

GUIDELINES FOR DEVELOPMENT IN RIPARIAN AND WATERSHED AREAS AND FIRE RISK ASSESSMENT

DOMINICAN RESIDENTIAL DEVELOPMENT
ASSESSOR'S PARCEL NUMBER 015-163-03
SAN RAFAEL, CALIFORNIA

PREPARED FOR

DOMINICAN VALLEY LLC

MARINDEVELOP@GMAIL.COM

PURPOSE

As a response to the Development Application, the City of San Rafael in their January 4, 2024 response letter (File No: CDR23-002, ED23-062, TS23-001, PLAN23-081) requested that the Applicant provide "a biological survey, which classifies portions of the site by their degree of risk of plant communities from wildland fires and establishes guidelines for development in riparian and watershed areas". This memo with attachments provides the Guidelines for Development in Riparian and Watershed Areas and a Fire Risk Assessment.

PROJECT SUMMARY

The Dominican Residential Development Project proposes to development residential housing on a currently vacant 20.79-acre site located at the intersection of Magnolia Avenue and Deer Park Avenue. The proposed project proposes to subdivide the property into 50 parcels and construct a total of 50 residential units to include 27 single-family homes ranging in size from 2,612 to 3,215 net sq. ft., 17 townhomes ranging in size from 1,150 to 1,390 net sq. ft., and six duplex units of 1,705 net sq. ft. each. Additionally, 14 Junior Accessory Dwelling Units (JADUs) are proposed.

FIRE RISK ASSESSMENT

The Project was designed to cluster development and avoid areas onsite with steep topography and the densest areas of vegetation, which are factors in fire risk. However, large portions of the site include fire-prone vegetation, such s eucalyptus and California bay trees. A Fire Risk Assessment has been developed by MWS consulting and is attached to this memo (Attachment A) to define the recommended extent of defensible space around the development and recommend removal of vegetation types within those zones.

WETLAND AND STREAM PROTECTION GUIDELINES

The Project was designed to cluster development and avoid areas onsite with steep topography. This design helps to avoid some of the drainages and riparian areas where they exist. The development maintains a 25-ft buffer from Sisters Creek top of bank.

The following guidelines will be used in the development of the Project for jurisdictional and non-jurisdictional waters and wetlands and associated riparian areas where they exist.

- 1. If work will be done within any jurisdictional watercourse or wetlands, regulatory permits from the US Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and the Department of Fish and Wildlife (CDFW) will be applied for before the work commences.
- 2. If work is needed within or adjacent to flowing waters, the waters will be separated from the work using cofferdams and a water diversion feature.
- 3. The work will not divert, obstruct, or alter in any way the courses or bed of any watercourse, drainage basin or channel within the city without first applying for all required regulatory permits.
- 4. No persons will deposit, or cause to be deposited, or to permit to accumulate in any watercourse any litter, brush, stumps, earth, household trash, rubbish, or garbage or any other material or matter which can or may obstruct, divert or interfere with the natural flow of water, or to deposit, or cause to be deposited, or to permit to accumulate any of the aforementioned material in, or on, any bank adjacent to the watercourse without first acquiring all required regulatory permits.
- 5. Creek setbacks will be determined for each stream identified.
 - a. A creek setback will be determined that will provide for adequate maintenance, emergency vehicle access, adequate debris flow avalanche corridors, flood control, protection from damage due to stream bank undercutting, and will adequately protect and preserve native riparian and wildlife habitat.
 - b. A creek setback will protect major view corridors and provide for recreation opportunities where appropriate.
 - c. The setback permits provision of adequate and attractive natural landscaping.
 - d. The creek setback will be determined through a determinization and assessment of current habitat values of any creeks, the adjacency and magnitude of the impact, and the loss of functional habitat values subject to review by the appropriate resource agencies such as the US Army Corps of Engineers, Regional Water Quality Control Board, and/or California Department of Fish and Wildlife.
- 6. Wetland setbacks shall be determined for each jurisdictional wetlands identified.
 - a. A wetland setback will be measured from the edge of a wetland, as determined through application of the procedures in City of San Rafael Code of Ordinances ("SR Code") Section 14.13.05(A), Determination of wetland boundaries. The setback from a creek or drainage way wetland, or from the San Rafael Canal, will be established and measured consistent with the provisions of SR Code Section 14.16.080, Creeks and other watercourses of this title. The
 - b. The wetland setback will be determined through a determinization and assessment of current habitat values of any wetlands, the adjacency and magnitude of the impact, and the loss of functional habitat values subject to review by the appropriate resource agencies such as the US Army Corps of Engineers, Regional Water Quality Control Board, and/or California Department of Fish and Wildlife.
 - c. If an appropriate wetland setback cannot be adhered to or if impacts to wetlands are anticipated, permits from the US Army Corps of Engineers and Regional Water Quality Control Board must be sought.
- 7. Appropriate measures, such as fencing and screening, landscaping, and natural habitat areas will be implemented to minimize adverse impacts on wetlands and wetland habitat.
- 8. Landscaping and vegetation installed within the wetland setback will be native plant species that are indigenous to the area and selected to enhance and/or protect habitat for the present wildlife species.
- 9. During construction, every precaution shall be taken to prevent the disruption or degradation of adjacent wetlands. Best-management practices will be implemented to minimize siltation, sedimentation and erosion, subject to approval by the department of public works. To ensure that sediment remains on the site and is not transported into wetlands, erosion and sediment controls will be left in place until the site is stabilized with permanent vegetation.
- 10. Stormwater runoff systems will be designed to:

