

Ethernet Fundamentals

How to sculpture an elephant

Get a large block of stone and chip away all of those parts that do not look like an elephant.

We will continue on
toward TCP/IP

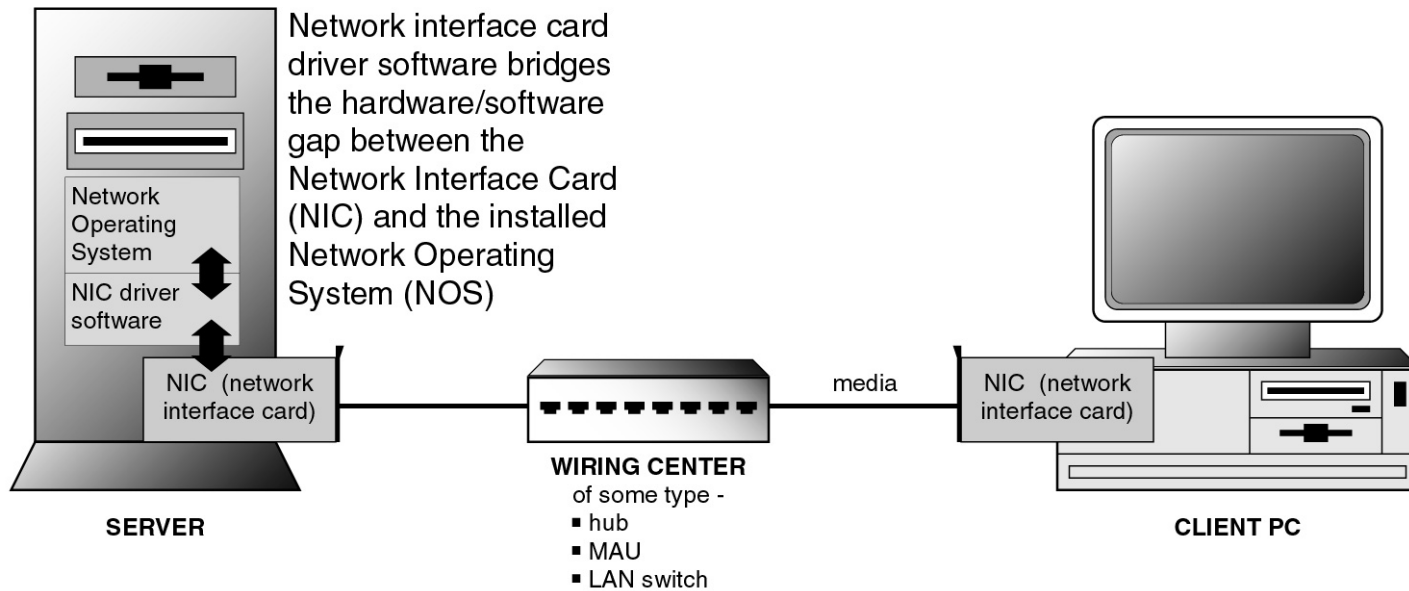

- Local LANs are composed of the following components:
 - Wiring concentrator
 - Media (cable)
 - NIC card
 - Software

LAN Components

Logical Diagram

GOLDMAN & RAWLES: LAN 2e
FIG: 03-01

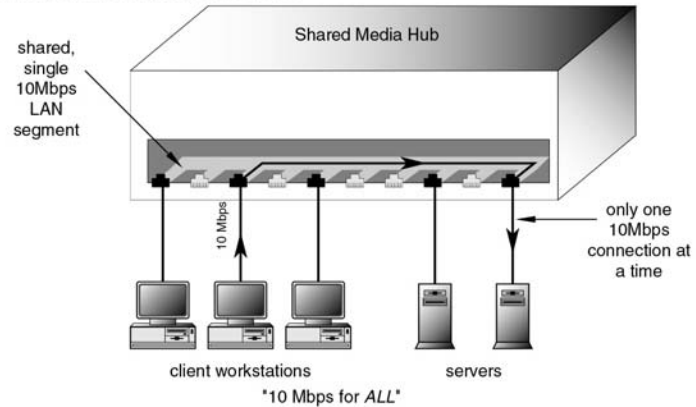

- Shared-media Networks
 - Hubs
 - Cable based links (I.e. Ethernet coax)
- Switched LANs
 - Each port on the switch is a dedicated LAN segment

