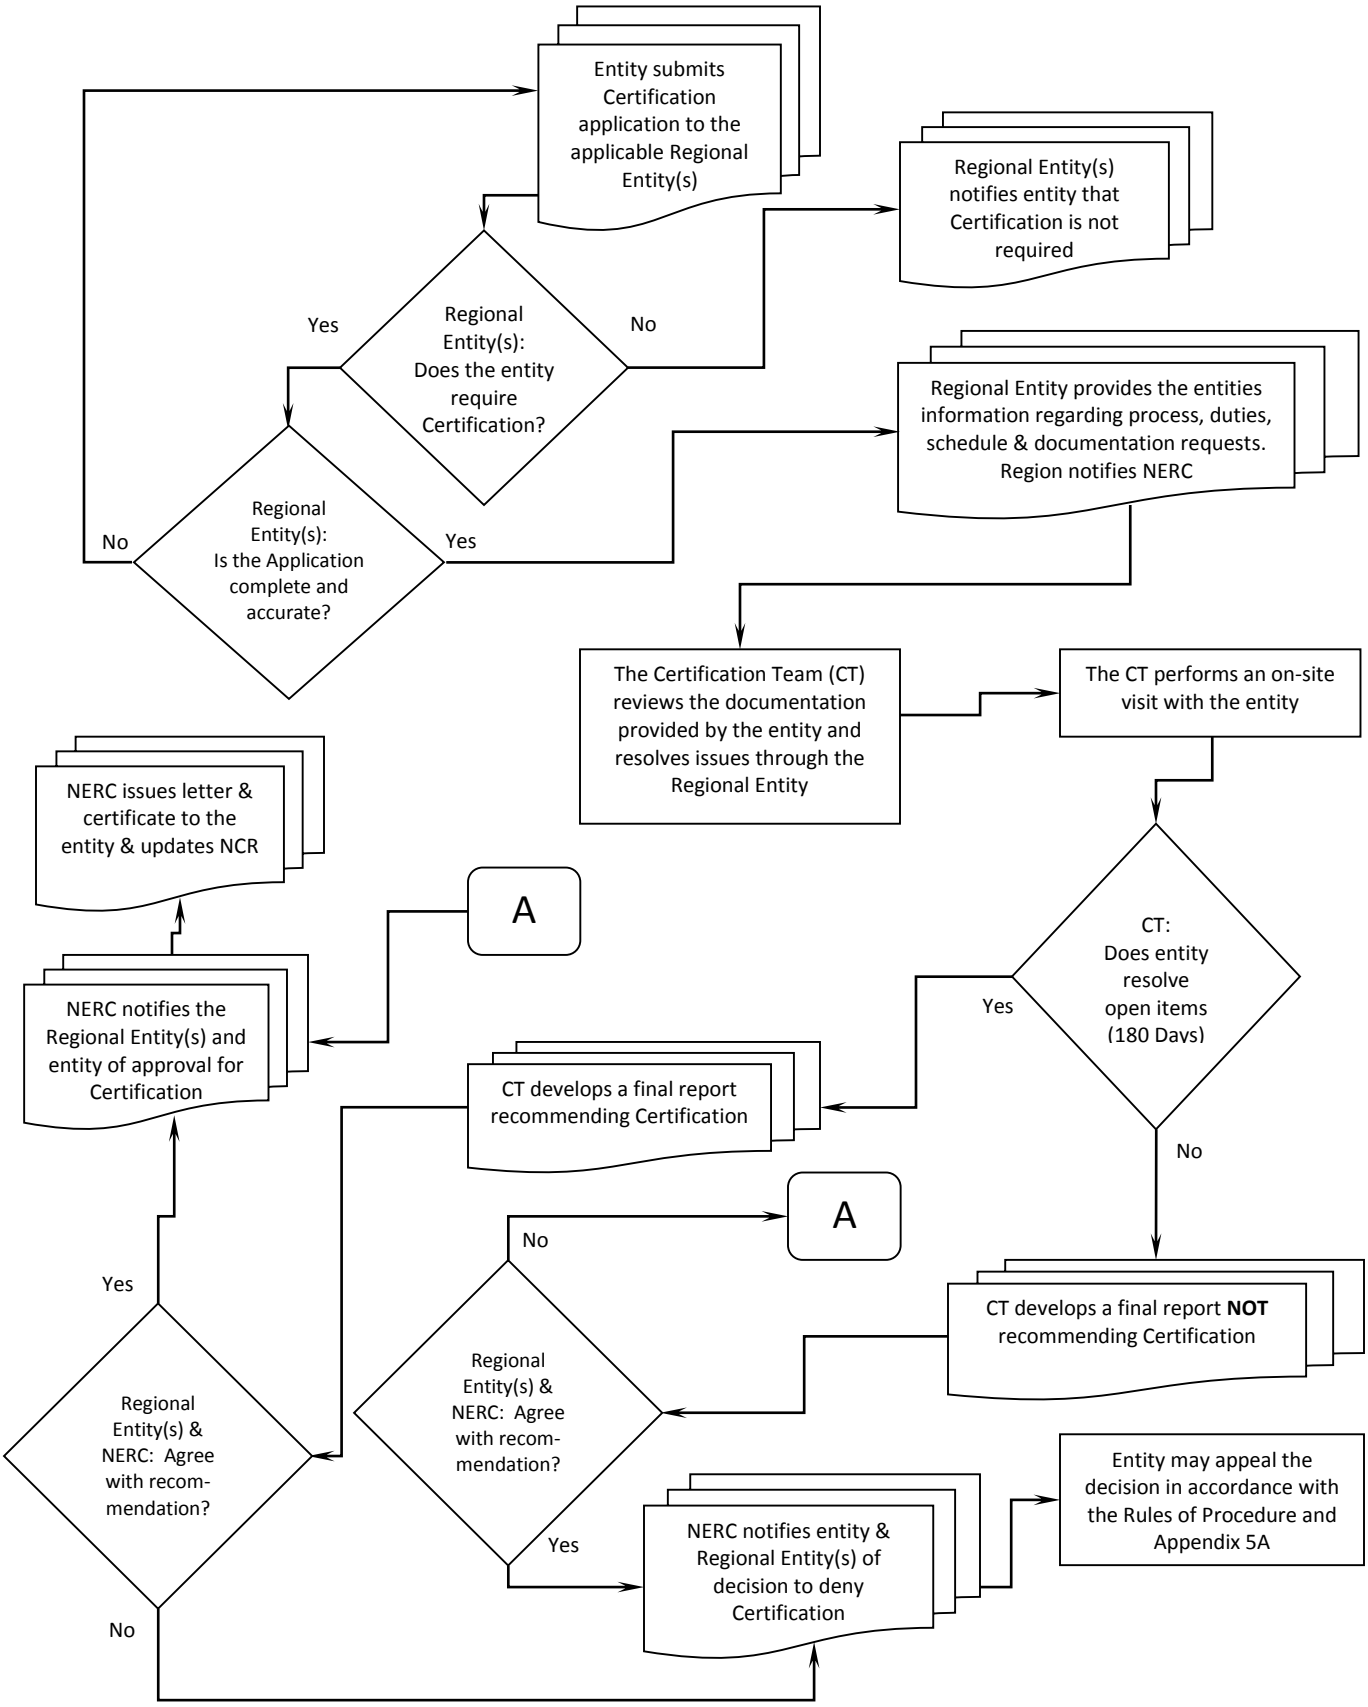

Figure 2: Organization Certification Process Overview

Section V — NERC Organization Registration Appeals Process

Purpose and Scope

This section describes the process that any organization must use to seek review of its listing and functional assignment on the NCR.

Overview

NERC has established documented procedures to ensure a fair and impartial appeals process. No one with a direct interest in a dispute may participate in the appeals process except as a party or witness. See Figure 3, *Organization Registration Appeals Process Overview*.

Organization Registration Appeals Procedure

1. Any Registered Entity included on the NCR may challenge final decisions regarding its listing, functional assignments, and determinations regarding the applicability of a sub-set of Reliability Standards (which specifies the specific Reliability Standards and may specify Requirements/sub-Requirements).
2. All registration appeals must be filed in writing to NERC, via registered mail. Appeals are sent to:

   Compliance Operations
   3353 Peachtree Road NE
   Suite 600, North Tower
   Atlanta, GA 30326
   Main: (404) 446-2560
   Facsimile: (404) 446-2595
3. Each party in the appeals process shall pay its own expenses for each step in the process.
4. A stipulation of invoking the appeals process is that the Regional Entity or Registered Entity requesting the appeal agrees that NERC (its Members, Board, committees, subcommittees, and staff), any person assisting in the appeals process, and any company employing a person assisting in the appeals process, shall not be liable for, and shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.
5. Parties retain the right to seek further review of a decision in whatever regulatory agency or court that may have jurisdiction.
6. All appeals must be received within 21 Days of receipt of the NERC determination that is being appealed. The appeal must state why the Registered Entity believes it should not be registered or should be deactivated based on the NERC ROP and the *NERC Statement of Compliance Registry Criteria* or why its compliance obligations should be limited only to a sub-set list of otherwise applicable Reliability Standards (which specifies the Reliability Standards and may specify Requirements/sub-Requirements). A copy of the appeal must be concurrently served on the Regional Entity.

7. After receipt of the appeal, the Registered Entity has a 30 day period to work with the Regional Entity to resolve the appeal, if possible. If the appeal is resolved, the Regional Entity will notify NERC with the details of the resolution and NERC will close the appeal.
