

# **Arris (C-COR) Switched Digital Video (SDV) Training**

## **SDV-101**

## Introductions

**Cliff Aaby**

Principle System Architect, On Demand

Arris Group

**Cliff.Aaby@arrisi.com**

**503-690-6322**

## Training Objectives

- Explain the difference between **switched digital video** and broadcast systems
- List the benefits of SDV
- Identify the major components of SDV
  - **Video Plane**
  - **Control Plane**
  - **Client Plane**
- Describe the major functions of the **SM** (Session Manager)
- Describe the major functions of the **ERM** (Edge Resource Manager)

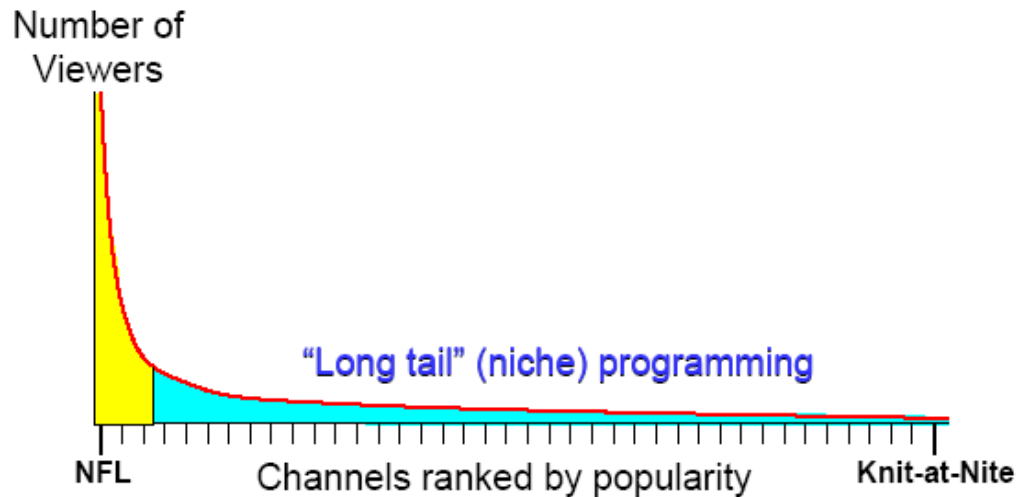

## Why Switched Video?

### Haven't we got enough to do ALREADY???

Look what we are facing:

- **Competitive threat:** Direct TV launches 140 HD channels
- **Bandwidth issues:** Remove unwatched programs from plant
- **Content limitations:** Enables cable to deliver unlimited content
- **No idea** what subscribers are viewing
- **Advertising challenges:** targeted advertising
  
