

## Memorandum

**Date:** April 1, 2022  
Updated October 18, 2022

**To:** Joanna Julian, Thompson-Dorfman Partners, LLC

**From:** Philip Ault, Director of Noise and Air Quality  
Kimber Johnson, Senior Air Quality Scientist

**Subject:** Air Quality and Greenhouse Gas Emissions Analysis for the Mallard Pointe Improvement Project

---

This memorandum summarizes the findings of the air quality and greenhouse gas emissions analysis conducted by FirstCarbon Solutions (FCS) for the proposed Mallard Pointe Improvement Project (proposed project) located along Mallard Road, in Belvedere, California. This analysis serves to support the proposed project's Class 32 categorical exemption under the California Environmental Quality Act (CEQA).

### PROJECT UNDERSTANDING

The proposed project would demolish 11 existing duplex buildings containing 22 residential units along Mallard Road and redevelop the 2.8-acre Mallard Pointe site in Belvedere, California. The redevelopment of the site would include six single-family residences, 10 duplexes, and 23 apartment units. The proposed project would develop 42 units (including the proposed Accessory Dwelling Units [ADUs]) on 2.8 acres, which would result in an average housing density of 15 units per acre.

### AIR QUALITY ASSESSMENT

Pursuant to CEQA Guidelines regarding streamlining projects qualifying for a Class 32 exemption, potential impacts that are not peculiar to the proposed project or project site that can be mitigated to a less than significant level by the imposition of City regulations and consistency with the General Plan programs and policies does not require additional analysis.

#### Clean Air Plan Consistency

A measure for determining whether the proposed project supports the primary goals of the applicable air quality plan, the Bay Area Air Quality Management District (BAAQMD) 2017 Clean Air Plan, is if the proposed project would not result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the air quality plans. This measure is determined by evaluating whether the proposed project was reasonably accounted for in the Clean Air Plan.

The BAAQMD compiles the regional emissions inventory for the San Francisco Bay Area Air Basin (Air Basin). In part, the regional population, housing, and employment projections developed by the Association of Bay Area Governments (ABAG) are based on local general plan land use patterns. These projections form the foundation for the emissions inventory of the 2017 Clean Air Plan. These demographic trends are incorporated into Plan Bay Area, compiled by ABAG and the Metropolitan Transportation Commission (MTC), to determine priority transportation projects and Vehicle Miles Traveled (VMT) in the Bay Area. Projects consistent with the applicable local general plan's buildout potential are considered consistent with the regional air quality plan.

The project parcel is designated as "Medium Density Multi-Family Residential" according to the Belvedere General Plan (General Plan), which allows for a housing density of up to 20 dwelling units per acre.<sup>1</sup> The proposed project would develop 42 units (including the proposed Accessory Dwelling Units) on 2.8 acres, which would result in an average housing density of 15 units per acre. Therefore, the proposed project would not add a greater number of residents than what was anticipated in the General Plan. Additionally, the proposed project would not conflict with the BAAQMD 2017 Clean Air Plan as shown in Table 1. Therefore, the proposed project would be consistent with the buildout potential of the General Plan and subsequent population growth projections in the BAAQMD 2017 Clean Air Plan. **As such, the proposed project would be consistent with the 2017 Clean Air Plan and this air quality impact would be less than significant.**

**Table 1: Project Consistency with Clean Air**

Control Measure	Project Consistency
<b>Buildings Control Measures</b>	
<b>BL1:</b> Green Buildings	<b>Consistent.</b> The proposed project would not conflict with implementation of this measure. The proposed project would comply with the latest energy efficiency standards and incorporate applicable energy efficiency features designed to reduce project energy consumption.
<b>BL4:</b> Urban Heat Island Mitigation	<b>Consistent.</b> The proposed project would include 0.9 acre of landscaped and bioretention basin area, which would include the planting of shade trees and would serve to reduce stormwater runoff; hence reducing the urban heat island effect.
<b>Energy Control Measures</b>	
<b>EN1:</b> Decarbonize Electricity Generation	<b>Consistent.</b> The project applicant would, at a minimum, be required to conform to the energy efficiency requirements of the California Building Standards Code, also known as Title 24. For example, the proposed project would be required to install solar photovoltaic
<b>EN2:</b> Decrease Electricity Demand	

<sup>1</sup> City of Belvedere. Belvedere General Plan. Website: <https://www.cityofbelvedere.org/213/General-Plan-Housing>. Accessed January 19, 2022.

Control Measure	Project Consistency
	systems that are compliant with Title 24 Standards. Additionally, the proposed project would apply energy-efficient and low-flow fixtures, increased insulation, and solar hot water devices that would reduce energy use.
<b>Natural and Working Lands Control Measures</b>	
<b>NW2:</b> Urban Tree Planting	<b>Consistent.</b> The proposed project would include 0.9 acre of landscaped and bioretention basin area. Plantings would include trees, shrubs, and groundcover.
<b>WA3:</b> Green Waste Diversion <b>WA4:</b> Recycling and Waste Reduction	<b>Consistent.</b> The waste service provider for the proposed project will be required to meet the Assembly Bill (AB) 341 Mandatory Commercial Recycling. In addition, AB 1383 Organic Waste Collection went into effect on January 1, 2022, which aims to reduce organic waste disposal by 75 percent by 2025.
<b>Stationary Control Measures</b>	
<b>SS36:</b> Particulate Matter from Trackout	<b>Consistent with mitigation.</b> BAAQMD's recommended BMPs for construction fugitive dust control would be implemented to reduce fugitive dust and trackout during project construction. In addition, mud and dirt that may be tracked out onto the nearby public roads during construction activities shall be removed promptly by the contractor based on BAAQMD's requirements. Therefore, the proposed project would be consistent with this measure.
<b>SS37:</b> Particulate Matter from Asphalt Operations	<b>Consistent.</b> Asphalt used during the construction of the proposed project would be subject to BAAQMD Regulation 8, Rule 15-Emulsified and Liquid Asphalts. Although this rule does not directly apply to the proposed project, it does limit the reactive organic gas (ROG) content of asphalt available for use during construction through regulating the sale and use of asphalt. By using asphalt from facilities that meet BAAQMD regulations, the proposed project would be consistent with this Clean Air Plan measure.
<b>Transportation Control Measures</b>	
<b>TR9:</b> Bicycle and Pedestrian Access and Facilities.	<b>Consistent.</b> There will be sidewalks constructed on Mallard Road and Community Road that connect to the nearest arterial road. The project site is within 400 feet of City Hall and public parks that would encourage walking and bicycling. Therefore, the proposed project would not conflict with the BAAQMD's efforts to encourage planning for pedestrian and bicycle facilities.

