

Supporting Information S2 Fig.: Community composition ordination (PCoA).

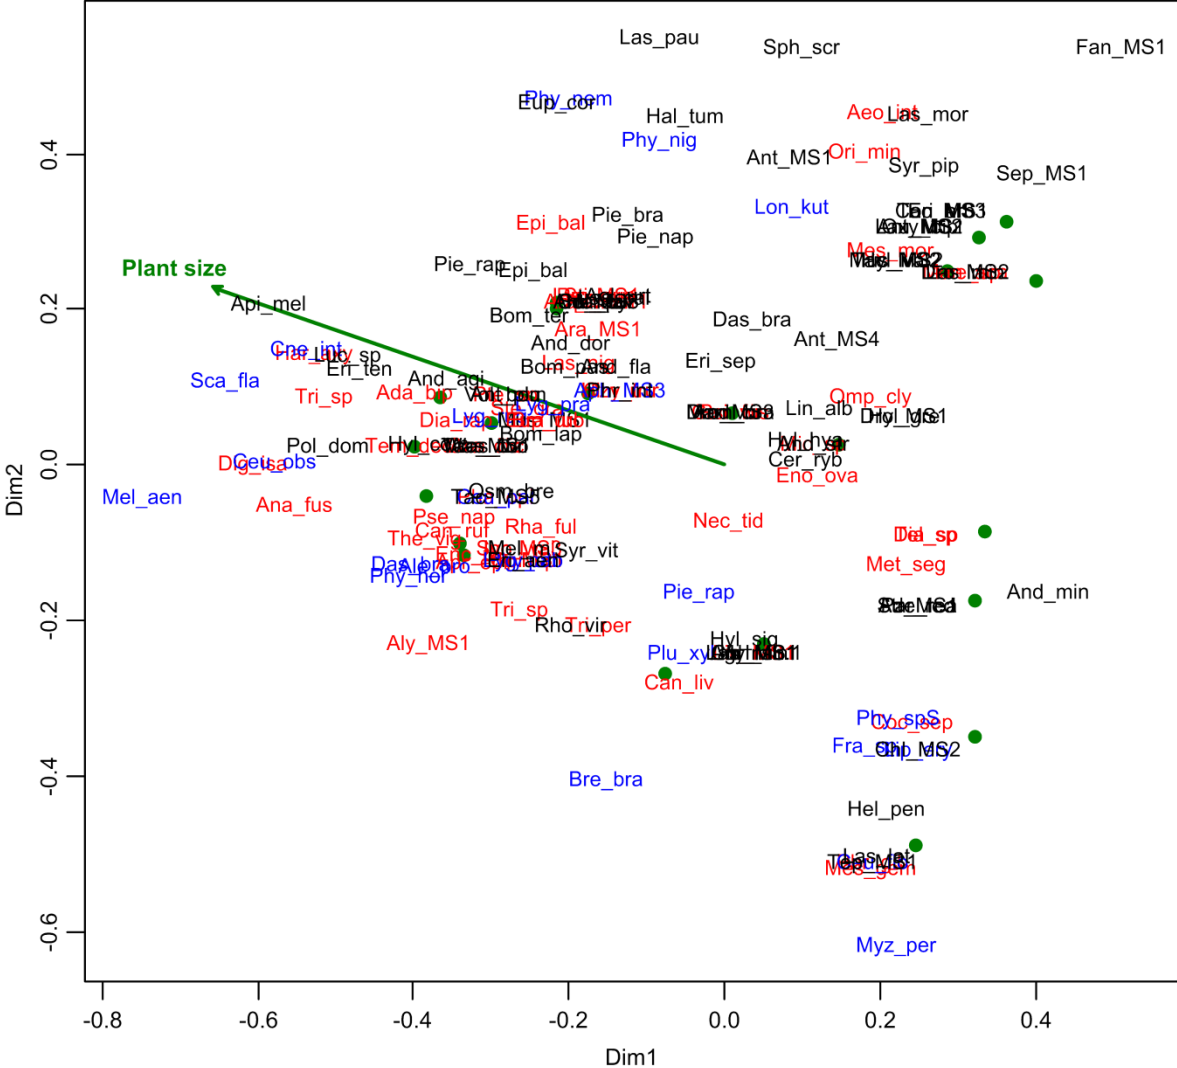

Figure S2. Community composition ordination (PCoA). The matrix of arthropod species (based on abundance data per plant species and Bray-Curtis dissimilarity; herbivore species in blue, their natural enemies in red and pollinator species in black; abbreviations refer to the first letters of the species names, see S3 Table) and plant species (green dots) was calculated independently of plant size (variance explained by axes = 40 % each). Association between ordination and plant size: $R^2 = 0.630$, $p < 0.001$.