8. At any time through this appeals process, a Registered Entity may agree with the decision and/or agree to close the appeal. NERC shall notify the involved parties and the NERC BOTCC that the appeal is resolved and update the NCR as applicable.
9. NERC will notify the Registered Entity and the applicable Regional Entity(ies) regarding the appeal with the following expectations:
    a. The Registered Entity will provide NERC and the applicable Regional Entity(ies) any additional data supporting its appeal within 10 Days of the date of the NERC appeal notification.
    b. The applicable Regional Entity(ies) will provide a copy of its assessment directly to the Registered Entity, as well as to NERC, within 20 Days of the date of the NERC appeal notification.
    c. The Registered Entity may submit a response to the Regional Entity(ies) assessment, with copies to the Regional Entity(ies) and NERC, within 30 Days of the date of the NERC appeal notification.
    d. To ensure there is no confusion with respect to the rights and responsibilities of the Registered Entity during the appeal process, the notification will confirm whether the Registered Entity will remain on the NERC Compliance Registry and will be responsible for compliance with approved Reliability Standards applicable to the function under appeal during the appeal.
    e. NERC may extend the timelines for good cause shown. Requests should be sent to the Director of Compliance. NERC shall notify the Registered Entity and the Regional Entity of such time extensions.
10. Hearing and Ruling by the BOTCC
    a. The BOTCC will resolve Registration disputes.
    b. The BOTCC may request additional data from NERC, the relevant Regional Entity(ies) or the Registered Entity, and prescribe the timeframe for the submitting the requested data.
    c. The BOTCC will provide a written decision regarding any appeals, along with the basis for its decision.
    d. If the BOTCC upholds the appeal, NERC will:
        - Notify the Registered Entity and Regional Entity(ies) that the appeal was granted.
        - Update the NCR.
    e. If the BOTCC does not uphold the appeal, NERC will:
        - Notify the Registered Entity and the Regional Entity(ies) that the appeal was denied.
        - The Registered Entity may appeal to Federal Energy Regulatory Commission (FERC) or another Applicable Governmental Authority within 21 Days of the notification of the decision.
    f. A record of the appeals process shall be maintained by NERC. Confidentiality of the record of the appeal will be based on the NERC ROP Section 1500.