## Cumulative Criteria Pollutant Emissions Impacts

The BAAQMD has screening criteria for project construction and operation in its 2017 CEQA Air Quality Guidelines.<sup>2</sup> If all screening criteria are met by the proposed project, then a detailed air quality assessment is not necessary. These screening criteria consider new development on greenfield sites without any form of mitigation, project design features, or local development requirements that may result in additional emissions reductions.<sup>3</sup> For project construction, all of the following screening criteria must be met to apply the screening criteria to determine whether the proposed project's construction emissions can be considered less than significant:

- The project is below the applicable screening level size shown in Table 3-1 of the BAAQMD 2017 CEQA Air Quality Guidelines.
- All *Basic Construction Mitigation Measures* would be included in the project design and implemented during construction.
- Construction-related activities would not include any of the following:
  - Demolition;
  - Simultaneous occurrence of more than two construction phases (e.g., paving and building construction would occur simultaneously);
  - Simultaneous construction of more than one land use type (e.g., project would develop residential and commercial uses on the same site) (not applicable to high density infill development);
  - Extensive site preparation (i.e., greater than default assumptions used by the Urban Land Use Emissions Model [URBEMIS] for grading, cut/fill, or earth movement); or
  - Extensive material transport (e.g., greater than 10,000 cubic yards of soil import/export) requiring a considerable amount of haul truck activity.

The most applicable construction screening criteria for the proposed project is 240 dwelling units, identified under the “Condo/townhouse, general” land use type in Table 3-1 of the BAAQMD 2017 CEQA Air Quality Guidelines. As a result, the proposed project consisting of 42 dwelling units would be well below the BAAQMD’s most applicable screening criteria of 240 dwelling units. However, the BAAQMD specifies that the screening tables should not be used when a project consists of more than land use. Although the proposed project is residential in nature, it includes a mix of residential land use types. In addition, the proposed project would involve demolition activities. As a result, the proposed project cannot be screened out according to the BAAQMD’s construction screening criteria. As such, emissions associated with project construction were quantified and are compared below against the applicable BAAQMD significance thresholds.

## Estimation of Criteria Air Pollutants

As the proposed project would result the demolition activities of approximately 34,103 square feet of buildings and 55,480 square feet of pavement, the proposed project would not meet the construction screening criteria. Therefore, construction emissions have been quantified and measured against the BAAQMD significance thresholds, as shown in Table 2. The construction emissions were quantified by applying the CalEEMod (Version 2020.4.0) land use emission model. Land use summary, demolition calculation, cut and fill volume, construction schedule, and operational vehicle trips are based on applicant-provided information; all other information are based on CalEEMod defaults. Please refer to the “CalEEMod Notes” document contained in Attachment A for more detailed modeling assumptions. **As shown below in Table 2, the proposed project’s construction emissions would not exceed BAAQMD significance thresholds, and this impact would be less than significant.**

Source: Attachment A.				

The BAAQMD's operational screening criteria for air quality impacts for the "Single-family" and "Condo/townhouse, general" land use are 325 dwelling units and 451 dwelling units, respectively. The proposed project, which proposes developing six single-family residences, three ADUs, 10 duplexes, and 23 apartment units, would fall below the most relevant operational screening criterion. However, based on BAAQMD guidance, the screening criteria are designed for single land uses and should not be applied when considering a mix of land uses (which would include mixed residential projects). Therefore, the proposed project's operational emissions were quantified and analyzed against the applicable BAAQMD significance thresholds in Table 3. It should be noted that Table 3 does not consider existing land use emissions. If existing emissions were considered, the project's net increase in emissions would be below the total project emissions shown in Table 3 and would remain below the applicable thresholds. Please refer to the "CalEEMod Notes" document contained in Attachment A for more detailed modeling assumptions.

Source: Attachment A.

As shown in Table 3, the proposed project would not exceed the BAAQMD's thresholds of significance during operation, indicating that ongoing project operations would not be considered to have the potential to generate a significant quantity of air pollutants. **Therefore, long-term operational impacts associated with criteria pollutant emissions generated by the proposed project would be less than significant.**

## Impacts to Sensitive Receptors

The following four criteria were applied to determine the significance of project emissions to sensitive receptors. The proposed project is considered to have a potentially significant impact if:

- **Criterion 1:** Construction of the project would result in an exceedance of the health risk significance thresholds.
- **Criterion 2:** The cumulative health impact would result in an exceedance of the cumulative health risk significance thresholds.
- **Criterion 3:** Operation of the project would result in an exceedance of the health risk significance thresholds.
- **Criterion 4:** A carbon monoxide (CO) hotspot assessment demonstrates that the project would result in the development of a CO hotspot that could cause an exceedance of the CO ambient air quality standards.

### **Criterion 1: Project Construction Toxic Air Pollutants**

As specified by the BAAQMD, health risk and hazard impacts should be analyzed for sensitive receptors within a 1,000-foot radius of the project site.<sup>4</sup> The closest sensitive receptor to the project site is a residence immediately adjacent to the proposed project's southern boundary. Other nearby sensitive receptors accounted for in this analysis include a residence as close as 25 feet northwest of the project site, residential neighborhoods surrounding the project site, Belvedere Park as close as 35 feet southwest of the project site, Belvedere-Hawthorne Nursery School approximately 1,165 feet east of the project site, and Reed Elementary School approximately 1,720 feet north of the project site. The majority of sensitive receptors near the project site consist of residences.

#### ***Estimation of Construction Diesel Particulate Matter Emissions***

Construction PM<sub>2.5</sub> exhaust emissions were utilized in this assessment to represent construction diesel particulate matter (DPM) emissions and were estimated using CalEEMod, Version 2020.4.0. As shown in the information provided by the project applicant, the proposed project's construction is anticipated to occur from January 2024 through September 2025.

Construction emissions were calculated for each construction activity, as displayed in Table 2. On-site and off-site emissions generated during project construction were modeled with a working schedule of 8 hours per day, 5 days per week. When modeling a non-continuously emitting source (e.g., operating for 8 hours per day and 5 days per week), the modeled long-term average concentrations predicted by American Meteorological Society/EPA Regulatory Model (AERMOD) are based on 24 hours a day and seven days per week for the period of the meteorological data set. To address this discrepancy, a variable emission rate factor was applied in AERMOD to reflect a construction working schedule of 8 hours per day, 5 days per week. An adjustment factor of 4.2 ((24 hours per day/8 hours per shift) \* (7 days in a week/5 days in a work week)) was applied to the hours that construction emissions were assumed to occur, while zeros were applied to non-working hours.

