Dear colleagues

The management and restorative treatment of severe tooth wear is a relevant issue in dentistry. On conferences, courses and continuing education programs a wide variety of restorative treatment options is presented, varying from traditional full crown rehabilitations to minimally invasive direct restorations. Different treatment preferences seem to exist, probably more depending on different health care systems than based on scientific evidence, which is restricted to few clinical trials, some retrospective reports as well as several case reports.

In this clinically orientated congress a unique group of international experts will show and discuss different approaches for the management and restorative treatment of severe tooth wear, ranging from monitoring to full rehabilitation using ceramic restorations.

We are looking forward to meet you in Nijmegen on the 28th of October 2016!

Bas Loomans en Niek Opdam