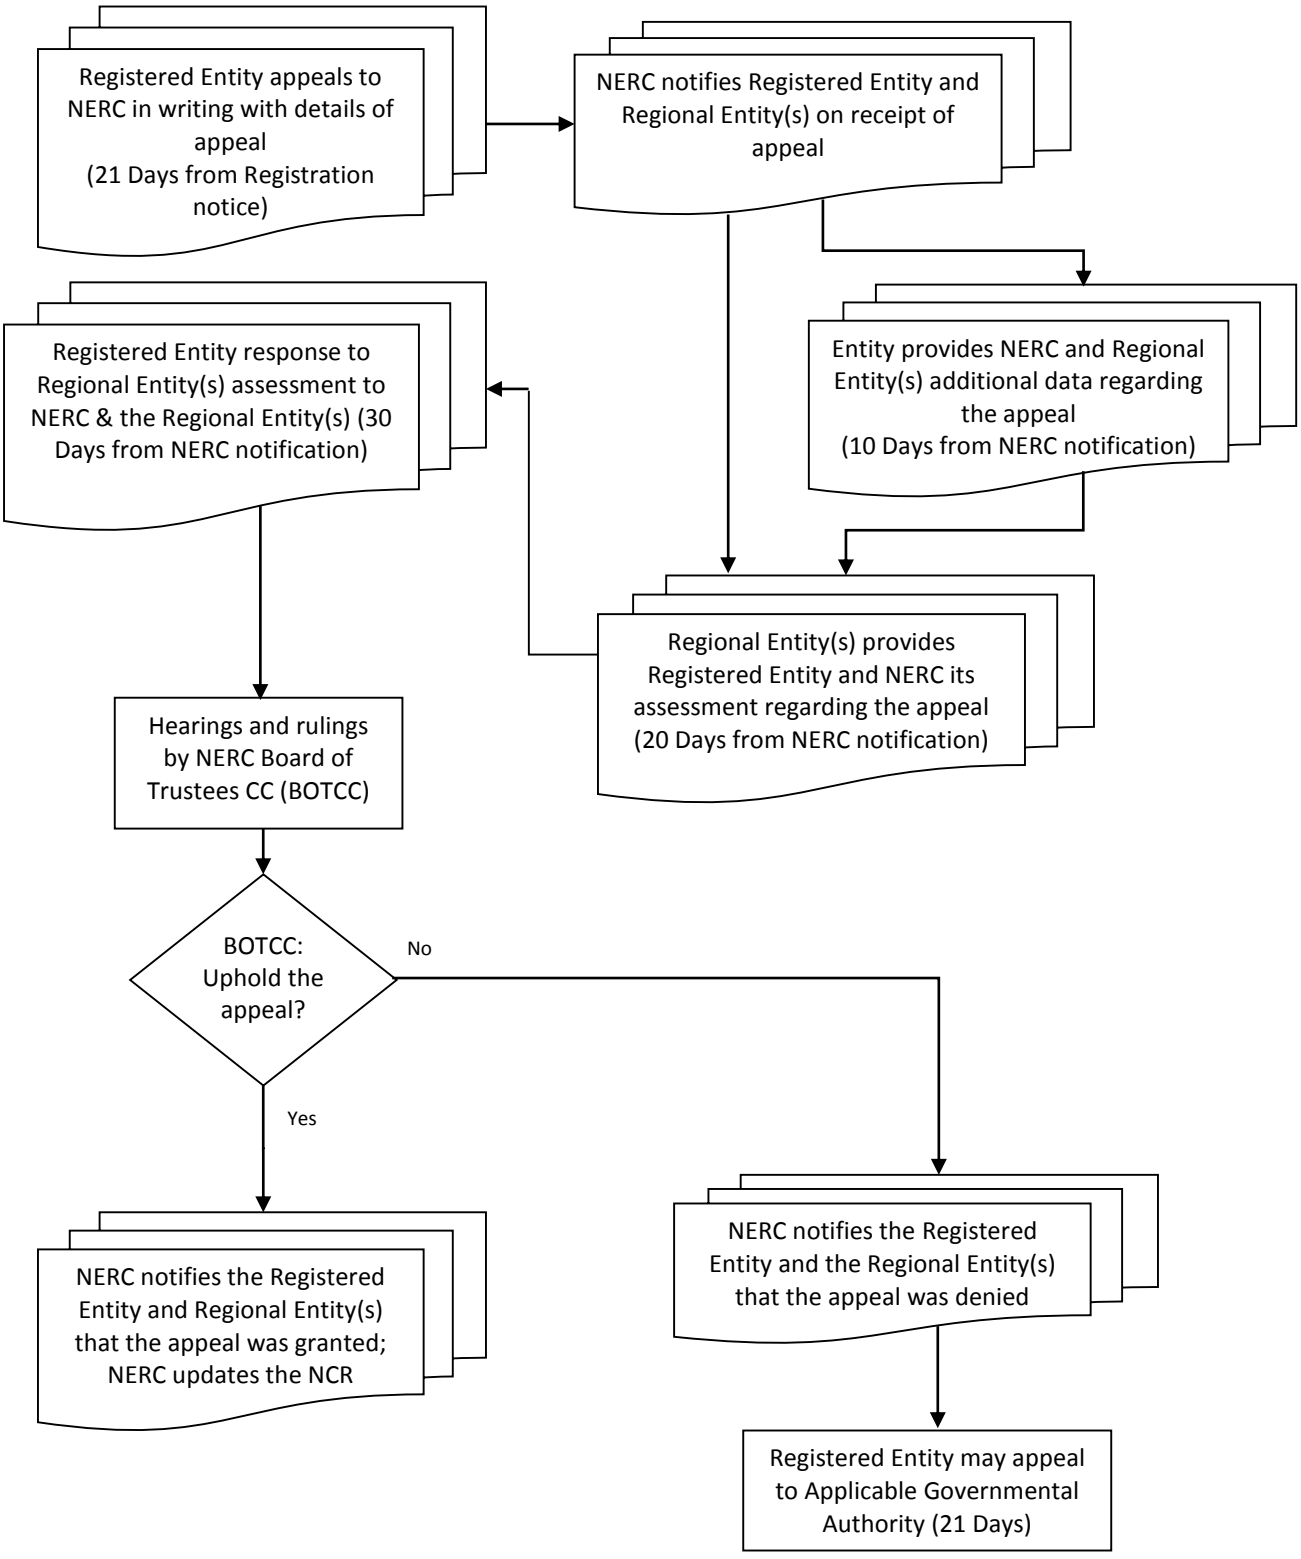

Figure 3: Organization Registration Appeals Process Overview

Section VI — NERC Organization Certification Appeals Process

Purpose and Scope

This section describes the process for an organization to appeal the Certification decision that was determined in the Certification process.

Overview

The NERC Organization Certification Program provides a key means to fulfill NERC's mission. In conducting this program, NERC has established documented procedures to ensure a fair and impartial appeals process. No one with a direct interest in a dispute may participate in the appeals process except as a party or witness. See Figure 4 *Organization Certification Appeals Process Overview*.

