Suppl. Fig. 2 to Figure 2. Caspase 3-associated apoptosis is induced by Dad-mediated Dpp signal attenuation. *optix2/3-GAL4; UAS-Dad* (*optix>Dad*) eye disc stained for activated caspase 3 (*cas3*'). Abundant cas3* signal is detected in cells anterior to the differentiation wave-front (dashed line). The disc is counterstained with the nuclear marker DAPI. (b,b') Close up of a cas3*-positive region. Cas3* signal (b': arrows) overlaps with pycnotic nuclei stained with DAPI (small, dense DAPI signal), indicating that cells enter an irreversible apoptotic process.