- a. Maintain adequate water flows to any potential wetlands so as to maintain its integrity; and
- b. Ensure that stormwater runoff is substantially free of debris, pollutants and silt. Stormwater runoff management proposals will be submitted and will be subject to approval by the community development department, planning division and the department of public works.
- 11. Loss of wetlands due to filling will be strictly avoided, unless it is not possible or practical. Filling of wetlands is permitted only when it is demonstrated and determined that, due to site constraints and unique site conditions, wetland fill cannot be avoided by reducing the size, scope, configuration, intensity or density of the development, or by changing the design of the development in a way that would avoid or result in fewer adverse effects on the wetland.
 - a. If it is demonstrated that wetland fill cannot be avoided, a use permit to authorize the fill through the planning commission will be sought. Wetlands will be replaced, in-kind and on-site at a minimum ratio of 2:1 (two (2) acres of new wetland for every one (1) acre of wetland that is filled). If it is not possible or practical to create new, on-site wetland, off-site, in-kind replacement will be at a minimum ratio of 3:1. All wetland fill and replacement will be reviewed and authorized consistent with the provisions of SR Code Section 14.13.080(C), Required wetland restoration or creation, and SR Code Section 14.13.070, Findings.
 - b. If small wetlands that are 0.1-acres in size are impacted, a waiver will be requested to the planning commission for fill of small wetlands, given that:
 - the wetland is isolated meaning that it is not within, a part of, directly connected with or hydrologically-linked by natural flow to a creek, drainageway, wetland or submerged tidelands;
 - ii. it is demonstrated by a qualified wetland expert the preservation of the wetland is not practical as it would not result in a functioning, biological resources because of its isolation;
 - iii. the city has determined that filling will result in a more appropriate and desirable site plan for the project; and
 - iv. the city consults with and considers comments received from the appropriate resource agencies with wetland oversight (e.g., California Department of Fish and Wildlife and/or California Regional Water Quality Control Board)
- 11. Removal of wetland vegetation or changing of drainage characteristics by private parties which adversely affects will be avoided and if needed, a use permit will be acquired. (see SR Code Section 14.13.070, Findings).

RIPARIAN PROTECTION GUIDELINES

- 1. Work will avoid, where feasible, impacting a riparian corridor and vegetation.
- 2. If work is done within the riparian corridor or within riparian habitat, regulatory permits from the RWQCB and CDFW will be applied for.
- 3. Vegetation removal will be kept to the minimum necessary.

WATERSHED PROTECTION GUIDELINES

- 1. An Erosion and Sediment Control Plan (ESCP) will be submitted for review and approval by the City. The project applicant will follow the most recent version of the MCSTOPPP Construction Erosion and Sediment Control Plan Applicant Package. At a minimum, the ESCP will include:
 - a. Description of the proposed project and soil disturbing activity;
 - b. Site specific construction-phase Best Management Practices (BMPs);
 - c. Rationale for selecting the BMPs;
 - d. List of applicable outside agency permits associated with the soil disturbing activity, such as: Construction General Permit (CGP); Clean Water Act Section 404 Permit; Clean Water Act Section 401 Water Quality Certification; Streambed/Lake Alteration Agreement (1600 Agreements).

