O.E.M. Performance Remapping Program

REVERSED ENGINEERED TUNING®

The O.E.M. performance remapping program software is designed by a group of engineers that work at a major automobile manufacturer in Stuttgart Germany. They prepare software for the private racing community and select European car manufacturers. The principle process of using the car's original software and reverse engineering its perimeters safely, allows the automobile to perform significantly better without voiding the warranty. All diagnostic settings and codes are kept intact while dramatic performance gains are experienced in every day driving. This process of enabling vehicules to run more efficiently at lower rpms results in less wear and tear and better fuel economy. This remapping process permits engines to run full strength at low rpms.