Based on the analysis presented in this section, emissions were estimated for unmitigated project construction. To characterize the emissions, on-site construction activities are represented with one polygon area source across the entire project site. Off-site construction hauling and vendor truck operation for project construction is represented with a line volume source along Beach Road, San Rafael Avenue, Community Road, and Leeward Road within 1,000 feet of the project site (see Off-site PM<sub>2.5</sub> Exhaust Adjustment Sheet in Attachment A). Table 4 summarizes the emission rates of unmitigated DPM during construction of the proposed project.

**Table 4: Project Localized DPM and PM<sub>2.5</sub> Construction Emissions (Unmitigated)**

Emissions Scenario	On-site DPM (Tons)	Off-site DPM (Tons)	Total DPM (Tons)
Construction DPM (Exhaust PM <sub>2.5</sub> )	0.02015	0.00158	0.02173
Construction Dust PM <sub>2.5</sub> <sup>1</sup>	0.00776	0.03452	0.04228
Construction Total PM <sub>2.5</sub> <sup>1</sup>	0.02791	0.0361	0.06401

Notes:  
DPM = diesel particulate matter  
<sup>1</sup> Includes compliance with BMPs recommended by the BAAQMD to reduce potential impacts related to fugitive dust emissions.

Source: Attachment A.

### ***Estimation of Cancer Risks and Hazards***

The BAAQMD has developed a set of guidelines for estimating cancer risks resulting from exposure to toxic air contaminants (TACs).<sup>5</sup> As part of this guidance, the American Meteorological Society and United States Environmental Protection Agency (EPA) Regulatory Model (AERMOD), Version 22112, air dispersion model was used to estimate the DPM and PM<sub>2.5</sub> concentrations affecting nearby sensitive receptors during project construction. AERMOD was used by inputting the estimated construction DPM and PM<sub>2.5</sub> emissions and representative meteorological data to transport and disperse the construction emissions. Meteorological data from the San Francisco International Airport (SFO) were obtained from the California Air Resources Board (ARB) to perform the dispersion calculations. The guidelines recommend using the ARB Hotspots Analysis and Reporting Program (HARP2) software to identify the cancer risk associated with DPM emissions generated during construction activities.<sup>6</sup> HARP2 was used to process health risk metrics from the proposed project's DPM emissions using the concentrations generated from AERMOD. The closest receptors to the project site (where the majority of emissions would be concentrated) included residential receptors and park receptors. To provide a conservative estimate of health risk metrics and associated impacts, all receptors were assessed as residential sensitive receptors. The HARP2 output files show the relevant input assumptions and are included as part of Attachment A.

### ***Estimation of Non-Cancer Chronic Hazards***

TACs can also cause chronic (long-term) effects related to non-cancer illnesses such as reproductive effects or birth defects, or adverse environmental effects. Non-cancer health risks are conveyed in terms of the hazard index (HI), a ratio of the predicted concentration of the facility's reported TAC emissions to a concentration considered acceptable to public health professionals. A significant risk is defined as an HI

<sup>5</sup> Bay Area Air Quality Management District (BAAQMD). 2020. BAAQMD Health Risk Assessment Modeling Protocol. Website: [https://www.baaqmd.gov/~/media/files/ab617-community-health/facility-risk-reduction/documents/baaqmd\\_hra\\_modeling\\_protocol-pdf.pdf?la=en](https://www.baaqmd.gov/~/media/files/ab617-community-health/facility-risk-reduction/documents/baaqmd_hra_modeling_protocol-pdf.pdf?la=en). Accessed January 19, 2022.

<sup>6</sup> California Air Resources Board (ARB). Hot Spots Analysis & Reporting Program. 2022. Website: <https://ww2.arb.ca.gov/our-work/programs/hot-spots-analysis-reporting-program>. Accessed January 19, 2022.

of 1 or greater. An HI of less than 1 indicates that no significant health risks are expected from the facility's TAC emissions. The relationship for the non-cancer hazards of TACs is given by the following equation:

$$HI = C_{\text{ann}}/\text{REL}$$

Where:

HI = Hazard Index: an expression of the potential for chronic non-cancer health risks

$C_{\text{ann}}$  = Annual average TAC concentration (micrograms per liter [ $\mu\text{g}/\text{m}^3$ ])

REL = Reference Exposure Level: the DPM concentration at which no adverse health effects are anticipated

Annual concentrations of DPM as predicted by the air dispersion model are used to estimate chronic non-cancer hazards. The California Office of Environmental Health Hazard Assessment (OEHHA) has defined a REL for DPM of 5  $\mu\text{g}/\text{m}^3$ . OEHHA and ARB have not established acute toxicity factors for DPM.

#### ***Estimation of Health Risks and Hazards from Project Construction***

To assess impacts to off-site sensitive receptors, discrete receptors are placed at locations of existing residences located in the vicinity of the project boundary. As previously discussed, project construction is anticipated to start in January 2024 and conclude by September 2025. The following AERMOD modeling parameters were utilized to identify the DPM concentration at identified receptors.

Sensitive receptors (e.g., schools, daycare facilities, hospitals, care facilities, residences, parks) in the immediate project vicinity are represented in the model with discrete Cartesian receptors at a flagpole height of 1.5 meters.

1. A nested Cartesian grid was placed in AERMOD with the following spacing parameters:
  - 20 meters spacing within the project site and up to 200 meters from the project site.
  - 50 meters spacing between 200 meters and 500 meters from the project site.
  - 100 meters spacing between 500 meters and 1,000 meters from the project site.
  - 200 meters spacing between 1,000 and 2,000 meters from the project site.
  - All receptors were converted to discrete and were placed directly over the closest sensitive receptors in all directions of the project site. Discrete receptors were removed from some roadways and open space areas.
2. AERMOD's default regulatory dispersion option was used in the assessment.
3. The "Rural" dispersion coefficient was used as greater than 50 percent of the surrounding three kilometers is open water.
4. Emissions were characterized in the model using various area and volume sources to represent different activities. The following describes the emission sources utilized in the model for each model scenario.

- On-site construction activities are represented with one polygon area source across the entire project site.
  - Off-site construction hauling and vendor truck operation for project construction are represented with line volume sources along Beach Road, San Rafael Avenue, Community Road, and Leeward Road.
5. Off-site emissions were adjusted to account for off-site emissions that would occur within 1,000 feet of the project site (see Off-Site PM<sub>2.5</sub> Exhaust Adjustment Sheet in Attachment A).
  6. Meteorological data from the SFO Air Monitoring Station, Station ID 23230. This station was selected as it is the closest monitoring station to the project site, and it resembles physical site characteristics and elevation generally representative of the project site. The SFO Air Monitoring Station provides preprocessed meteorological data covering the years 2009-2014. The model used all years of available meteorological data.