- e. If the project requires coverage under the CGP issued by the State Water Resources Control Board (SWRCB), Permit Registration Documents will be filed with the SWRCB for said coverage and a copy of the Waste Discharge Identification Number will be submitted to the City prior to issuance of a permit for construction. The project applicant will submit the Storm Water Pollution Prevention Plan (SWPPP) required by the General Construction Activity Stormwater Permit in lieu of the ESCP provided it meets the requirements of the ESCP.
- f. The ESCP will be implemented year round and must be updated to reflect changing conditions on the project site. Any modifications to the ESCP shall be submitted to the City for review and approval.
- 2. Vegetation removal will be kept to a minimum.
- 3. No discharge of non-stormwater discharges to the city's storm drain system will occur. Any discharges other than stormwater will be in compliance with a NPDES permit issued for the discharge.
- 4. Any activities which will or may result in pollutants entering the city storm drains will undertake all practicable measures to cease such activities and to eliminate or reduce such pollutants.
- 5. Except for pollutants lawfully disposed of by way of containers or at a licensed dumping grounds, the project will not throw, deposit, leave, maintain, keep or permit to be thrown, deposited, placed, left or maintained, any refuse, rubbish, garbage, or other discarded or abandoned objects, articles and accumulations, in or upon any street, alley, sidewalk, storm drain, inlet, catch basin, conduit or other drainage structures, business place, or upon any public or private lot of land or other premises in the city, so that the same might be or become a pollutant discharged to water.
- 6. The ESCP will address erosion and sediment control and pollution prevention during the construction phase as well as final stabilization control measures. The ESCP and the specific control measures to be utilized will be subject to the review and approval of the City. The ESCP will be implemented year-round and will be revised to reflect changing conditions on the project site. The City shall require modifications of an approved ESCP if during the course of construction at a site unanticipated conditions occur or the plans prove inadequate for the intended purpose. Revisions of the approved ESCP will be submitted to the agency for review and approval.

Attachment: Fire Hazard Assessment

Memorandum

Date: March 28, 2024

Project: Dominican Valley Housing

APN: 015-163-03

From: Megan W. Stromberg

MWS Consulting

Subject: Fire Hazard Assessment

The Dominican Valley property is a 20.79 Acre site located in the Dominican / Black Canyon neighborhood of San Rafael. The subject site is bordered northwesterly between the streets of Gold-Hill grade and Deer Park Ave and southerly by Highland Ave and Margarita Drive. The development proposes Subdivision of the site into 50 lots with 50 units of residential housing (+14 Attached Junior ADUs).

FIRE HAZARD ASSESSMENT MATRIX

MWS Consulting prepared a fire-hazard-assessment matrix that defines the recommended extent of defensible space based on site features including aspect, slope, and vegetation type. The fire-hazard-assessment matrix was prepared in accordance with Fire Protection Standard 100 for the San Rafael Fire Department (See Appendix 1).

The fire-hazard-assessment matrix provides a recommended clearance distance from the building. Clearance includes removal of fire prone species such as Eucalyptus, brooms, and California Bay, which are commonly found on-site. Remaining existing plants should also be thinned such that the distance between tree canopies and shrubs is adequate to prevent fire spread between individuals. Shrubs should have a minimum of 2 times the shrub height between individuals with increased spacing on slopes. Trees should have a minimum of 10' spacing between individuals with 20' to 30' required on slopes. Specific plant removal recommendations are included in the matrix for each lot. Recommendations assume that the tree removals shown on sheet L1 dated March 25, 2024 will be implemented. Additional requirements

Megan W. Stromberg Consulting

130 Mono Ave Fairfax, CA 94930

415.938.6340

from the San Rafael Fire Department are possible above and beyond those included in the Matrix.

Sheet F1 shows the associated Clearance Zones evaluated in the Hazard Assessment Matrix.

Assessment Zone A (o' to 3o') - The project is proposing to clear most trees within 3o' of the proposed buildings with the exception of a few native trees. This zone will be planted and irrigated in most places (See Sheet L2). Planting in this zone should be primarily limited to groundcovers not exceeding 6" in height with adequately spaced taller shrubs. Rock mulch and wood mulch are appropriate to maintain soil moisture and reduce irrigation needs. See Planting Recommendations Section below for further recommendations regarding species choices.

Assessment Zone B (31' to 100') - The Fire Hazard Risk Assessment indicates that the project should remove pyrophoric vegetation including eucalyptus (Eucalyptus spp.), bay trees (Ubellularia californica), Scotch broom (Cytisus scoparius), and French broom (Genista monspessulana) to a distance of 50' to 100' (if downslope of the building) in most of the defensible zones as shown for each building site in the Hazard Assessment Matrix. Ground covers in this zone should also be maintained at a maximum height of 6" when within 50' of a structure and 18" when beyond 50'.