Organization Certification Appeals Procedure

1. Appeal for an Organization Certification Finding.
2. Any entity can appeal an organization Certification decision issued as a result of the Certification process.
3. Requirements and Conditions for Appeals.
    a. For all appeals under the NERC Organization Certification Program, the appeals process begins when an entity notifies the NERC Vice President and Director of Compliance, in writing, that it wishes to use the NERC appeals process.
        - The Director of Compliance is the main contact for all parties in all steps of the appeals process.
        - If an appeal is not filed within 21 Days of the date that the Certification report or finding is issued, or the final Regional Entity appeals process ruling is made, the finding shall be considered final and un-appealable.
    b. Each party in the appeals process shall pay its own expenses for each step in the process.
    c. A stipulation of invoking the appeals process is that the Regional Entity or entity requesting the appeal agrees that NERC (its Members, Board, committees, subcommittees, and staff), any person assisting in the appeals process, and any company employing a person assisting in the appeals process, shall not be liable, and shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.
    d. Parties retain the right to seek further review of a decision in whatever regulatory agency or court that may have jurisdiction.
4. At any time through this appeals process, an entity may withdraw its appeal.
5. Hearing and Ruling by the Compliance and Certification Committee.
    a. Within 28 Days of receiving notice from the NERC Director of Compliance, the CCC will conduct a hearing where all the parties or representatives of the disputing parties will present the issue in question, in accordance with CCC procedure CCCPP-005, *Hearing Procedures for Use in Appeals of Certification Matters*, which is incorporated in **Appendix 4E** of the ROP.
    b. If the appeal is upheld, NERC notifies the entity and Regional Entity(s), updates the NCR, and issues any appropriate letter and certificate to the entity.
    c. If the appeal is denied, NERC notifies the entity and Regional Entity(s).

6. Hearings and Ruling by the BOTCC.

   a. The BOTCC will be asked to resolve a dispute related to the NERC Organization Certification Program if any party to the appeal contests the CCC final order.

   b. The BOTCC may request additional data from NERC, Regional Entity(s) or the entity and prescribe the timeframe for the submitting the requested data.

   c. At the next regularly scheduled BOTCC meeting, or at a special meeting if the Board determines it is necessary, the Chairman of the CCC will present a summary of the dispute and the actions taken to the BOTCC.

      - Each party will have an opportunity to state its case.
      - The BOTCC will then rule on the dispute.

   d. If the BOTCC upholds the appeal, NERC will:

      - Notify the entity and the Regional Entity(ies) that the appeal was upheld.
      - Update the NCR.
      - Issue a Certification letter and a certificate to the entity as applicable.

   e. If the BOTCC does not uphold the appeal, NERC will notify the entity and the Regional Entity(ies) that the appeal was denied.

      - The entity may appeal to Applicable Governmental Authorities within 21 Days of the issuance of the decision.

   f. A record of the appeals process shall be maintained by NERC and available upon request. Confidentiality of the record of the appeal will be based on the NERC ROP Section 1500.

