

# Bearings for Mining Machinery

Tough bearings offer longer service life under demanding mining conditions through NSK's wealth of outstanding technologies.

**Choose  
NSK**

**NSK bearings offer mine operators longer service life under the most challenging operating conditions to maximize uptime and reduce maintenance costs for improved productivity at mining sites.**

Durability and reliability are of paramount importance for mining machinery operating in remote locations such as mountains and deserts, where failure of a single component can impact the entire mining operation. NSK has applied state-of-the-art technology to exceed the life and limiting speed of conventional bearings. Our superior bearings offer higher limiting speed and longer operating life, thereby reducing maintenance costs for mine operators.

NSK bearings support mining machinery for the challenging task of raising efficiency and productivity of operations under harsh environments.

 <p><b>Jaw Crusher</b> Work material is crushed between two opposing jaw plates. One plate opens and shuts, crushing raw material against the stationary jaw plate.</p>	 <p><b>Cone Crusher</b> Material is fed into the crusher cavity and processed by the eccentric rotating action of the inner cone against the outer cone. Work can be reduced to a diameter ranging from 50 mm to 100 mm.</p>	 <p><b>Vibrating Screen</b> The vibrating screen consists of a case with a shaft and housing installed inside, with springs supporting the case. The swing and rotation of the shaft is produced by the attached unbalanced weight, which generates vibration. This vibration sifts the material set on the screen on the top of the case.</p>	 <p><b>Impact Crusher</b> As indicated by its name, this machine crushes ore through impact, and steadily reduces the size of the crushed particles through sharp, repeated impact with a rapidly spinning hammer, steel plate, or stick.</p>

**NSK R&D Capabilities**

**Four Core Technologies**

Japan Corporate R&D Center

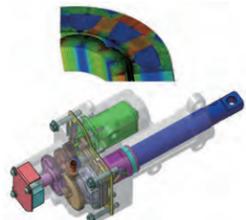

**Tribology**

Bearing products supplied to the market by NSK embody advances in the field of tribology—the science of lubrication, including enhanced grease formulations and solid lubricants, and the improvement of surface-processing methods for meeting the demands for high-speed performance, quiet rotation, the capability to sustain heavy loads and durability.

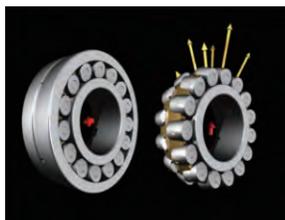

**Material Engineering**

NSK must always reconcile the demands of product functionality and durability with those of cost and productivity. To this end, material design, heat treatment processing, and analytical evaluation are reflected in NSK bearing products.

**Mechatronics**

Mechatronics is based on the fusion of mechanical elements and electronics. It is a field of advanced technologies that include high-performance sensing technology, mounting technology for applications requiring high temperatures, high densities, and high reliability, which are also reflected in NSK bearing products.

**Analysis Technology**

Optimum designs for bearing products are developed using advanced analysis technology by making full use of computer simulations through cutting-edge 3D interactive graphical virtual environments.

**A Product Line that Matches Specific Applications**

CA series bearings are double-row self-aligning spherical roller bearings with a machined brass cage that have a high load capacity, superior durability, and are resistant to wear. The CA series are especially suitable for applications that operate under heavy or shock load conditions.

**CA Series Spherical Roller Bearings**

CA-VS series bearings are CA series bearings that have been optimized for harsh vibrating applications, including vibrating screens and feeders.

**CA-VS Series Spherical Roller Bearings**

NSKHPS series bearings are double-row self-aligning spherical roller bearings capable of carrying heavy radial loads with moderate axial loads in either direction. The spherical profile of the rollers, the inner ring raceway, and the outer ring raceway, enable a self-aligning function that allows full capacity loading. The NSKHPS series offers high performance standard-size bearings with longer operating life and higher limiting speeds than conventional bearings.

**NSKHPS Spherical Roller Bearings**

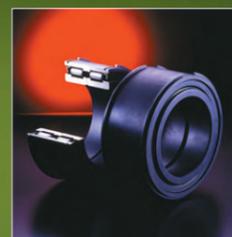

EM and EW series bearings are cylindrical roller bearings capable of carrying particularly large radial loads and are suitable for high-speed applications. The EW series features a pressed steel cage and the EM series features a one-piece machined brass cage. Both cages offer high-load capacity for standard-size bearings, in addition to excellent functionality and longer operating life.