- **TWC has over 1 MILLION subs on SDV today!**

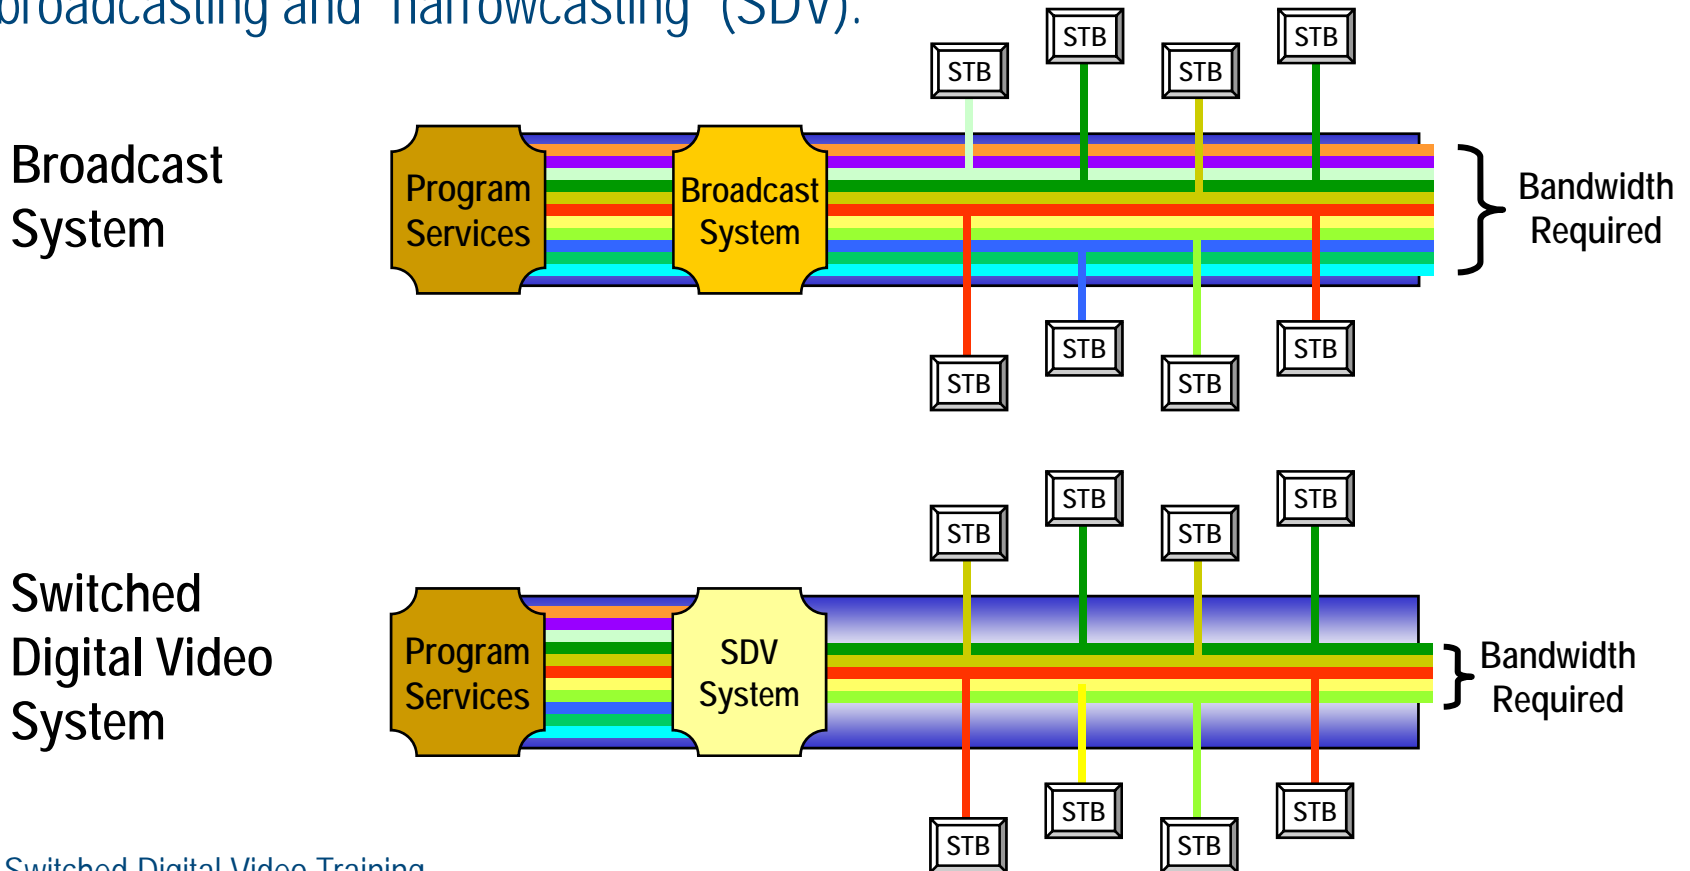

## SDV Enables more ('unlimited') Niche Programming

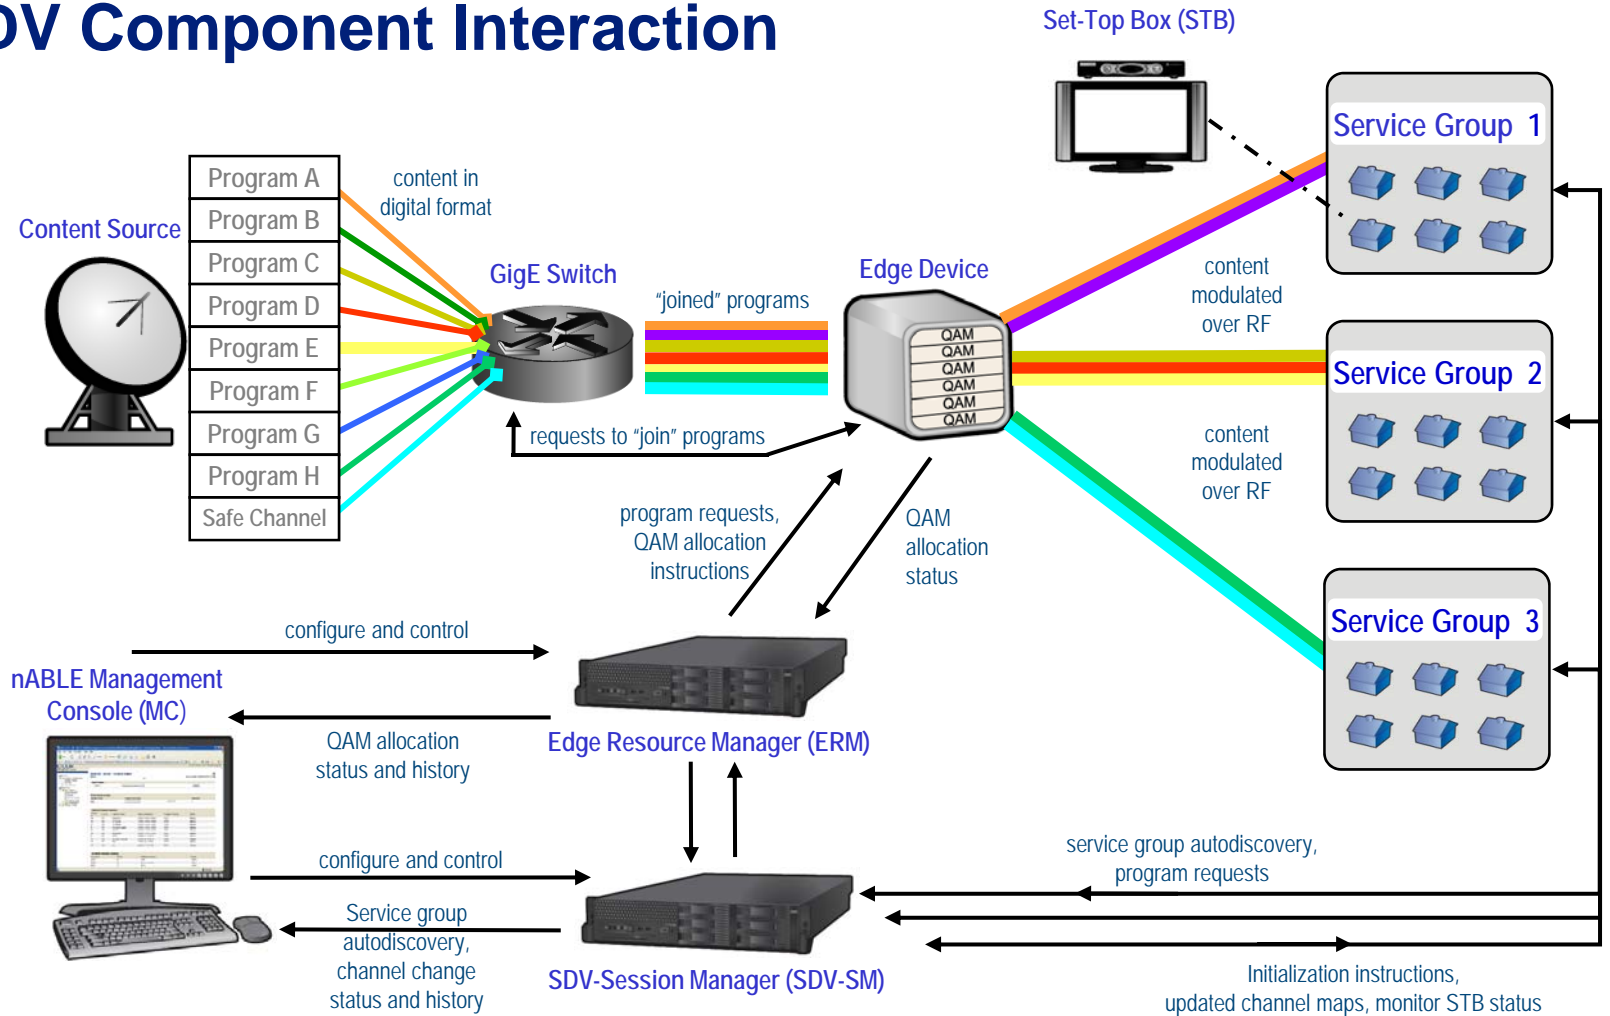

- Niche programming represents the vast majority of broadcast tier
- 10% of the programs represent 90% of the views
- In one trial 50% of the broadcast tier was NEVER watched
- **Switched Digital Video takes advantage of the way subscribers watch "large collections" of content**