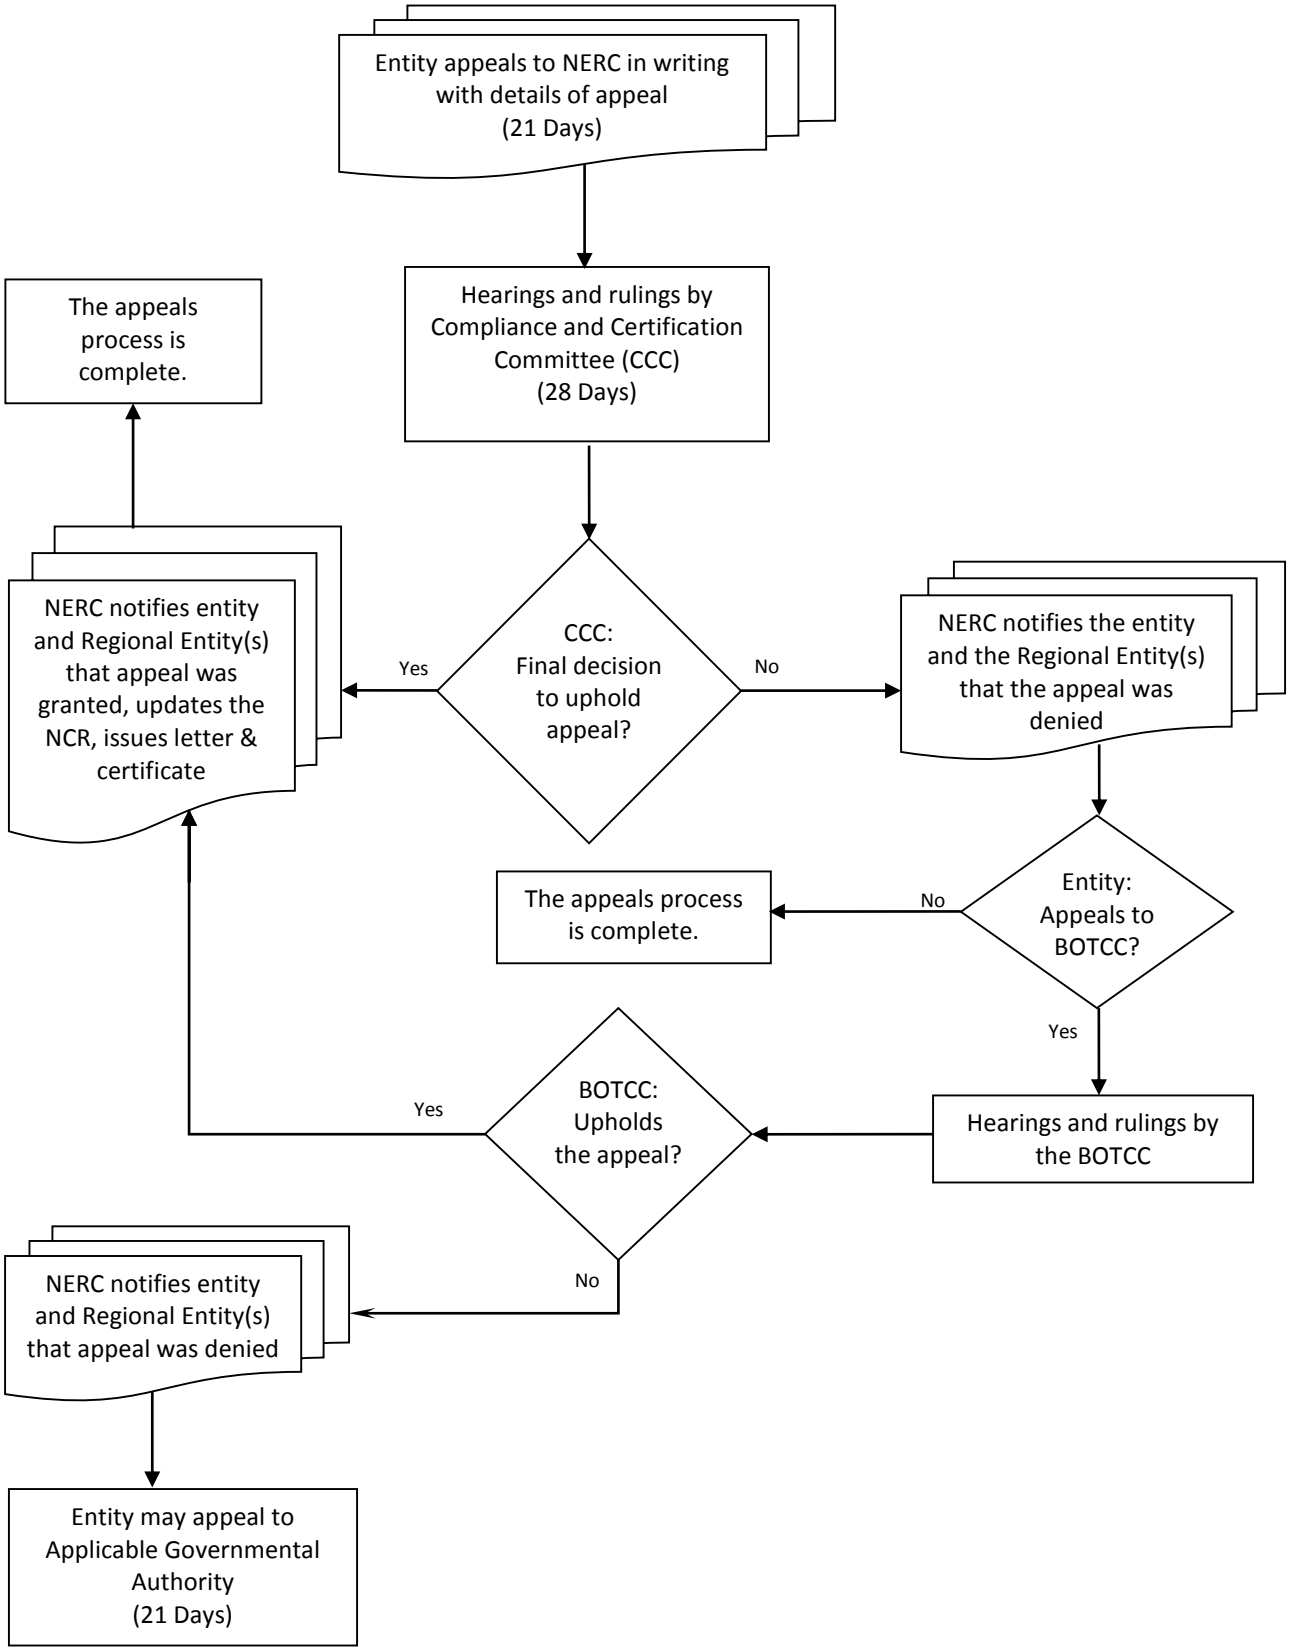

Figure 4: Organization Certification Appeals Process Overview

Definitions

Capitalized terms used in this Appendix shall have the definitions set forth in Appendix 2 of the ROP. For convenience of reference, definitions used in this Appendix are also set forth below:

NERC Organization Certification	The process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator.
Compliance and Certification Manager	The individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities with applicable NERC Reliability Standards.
Days	Days as used in the Registration and Certification processes are defined as calendar days.
Footprint	The geographical or electric area served by an entity.
Functional Entity	An entity responsible for a function that is required to ensure the Reliable Operation of the electric grid as identified in the NERC Reliability Standards.
Mapping	The process of determining whether a Regional Entity's Footprint is being served by Registered Entities.
NERC Identification Number (NERC ID)	A number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.
Regional Entity	An entity having enforcement authority pursuant to 18 C.F.R. § 39.8.
Registration	Processes undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region.
Coordinated Functional Registration (CFR)	Where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more Reliability Standard(s) applicable to a particular function, and/or for one or more Requirement(s)/sub-Requirement(s) within particular Reliability Standard(s).

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix 5B[1]
Statement of Compliance Registry Criteria

Revision 5.2

Effective: ~~March 19, 2015~~DATE

[1] Highlighted text reflects incremental changes made in response to stakeholder feedback.

Statement of Compliance Registry Criteria (Revision 5.2)

Summary

This document describes how the North American Electric Reliability Corporation (NERC) will identify organizations that may be candidates for Registration and assign them to the Compliance Registry.

NERC and the Regional Entities[2] have the obligation to identify and register all entities that meet the criteria for inclusion in the Compliance Registry, as further explained in the balance of this document.