**EW/EM Series Cylindrical Roller Bearings**

Hi-TF bearings were developed with innovative materials and heat treatment technology for increased durability under harsh conditions. They combine long service life with good resistance to wear and seizure even under contaminated lubrication to achieve outstanding cost performance.

**Hi-TF Bearings**

Full-complement double-row cylindrical roller bearings featuring a thin-section profile and broad width specially designed for crane rope sheaves. Other applications include machinery operated at low-speed under a high load. These non-separable bearings can withstand heavy shock loads and moment loads, and have sufficient axial load capacity for use in sheaves.

**Full-Complement Cylindrical Roller Bearings for Sheaves**

Plummer blocks are bearing housings that provide high rigidity and sealing capability for large machinery and heavy load applications. Plummer blocks are available in a wide range of types and models for various applications. The two global-standard types of plummer blocks, N and SD, are available from NSK for large-scale heavy-load applications.

## Super Long-Life Spherical Roller Bearings for Vibrating Equipment CA-VS3, CA-VS4 Series

The CA-VS3 series and CA-VS4 series with machined brass cages boast enhanced performance by inheriting features of the conventional CA-VS series of spherical roller bearing and by adopting the advanced technologies of NSK's high-performance products.

### New Features

Compared to the conventional CA-VS series :

Bearing life  
Maximum **2 times**  
or Twofold

Dynamic load rating  
Maximum **25% higher**

### Features

- Highly resistant to heavy or shock loads.
- Long service life for vibrating applications.

- Excellent self-aligning ability.
- Preventive measure against shaft deflection.

Easy to install

CA-VS3 (4) series bearings are available with inner ring bore dimensions ranging from 40 mm to 190 mm

## NSKHPS Spherical Roller Bearings

Bearings are expected to reduce maintenance costs and enhance performance for a variety of equipment. NSKHPS spherical roller bearings satisfy these requirements by fully utilizing NSK's experience and expertise to deliver longer life and higher limiting speed.

### Features

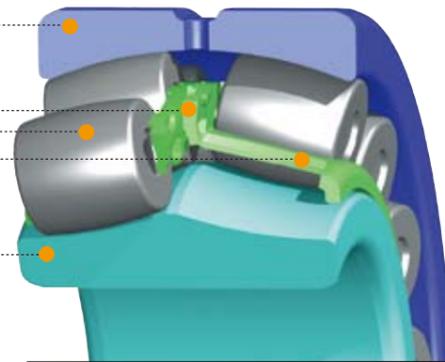

Compared to the conventional EA Series:

Bearing life  
Maximum **2 times**  
Increased dynamic load rating to maximum of 25%

Limiting speed  
Maximum **20% higher**

NSKHPS bearings are available with inner bore dimensions ranging from 40 mm to 130 mm

- Outer Ring** ..... High-temperature operability (dimensional stability) and lubrication groove and holes
- Cage Flange** ..... High limiting speed
- Rollers** ..... Increased size and number
- Cage** ..... High-strength pressed steel with special surface treatment
- Inner Ring** ..... High-temperature operability (dimensional stability)

## Full Complement Cylindrical Roller Bearings for Crane Sheaves

This cylindrical roller bearing incorporates seals to prevent the entry of foreign matter.

### Features

- Improved seal: Contact seal increases resistance to entry of foreign matter or water.
- High load capacity: Larger radial load and axial load capacity compared to conventional sheave bearings.
- Corrosion resistance: Phosphate surface treatment improves resistance to rust.
- Easier grease replenishment: Sealed bearing includes inner ring holes to facilitate grease replenishment.
- Fewer mounted components: With snap rings for the outer ring, fewer components are required around the bearing, making for a more cost-effective sheave.

Catalog No. E1206

## EW/EM Series Cylindrical Roller Bearings

The EW and EM series of high-load capacity, standard-size cylindrical roller bearings deliver outstanding performance across a wide range of applications. High-load capacity is achieved by using more rollers than conventional bearings based on an innovative NSK concept. We also offer standard-size cylindrical roller bearings for today's needs that provide longer service life and low-noise and low-vibration performance through an optimally designed one-piece cage with high rigidity and low wear. This cage feature is incorporated in the EW series as a pressed steel cage and in the EM series as a one-piece machined brass cage.

