

## How healthy is the security of your information?

\_\_ Does your firm have IT policies in place that protect your bottom line from intrusion, exploitation, and ransomware attacks?

\_\_ Are you aware of present and imminent threats to your industry, market segment and/or business model?

\_\_ Are the strategies and safeguards implemented by your IT services clearly defined and understood by you and your management team?

\_\_ Have you compared your IT services to other providers to ensure you are getting the best value for your money?

\_\_ Does your staff attend regular awareness training to identify and prevent social engineering data breaches?

\_\_ Does your management team have access to compliance reporting that illustrates the state of your IT security preparedness?

\_\_ Does your IT department or out-sourced provider perform regular InfoSec reviews of your network infrastructure, IT processes, and policies?

\_\_ Do your Business Continuation and Disaster Recovery plans include both Recovery Point Objectives (backup) and Recovery Time Objectives (restore)?

**If you have not checked them all, it may be time to consider a change?**