Organizations will be responsible to register and to comply with approved Reliability Standards to the extent that they are owners, operators, and users of the Bulk Power System (BPS), perform a function listed in the functional types identified in Section II of this document, and are material to the Reliable Operation of the interconnected BPS as defined by the criteria and notes set forth in this document. NERC will apply the following principles to the Compliance Registry:

- In order to carry out its responsibilities related to enforcement of Reliability Standards, NERC must identify the owners, operators, and users of the BPS who have a material impact[3] on the BPS through a Compliance Registry. NERC and the Regional Entities will make their best efforts to identify all owners, users and operators who have a material impact on the BPS in order to develop a complete and current Compliance Registry list. The Compliance Registry will be updated as required and maintained on an on-going basis.
- Organizations listed in the Compliance Registry are responsible and will be monitored for compliance with applicable mandatory Reliability Standards. They will be subject to NERC's and the Regional Entities' Compliance Monitoring and Enforcement Programs.
- NERC and Regional Entities will not monitor nor hold those not in the Compliance Registry responsible for compliance with the Reliability Standards. An entity which is not initially placed on the Compliance Registry, but which is identified subsequently as having a material impact, will be added to the Compliance Registry. Such entity will not be subject to a sanction or Penalty by NERC or the Regional Entity for actions or inactions prior to being placed on the Compliance Registry, but may be required to comply with a Remedial Action Directive or Mitigation Plan in order to become compliant with applicable Reliability Standards. After such entity has been placed on the Compliance Registry, it shall be responsible for complying with Reliability Standards and may be subject to sanctions or Penalties as well as any Remedial Action Directives and Mitigation Plans required by the Regional Entities or NERC for future violations, including any failure to follow a Remedial Action Directive or Mitigation Plan to become compliant with Reliability Standards.
- Required compliance by a given organization with the Reliability Standards will begin the later of (i) inclusion of that organization in the Compliance Registry and (ii) approval by the Applicable Governmental Authority of mandatory Reliability Standards applicable to the registered entity.

[2] The term "Regional Entities" includes Cross-Border Regional Entities, that have footprints in the U.S., Canada and Mexico, as applicable. Applicable Governmental Authorities in Canadian jurisdictions may have adopted their own Rules of Procedure and Compliance Registry requirements. Registered Entities may be subject to the Compliance Monitoring and Enforcement Programs (CMEP) in their respective jurisdictions, in accordance with applicable laws and regulations.

[3] The criteria for determining whether an entity will be placed on the Compliance Registry are set forth in the balance of this document. At any time a person may recommend in writing, with supporting reasons, to the Director of Compliance (or an equivalent position) that an organization be added to or removed from the Compliance Registry, pursuant to NERC Rules of Procedure Section 501.1.3.5.

Entities responsible for funding NERC and the Regional Entities have been identified in the budget documents filed with FERC.[4] Presence on or absence from the Compliance Registry has no bearing on an entity's independent responsibility for funding NERC and the Regional Entities.

Background

In 2005, NERC and the Regional Entities conducted a voluntary organization registration program limited to Balancing Authorities, Planning Authorities, regional reliability organizations, Reliability Coordinators, Transmission Operators, and Transmission Planners. The list of the entities that were registered constitutes what NERC considered at that time as its Compliance Registry.

NERC initiated a broader program to identify additional organizations potentially eligible to be included in the Compliance Registry and to confirm the information of organizations currently on file, taking into account the following considerations:

- As of July 20, 2006, NERC was certified as the Electric Reliability Organization (ERO) created for the U.S. by the Energy Policy Act of 2005 (EPAct) and FERC Order No. 672. NERC has received similar recognition by Canadian authorities in their respective jurisdictions.
- FERC Order No. 672 directs that owners, operators and users of the BPS in the U.S. shall be registered with the ERO and the appropriate Regional Entities.
- As the ERO, NERC has filed its current Reliability Standards with FERC and with Canadian authorities. As accepted and approved by FERC and appropriate Canadian authorities, the Reliability Standards are no longer voluntary, and organizations that do not fully comply with them may face Penalties or other sanctions, in accordance with applicable laws, regulations and orders of Applicable Governmental Authorities.
- NERC's Reliability Standards include compliance Requirements for additional reliability function types beyond the six types registered by earlier registration programs.
- Based on selection as the ERO, NERC's Organization Registration program[5] is the means by which NERC and the Regional Entities plan, manage and execute Reliability Standard compliance oversight of owners, operators, and users of the BPS.
- Organizations listed in the Compliance Registry are subject to NERC's and the Regional Entities' Compliance Monitoring and Enforcement Programs.

Statement of Issue

As the ERO, NERC intends to comprehensively and thoroughly protect the reliability of the grid. To support this goal NERC will include in its Compliance Registry each entity that NERC concludes can materially impact the reliability of the BPS.

NERC wishes to identify those entities that may need to be listed in its Compliance Registry. Identifying these organizations is necessary and prudent for the purpose of determining resource needs, both at the

[4] Budget documents are submitted to Applicable Governmental Authorities in Canada for information.
[5] *See* NERC ERO Application; Exhibit C; Section 500 – Organization Registration and Certification.

NERC and Regional Entity level, and for communicating with these entities regarding their potential responsibilities and obligations. NERC and the Regional Entities believe that candidate entities can be identified at any time, as and when needed. The Compliance Registry is available on NERC's website.

Resolution

The potential costs and effort of registering every organization potentially within the scope of "owner, operator, and user of the BPS," while ignoring their impact upon reliability, would be disproportionate to the improvement in reliability that would reasonably be anticipated from doing so.

NERC and the Regional Entities have identified two principles they believe are key to the entity selection process. These are:

1. There needs to be consistency between Regions and across the continent with respect to which entities are registered; and
2. Any entity reasonably deemed material to the reliability of the BPS will be registered, irrespective of other considerations.

To address the second principle the Regional Entities, working with NERC, will identify and register any entity they deem material to the reliability of the BPS.

In order to promote consistency, NERC and the Regional Entities use the following criteria as the basis for determining whether particular entities should be identified as candidates for Registration. All organizations meeting or exceeding the criteria will be identified as candidates.

The following four groups of criteria (Sections I-IV) plus the statements in Section V will provide guidance regarding an entity's Registration status:

- Section I determines if the entity is an owner, operator, or user of the BPS and, hence, a candidate for organization Registration.
- Section II uses NERC's current functional type definitions to provide an initial determination of the functional types for which the entities identified in Section I should be considered for Registration.
- Section III lists the criteria regarding smaller entities; these criteria can be used to forego the Registration of entities that were selected to be considered for Registration pursuant to Sections I and II and, if circumstances change, for later removing entities from the Compliance Registry that no longer meet the relevant criteria.
- Section IV — additional criteria for joint Registration. Joint Registration criteria may be used by joint action agencies, generation and transmission cooperatives and other entities which agree upon a clear division of compliance responsibility for Reliability Standards by written agreement. Rules pertaining to joint Registration and Joint Registration Organizations, as well as Coordinated Functional Registrations, are now found in Sections 501, 507 and 508 of the NERC Rules of Procedure.