Assessment Zone C (101' to 200' or Property line) - The City's guidelines require assessment of up to 200' or the property line. Some of the proposed building sites include undeveloped areas beyond 200'. Many of these areas are dominated by pyrophoric vegetation such as Eucalyptus trees. The fire department may require removal of additional trees in these extended zones.

Riparian Buffer - In areas where the riparian buffer is within the recommended defensible space zone, trees may have additional habitat value. Despite the habitat value, Eucalyptus trees, broom, and other fire prone plants are not native and should still be removed within the riparian corridor. Where tree and brush removals are necessary in the riparian buffer for fire mitigation, replant the cleared area with fire resistant native species appropriate for riparian habitat.

CLEARING RECOMMENDATIONS

The range of slopes on the site is from 8% to over 30%. The slope aspects found on site are primarily northwest- and west-facing with a few sites that have south-facing aspects.

The dominant vegetation across most of the site is Eucalyptus and California Bay trees, with an understory of grasses and brush including Scotch broom, French broom, poison oak, and other shrubs and herbaceous plants, like ferns, oxalis, and other shade-loving species. Eucalyptus, California Bay, and brooms are considered fire prone and are recommended for removal within the recommended defensible space zone by the San Rafael fire department guidelines.

The fire-hazard-assessment matrix includes a recommended clearing distance for each building under the column 'Recommended Clearance'. The following diagram shows the layout of the recommended clearance distances.

Figure 1 – Defensible Space Zones
The largest distance is downslope of the building.

PLANTING RECOMMENDATIONS

The City of San Rafael Fire Department publishes a plant list of fire prone plants (see Appendix 1) which are prohibited from being planted within the recommended defensible space zones. 'Gorilla hair' mulch is also prohibited due to its flammability although other types of mulch including bark, or chipped wood are encouraged to maintain soil moisture.

Sheet L₃ of the Landscape Plans dated December 4, 2023, proposes three species that are on the prohibited Fire Prone Plants list:

- Arctostaphylos 'Howard McMinn' (Howard McMinn Manzanita)
- Baccharis pilularis 'Pigeon Point' (Prostrate coyote brush)
- Arctostaphylos 'Pacific Mist' (Pacific mist manzanita)

These three species should be replaced with alternatives from the Fire Resistant Plant List included in Appendix 1 or natives that are not on the Fire Prone list such as:

- Lupinus albifrons (Silver lupine)
- Mimulus aurantiacus (Monkeyflower)
- Symphoricarpos mollis (Snowberry)

- Ceanothus thyrsiflorus griseus 'Point Sal' (Point Sal Carmel Creeper)
- Berberis aquifolium var. repens (Creeping barberry)

Fire Prevention Bureau Standard

Vegetation Standard 100

Vegetation Management Plan (VMP)

Date:	1	10/02/2017			
Revision	on:_	2	2		
Page:	1	of	14		

This Standard has been developed pursuant to the 2016 California Fire Code, the 2015 International Fire Code and Appendix B of the 2015 Edition of the International Wildland Urban Interface Code, all as adopted by local ordinance by the City of San Rafael and Section 4290 and 4291 of the Public Resources Code. Fuel modification distances, type of vegetation and topographic features are factors in determining adequate green belts and fire fuel modification around structures. This methodology is implemented for the primary purpose of providing time for fire suppression personnel and equipment to respond and establish effective operational tactics and strategies during an ensuing wildland fire.

This standard applies to all new homes and structures, subdivisions, and those buildings that are undergoing substantial remodel that are within the Wildland-Urban Interface as defined by the San Rafael Fire Department.

Included here are requirements for submitting a vegetation management plan (VMP), and a firehazard-assessment matrix that defines the recommended extent of defensible space based on site features including aspect, slope, and vegetation type. Guidelines for treating vegetation within the recommended defensible space are also provided.

This standard will determine the minimum required defensible space without reference to property lines. If the minimum required defensible space crosses property lines, the property owner will be required to obtain a "defensible space easement" from the adjoining property owner. If this cannot be obtained, the proposed structure may be required to be resited. For existing structures, additional fire protection measures may be required to mitigate a reduction in the required defensible space.

I. General

A. The Vegetation Management Plan referred to hereinafter as the VMP shall be submitted to the Fire Marshal for review prior to implementation. The VMP shall be submitted in two forms, line drawings and text format describing specific and applicable contributing factors in the selection and design of the plan.