# Defining Switched Digital Video (SDV)

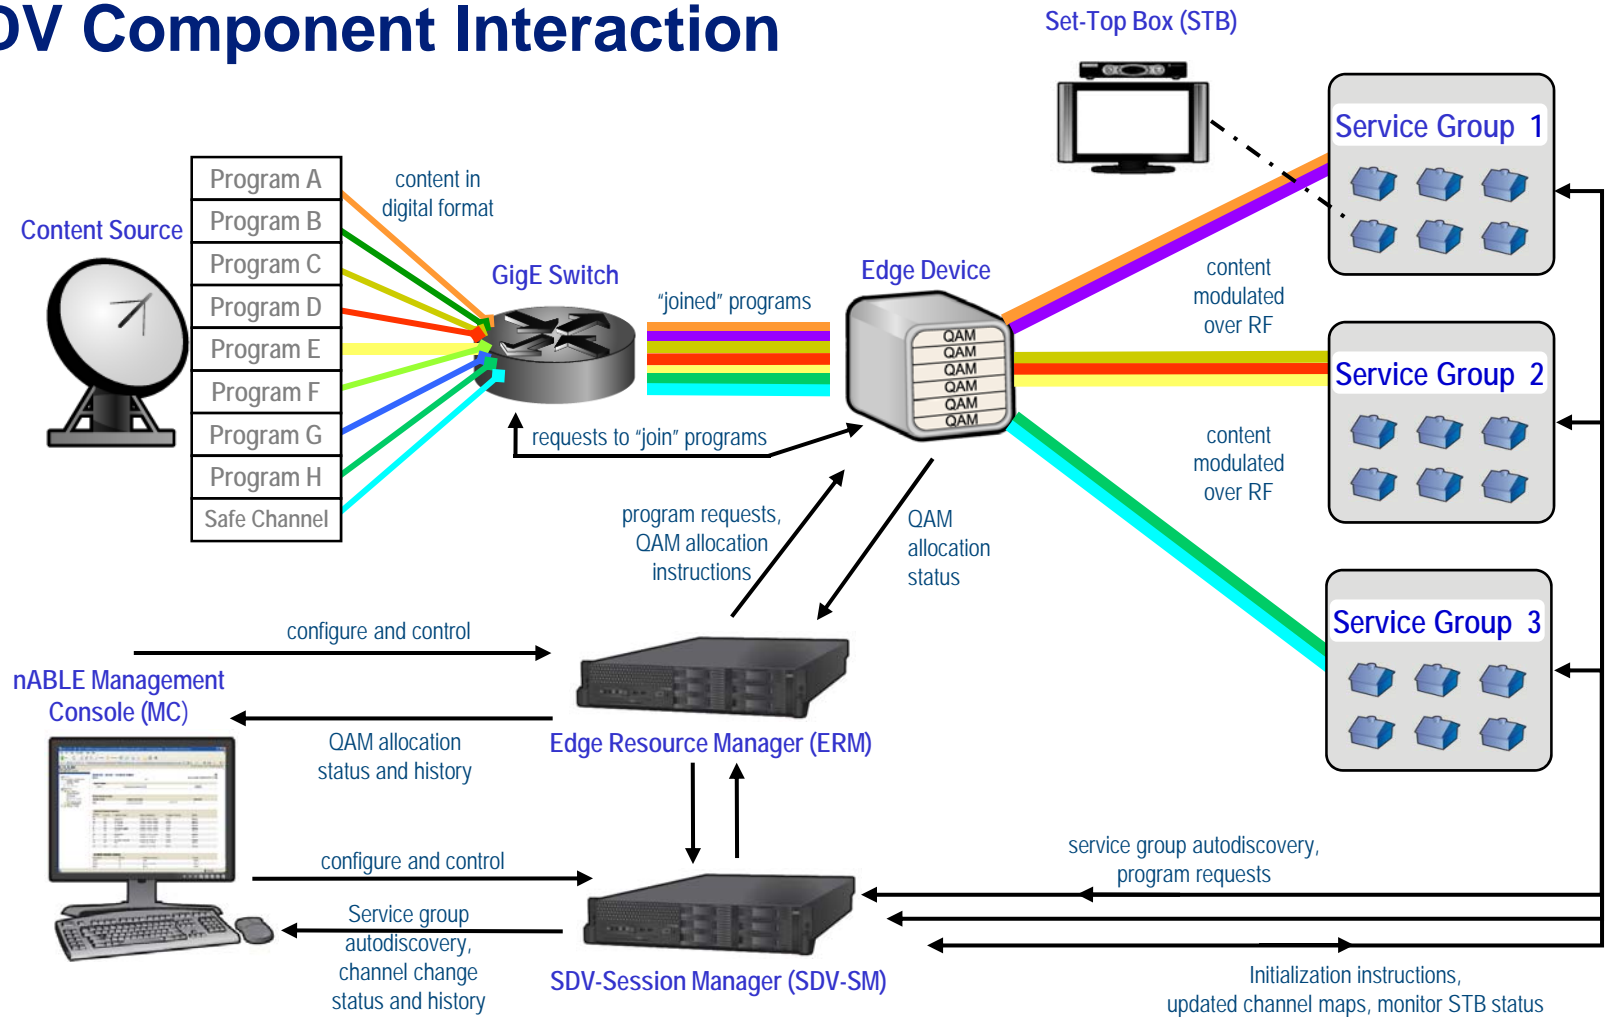

Switched Digital Video (SDV) delivers broadcast content *selectively* on subscriber requests. The graphic below depicts the difference between broadcasting and "narrowcasting" (SDV).