Based on the BAAQMD CEQA Guidelines (2017),<sup>7</sup> a project would result in a significant construction TAC or PM<sub>2.5</sub> impact if it exceeds any of the thresholds of significance listed below:

- An excess cancer risk level of more than 10 in one million, or a non-cancer (chronic or acute) HI greater than 1.0; or
- An incremental increase of more than 0.3 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) annual average PM<sub>2.5</sub>, including both DPM (as PM<sub>2.5</sub> exhaust) and PM<sub>2.5</sub> fugitive dust).

The Maximally Impacted Sensitive Receptor (MIR) during project construction was determined to be the single-family residence immediately adjacent to the proposed project's northwestern boundary. Table 5 presents a summary of the proposed project's construction cancer risk, chronic non-cancer hazard, and annual PM2.5 concentration impacts at the MIR, which are assessed against the BAAQMD's significance thresholds.

**Table 5: Estimated Health Risks and Hazards During Project Construction (Unmitigated)**

Impact Scenario	Cancer Risk (Risk per million)	Chronic Non-Cancer Hazard Index	Annual PM <sub>2.5</sub> Concentration ( $\mu\text{g}/\text{m}^3$ ) <sup>1</sup>
MIR (Existing Residence) <sup>2</sup>	6.55	0.005	<0.001
<b>Maximum MIR Impact</b>	<b>6.55</b>	<b>0.005</b>	<b>&lt;0.001</b>
BAAQMD Thresholds of Significance	10	1	0.3
Exceeds Individual Source Threshold?	No	No	No

<sup>7</sup> Bay Area Air Quality Management District (BAAQMD). 2017. CEQA Air Quality Guidelines. May. Website: [http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa\\_guidelines\\_may2017-pdf.pdf?la=en](http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en). Accessed August 1, 2019.

Impact Scenario	Cancer Risk (Risk per million)	Chronic Non-Cancer Hazard Index	Annual PM <sub>2.5</sub> Concentration ( $\mu\text{g}/\text{m}^3$ ) <sup>1</sup>
Notes:			
$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter			
BAAQMD = Bay Area Air Quality Management District			
PM <sub>2.5</sub> = particulate matter 2.5 microns in diameter			
MIR = Maximally Impacted Sensitive Receptor			
<sup>1</sup> The annual PM <sub>2.5</sub> concentration includes fugitive dust and exhaust PM <sub>2.5</sub> . The value shown includes application of BMPs recommended by the BAAQMD. It should be noted that inclusion of MM AIR-1 only reduces PM <sub>2.5</sub> total and not PM <sub>2.5</sub> exhaust.			
<sup>2</sup> The MIR was determined to be an existing residence located adjacent to the northwest portion of the project site.			
MIR Latitude, Longitude: 37° 52' 30.15" N, 122° 27' 57.34" W			
Source: Attachment A.			

As shown in Table 5, the MIR shown represents the MIR across all potentially impacted receptors during project construction in the project area. As illustrated therein, the proposed project's construction DPM emissions would not exceed the BAAQMD's cancer risk, chronic non-cancer HI, or annual PM<sub>2.5</sub> thresholds of significance at the MIR. **Therefore, the proposed project's construction emissions would not result in significant health impacts to nearby sensitive receptors.**

## Criterion 2: Cumulative Health Impact

The BAAQMD recommends assessing the potential cumulative impacts from sources of TACs within 1,000 feet of a project. For a project-level analysis, BAAQMD provides several tools for use in screening potential sources of TACs. The BAAQMD-provided tools used to assess the potential cumulative impacts from TACs are described below:

- **Health Risks for Local Roadways.** The BAAQMD pre-calculated concentrations and the associated potential cancer risks and PM<sub>2.5</sub> concentration increases for each county within their jurisdiction for roadways that carry at least 30,000 Average Daily Traffic (ADT). For certain areas, the BAAQMD also included local roadways that meet BAAQMD's "major roadway" criteria of 10,000 vehicles or 1,000 trucks per day. The latest available screening tool is in the form of a Geographic Information System (GIS) raster file. The proposed project is not located in a Community Air Risk Evaluation (CARE) Program area;<sup>8</sup> therefore, the BAAQMD's local roadway calculator and the City's General Plan Environmental Impact Report (EIR)<sup>9</sup> were utilized in combination with the BAAQMD's roadway raster file to identify cancer risk, chronic non-cancer hazard, and PM<sub>2.5</sub> concentrations at the MIR associated with local roadways.
- **Freeway Screening Analysis Tool.** The BAAQMD prepared a GIS tool that contains pre-estimated cancer risk and PM<sub>2.5</sub> concentration increases for highways within the Bay Area. The nearest

<sup>8</sup> Bay Area Air Quality Management District (BAAQMD). 2014. Community Air Risk Evaluation Program. Website: <https://www.baaqmd.gov/community-health/community-health-protection-program/community-air-risk-evaluation-care-program>. Accessed January 19, 2022.

<sup>9</sup> City of Belvedere. 2010. General Plan 2030 Volume Three: Technical Report and Appendices. Website: <https://www.cityofbelvedere.org/DocumentCenter/View/1778/Vol-3--Technical-Reports-and-Appendices?bidId=>. Accessed March 22, 2022.

freeways to the proposed project include State Route (SR) 131 (Tiburon Boulevard), approximately 900 feet northeast of the project site.

- **Stationary Source Risk and Hazard Screening Tools.** The BAAQMD prepared a GIS tool<sup>10</sup> with the location of permitted sources and provides a health risk calculator that estimates and refines screen-level cancer risk, a non-cancer health HI, and PM<sub>2.5</sub> concentrations using emissions data from BAAQMD's permitting database.<sup>11</sup> For each emissions source, the BAAQMD provides estimates of cancer risk and PM<sub>2.5</sub> concentrations. Based on information from the GIS tool, two BAAQMD-permitted stationary sources exist within the vicinity of 1,000 feet of the project site.
- **Rail Screening Tools.** The BAAQMD prepared GIS tools that contain estimated cancer risks and PM<sub>2.5</sub> concentrations from railroad operations at any point within the Air Basin. Based on review of available aerial imagery, no railways are within 1,000 feet of the project site. However, the cancer risk and PM<sub>2.5</sub> concentrations were still retrieved from the BAAQMD's raster tool to identify potential health impacts associated with existing rail lines outside of a 1,000-foot radius from the project site.