I. Entities that use, own or operate Elements of the Bulk Electric System (BES) as established by NERC's approved definition of BES below are (i) owners, operators, and users of the BPS and (ii) candidates for Registration:

"Bulk Electric System" or "BES" means unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

Inclusions:

- ***I1*** *- Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded by application of Exclusion E1 or E3.*
- ***I2*** *- Generating resource(s) including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above with:*
  - *a) Gross individual nameplate rating greater than 20 MVA. Or,*
  - *b) Gross plant/facility aggregate nameplate rating greater than 75 MVA.*
- ***I3*** *- Blackstart Resources identified in the Transmission Operator's restoration plan.*
- ***I4*** *- Dispersed power producing resources that aggregate to a total capacity greater than 75 MVA (gross nameplate rating), and that are connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage of 100 kV or above. Thus, the facilities designated as BES are:*
  - *a) The individual resources, and*
  - *b) The system designed primarily for delivering capacity from the point where those resources aggregate to a greater than 75 MVA to a common point of connection at a voltage of 100 kV or above.*
- ***I5*** *- Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1 unless excluded by application of Exclusion E4.*

Exclusions:

- ***E1*** *- Radial systems: A group of contiguous transmission Elements that emanates from a single point of connection of 100 kV or higher and:*
  - *a) Only serves Load. Or,*
  - *b) Only includes generation resources, not identified in Inclusions I2, I3, or I4, with an aggregate capacity less than or equal to 75 MVA (gross nameplate rating). Or,*
  - *c) Where the radial system serves Load and includes generation resources, not identified in Inclusions I2, I3 or I4, with an aggregate capacity of non-retail generation less than or equal to 75 MVA (gross nameplate rating).*

Note 1 – A normally open switching device between radial systems, as depicted on prints or one-line diagrams for example, does not affect this exclusion.

Note 2 – The presence of a contiguous loop operated at a voltage level of 50 kV or less, between configurations being considered as radial systems, does not affect this exclusion.

- ***E2** - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.*
- ***E3** - Local networks (LN): A group of contiguous transmission Elements operated at less than 300 kV that distribute power to Load rather than transfer bulk power across the interconnected system. LN's emanate from multiple points of connection at 100 kV or higher to improve the level of service to retail customers and not to accommodate bulk power transfer across the interconnected system. The LN is characterized by all of the following:*

  a) Limits on connected generation: The LN and its underlying Elements do not include generation resources identified in Inclusions I2, I3, or I4 and do not have an aggregate capacity of non-retail generation greater than 75 MVA (gross nameplate rating);

  b) Real Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN; and

  c) Not part of a Flowgate or transfer path: The LN does not contain any part of a permanent Flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection, or a comparable monitored Facility in the ERCOT or Quebec Interconnections, and is not a monitored Facility included in an Interconnection Reliability Operating Limit (IROL).

- ***E4** - Reactive Power devices installed for the sole benefit of a retail customer(s).*

  Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

II. Entities identified in Section I above will be categorized as Registration candidates who may be subject to Registration under one or more appropriate Functional Entity types based on a comparison of the functions the entity normally performs against the following function type definitions: [6]

Function Type	Acronym	Definition/Discussion
Balancing Authority	BA	The responsible entity that integrates resource plans ahead of time, maintains Load-interchange-generation balance within a

[6] Exclusion: An entity will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, including bilateral agreements and Sections 501, 507 and 508 of the NERC Rules of Procedure.

Function Type	Acronym	Definition/Discussion
		Balancing Authority Area, and supports Interconnection frequency in real-time.
Distribution Provider	DP	Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage. Note: As provided in Section III.b.1 and Note 5 below, a Distribution Provider entity shall be an Underfrequency Load Shedding (UFLS)-Only Distribution Provider if it is the responsible entity that owns, controls or operates UFLS Protection System(s) needed to implement a required UFLS program designed for the protection of the BES, but does not meet any of the other registration criteria for a Distribution Provider.
Generator Operator	GOP	The entity that operates generating Facility(ies)and performs the functions of supplying energy and Interconnected Operations Services.
Generator Owner	GO	Entity that owns and maintains generating Facility(ies).
~~Load-Serving Entity~~	~~LSE~~	~~Secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.~~
Planning Authority/ Planning Coordinator	PA/PC	The responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.
Reliability Coordinator	RC	The entity that is the highest level of authority who is responsible for the Reliable Operation of the BES, has the Wide Area view of the BES, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.

Function Type	Acronym	Definition/Discussion
Reserve Sharing Group	RSG	A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g., ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.
Resource Planner	RP	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific Loads (customer demand and energy requirements) within a Planning Authority area.
Transmission Owner	TO	The entity that owns and maintains transmission Facilities.
Transmission Operator	TOP	The entity responsible for the reliability of its local transmission system and operates or directs the operations of the transmission Facilities.
Transmission Planner	TP	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.
Transmission Service Provider	TSP	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.

III. Except as provided in Section V and the Notes to the Criteria below, entities identified in Section II above as being subject to Registration as a Distribution Provider should be included in the Compliance Registry for these functions only if they meet any of the criteria listed below:

~~III(a) Load-Serving Entity:~~

~~III.a.1 Load-Serving Entity peak Load is > 25 MW and is directly connected to the Bulk Power (>100 kV) System, or;~~

~~III.a.2 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required UFLS program designed, installed, and operated for the protection of the BPS, or;~~

~~III.a.3 Load-Serving Entity is designated as the responsible entity for Facilities that are part of a required Undervoltage Load Shedding (UVLS) program designed, installed, and operated for the protection of the BPS.~~

~~*[Exclusion: A Load-Serving Entity will not be registered based on these criteria if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]*~~

~~III.a.4 Distribution Providers registered under the criteria in III.b.1 or III.b.2 will be registered as a Load Serving Entity (LSE) for all Load directly connected to their distribution facilities.~~

~~*[Exclusion: A Distribution Provider will not be registered based on this criterion if responsibilities for compliance with approved NERC Reliability Standards or associated Requirements including reporting have been transferred by written agreement to another entity that has registered for the appropriate function for the transferred responsibilities, such as a Load-Serving Entity, Balancing Authority, Transmission Operator, generation and transmission cooperative, or joint action agency as described in Sections 501 and 507 of the NERC Rules of Procedure.]*~~

~~III(b)~~III(a) Distribution Provider:

~~III.b.1~~III.a.1 Distribution Provider system serving >75 MW of peak Load that is directly connected to the BES;[7] or

~~III.b.2~~III.a.2 Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the BES:[8]

- a required Undervoltage Load Shedding (UVLS) program and/or
- a required Special Protection System or Remedial Action Scheme and/or
- a required transmission Protection System; or

III.~~b~~a.3 Distribution Provider that is responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs) pursuant to an executed agreement; or

III.~~b~~a.4 Distribution Provider with field switching personnel identified as performing unique tasks associated with the Transmission Operator's restoration plan that are outside of their normal tasks.