II. **VMP** Content

- A. The VMP shall include at the minimum:
 - 1. The entire "plan content" elements described in narrative form. A text narrative describing specific and applicable contributing factors in the selection and design of the plan and scope of work.
 - 2. Vegetation management and defensible space agreement to perform annual maintenance. An Annual Maintenance Plan to include a statement agreeing to "maintain annually", the required defensible space and vegetation annually.

Vegetation Standard 100

Vegetation Management Plan (VMP)

Date:	10)/02/20)17	
Revisio	n:	2		
Page:	2	of	14	

- 3. Not less than three (3) complete graphic plan sets should be submitted to the San Rafael Building Department for review. The plan sets are required to show the structure(s) and its defensible space zone, the location and configuration of existing plants/shrubs/trees, delineate those planned to be removed and/or modified, and the location, name and configuration of vegetation to be planted.
- 4. The Hazard Assessment Matrix
- 5. The list of plants to be used and/or retained.
- 6. Irrigation Graphic Plan. The irrigation system and its related components shall be planned and designed to allow for proper installation, management, and maintenance.
- 7. San Rafael Fire Department permit application with permit fee deposit.
- **Landscape plans will be rejected unless they include a specific outline of the information required by this standard**

III. Determining Risk

- A. Using the Hazard Assessment Matrix in the back of this standard, determine the hazard points of the specific property.
- B. Aspect. This is the direction in which the face of the slope is situated.
- C. Slope. This is the degree of angle on the site that the structure is to be placed.
- D. Fuel. Zone A Identify from the fuel type list on the hazard assessment matrix what vegetation is mostly represented in the 0 to 30 ft. zone from the proposed structure.
- E. Fuel. Zone B Identify the fuel type list on the hazard assessment matrix what vegetation type is most represented in the 31 to 100 ft. zone from the proposed structure.
- F. Fuel. Zone C Identify the fuel type list on the hazard assessment matrix what vegetation type is most represented from the outermost edge of Zone B up to 200 feet from structure or to property line.
- G. Total the hazard assessment points for each category. This will provide a set of distances that clearance is required around the proposed structure.

Revision:	2
Page: 3	of 14

IV. Plant List and Selection within the Zone

- A. The entire defensible space zone (see Figure II) shall be planted (if applicable) and irrigated if necessary.
- B. By using the FireScape Plant selection list on the University of California Cooperative Extension Pyrophytic vs. Fire Resistant Plants brochure or attached list (Table 2) of Fire Resistant Plant List as determined by the Fire Marshal, select use of native, domestic or combination thereof that best suits the architectural and planning design of the proposed project. Slope, soil type, drought resistance should be considered when selecting plant types. Also, see the attached list (Table 1) of Fire Prone prohibited plants. Note that these lists are not all-inclusive and some proposed plants may be deleted from your project.
- C. Zone A Landscaping and vegetation in this zone shall consist primarily of green lawns, ground covers not exceeding 6 inches in height, and adequately spaced shrubs. Irrigation by automatic or manual systems shall be provided to landscaping to maintain healthy vegetation and fire resistance. The overall characteristics of the landscape shall provide adequate defensible space in a fire environment. Plants in Zone A shall be inherently highly fire resistant and spaced appropriately.
- D. Fuel. Zone B Irrigation by automatic or manual systems shall be provided to landscaping to maintain healthy vegetation and fire resistance. Landscaping and vegetation in this zone shall typically consist primarily of green lawns, ground covers, and adequately spaced shrubs and trees. Unless otherwise approved, Ground covers shall be maintained at a height not to exceed 6 inches in Zone A and B. If on a slope 12 inches is acceptable in Zone B within 50 feet of a structure and 18 inches beyond 50 feet. The overall characteristics of the landscape shall provide adequate defensible space in a fire environment. Specimen native plants may be approved to remain if properly maintained for adequate defensible space. Plants in Zone B shall typically be fire resistant and spaced appropriately.
- E. Fuel. Zone C Required thinning and clearance will be determined upon inspection. Required clearance may increase to the maximum allowed by the Fire Code as needed because of vegetation growth. Irrigation systems are not required for this zone if it consists entirely of native plants. (Native plants are generally not compatible with regular, unseasonal supplemental water.) Vegetation in this zone may consist of modified existing native plants, adequately spaced ornamental shrubs and trees, or both. In all cases the overall characteristics of the landscape shall provide adequate defensible space in a fire environment. Plants in Zone C shall be spaced appropriately. Existing native vegetation shall be modified by thinning and removal of those species constituting a fire risk.