#### ***Cumulative Health Risk Assessment at the Maximum Impacted Sensitive Receptor***

A cumulative Health Risk Assessment was performed that examined the cumulative impacts of the proposed project's construction emissions and sources of TAC emissions within 1,000 feet of the project site.

The cumulative health risk results, including health risks from the existing stationary source, are summarized during project construction in Table 6. Cumulative health risk results shown therein are representative of the health risks to the MIR that would experience the highest concentration of pollutants, which represents the park MIR from Table 5.

**Table 6: Summary of the Cumulative Health Impacts at the MIR during Construction**

Source/Impact Scenario	Source Type	Distance to MIR <sup>1</sup> (Feet)	Cancer Risk (Risk per million)	Chronic Non-Cancer Hazard Index	Annual PM <sub>2.5</sub> Concentration ( $\mu\text{g}/\text{m}^3$ )

Source: Attachment A.					

As shown in Table 6, the cumulative impacts from the project construction and existing sources of TACs would be less than the BAAQMD's cumulative thresholds of significance. **Thus, the cumulative health risk impacts from project construction would be less than significant.**

### Criterion 3: Operational Emissions Health Risks

As previously discussed, the proposed project's operational emissions would be below the BAAQMD's applicable significance thresholds. The proposed project is residential in nature and would not result in

industrial or manufacturing or other substantial TAC-generating land uses. The proposed project's emissions would largely be generated by stationary source equipment and gasoline-fueled vehicles. Furthermore, any stationary source equipment permitted by the BAAQMD for the proposed project would undergo its own analysis to ensure that health impacts are less than significant.

Therefore, the proposed project would not generate criteria pollutant and precursor emissions in excess of established thresholds during operation. **As a result, the proposed project would not result in significant health impacts to nearby sensitive receptors during operation and the impact of operation would be less than significant.**

#### **Criterion 4: Carbon Monoxide Hotspot Assessment**

Based on the Transportation Study prepared for the proposed project, the proposed project would generate 267 daily weekday trips, consisting of 21 AM peak-hour weekday trips and 26 PM peak-hour weekday trips.<sup>12</sup> According to the City's General Plan EIR, the greatest traffic volumes experienced in Belvedere under the General Plan's cumulative 2020 conditions would be Tiburon Boulevard west of San Rafael Avenue with 22,080 ADT.<sup>13</sup> The BAAQMD's CEQA Air Quality Guidelines provides screening criteria for determining whether a project could potentially result in a CO hotspot, which consist of: (1) 44,000 vehicles per hour along any roadway segment or intersection, (2) 24,000 vehicles per hour along any roadway segment or intersection with features that substantially limit air flow, such as tunnels or overpasses, or (3) conflict with a local congestion management plan. If the proposed project meets any of these screening criteria, it would present the potential to result in a CO hotspot.

Conservatively assuming that all 22,080 existing daily trips along Tiburon Boulevard would occur during the PM peak-hour and all 26 project-generated PM peak-hour vehicle trips would travel along Tiburon Boulevard west of San Rafael Avenue, the proposed project would not result in local roadways experiencing greater than 24,000 vehicles per hour, regardless of whether those roadways contain features which substantially limit air flow. Finally, the BAAQMD identifies the potential for CO hotspots to occur if a project presents a conflict with the local congestion management plan. As the size and nature of the proposed project does not trigger the need for a level of service analysis,<sup>14</sup> it is presumed that the proposed project would not conflict with the local congestion management plan. **Therefore, the proposed project would not generate sufficient vehicle traffic volumes during project operation to substantiate creating a CO hotspot. Impacts related to the potential creation of a CO hotspot would be less than significant.**

As described above, the proposed project would not expose sensitive receptors at nearby residences to substantial pollutant concentrations during either construction or operations. **Therefore, this impact would be less than significant.**

<sup>14</sup> Parisi Transportation Consulting. 2021. Transportation Study for Mallard Pointe Project. December 13.

## Odor Impacts

For odor impacts, residences are not considered to be odor-generating land uses.<sup>15</sup> However, odors would be generated from residential laundry cleaning, vehicle exhaust, outdoor cooking, and waste disposal. These occurrences would be small in quantity and duration and would not pose an objectionable odor impact to a substantial number of people. Therefore, operational impacts associated with the proposed project's potential to create odors would be less than significant. As a receptor, the proposed project is surrounded by the Belvedere Lagoon, and none of the odor-generating land uses are identified within screening distances based on BAAQMD guidelines. **Therefore, the proposed project would not be subject to any significant odor impact.**

Therefore, with implementation of applicable BAAQMD BMPs and policies, along with compliance with state and federal air quality regulations, approval of the proposed project would not result in any significant effects relating to air quality. **Therefore, the proposed project meets the criteria of CEQA Guidelines Section 15332(d) with respect to air quality.**

## GREENHOUSE GAS EMISSIONS ASSESSMENT

### Greenhouse Gas Emissions

Pursuant to CEQA Guidelines regarding streamlining projects qualifying for a Class 32 exemption, potential impacts that are not peculiar to the proposed project or project site that can be mitigated to a less than significant level by the imposition of City regulations and consistency with General Plan programs and policies do not require additional analysis.

### Construction Impacts

The proposed project would emit greenhouse gas (GHG) emissions during construction from the operation of off-road equipment and vehicles, construction worker vehicles, and any soil or material hauling that may occur. Attachment A includes detailed construction assumptions. The BAAQMD does not presently provide a construction-related GHG generation threshold but recommends that construction-generated GHGs be quantified and disclosed. Table 7 presents the total GHG emissions generated during all construction activities. In the absence of a construction emission threshold, construction GHG emissions are amortized over the expected lifetime of the proposed project (30 years). The proposed project's amortized construction GHG emissions are then added to the operational GHG emissions in Table 8.

Notes:  
MT CO<sub>2</sub>e = metric tons of carbon dioxide equivalent  
<sup>1</sup> Construction GHG emissions are amortized over the 30-year lifetime of the proposed project.  
Source: CalEEMod Output in Attachment A.

## Long-term Operational Impacts

Operational or long-term emissions occur over the life of a project. The major residential sources for operational GHG emissions include motor vehicles, natural gas consumption, electricity consumption, water transport, and waste decomposition.