### EW Series (pressed cage)

### Features

Compared to the NSK's conventional type:

Approximately **twice** the bearing life

**30% to 40% less** noise and vibrations

Cage strength increased **1.5 to 2 times**

**10% to 25% higher** limiting speed

Series offers bearing inner bore dimensions ranging from 25 mm to 65 mm

Roller cage guide face

Catalog No. E1238

### EM Series (machined cage)

### Features

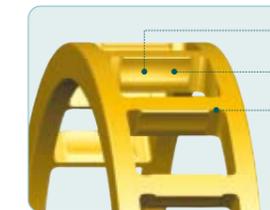

Compared to the NSK's conventional type:

Approximately **twice** the bearing life

**50% to 60% less** noise and vibrations

**Enhanced** cage strength

Series offers bearing inner bore dimensions ranging from 25 mm to 200 mm

High precision cage

- Advantages of a roller-guided cage
- Trouble-free packing of grease
- Improved oil flow

Greater accuracy of the roller guidance achieved through special pocket profiling

Large pocket corner radii relieve stress concentrations on the cage

Catalog No. E1237

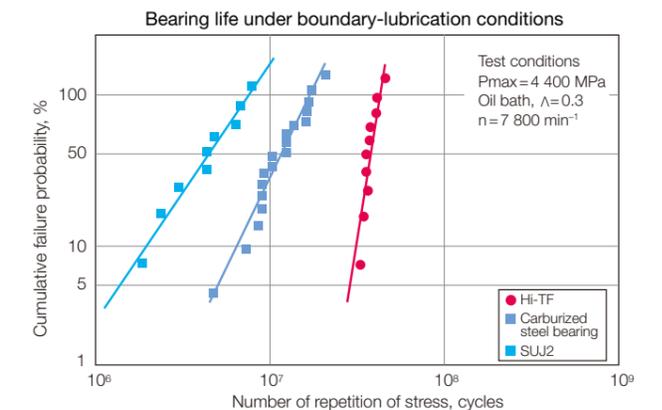

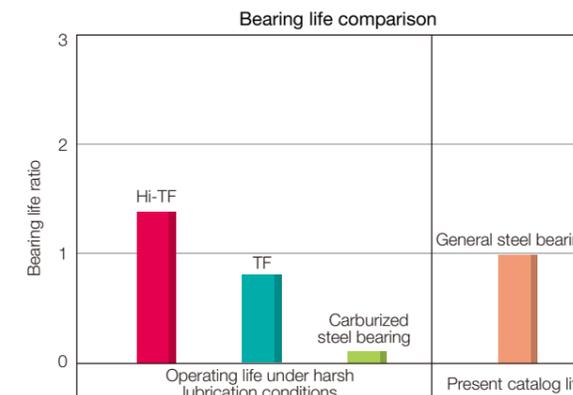

## Hi-TF Bearings

Bearings manufactured from NSK's Hi-TF material have been specifically designed for outstanding toughness under harsh operating conditions, surpassing even NSK's earlier TF bearings. Hi-TF bearings incorporating this new material and a new heat-treatment technology provide long service life under contaminated lubrication conditions with superior resistance to wear, seizure, and heat. Hi-TF bearings are capable of handling the foreseeable needs of the future as well as meeting today's requirements.

### Features

Achieves longer bearing life even under harsh conditions with excellent resistance to wear, seizure, and heat

## Dimensional tolerance and radial clearance

NSK's -VS3, VS4 specifications stabilize the load distribution by controlling the internal clearance and the dimensional tolerance of the bearing.

■ VS3, VS4 series has succeeded to U15 specification (special tolerance for vibrating equipment) that has been adopted to spherical roller bearing CA-VS series. However to clarify the simplification of the suffix and the difference between new series and conventional series, suffix U15 is omitted.

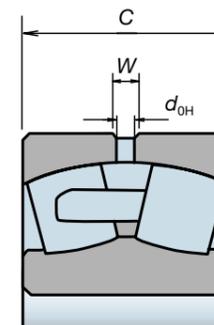

■ Number symbols (3 and 4) of VS3 and VS4 mean bearing internal clearance "C3U15 and C4U15"

- The dimensional tolerance bearing is set at 1/2 relative to the outer diameter tolerance and the internal diameter tolerance.
- The radial internal clearance is set at 2/3 relative to the standard.

