FIG. S7. Emergence of global order in the system with no informed individuals, $R_{inf} = 0$. 

a: Coordination $\tilde{C}$ (directional order) versus attention limit $k$ for different DS densities.
b: DS avoidance versus attention limit $k$. $A = 1$ corresponds to non-interacting agents. The qualitative behavior with a coordination-responsiveness trade-off is similar to the model with informed individuals, but here instead of a specific direction, the emergent consensus direction is random (spontaneous symmetry breaking).