A more detailed description of the assumptions used to estimate project-generated GHG emissions and detailed modeling results are included in Attachment A. Operational GHG emissions by source are shown in Table 8. For buildings in general, it is reasonable to look at a 30-year time frame, since this is a typical interval before a new building requires the first major renovation.<sup>16</sup> Therefore, this analysis includes construction emissions amortized over the anticipated life of the proposed project (30 years). As presented in Table 7, project construction emissions were calculated as 331 metric tons (MT) carbon dioxide equivalent (CO<sub>2</sub>e) for the entire construction duration. When amortized over 30 years, construction emissions equal 11 MT CO<sub>2</sub>e per year.

The BAAQMD mass emissions threshold of 1,100 MT CO<sub>2</sub>e per year was designed for the region to meet the Assembly Bill (AB) 32 goal of reducing GHG emissions to 1990 levels by 2020. This significance threshold is based on the AB 32 GHG reduction goals and a “gap analysis” that attributes an appropriate share of GHG emissions reductions to new land use development projects in BAAQMD’s jurisdiction. However, the BAAQMD has not yet adopted a significance threshold that is aligned with the State’s 2030 GHG reduction target codified by Senate Bill (SB) 32. Accordingly, BAAQMD’s existing mass emissions threshold is no longer appropriate for analyzing the GHG impacts of projects being implemented after

<sup>16</sup> International Energy Agency (IEA). 2008. Energy Efficiency Requirements in Building Codes, Energy Efficiency Policies for New Buildings.

2020 without adjusting the threshold to be consistent with the SB 32 target of reducing Statewide GHG emissions by 40 percent below 1990 levels by 2030.

The City recently adopted the City of Belvedere Climate Action Plan 2030 (CAP) in June 2022, which includes a range of strategy categories to guide the City's effort in reducing GHG emissions.<sup>17</sup> The overall GHG emissions reduction goal of the CAP is 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by year 2050. The Plan lays out measures that will meet the 2030 target and put the City on a trajectory to meet the 2050 goal.

Because the proposed project would be constructed after 2020, the BAAQMD significance threshold of 1,100 MT CO<sub>2</sub>e per year was adjusted to reflect "substantial progress" toward the SB 32 target of 40 percent below 1990 levels (i.e., 60 percent of 1990 levels). This approach is consistent with the City of Belvedere's 2030 GHG Reduction goal, which is based on the SC 32 target. Therefore, the BAAQMD's AB 32 significance threshold of 1,100 MT CO<sub>2</sub>e per year was adjusted to 660 MT CO<sub>2</sub>e per year ( $1,100 \times 0.60 = 660$ ) and is utilized in this analysis to determine whether the proposed project would result in potentially significant impacts related to GHG emissions.

The estimated total annual GHG emissions, including amortized construction emissions and proposed project operational emissions, were compared with an adjusted bright-line threshold of 660 MT CO<sub>2</sub>e/year to determine significance at project buildout in the year 2025 and are included in Table 8. The project's efficiency metric (GHG emissions generated per resident) is also shown for information purposes. The service population<sup>18</sup> (SP) is based on CalEEMod default values for the proposed land uses, and the project's GHG emissions per capita is 2.4 MT CO<sub>2</sub>e/SP/year. It should be noted that existing land use emissions are not shown in this analysis, thereby providing a conservative assessment of the proposed project's GHG emission impacts.

**Table 8: Operational Greenhouse Gas Emissions**

Emission Source	Year 2025 Annual Emissions (MT CO <sub>2</sub> e/Year)
Area	3
Energy	52
Mobile (Vehicles)	211
Waste	8
Water	5
Amortized Construction Emissions <sup>1</sup>	11
<b>Total Emissions</b>	<b>290</b>
<i>Bright-Line Significance Threshold (MT CO<sub>2</sub>e/year)</i>	<i>660</i>

<sup>17</sup> City of Belvedere. 2022. Climate Action Plan 2030. June 13.

<sup>18</sup> Service population is defined as employees plus residents; for the proposed project, the service population consists of residents.

Emission Source	Year 2025 Annual Emissions (MT CO <sub>2</sub> e/Year)
<b>Exceeds Threshold?</b>	<b>No</b>
Service Population (based on CalEEMod default)	121
CO <sub>2</sub> e per Service Population (MT CO <sub>2</sub> e/SP/year)	2.4

Notes:  
MT CO<sub>2</sub>e = metric tons of carbon dioxide equivalent  
<sup>1</sup> Construction GHG emissions are amortized over the 30-year lifetime of the proposed project.  
Source: CalEEMod Output in Attachment A.

The City's Community GHG Emissions Inventory estimates that the average GHG emissions would be 7.2 MT CO<sub>2</sub>e per capita in 2005, and 5.2 MT CO<sub>2</sub>e per capita in 2019.<sup>19</sup>

**Therefore, the proposed project's combined operational emissions and amortized construction emissions would not exceed the BAAQMD recommended thresholds for GHG emissions and City's GHG reduction goal and this impact would be less than significant.**

### **Consistency with Local GHG Reduction Plan**

To determine the proposed project's consistency with applicable plans, policies, or regulations adopted for the purpose of reducing the GHG emissions, the proposed project's consistency with the CAP is discussed below.

The City recently adopted its CAP in June 2022, which includes a range of strategy categories to guide the City's effort in reducing GHG emissions.<sup>20</sup> The overall GHG emissions reduction goal of the CAP is 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by year 2050. The Plan lays out measures that will meet the 2030 target and put the City on a trajectory to meet the 2050 goal. The categories presented in the CAP include "Low Carbon Transportation," "Renewable Energy and Electrification," "Energy Efficiency," "Waste Reduction," "Water Conservation," "Sequestration and Adaptation," "Community Engagement," and "Implementation and Monitoring" to identify reduction strategies and actions that are applicable for communities and government agencies.

The proposed project includes several design features that are consistent with strategies and actions from the City's CAP. For instance, Measure Low Carbon Transportation, encourages using electric vehicles and alternative transportation modes. The proposed project would be required to comply with Title 24, Part 11, of the California Building Standards Code (CBC) to provide parking for clean air vehicles and electric vehicle (EV) charging station infrastructure, thus encouraging the adoption of clean air vehicles.

<sup>19</sup> City of Belvedere. 2022. Community Greenhouse Gas Emissions Inventory for Year 2019. January.

<sup>20</sup> City of Belvedere. 2022. Climate Action Plan 2030. June 13.

Measure Renewable Energy and Electrification encourages installation of residential and commercial solar and energy storage systems. Measure Energy Efficiency, states the City's intention to require a higher level of energy efficiency for new construction and renovation. The proposed project would apply energy-efficient and low-flow fixtures, increased insulation, and solar hot water devices that would reduce energy use as well as GHG emissions. The proposed project would be required to comply with Title 24, Part 11, of the CBC for energy efficiency and other green building requirements.