# Full-Complement Cylindrical Roller Bearings for Crane Sheaves

## Recommended fitting and bearing internal clearance

When a crane sheave and wheel are used with an outer ring rotating load, bearing fitting and radial internal clearance are as follows:

Load conditions		Tolerance range class of shaft	Tolerance range class of housing	Recommended internal clearance
Outer ring rotating	Heavy load with thin housing	g6 or h6	P7	C3
	Normal load or heavy load	g6 or h6	N7	C3
	Light load or fluctuating load	g6 or h6	M7	CN

## Handling precautions

Be sure to push on the end face of the outer ring when mounting the bearing into a sheave. When mounting the bearing on a shaft, push on the end face of the inner ring.

# Radial Clearance in Spherical Roller Bearings with Tapered Bores

Bearings with tapered bores are directly mounted onto tapered shafts or onto cylindrical shafts with adapters or withdrawal sleeves (Fig. 1).

Large bearings are often mounted using hydraulic pressure. Fig. 2 shows a bearing mounting utilizing a sleeve and hydraulic nut. Another mounting method is to drill holes in the sleeve which are used to feed oil under pressure to seat the bearing. As the bearing expands radially, the sleeve is inserted axially with adjusting bolts.

The bearing should be mounted with a suitable interference fit by checking residual clearance while measuring their radial-clearance reduction and referring to the amount of axial movement listed in Table 1. Radial clearance must be measured using clearance

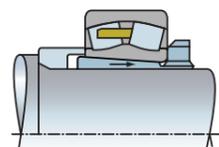

Fig. 1 Mounting with adapter

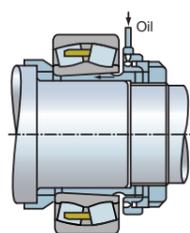

Fig. 2 Mounting with hydraulic nut

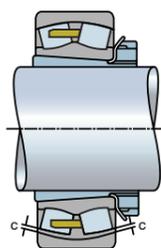

Fig. 3 Clearance measurement of spherical roller bearing

gauges. As shown in Fig 3, radial clearance for both rows of rollers must be measured simultaneously, and those two values should be kept roughly the same.

When a large bearing is mounted on a shaft, the outer ring may be deformed into an oval shape by its own weight. If radial clearance is measured at the lowest part of the deformed bearing, the measured value may be greater than the true value. If an incorrect radial internal clearance is obtained in this manner and the value in Table 1 are used, then the interference fit may become too tight and the true residual clearance may become too small. In this case, as shown in Fig. 4, one half of the total clearance at points a and b (which are on a horizontal line passing through the bearing center) and c (which is the lowest position of the bearing) may be used as the residual clearance.

# Bearing Maintenance and Inspection

## Maintenance

Bearings and operating conditions must be periodically inspected and maintained to maximize bearing life to prevent mechanical failure, ensure reliable operation, raise productivity, and enhance cost performance.

Maintenance should be performed regularly according to work standards that may vary according to machine operating conditions. Operating conditions should be monitored, lubricant replenished or changed, and the machine periodically disassembled and overhauled.

## 1. Inspection under operating conditions

Review lubricant properties, check operating temperatures, and inspect for any vibrations and bearing noise to determine bearing replacement periods and replenishment intervals of the lubricant.

## 2. Inspection of the bearing

Be sure to thoroughly examine the bearings during periodic machine inspections and part replacement. Check the raceway for any damage and confirm if the bearing can be reused or should be replaced.

## Inspection points

Items to be checked while the machine is running should include bearing noise, vibrations, temperature, and lubricant condition.

### 1. Bearing noise

Sound detection instruments can be used during operation to ascertain the volume and characteristics of bearing rotation noise through sound patterns that are readily distinguishable, which can reveal the presence of bearing damage such as slight flaking. Three typical noise conditions are described in Table 2.

### 2. Bearing vibration

Bearing irregularities can be analyzed by performing a quantitative analysis of vibration amplitude and frequency using a frequency spectrum analyzer. Measured data varies depending on the operating conditions of the bearing and the location of the vibration pick-up. Therefore, this method requires the determination of evaluation standards for each measured machine.