# SDV Component Interaction

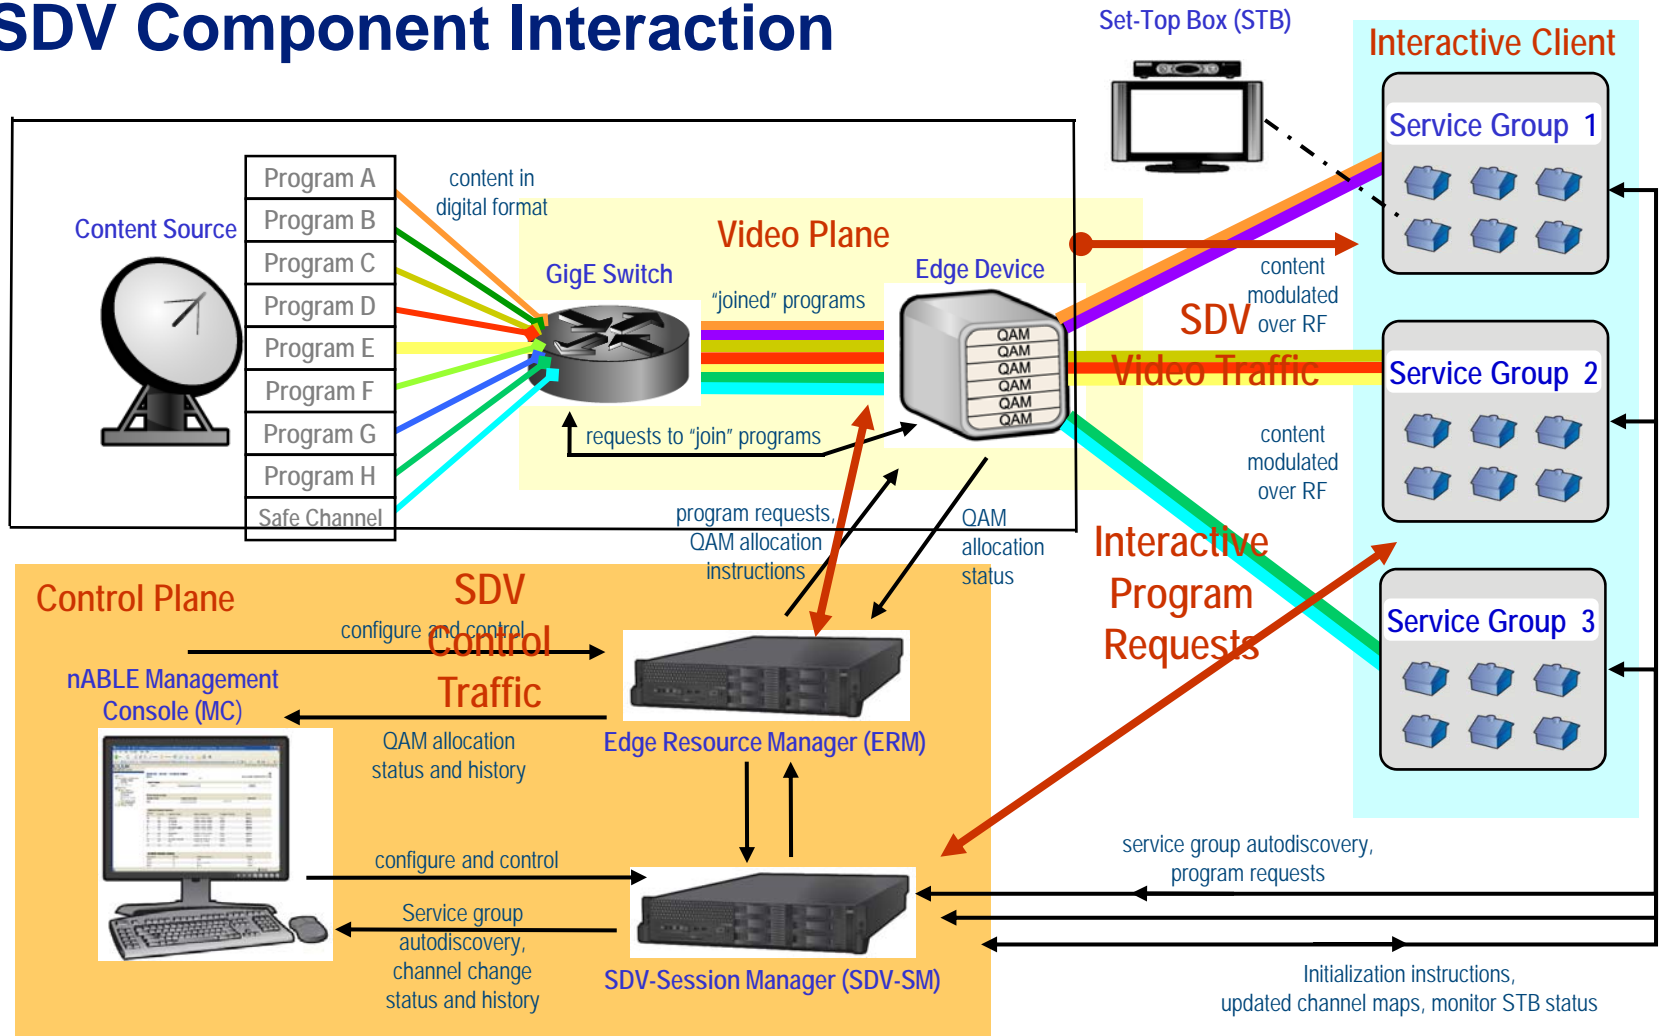

# SDV Component Interaction

## Role of the Management Console (MC)

### Users can *configure* the entire system using the MC GUI

- For example:
  - Configure **switched** programming
  - Select **timeout** and other critical values
  - Identify **edge** resources (modulators)