Measure Waste Reduction considers a composting program alongside the recycling program and promotes residential composting. Measure Water Conservation states that the City would work with Marin Municipal Water District and other organizations to promote water conservation programs and incentives. The proposed project would be required to comply with the applicable City requirements as well as State requirements for inclusion of low-flow water fixtures, waste diversion, and composting, as applicable. As such, the proposed project would be consistent with the CAP policies.

**Provided the above discussions, the proposed project would support and implement the applicable measures of the City's CAP, and the proposed project's GHG emission impacts would be less than significant. Therefore, the proposed project meets the criteria of CEQA Guidelines Section 15332(d) with respect to GHG emissions.**

## SUMMARY

Based on the project understanding described above, the proposed project would result in less than significant impacts to air quality. The analysis further determined that the proposed project would not generate criteria pollutant, TAC, or GHG emissions, either directly or indirectly, that may have a significant impact on the environment or surrounding receptors; nor would the proposed project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions.

Thank you for the opportunity to conduct an air quality and greenhouse gas emissions impacts analysis. Please feel free to contact Phil Ault (559.930.6191 or [pault@fcs-intl.com](mailto:pault@fcs-intl.com)) or Kimber Johnson (559.392.3665 or [kjohnson@fcs-intl.com](mailto:kjohnson@fcs-intl.com)) should you have any questions.

Sincerely,

## Mallard Pointe CalEEMod Notes

### Note 1

The following proposed and existing land uses are drawn from information provided by the project applicant, dated February 14, 2022. Land uses provided below were represented in CalEEMod with the most relevant land use subtype available in the model. For example, there is no landscaping land use subtype in CalEEMod; therefore, the CalEEMod land use subtype City Park was utilized to represent landscaped areas.

Land Uses	Size or Number	Footprint (Square Feet)	Gross Building Area (Square Feet)	Net Acreage (Footprint Acreage)
<b>Existing on Project Site</b>				
Single-Family House or Duplex	22	34,103 SF including garage	34,103 SF including garage	0.8 acres
Street Parking and other paved surfaces		55,480 SF		1.3 acres
Landscaping		29,500 SF		0.7 acres
<b>Proposed Project</b>				
Single Family Residence	6 DU + 3 ADUs	17,057 SF including uncovered decks above 4 feet	23,983 SF including garage	0.4 acres
Duplex	10 DU	17,516 SF including uncovered decks above 4 feet	19,632 SF including garage	0.4 acres
Apartment Mid Rise	23 DU	16,905 SF	47,325 SF including garage	0.4 acres
Street Parking and other paved surfaces	No street parking 27 unassigned or apron spaces.	30,200 SF	-	0.7 acres
Landscaping		37,400 SF	-	0.9 acres
<b>Total On-site</b>				<b>2.8</b>

### Note 2

The following anticipated construction schedule was provided by the project applicant, dated February 14, 2022. As the dates and total workdays do not exactly align, the start date and total workdays were utilized for each construction activity in the model.

<b>Construction Activity</b>	<b>Phase Start Date</b>	<b>Phase End Date</b>	<b>Working Days per Week</b>	<b>Total Number of Working Days</b>
Demolition	Jan 2, 2024	Feb 13, 2024	5	29
Site Preparation	Feb 6, 2024	April 9, 2024	5	40
Grading	Feb 6, 2024	Mar 5, 2024	5	20
Building Construction	April 9, 2024	Dec 9, 2025	5	420
Paving	June 17, 2024	June 21, 2024	5	5
Architectural Coating	Feb 3, 2025	Sep 1, 2025	5	140

#### Note 3

According to email correspondence with the project applicant on February 15, 2022, the general contractor confirmed that the default construction equipment provided by CalEEMod is a reasonable representation of anticipated equipment use but clarified that the equipment utilized during project construction would operate 30 percent of the time on average. As such, the equipment list was adjusted to reflect 30 percent of the default hours per day.

#### Note 4

According to applicant-provided information, dated February 14, 2022, approximately 34,103 square feet of building space and 55,480 square feet of pavement would be removed during demolition, resulting in approximately 3,658 tons of demolition debris. In addition, approximately 1,500 cubic yards of soil would be exported during grading activities.

#### Note 5

The project's vehicle trip generation is based on a Transportation Study prepared by Parisi Transportation Consulting, dated December 13, 2021.<sup>1</sup> As such, the trip generation rates in the model were updated to reflect this information. Because the Transportation Study identifies a different breakdown of trip assignment between apartments, single family dwellings, and condos, the total daily trips generated by the proposed project (267) were identified and then divided proportionally among the various residential land use types depending on each land use type's proportional share of total dwelling units.

#### Note 6

According to the BAAQMD's Regulation 6, Rule 3, new residential developments are prohibited from installing wood-burning stoves and fireplaces. As a result, the model was adjusted to remove the inclusion of wood-burning devices.

---

<sup>1</sup> Parisi Transportation Consulting. 2021. FINAL Mallard Pointe Transportation Study; Belvedere, CA. December 13.

#### Note 7

BAAQMD *Basic Construction Mitigation Measures Recommended For All Proposed Projects* was applied to this project, which includes watering exposed areas at minimum twice per day and limiting construction vehicle speeds to 15 miles per hour on unpaved roads.

The project applicant indicated via email correspondence that Tractors/Loaders/Backhoes, Graders, Scrapers, Pavers, Paving Equipment, and Air Compressors would be certified to meet Tier 4 Interim standards and Concrete/Industrial Saws, Forklifts, Generator Sets, and Rollers would be certified to meet Tier 4 Final standards. Therefore, the model was adjusted to reflect this information.

#### Note 8

According to the operational model outputs, the proposed project would consume approximately 218,642 kWh per year. As such, assuming an average operation of 365 days per year and 24 hours per day, the proposed project is estimated to need an average supply of 25 kW per hour. Assuming 2 horsepower for each kW of supply, the proposed project is estimated to require a 50-horsepower generator. To conservatively build in the potential use of generators for the proposed project, each building (15) was assumed to be outfitted with a 50-horsepower generator. As such, 15 generators at 50 horsepower each were included in the model. As permitted stationary sources would be limited to no greater than 50 hours per year for maintenance and testing purposes, the generators were assumed to operate 50 hours per year.