Table 1 Bearing irregularity causes and measures

Irregularities	Possible causes	Measures	
Noise	Loud metallic sound	Abnormal load	Improve the fit, internal clearance, preload, or position of housing shoulder.
		Incorrect mounting	Improve machining accuracy, alignment accuracy or mounting accuracy of shaft and housing, or use the correct mounting method.
		Insufficient or improper lubricant	Replenish the lubricant or select another lubricant.
	Loud regular sound	Contact of rotating parts	Modify the labyrinth seal.
		Flaws, corrosion, or scratches on raceways caused by foreign particles	Replace or clean the bearing, improve sealing conditions, or use clean lubricant.
		Brinelling	Replace the bearing and use care when handling.
Irregular sound	Flaking on raceway	Replace the bearing.	
	Excessive clearance	Improve the fit, clearance, or preload.	
Abnormal temperature rise	Contamination by foreign particles	Replace or clean the bearing, improve the seals, and use clean lubricant.	
	Flaws or flaking on balls	Replace the bearing.	
	Excessively small clearance	Excessively small clearance	Improve the fit, clearance, or preload.
		Excessive amount of lubricant	Reduce amount of lubricant and select stiffer grease.
		Insufficient or improper lubricant	Replenish lubricant or select a proper one.
	Incorrect mounting	Abnormal load	Improve the fit, internal clearance, preload, or position of housing shoulder.
Incorrect mounting		Improve machining accuracy, alignment accuracy or mounting accuracy of shaft and housing, or use the correct mounting method.	
Creep on fitted surface, or excessive seal friction		Correct the seals, replace the bearing, and correct the fitting or mounting.	
Vibration (Axial runout)	Brinelling	Replace the bearing, and use care when handling bearings.	
	Flaking	Replace the bearing.	
	Incorrect mounting	Correct the squareness between the shaft and housing shoulder or side of spacer.	
	Penetration of foreign particles	Replace or clean the bearing components and improve sealing.	
Leakage or discoloration of lubricant	Too much lubricant, or contamination by foreign particles or wear debris	Reduce the amount of lubricant. Select a stiffer grease. Replace the bearing or lubricant. Clean the housing and adjacent parts.	

# Bearing Damage and Measures

## Flaking

Damage condition	Possible causes	Measures
Flaking occurs when fragments of bearing material chip off from the smooth surface of the raceway or rolling elements due to rolling fatigue, thereby creating regions having rough and coarse texture.	<ul style="list-style-type: none"> <li>Excessive load</li> <li>Incorrect mounting (misalignment)</li> <li>Moment load</li> <li>Entry of foreign matter, water penetration</li> <li>Poor lubrication, improper lubricant</li> <li>Unsuitable bearing clearance</li> <li>Improper precision for shaft or housing, unevenness in housing rigidity, large shaft bending</li> <li>Progression from rust, corrosion pits, smearing, dens (brinelling)</li> </ul>	<ul style="list-style-type: none"> <li>Reconfirm the bearing application and check the load conditions</li> <li>Improve the mounting method</li> <li>Improve the sealing mechanism, prevent rust during non-running</li> <li>Use a lubricant with a proper viscosity, improve the lubrication method</li> <li>Check the precision of shaft and housing</li> <li>Check the bearing internal clearance</li> </ul>

Part: Inner ring of an angular contact ball bearing  
Symptom: Flaking occurs around half of the circumference of the raceway surface  
Cause: Incorrect lubrication due to entry of cutting coolant into bearing

Part: Inner ring of an angular contact ball bearing  
Symptom: Flaking occurs diagonally along raceway  
Cause: Improper alignment between shaft and housing during mounting

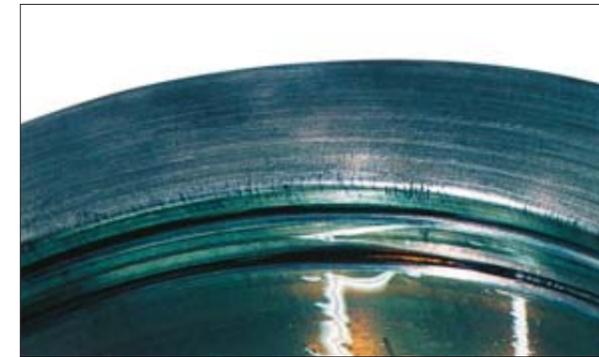

Part: Inner ring of a spherical roller bearing  
Symptom: Flaking of only one raceway over its entire circumference  
Cause: Excessive axial load

Part: Inner ring of a spherical roller bearing  
Symptom: Flaking of only one row of raceway  
Cause: Incorrect lubrication