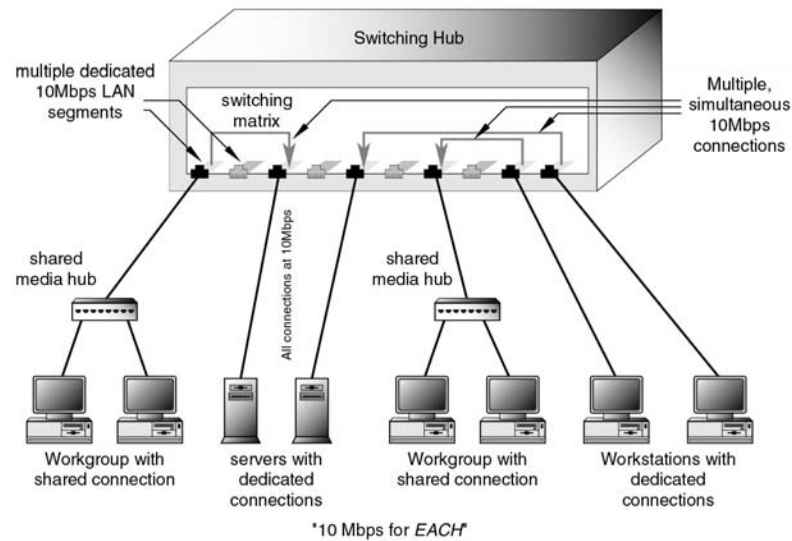

Hubs versus Switches

Shared Media LAN Architecture

Switch-Based LAN Architecture

GOLDMAN & RAWLES: LAN 2e
FIG: 03-03

Switched LAN Architectures

Stand-Alone Workgroup/Departmental LAN Switches

Standard

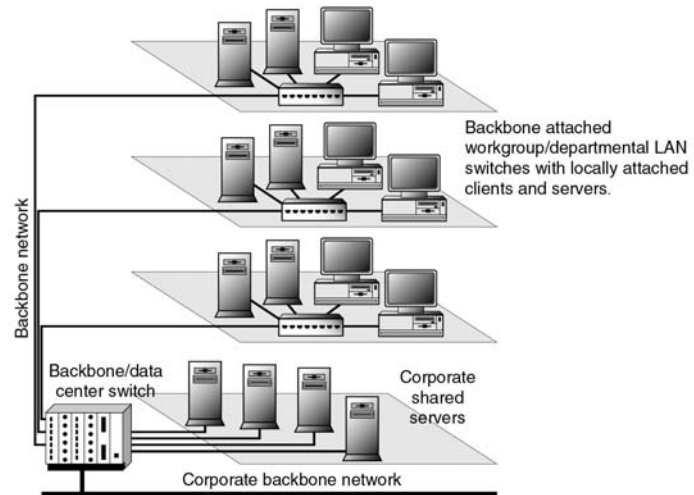

Server front-end variation

Backbone-Attached Workgroup/Departmental LAN Switches

Backbone/Data Center Switches

- The interface between the PC and the network.
- Provides LAN connection and MAC layer
 - OSI level 1 and lower part of 2
- LAN standard on one side, PC bus on the other side

- RJ45 (most common)
 - 10BaseT
 - 100Base-T
 - UTP based media
- BNC (obsolete)
 - 10Base2 Coax Media
- AUI (obsolete)
 - 10Base5 Coax Media

Ethernet Media Interfaces

GOLDMAN & RAWLES: LAN 2e
FIG: 03-08

- Dual speed cards, 10/100 Mbps
- On the PC motherboard
- Full Duplex
- Multi-port NICs for servers
- Performance Enhanced
 - Packet overlapping

- The link between active network components
 - Copper based cable
 - UTP
 - STP
 - Coax
 - Various flavors of fiber optic cable
- Two most common medias
-
- A diagram consisting of two arrows originating from the text "Two most common medias". One arrow points to the left towards the "UTP" bullet point, and the other points downwards and to the left towards the "Various flavors of fiber optic cable" bullet point.

Packets and Frames

- Layer 2 uses Frames
- Layer 3 uses Packets
- Packets are encapsulated in Frames

LAYER 3 **PACKET**

LAYER 2 **FRAME**

GOLDMAN & RAWLES: LAN 2e
FIG: 04-04

Ethernet Frames

Format used by IP

Ethernet II Frame Layout

Preamble 8 Octets	Destination Address 6 Octets	Source Address 6 Octets	Type 2 Octets	Data Unit 46 to 1500 bytes	Frame Check Sequence 4 Octets
----------------------	---------------------------------	----------------------------	------------------	-------------------------------	----------------------------------

The overall frame length varies from 64 to 1518 Octets

IEEE 802.3 Frame Layout

Preamble 7 Octets	Start Frame Delimiter 1 Octet	Destination Address 2 or 6 Octets	Source Address 2 or 6 Octets	Length 2 Octets	Logical Link Control IEEE 802.2 Data 46 to 1500 bytes	Frame Check Sequence 4 Octets
----------------------	----------------------------------	--------------------------------------	---------------------------------	--------------------	---	----------------------------------

The overall frame length varies from 64 to 1518 Octets

NOTE: 1 Octet = 8 bits

- Ethernet II Frame
 - Used a type field to identify the higher level protocol that is encapsulated in the Data area.
 - 8137 SPX/IPX
 - 0800 TCP/IP
 - Uses CRC32 in the Frame Check Sequence
 - Used by almost all LANs for error checking
 - Max 1518, Min 64

- Required to control access to the network by multiple users on media sharing LANs
- Specific to the the type of LAN
 - Token passing for token ring and FDDI
 - CSMA/CD for Ethernet
- Part of the physical layer

- Carrier sense multiple access/collision detection.
 - Listen for traffic
 - Access the network sending a frame
 - Check for collision (two stations talk)
 - Backoff and retry
- Collisions caused by propagation delay