III(~~c~~b) Distribution Provider with UFLS-Only assets (referred to as "UFLS-Only Distribution Provider")

[7] Ownership, control or operation of UFLS Protection System(s) needed to implement a required UFLS Program designed for the protection of the BES does not affect an entity's eligibility for registration pursuant to III.~~b~~a.1.

[8] As used in Section III.~~b~~a.2, "protection of the Bulk Electric System" means protection to prevent instability, Cascading, or uncontrolled separation of the BES and not for local voltage issues (UVLS) or local line loading management (Special Protection System) that are demonstrated to be contained within a local area.

III.~~c~~b.1 UFLS-Only Distribution Provider does not meet any of the other registration criteria in Sections III(a~~b~~)(1)-(4) for a Distribution Provider; and

III.~~c~~b.2 UFLS-Only Distribution Provider is the responsible entity that owns, controls, or operates UFLS Protection System(s) needed to implement a required UFLS Program designed for the protection of the BES.

The Reliability Standards applicable to UFLS-Only Distribution Providers are: (1) PRC-005,[9] PRC-006-1, PRC-006-2 and (2) any regional Reliability Standard whose purpose is to develop or establish a UFLS Program [PRC-006-NPCC-1 and PRC-006-SERC-01]. Reliability Standards that apply to Distribution Providers will not apply to UFLS-Only Distribution Providers, unless explicitly stated in the applicability section of these Reliability Standards and in future revisions and/or versions.

IV. Joint Registration Organization, Coordinated Functional Registration and applicable Member Registration.

Pursuant to FERC's directive in paragraph 107 of Order No. 693, NERC's rules pertaining to joint Registrations and Joint Registration Organizations, as well as Coordinated Functional Registrations, are now found in Section 501, 507 and 508 of the NERC Rules of Procedure.

V. If NERC or a Regional Entity encounters an organization that is not listed in the Compliance Registry, but which should be subject to the Reliability Standards, NERC or the Regional Entity is obligated and will initiate actions to add that organization to the Compliance Registry, subject to that organization's right to challenge as provided in Section 500 of NERC's Rules of Procedure and as described in Note 3 below.

Notes to the Registry Criteria in Sections I-V

1. The above are general criteria only. The Regional Entity considering Registration of an organization not meeting (e.g., smaller in size than) the criteria may propose Registration of that organization if the Regional Entity believes and can reasonably demonstrate[10] that the organization is a BES owner, or operates, or uses BES assets, and is material to the reliability of the BES. Similarly, the Regional Entity may exclude an organization that meets the criteria described above as a candidate for Registration if it believes and can reasonably demonstrate to NERC that the BES owner, operator, or user does not have a material impact on the reliability of the BES. Such decisions must be made in accordance with Section V of Appendix 5A to the NERC Rules of Procedure. In order to ensure a consistent approach to assessing materiality, a non-exclusive set of factors ("materiality test") for consideration is identified below; however, only a sub-set of these factors may be applicable to particular functional registration categories:

   a. Is the entity specifically identified in the emergency operation plans and/or restoration plans of an associated Reliability Coordinator, Balancing Authority, Generator Operator or Transmission Operator?

[9] Four versions of PRC-005 are currently in various stages of Commission approval and standard development. For the period that each is in effect, PRC-005-2(ii), PRC-005-3(i), PRC-005-3(ii), PRC-005-4, PRC-005-5, and PRC-005-6 will apply to an entity included on the NCR as a UFLS-Only Distribution Provider during that period.

[10] The reasonableness of any such demonstration will be subject to review and remand by NERC itself, or by any Applicable Governmental Authority, as applicable.

b. Will intentional or inadvertent removal of an Element owned or operated by the entity, or a common mode failure of two Elements as identified in the Reliability Standards (for example, loss of two Elements as a result of a breaker failure), lead to a reliability issue on another entity's system (such as a neighboring entity's Element exceeding an applicable rating, or loss of non-consequential load due to a single contingency). Conversely, will such contingencies on a neighboring entity's system result in Reliability Standards issues on the system of the entity in question?

c. Can the normal operation, misoperation or malicious use of the entity's cyber assets cause a detrimental impact (e.g., by limiting the operational alternatives) on the operational reliability of an associated Balancing Authority, Generator Operator or Transmission Operator?

d. Can the normal operation, Misoperation or malicious use of the entity's Protection Systems (including UFLS, UVLS, Special Protection System, Remedial Action Schemes and other Protection Systems protecting BES Facilities) cause an adverse impact on the operational reliability of any associated Balancing Authority, Generator Operator or Transmission Operator, or the automatic load shedding programs of a PC or TP (UFLS, UVLS)?

2. An organization not identified using the criteria, but wishing to be registered, may request that it be registered. For further information refer to: NERC Rules of Procedure, Section 500 – Organization Registration and Certification; Part 1.3.

3. An organization may challenge its Registration within the Compliance Registry. NERC or the Regional Entity will provide the organization with all information necessary to timely challenge that determination including notice of the deadline for contesting the determination and the relevant procedures to be followed as described in the NERC Rules of Procedure; Section 500 – Organization Registration and Certification.

4. If an entity is part of a class of entities excluded based on any of the criteria above as individually being unlikely to have a material impact on the reliability of the BES, but that in aggregate have been demonstrated to have such an impact it may be registered for applicable Reliability Standards and Requirements irrespective of other considerations, in accordance with laws, regulations and orders of an Applicable Governmental Authority.

5. NERC may limit the compliance obligations of a given entity registered for a particular function or similarly situated class of entities, as warranted based on the particular facts and circumstances, to a sub-set list of Reliability Standards (which may specify Requirements/sub-Requirements).
