Figure S8. Between-network dispersion with age for four age windows. Participants were segmented into four age windows (late childhood to adolescence: 8–19 years;
young adulthood: 20–39 years; middle adulthood: 40–59 years; and late adulthood: 60–89 years). The asterisk represents the significant changes in the age windows. $P$ values were corrected by the false-discovery rate. The data underlying this figure can be found in S1 data.
