Banana plantations in the Honduras are irrigated [1-3], either all year long [Dole plantations, see p29 2] or from January to August [independent plantations from which Dole purchase bananas, see p31 2]. Omonita Farm in the Honduras [1] is between expert database sites #73 and #74 (CliMond grid cells 157879 and 157311, respectively). Under the irrigation scenario, the EI values are high (53 and 54), with growth occurring year-round, but limited by high temperatures. Not surprisingly, given their proximity to one another, the climate in these two grid cells is very similar.