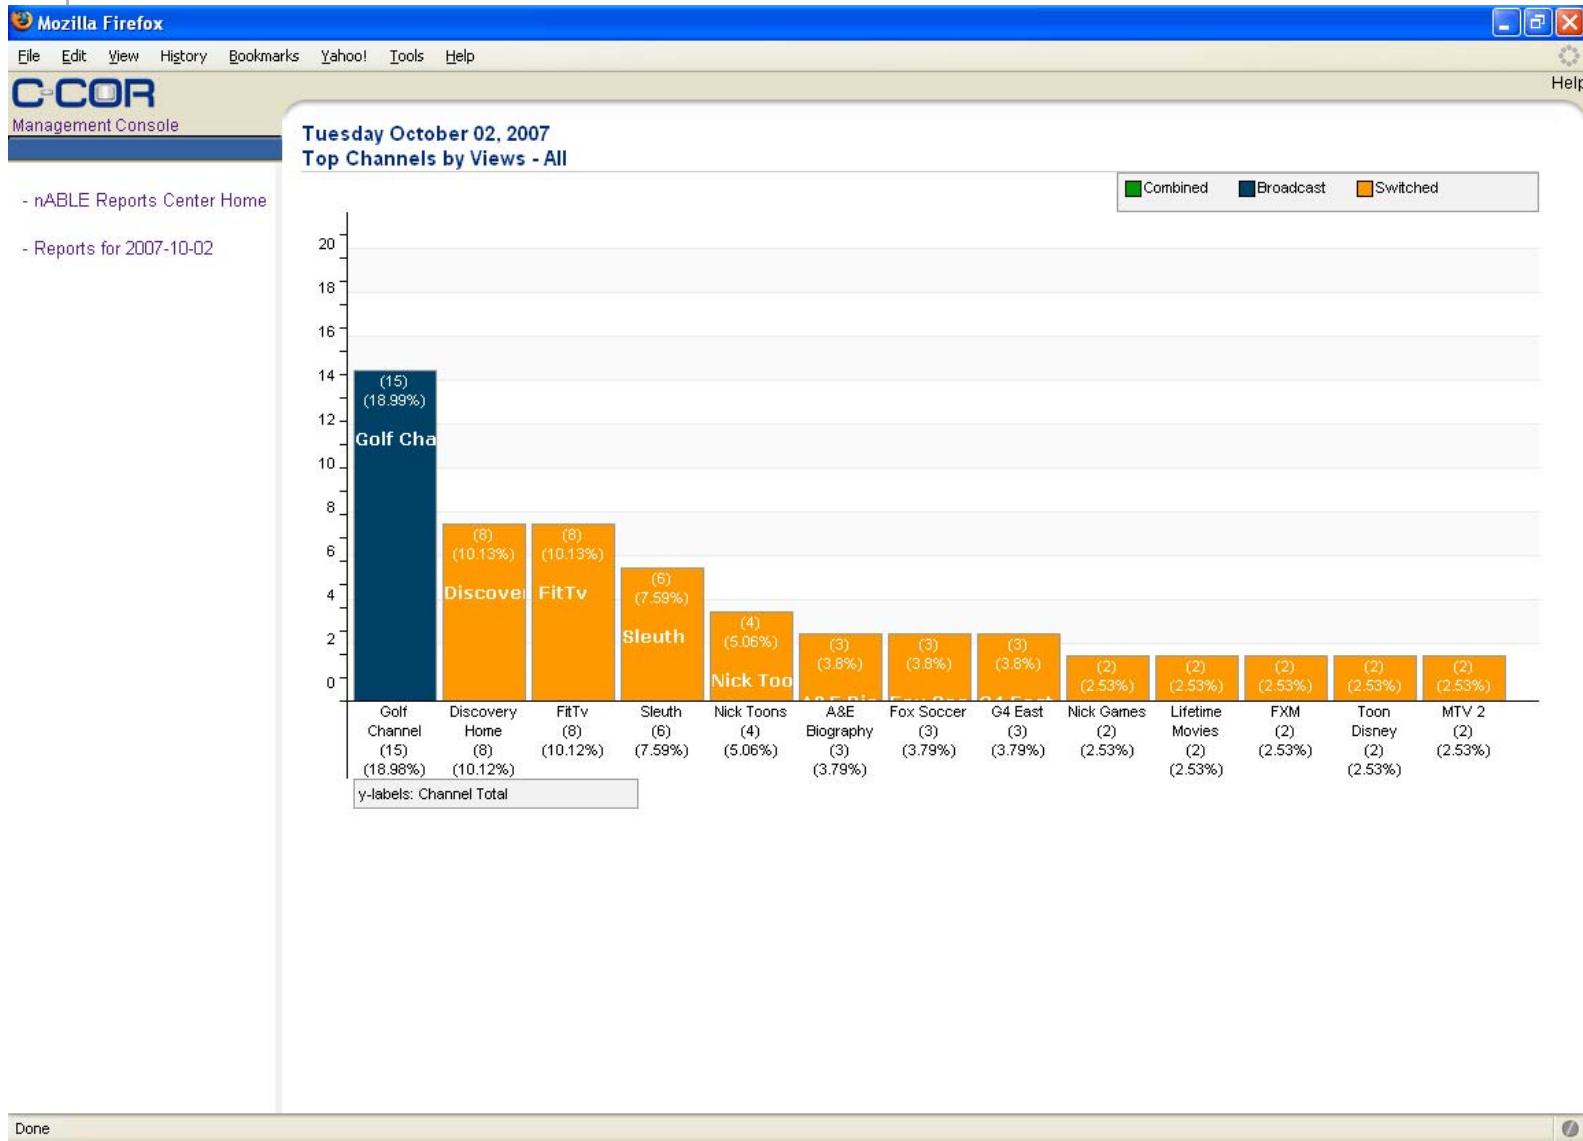

### Users can *troubleshoot* the entire system using the MC GUI

- For example:
  - Determine the status of either the **ERM** or **SM**
  - View **active tuners** in a **service group**
  - Determine **QAM** status
  - Monitor system event status including warnings and error

### A *report* feature gathers statistics on subscriber activities

- For example:
  - **Top channels** by viewing time
  - **Top service groups** by views
  - Channel views **by day, hour, and minute**

### deployment1 - erm1 - Service Group Activity

Last Updated 07/26/2007 01:12 PM

◀ Back

**Select Service Group**

Service Group :

**Service Group Summary**

Region	Beaverton		Active	Reclaimable
ID	899	Active Bandwidth	4 Mbps (5%)	
Number of Qams	2	Reclaimable Bandwidth	18 Mbps (23%)	
		Remaining Bandwidth	55.6 Mbps (72%)	
		Total Bandwidth	77.6 Mbps	

**Qam Summary** Expand All | Collapse All

Status	QamId	Tsid	Edge Device	Used Bandwidth	Streams	
Enabled	1251	1251	StreamingZone.Hub.134.242.162.156	( 4 Mbps / 38.8 Mbps ) 10 %	3	
<b>Channel</b>	<b>Multicast Address</b>	<b>PN</b>	<b>Source Address</b>	<b>Input Port</b>	<b>Status</b>	<b>Bitrate</b>
Nicktoons	226.55.100.41:10041	157	134.242.190.26	134.242.190.33	Reclaimable	4 Mbps
Military Channel	226.55.120.56:12056	155	134.242.190.26	134.242.190.33	Reclaimable	4 Mbps
G4 East	226.55.77.95:7795	158	134.242.191.200	134.242.190.33	Active	4 Mbps
Enabled	1261	1261	StreamingZone.Hub.134.242.162.156	( 0 Mbps / 38.8 Mbps ) 0 %	2	

## Role of the Session Manager (SM)

- Manages communication with the **SDV client**
- Tracks ALL **switched** services
- Monitors the **state** of every **tuner** within every **STB**
- Sends usage data to the **Management Console** for processing
- Receives configuration information from the **Management Console**, and adjusts accordingly
- Sends out the **mini-carousel**
- Directs the **Edge Resource Manager** to allocate/de-allocate bandwidth.

