

World's Most Compact Power Station

YELLOW
POWER SYSTEMS

MicroRaptor Series

We believe high-capacity power stations should be compact, effortless to use, and for every application. Therefore, our MicroRaptors are five times smaller and lighter than their competitors, don't have user manuals, and can daisy-chain together for applications of every size. Our vision is to standardize batteries just like wall outlets: every application can run off a MicroRaptor(MR), just add more or less depending on the desired power. The MR does it all, unlike electric cars, handheld vacuums, and all other battery-operated equipment where the battery can't be interchanged with another brand or sometimes at all. How much better prepared can you be for a natural disaster when just a few high-quality and well-maintained MRs can power everything?

Portable

The MicroRaptor is extremely lightweight, small, and easy to carry. It even fits well in a backpack! Our goal is to bring power to the application. Going outside to blow some leaves? Bring the MicroRaptor!

Don't worry about carrying a bulky and heavy power station!

Simple

The MicroRaptor has no switches, fans, or any moving parts. No buttons to press! Two standard 120V outlets can be treated just like any other power outlet and turn on/off automatically. Plus, it's IP65 splashproof!

Don't worry about turning it on or draining the battery!

Modular

The MicroRaptor can be coupled together for more powerful applications. No need to upgrade to a larger power station and replace the smaller one, you can just buy another and hook them together!

Don't worry about spending more money on bigger power stations!