#### Note 9

According to the California Code of Regulations, Title 24, Part 6, Subchapter 8 – Low-Rise Residential Building – Performance and Prescriptive Compliance Approaches, Section 150.1(c)14, “[a]ll low-rise residential buildings shall have a photovoltaic (PV) system meeting the minimum qualification requirements as specified in Joint Appendix JA11, with annual electrical output equal or greater than the dwelling’s annual electrical usage as determined by Equation 150.1-C:”

##### Equation 150.1-C Annual Photovoltaic Electrical Output

$$kWPV = (CFA \times A)/1,000 + (NDwell \times B)$$

Where:

kWPV = kWdc size of the PV system

CFA = conditioned floor area

NDwell = number of dwelling units

A = Adjustment factor from Table 150.1-C

B = Dwelling adjustment factor from Table 150.1-C

As the project is located in climate zone 3, the A adjustment factor mentioned above is identified as 0.628 and the B adjustment factor mentioned above is identified as 1.12. The conditioned floor area is based on the building square footage.

Therefore:

$$\text{kWPV} = (90,940 \times 0.628)/1,000 + (42 \times 1.12) = 104.15 \text{ kW PV}$$

While this accounts for the entire project's kW PV system, it does not provide the annual production rate that would be generated by this size of system. Therefore, the total kW PV system was reduced to a per-dwelling-unit kW PV system to determine the expected annual production rate. 104.15 kW PV divided by 42 dwelling units results in an average 2.48 kW PV system per dwelling unit.

According to TheEcoExperts.com,<sup>2</sup> a 2 kW PV system has an average annual production rate of 1,700 kWh/year. The below equation proportionally applies the same average annual production rate to the calculated 2.48 kW system per each dwelling unit.

Therefore:

$$(2.48/2) * 1,700 \text{ kWh/year} = 2,108 \text{ kWh/year}$$

Therefore, the proposed project is expected to result in an average on-site electricity generation rate of 2,108 kWh per dwelling unit per year. As such, after multiplying 2,108 kWh per year by 42 dwelling units, the proposed project would generate an estimated 88,536 kWh annually.

---

Notes/Sources:

<sup>1</sup> California Air Pollution Control Officers Association (CAPCOA). 2021. California Emissions Estimator Model (CalEEMod), Version 2020.4.0.

<sup>2</sup> Parisi Transportation Consulting. 2021. FINAL Mallard Pointe Transportation Study; Belvedere, CA. December 13.

<sup>3</sup> Because the Final Mallard Pointe Transportation Study identifies a different breakdown of trip assignment between apartments, single family dwellings, and condos, the total daily trips generated by the proposed project (267) were identified and then divided proportionally among the various residential land use types depending on each land use type's proportional share of total dwelling units.

# Screening Report for Construction MIR

## Area of Interest (AOI) Information

Area : 7,052,644.74 ft<sup>2</sup>

Oct 13 2022 20:10:51 Pacific Daylight Time

Map data © OpenStreetMap contributors, CC-BY-SA

## Summary

Name	Count	Area(ft <sup>2</sup> )	Length(ft)
Permitted Stationary Sources	2	N/A	N/A

### Permitted Stationary Sources

#	FacID	FacName	Address	City	Street
1	23998	Sanitary District #5 of Marin County	Cove, Rd Pump Station	Tiburon	CA
2	100555_1	City of Belvedere	85 Lagoon Rd	Belvedere	CA

#	Zip	County	Latitude	Longitude	Details
1	94,920.00	Marin	37.87	-122.46	Generator
2	94,920.00	Marin	37.88	-122.46	Gas Dispensing Facility

#	NAICS	Sector	Sub_Sector	Industry	ChronicHI
1	221,320.00	Utilities	Utilities	Sewage Treatment Facilities	0.0000193
2	921,190.00	Public Administration	Executive, Legislative, and Other General Government Support	Other General Government Support	0.0003869

#	PM2_5	Cancer Risk {expression/expr0}	Chronic Hazard Index {expression/expr1}	PM2.5 {expression/expr2}	Count
1	0.0000938	0.003	0	0	1
2	0.0000000	0.081	0	No Data	1

NOTE: A larger buffer than 1000 feet may be warranted depending on proximity to significant sources.

# Roadway Screening Analysis Calculator

County specific tables containing estimates of risk and hazard impacts from roadways in the Bay Area.

## INSTRUCTIONS:

Input the site-specific characteristics of your project by using the drop down menu in the "Search Parameter" box. We recommend that this analysis be used for roadways with 10,000 AADT and above.

- County: Select the County where the project is located. The calculator is only applicable for projects within the nine Bay Area counties.
- Roadway Direction: Select the orientation that best matches the roadway. If the roadway orientation is neither clearly north-south nor east-west, use the highest values predicted from either orientation.
- Side of the Roadway: Identify on which side of the roadway the project is located.
- Distance from Roadway: Enter the distance in feet from the nearest edge of the roadway to the project site. The calculator estimates values for distances greater than 10 feet and less than 1000 feet. For distances greater than 1000 feet, the user can choose to extrapolate values using a distribution curve or apply 1000 foot values for greater distances.
- Annual Average Daily Traffic (ADT): Enter the annual average daily traffic on the roadway. These data may be collected from the city or the county (if the area is unincorporated).

When the user has completed the data entries, the screening level PM2.5 annual average concentration and the cancer risk results will appear in the Results Box on the right. Please note that the roadway tool is not applicable for California State Highways and the District refers the user to the Highway Screening Analysis Tool at: <http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx>.

Notes and References listed below the Search Boxes

Search Parameters		Results
County	Marin	
Roadway Direction	East-West	
Side of the Roadway	South	
Distance from Roadway	1000	feet
Annual Average Daily Traffic (ADT)	18,720	

**Marin County**

EAST-WEST DIRECTIONAL ROADWAY

PM2.5 annual average  
**0.0203** ( $\mu\text{g}/\text{m}^3$ )

Cancer Risk  
**1.29** (per million)

Data for Marin County based on meteorological data collected from Mt. Tamalpais in 2005

### Notes and References:

1. Emissions were developed using EMFAC2011 for fleet mix in 2014 assuming 10,000 AADT and includes impacts from diesel and gasoline vehicle exhaust, brake and tire wear, and resuspended dust.
2. Roadways were modeled using CALINE4 air dispersion model assuming a source length of one kilometer. Meteorological data used to estimate the screening values are noted at the bottom of the "Results" box.
3. Cancer risks were estimated for 70 year lifetime exposure starting in 2014 that includes sensitivity values for early life exposures and OEHHA toxicity values adopted in 2013.

Adjustment factor to account for updated OEHHA Guidance: 1.3744

**Adjusted Cancer Risk: 1.772**
