

Sofia

The friendly crib

sliding panel assembly manual.

Congratulations on getting a Sofia Crib!

This manual will guide you through installing the sliding door panel. It's simple!

You can assemble the rest of the crib before or after attaching slides to the front. Just make sure you leave the black spring platform for last so you have easier access to the bottom bolts.

Make sure to identify which side goes up and down, and left and right. The child lock comes pre-installed, so that gives you a good idea of which way is up.

Identify the top and bottom slides.
The top slide will have a bracket safety protection

It is best to do this on the ground.
Identify the blue stickers to attach the guides.
Remove the protection guard to get access to the bracket.

Use the short bolts. No need for washers. The threads have threadlock in them to secure.

prop it up!

Prop the sliding panel on 2 long bolts. This will help with getting it at the right height.

Attach the bolts to the top side and put the bracket guard back on.

Identify the opposing panel with the child lock. This one has the stickers on the bottom.

Align the bracket with the holes and secure the bolts.

You can put the spring platform in now.

If the door is to remain unlocked, it is recommended to keep the platform at the lowest possible setting, which is the third from the top.

If the child is very little, you may consider removing the legs from the crib to keep it lower on the ground.

We recommend using a mattress without a steel border wire, which may dig into the parent's gut.

Enjoy! If you have any questions or issues, feel free to contact us at support@sofiacrib.com or (609) 516-9588.