## Cracks

Damage condition	Possible causes	Measures
Cracks in the raceway ring and rolling elements. Continued use under this condition leads to larger cracks or fractures.	<ul style="list-style-type: none"> <li>Excessive interference</li> <li>Excessive load, shock load</li> <li>Progression of flaking</li> <li>Heat generation and fretting caused by contact between mounting parts and raceway ring</li> <li>Heat generation due to creep</li> <li>Improper taper angle of tapered shaft</li> <li>Improper cylindricality of shaft</li> <li>Interference with bearing chamfer due to a shaft corner radius that is larger than bearing chamfer dimension</li> </ul>	<ul style="list-style-type: none"> <li>Correct the interference</li> <li>Check the load conditions</li> <li>Improve the mounting method</li> <li>Use an appropriate shaft shape</li> </ul>

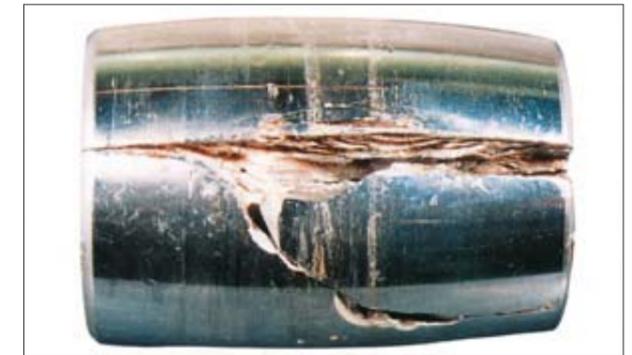

Part: Outer ring of a double-row cylindrical roller bearing  
Symptom: Thermal cracks occur on the outer ring side face  
Cause: Abnormal heat generation due to contact sliding between mating part and face of outer ring

Part: Inner ring of a spherical roller bearing  
Symptom: Axial cracks occur on raceway surface  
Cause: Large fitting stress due to temperature difference between shaft and inner ring

Part: Cross section of a fractured inner ring in a spherical roller bearing  
Symptom: Origin is directly beneath the raceway surface

Part: Roller of a spherical roller bearing  
Symptom: Axial cracks occurs on rolling surface

## Smearing

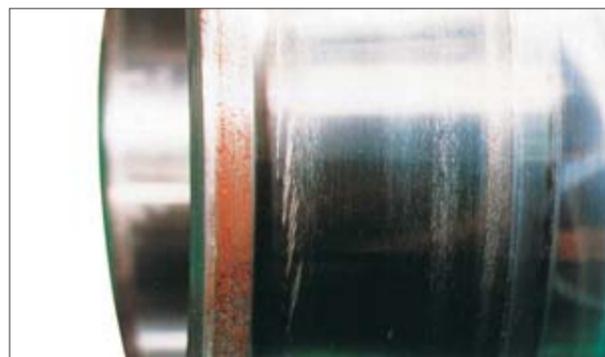

Damage condition	Possible causes	Measures
Smearing is surface damage which occurs from a collection of small seizures between bearing components caused by oil film rupture and/or sliding. Surface roughening occurs along with melting.	<ul style="list-style-type: none"> <li>• High speed and light load</li> <li>• Sudden acceleration/deceleration</li> <li>• Improper lubricant</li> <li>• Entry of water</li> </ul>	<ul style="list-style-type: none"> <li>• Improve the preload</li> <li>• Improve the bearing clearance</li> <li>• Use a lubricant with good oil film formation ability</li> <li>• Improve the lubrication method</li> <li>• Improve the sealing mechanism</li> </ul>

Part: Inner ring of a cylindrical roller bearing  
Symptom: Smearing occurs circumferentially on raceway surface  
Cause: Roller slipping due to excessive grease filling

Part: Outer ring of a cylindrical roller bearing  
Symptom: Smearing occurs circumferentially on raceway surface  
Cause: Roller slipping due to excessive grease filling

Part: Inner ring of a spherical roller bearing  
Symptom: Partial smearing occurs circumferentially on raceway surface  
Cause: Incorrect lubrication

Part: Convex rollers of a spherical roller bearing  
Symptom: Smearing occurs at the center of the rolling surface  
Cause: Incorrect lubrication