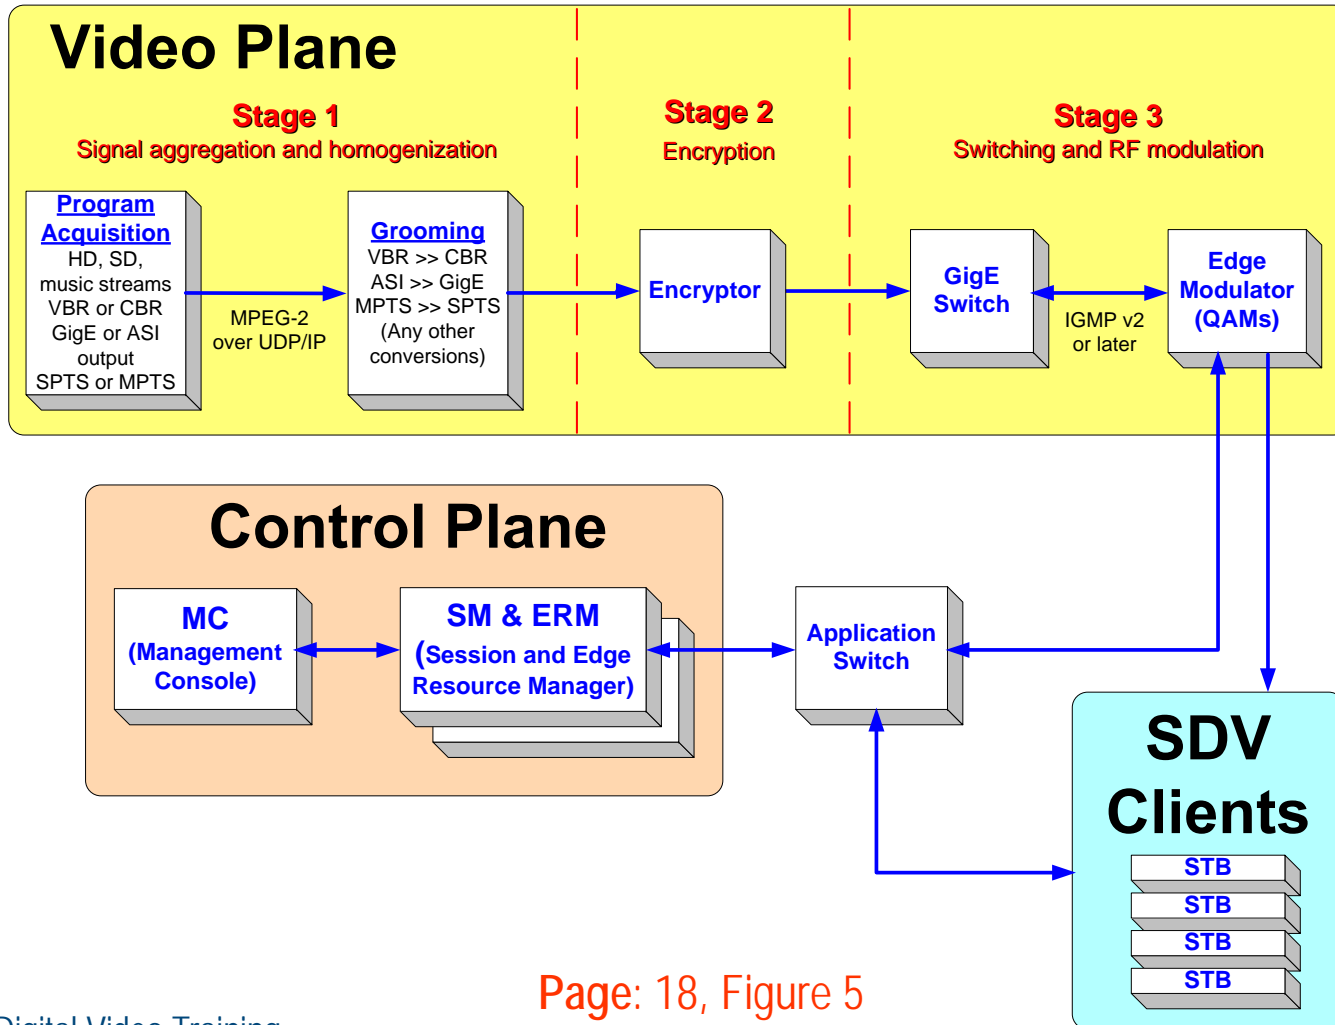

## Role of the Edge Resource Manager (ERM)

- Processes requests from the **SM** to setup or teardown sessions on the **edge device**
- Supports the **RTSP** protocols (**S6/D6/R6**)
- Manages BOTH used and available bandwidth. (The “capacity” for bandwidth is in the **QAM** itself)
- Manages the process of both adding and deleting Edge Devices (eg., D5 edge QAM) from the resource pool

# SDV System Components

Page: 18, Figure 5

## SDV Servers

In the **High-Availability** configuration: **6 total servers** in a basic SDV system

- The **Management Console**: 2 servers (one active, one standby)
- The **SM**: 2 servers (one active, one standby)
- The **ERM**: 2 servers (one active, one standby)
- Both **SM** and the **ERM** are clustered and utilize virtual IP (**VIP**)
- The **MC**, **SM** and **ERM** are high availability (**HA**) servers and are configured for failover.
- The **MC**, **SM** and **ERM** constantly communicate, replicate information between each other

## SDV Acronyms

- SM: Session Manager (Arris, Motorola)
- ERM: Edge Resource Manager (Arris, Motorola)
- MC: Management Console (Arris, Motorola)
- HA: High Availability
- VBR/CBR: Variable Bitrate, Constant Bitrate
- SD/HD: Standard Def, High Def
- ASI/DHEI: Async Serial Interface, ?
- GigE: Gigabit Ethernet
- SPTS/MPTS: Single Program Transport Stream, Multiple Program Transport Stream
- RTSP: Real Time Streaming Protocol (ERM <> Edge QAM)
- IGMP: Internet Group Multicast Protocol
- S6/D6: Comcast speak for "Session" and "Discovery" protocols

**Questions?  
Thanks!**
