City of San Rafael

2017 City Satisfaction Survey

April 2017

Overview and Research Objectives

The City of San Rafael commissioned Godbe Research to conduct a telephone and internet survey of voters with the following research objectives:

- Assess overall perceptions of living in San Rafael;
- Gauge satisfaction with the City's performance in providing resident services and programs;
- Assess awareness of the City's financial situation;
- Determine the most pressing problems facing the City;
- Test whether residents perceive the City to be responsible with taxpayer dollars;
- Assess adoption of green/sustainable practices in households;
- Gauge support for a revenue measure that would preserve essential city services with funding that cannot be taken by the State;
- Determine the type of tax, impact of features, and duration of the proposed measures on voter support;
- Assess support for allowing cannabis businesses to operate in San Rafael and taxation of gross receipts of sales;
- Gauge satisfaction with local information sources; and
- Identify differences in opinions due to demographic and/or behavioral characteristics that show statistically significant levels.

- Data Collection Internet and telephone Interviewing
- Universe 46,787 adult residents (ages 18 and older) in the City of San Rafael, with subsamples of likely November 2018 voters (18,466 voters), likely June 2018 voters (13,597), and likely November 2017 voters (12,474).
- Fielding Dates February 7 through February 19, 2017
- Interview Length 25 minutes
- Sample Size
858 adult residents/all voters
750 likely November 2018 voters
633 likely June 2018 voters
537 likely November 2017 voters
- Margin of Error
 $\pm 3.31\%$ adult residents /all voters
 $\pm 3.51\%$ likely November 2018 voters
 $\pm 3.80\%$ likely June 2018 voters
 $\pm 4.14\%$ likely November 2017 voters

Executive Summary

- Overall, residents continue to have a positive opinion of the quality of life in the City of San Rafael.
 - Eighty-seven percent of respondents indicated that they are “very satisfied” (46.4%) or “somewhat satisfied” (40.6%) with the quality of life in San Rafael.
- Opinion of the City’s financial situation is slightly better at 38.6 percent, although not statistically different. In 2015, 37.8 percent of residents felt the City financial situation was excellent or good, compared to 38 percent in 2013.
- In an open-end format, residents’ concerns clearly reflect current events. In the current survey:
 - Homelessness was cited by 26.2%
 - Cost of living or affordability of housing was an important concern among 25.2%
 - Traffic congestion was a top concern among 17.7%

- Overall, 76.1 percent of respondents were satisfied with the job the City is doing to provide services (31.8% “very satisfied” and 44.3% “somewhat satisfied”).
- Respondents reported satisfaction with a wide range of city services.
 - The survey assessed 29 specific city services. For 18 services, respondents as a whole were between “somewhat” and “very satisfied.” Further, 29 of 29 services received positive rankings.
- Thirty percent respondents indicated they were satisfied with the job the City is doing to spend taxpayer money, while 19.6 percent were dissatisfied. Thirty-two percent had mixed opinions and 11.4 percent did not have an opinion.
- With respect to sustainable behavior, majorities of respondents use reusable bags at grocery and other stores, compost kitchen food scraps, and reduced water consumption more than “most of the time”. But, only 30.8 percent use alternative modes of transportation.
 - The top reason for not engaging in sustainable practices continues to be “inconvenient” at 37.2 percent.

- Before information was provided, 55.1 percent of likely November 2017 voters supported a measure to increase the local sales tax by $\frac{1}{4}$ percent.
- Contrastingly, 39.5 percent of likely November 2017 voters supported a measure to increase the local utility users tax by 5 percent.
- The top arguments for the measure among the likely November 2017 voters included:
 - Every penny from this measure must stay in San Rafael. No funds can be taken away by the state
 - Maintaining adequate numbers of on-duty firefighters and paramedics and police
 - Maintaining rapid emergency police and fire response times
 - The measure will continue the appointed Citizen Oversight Committee to assure the money raised is used for its intended purposes
 - Repairing city streets and sidewalks
- After information was provided 54.4 percent of likely November 2017 voters support the measure to increase the local sales tax by $\frac{1}{4}$ percent.
- Alternatively, 41.2 percent of likely November 2017 voters supported a measure to increase the local utility users tax by 5 percent.
- Sixty-six percent of respondents support allowing medical cannabis businesses in San Rafael and 55.4 percent support allowing recreational cannabis businesses in the City.