## Seizure

Damage condition	Possible causes	Measures
When sudden overheating occurs during rotation, the bearing becomes discolored, and the raceway rings, rolling elements, and cage soften, melt, and deform as damage accumulates.	<ul style="list-style-type: none"> <li>• Incorrect lubrication</li> <li>• Excessive load (excessive preload)</li> <li>• Excessive rotational speed</li> <li>• Excessively small internal clearance</li> <li>• Entry of water and foreign matter</li> <li>• Poor precision of shaft and housing, excessive shaft bending</li> </ul>	<ul style="list-style-type: none"> <li>• Investigate the lubricant and lubrication method</li> <li>• Reinvestigate the suitability of the bearing type selected</li> <li>• Investigate the preload, bearing clearance, and fitting</li> <li>• Improve the sealing mechanism</li> <li>• Check the precision of the shaft and housing</li> <li>• Improve the mounting method</li> </ul>

Part: Inner ring of a spherical roller bearing  
Symptom: Discoloration and melting of raceway; worn particles from the cage were rolled and attached to the raceway  
Cause: Insufficient lubrication

Part: Convex rollers of a spherical roller bearing  
Symptom: Discoloration and melting of roller rolling surface, adhesion of abrasion fragments from cage  
Cause: Insufficient lubrication

## Fretting

Damage condition	Possible causes	Measures
Wear occurs due to repeated sliding between two surfaces (bore, shaft, roller, etc.) Fretting occurs at fitting surface and also at contact areas between raceway and rolling elements. Fretting corrosion is another term used to describe the reddish brown or black wear debris.	<ul style="list-style-type: none"> <li>• Incorrect lubrication</li> <li>• Vibration with a small amplitude</li> <li>• Insufficient interference</li> </ul>	<ul style="list-style-type: none"> <li>• Use a proper lubricant</li> <li>• Apply preload</li> <li>• Check the interference fit</li> <li>• Apply a film of lubricant to the fitting surface</li> </ul>

Part: Inner ring of a deep groove ball bearing  
Symptom: Fretting occurs on the bore surface  
Cause: Vibration

Part: Inner ring of an angular contact ball bearing  
Symptom: Notable fretting occurs over entire circumference of bore surface  
Cause: Insufficient interference fit

# Bearing Damage and Measures

## Wear

Damage condition	Possible causes	Measures
Wear is surface deterioration due to sliding friction at the surface of the raceway, rolling elements, roller end faces, rib face, cage pockets, etc.	<ul style="list-style-type: none"> <li>• Entry of foreign matter</li> <li>• Progression from rust and electrical corrosion</li> <li>• Incorrect lubrication</li> <li>• Sliding due to irregular motion of rolling elements</li> </ul>	<ul style="list-style-type: none"> <li>• Improve the sealing mechanism</li> <li>• Clean the housing</li> <li>• Filter the lubrication oil thoroughly</li> <li>• Check the lubricant and lubrication method</li> <li>• Prevent misalignment</li> </ul>

Part: Inner ring of a cylindrical roller bearing  
 Symptom: Many pits occurs due to electrical corrosion; wave-shaped wear on raceway surface  
 Cause: Electrical corrosion

Part: Outer ring of a spherical roller bearing  
 Symptom: Wear having a wavy or concave-and-convex texture on loaded side of raceway surface  
 Cause: Entry of foreign matter under repeated vibration while stationary

Part: Inner ring of a double-row tapered roller bearing  
 Symptom: Fretting wear of raceway and stepped wear on the rib face  
 Cause: Fretting progression due to excessive load while stationary

Part: Tapered rollers of a double-row tapered roller bearing  
 Symptom: Stepped wear on the roller end face  
 Cause: Fretting progression due to excessive load while stationary

## Creep

Damage Condition	Possible causes	Measures
Creep is a phenomenon in bearings where relative slipping occurs at the fitting surfaces and thereby creates a clearance at the fitting surface. Creep causes a shiny appearance, occasionally with scoring or wear.	<ul style="list-style-type: none"> <li>• Insufficient interference or loose fit</li> <li>• Insufficient sleeve tightening</li> </ul>	<ul style="list-style-type: none"> <li>• Check the interference, and prevent rotation</li> <li>• Correct the sleeve tightening</li> <li>• Investigate the shaft and housing precision</li> <li>• Preload in the axial direction</li> <li>• Prevent axial movement of ring</li> <li>• Apply adhesive to the fitting surface</li> <li>• Apply a film of lubricant to the fitting surface</li> </ul>

Part: Inner ring of a spherical roller bearing  
 Symptom: Creep accompanied by scoring of bore surface  
 Cause: Insufficient interference

Part: Outer ring of a spherical roller bearing  
 Symptom: Creep occurs over entire circumference of outside surface  
 Cause: Loose fit between outer ring and housing
