Notes On Main Driving Chains

The main driving chains are specified in general terms, being identified by American Standard Roller Chain standards. Notice that all these chains are *run in*. The stretch in a regular commercial chain (not run in) develops rapidly during the first hours of operation and adjustment must be made almost hourly. In addition it will probably be necessary to remove chain links during the first days of operation.

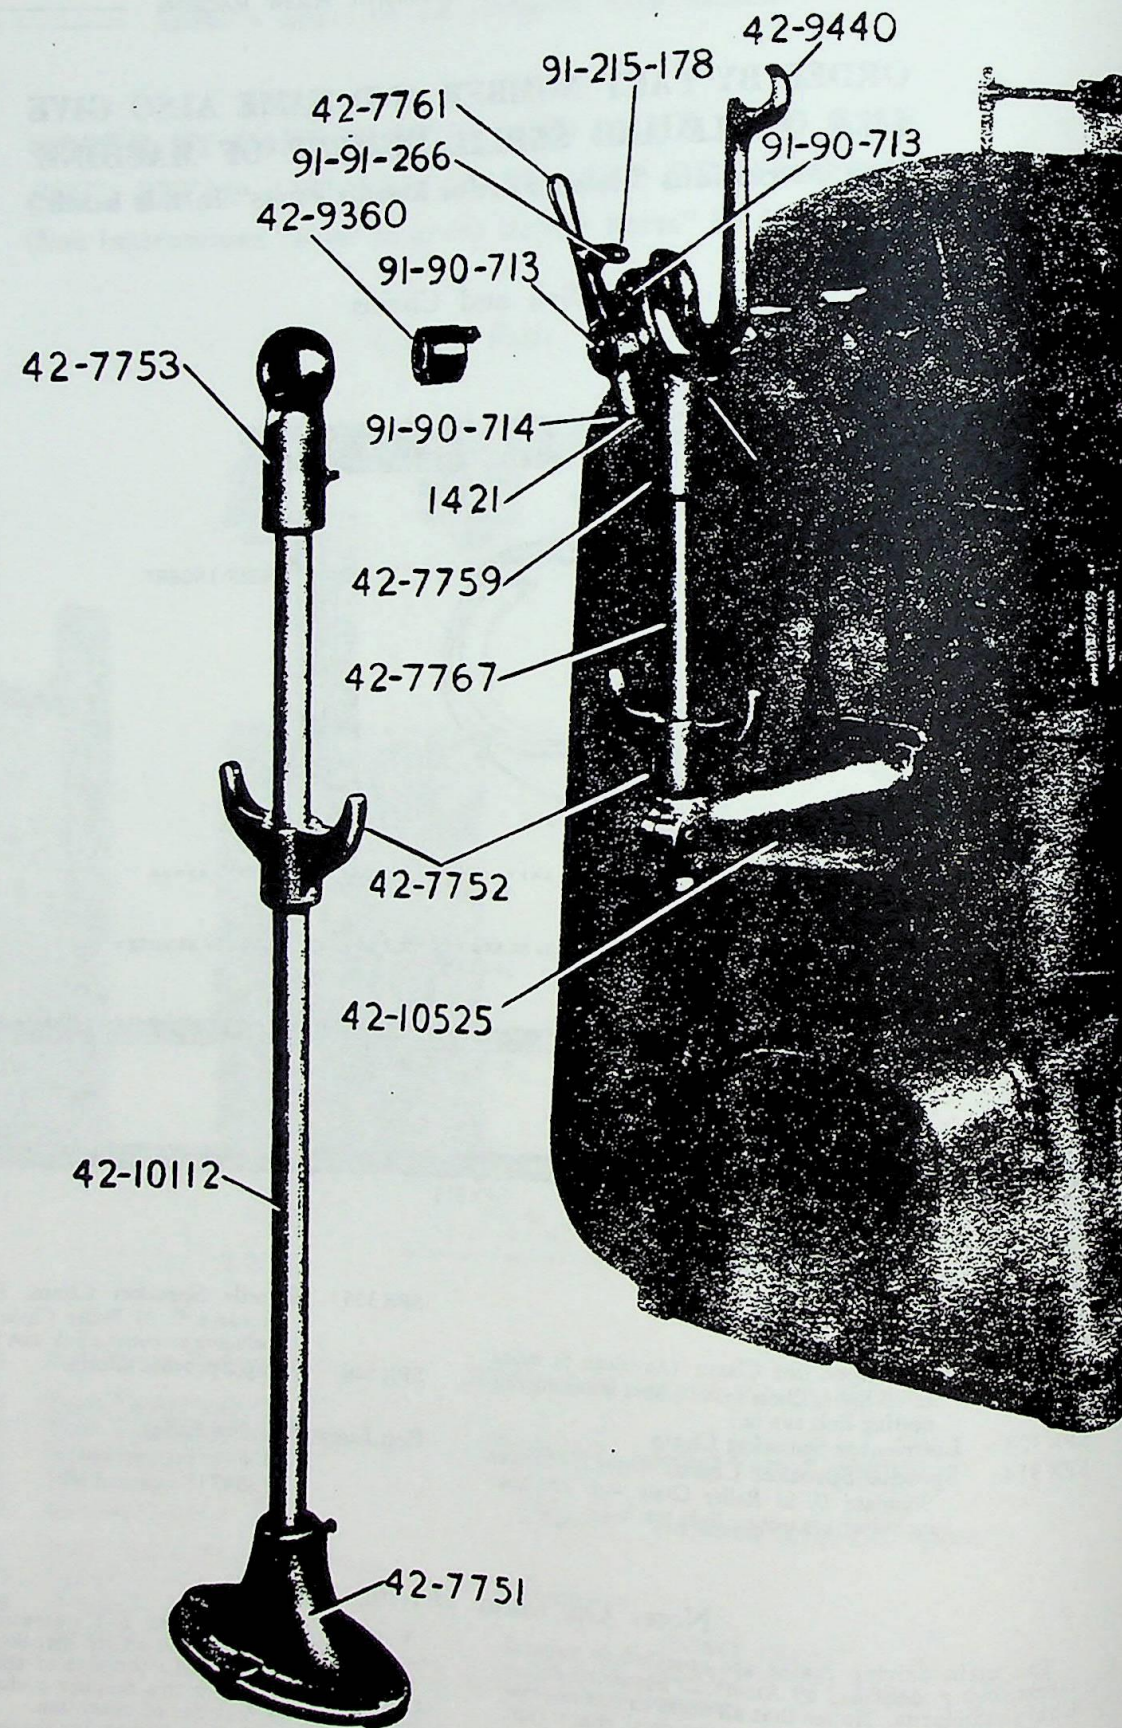

A chain which stretches and operates without proper tension will ride out on its sprocket and will permit the rollers to strike the tips of the sprocket teeth. When running in this manner a chain can be ruined during its first day of operation.

Even with "Run-In" chains regular checks on chain tension should be made, for maximum chain life cannot be obtained unless proper tension is maintained.