4AA. Reducing the impacts of homelessness	0.07	0.65	0	0.27	-0.19	0.67	-0.08	0.36	-0.23

Based on the importance – satisfaction values shown on the following pages, the top priorities for improvements are:

- Reducing the impacts of homelessness (4AA)
- Managing traffic on city streets (4F)
- Maintaining city streets and roads (4G)
- Providing sufficient parking downtown (4P)

Importance – Satisfaction Matrix

n=858

City Service	Derived Imp	Satisfaction		
4Y. Providing garbage collection and recycling services	0.378	1.32	Tier 1

Revenue Measure Ballot Tests

Q9. Uninformed Support: Sales Tax Sample A

Shall the City of San Rafael increase the local sales tax rate by one-quarter percent to provide funding that cannot be taken by the State, and can be used to preserve essential city services for a period of 20 years, including: maintaining rapid emergency police and fire response times and anti-gang and anti-drug programs, maintaining adequate numbers of on-duty firefighters and paramedics and police, addressing sea level rise and flooding, maintaining community centers and repairing city streets?

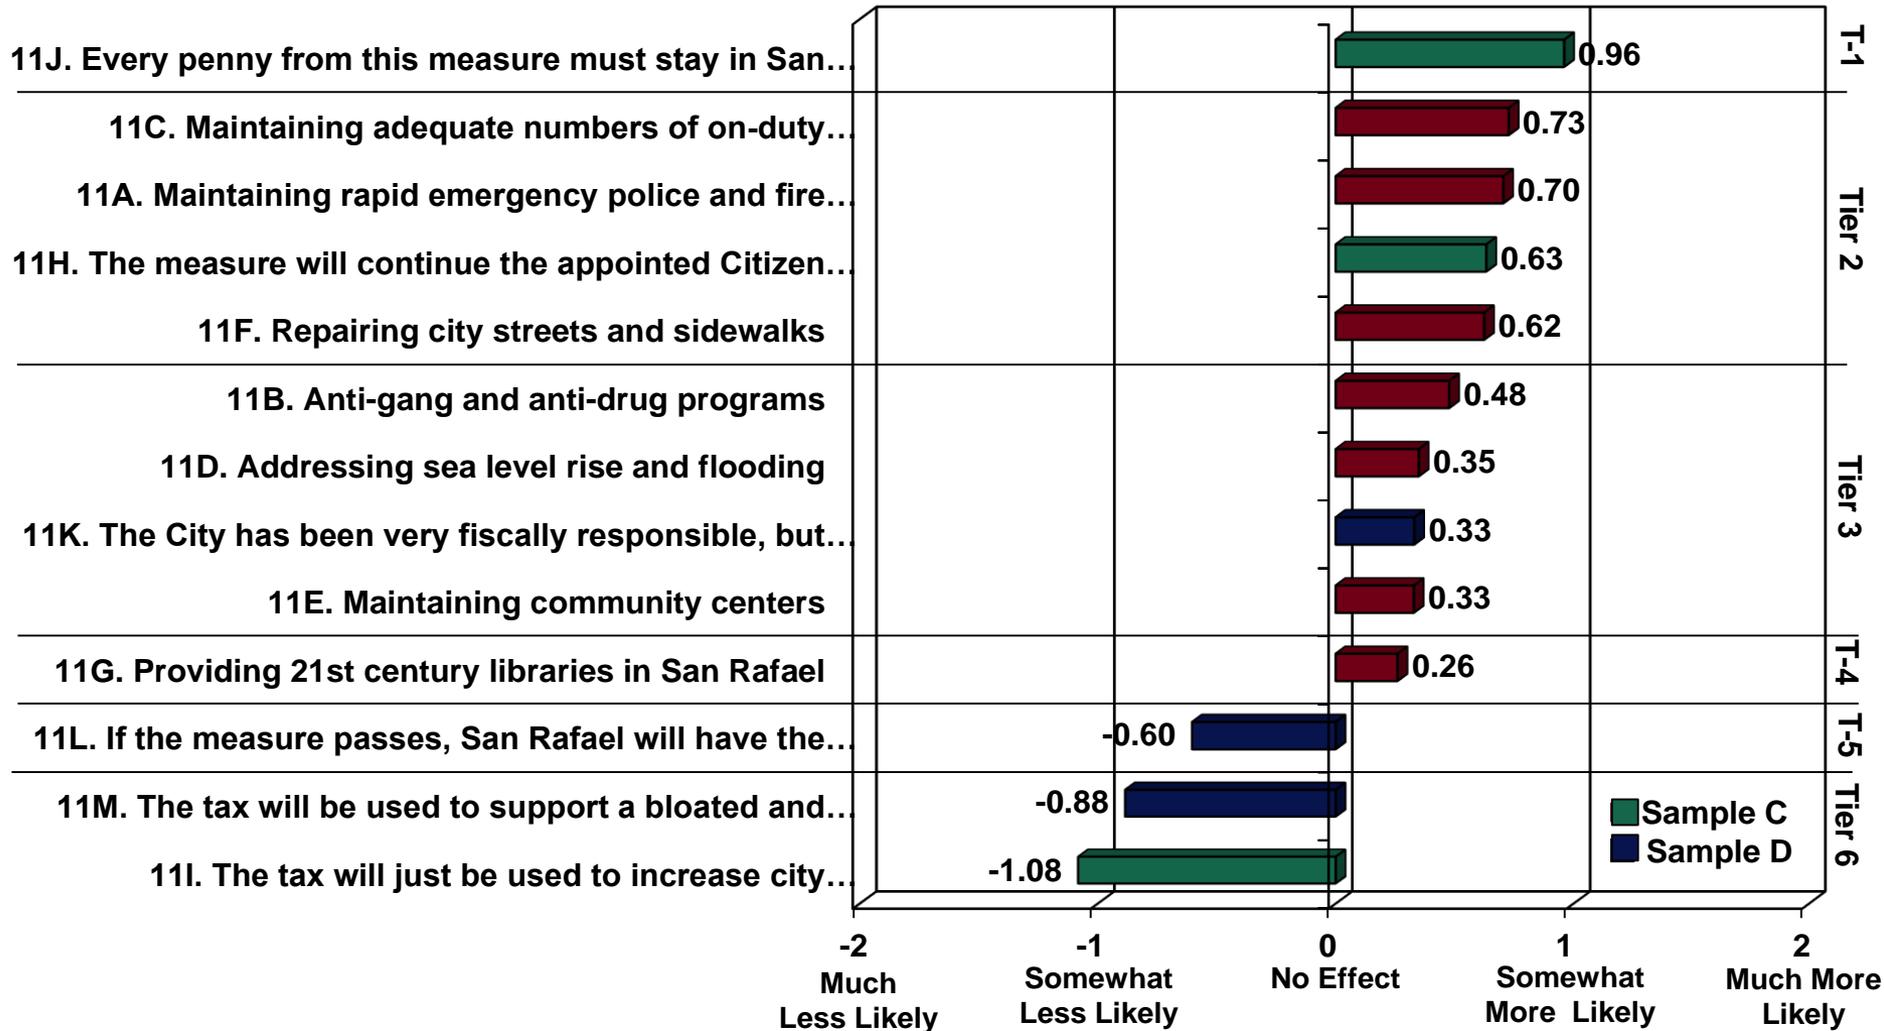

Q10. Uninformed Support: Utility Users Tax Sample B

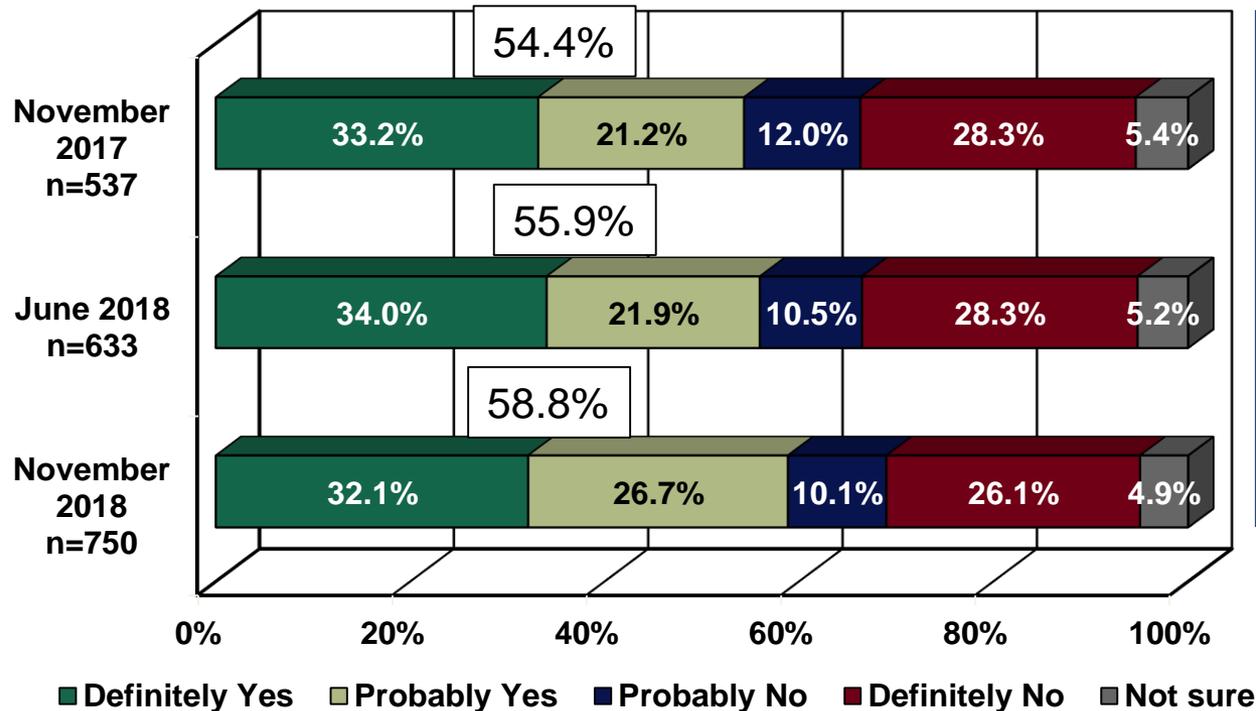

Shall the City of San Rafael levy a 5 percent utility users tax on telecommunications, gas, electric, water and sewer services to provide