

PAIN

CUSTOMIZED

PAIN, INFLAMMATION AND NEUROPATHY

We offer customized topical creams and gels for patients suffering from various types of pain, including neuropathy, inflammation, muscle spasms and poor circulation. Our formulas incorporate any combination of a number of active ingredients, such as TCAs, anesthetics, anti-inflammatories, alpha-antagonists, and/or calcium-ion channel inhibitors. Our permeation-enhancing cream and gel bases allow for optimal penetration of the active ingredients through the skin, while providing smooth application and steady absorption for effective medication delivery. Pharmacist consultation is available to help you determine which ingredients and strengths would be most appropriate for your patient.

Customization is a key aspect of our pain compounds. The ingredients chosen may provide immediate relief for the patient, or adjustments may be required over time based on patient response. Our goal is to help patients achieve reduced pain levels that are more manageable for their daily activities. Through titration, the provider or the patient can adjust strength or dose based on response and the changing needs of the patient. While complete pain elimination may not always be achievable, our compounded pain medications are designed to provide customized relief and improve the quality of life for our patients.