<u>Please Note:</u> Chipped wood and mulch can provide an excellent thermal barrier, which will help prevent, lost moisture in ground fuels. However, shredded bark, sometimes referred to as

Developed by Patrick Bignardi, Vegetation Management Specialist Approved by Chris Gray, Fire Chief Pervention Bureau Standard Fire Prevention Bureau Standard Vegetation Standard 100 Vegetation Management Plan (VMP) Page: 4 of 14

"monkey hair" is prohibited from use because its ease of ignition and fire spread characteristics.

V. Plant Spacing and Crown Separation

- A. Regardless of plant selection, shrubs should be spaced so that no continuity exists between the ground fuels and tree crowns, such that a ground fire will not extend into the tree canopy.
- B. Trees should be planted such that when mature, their crowns will be separated by at least 10 feet. Add an additional five feet for every ten (10%) percent increases in slope. Existing trees may be required to be thinned and/or removed depending on their configuration and distance from the structure(s).
- C. Separate individual shrub crowns by at least two times the height or clump shrubs into islands of no greater than 18-ft. diameter. Separate the islands by a distance of no less than two times the canopy height.

VI. Adjacent to Roadways and Driveways:

- A. Trim and maintain vegetation within 10 feet of roadways as for defensible space.
- B. Trim trees so they do not hang lower than 15-ft. above the roadway.

30x30x30 ft.	30x30x50 ft	50x50x100 ft.

V. **Fuel Types:**

- A. Specimen Garden: a well-maintained ornamental garden, usually irrigated. Trees and shrubs are well spaced or clustered, thinned and free of deadwood. The lawn is mowed and clean. No pyrophytic plants within 15 ft. of house.
- B. Hardwood (Model 9): Broadleaf (non-pyrophytic) trees such as oaks, maples, ash, etc.
- C. Grass (Model 1): Wild field grass dominates; trees and shrubs occupy less than 1/3 of the
- D. Mostly Grass (Model 2): Brush and tree reproduction occupy more than 1/3 and less than 2/3 of the area.
- E. Mostly Brush (Model 5): Brush and tree reproduction occupies 2/3 of the area. Includes young chaparral, coastal scrub and broom stands.
- F. Pyrophytic Hardwoods (Model 12): Broadleaf trees that is high in volatile oils, which produce heavy debris and burn intensely. May have some conifers mixed in but the flammable hardwoods dominate the fire behavior.
- G. Chaparral (Model 4): Six foot and taller old, pyrophytic brush with excessive deadwood. Includes mixed chaparral of Manzanita, scrub oak, chaparral pea, tall ceanothus, chamise, etc. Often has some young Douglas fir or pines.
- H. Conifer (Model 8): Needleleaf trees typically with heavy litter, low branches and plentiful deadwood. Often mixed with some hardwoods or even pyrophytic hardwoods, but conifers dominated and carry the fire.
- I. Conifer with Brush Understory (Model 10): Pine and Douglas Fir with heavy brush and down & dead branches and suppressed trees in the understory.

VI. **Slope Influence on Minimum Defensible Space Clearances**

Increasing slopes require increased defensible space clearances to be equally effective. For example, to be equally effective upslope, cross slope, and down slope clearances, around each structure must be increased as percentage of slope increases when compared to level terrain.

Rate of spread, flame length, convective and radiant heat increase in relation to fuel type, aspect, and percentage of slope factors. Increased defensible space zone radiuses in relation to slope are required around structures through fuel modification and reduction.

Note increased upslope and cross slope defensible space clearance requirements related to increase in slope. Minimum recommended cross slope and upslope increases are shown. Specific terrain may require adjustment:

Table 2

Fire Resistant Plant List

This is a curated list of common native and non-native fire safe plant species suitable to the climate in Marin County. This list is not comprehensive - other suitable plants may be fire resistant. These are preferred species for landscaping around homes in the Wildland Urban Interface. These plants exhibit relatively more resistance to burning when exposed to fire. To ensure fire-resistance, all plants on this list must be maintained in a living state, irrigated properly, and must be kept free of dead or dry twigs and material at all times.

	Scientific Name	Common Name	Lifeform	Recommendation	Native
1	Acer spp.	Maple	Tree	Preferred	
2	Achillea millefolium	Yarrow	Perennial	Preferred	X
3	Achillea tomentosa	Woolly Yarrow	Perennial, Cover	Preferred	
4	Aeonium spp.	Aeonium	Perennial	Preferred