funding that cannot be taken by the State, and can be used to preserve essential city services for a period of 20 years, including: maintaining rapid emergency police and fire response times, maintaining adequate numbers of on-duty firefighters and paramedics and police, addressing sea level rise and flooding, maintaining community centers and repairing city streets?

Q11. Statements About the Measure

Likely November 2017 Voters n=537

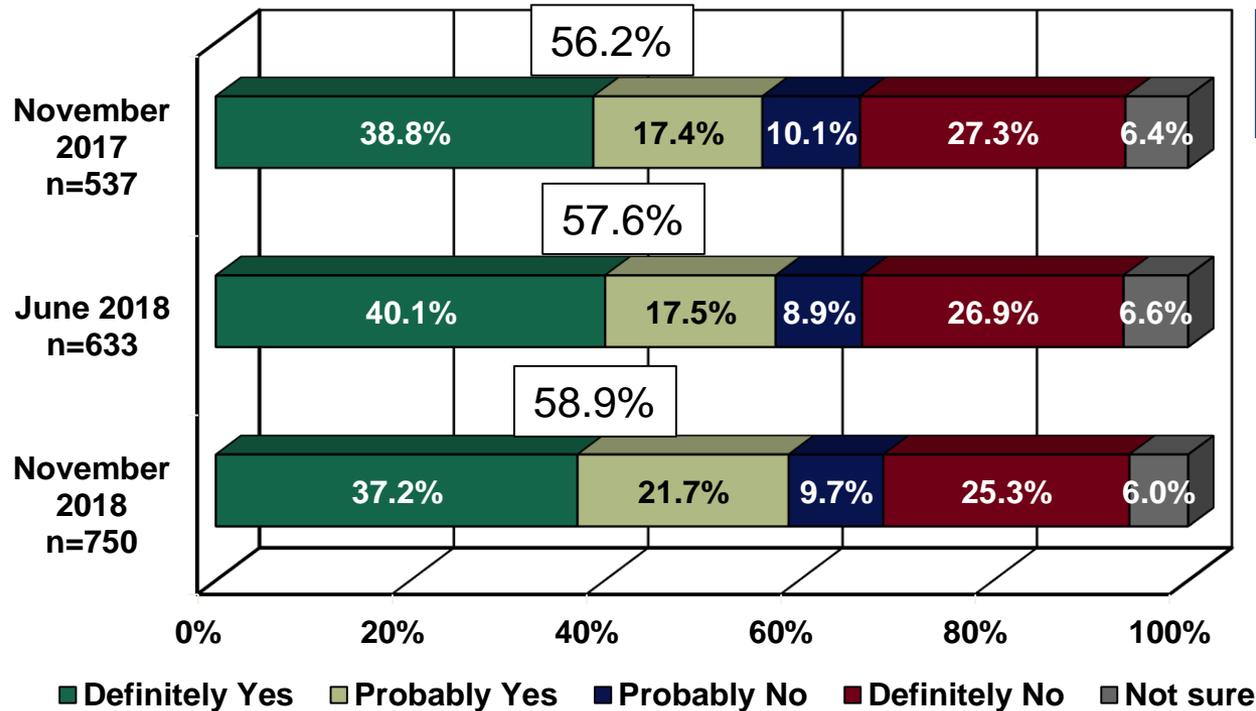

Q12. Informed Support: Sales Tax Sample A

Shall the City of San Rafael increase the local sales tax rate by one-quarter percent to provide funding that cannot be taken by the State, and can be used to preserve essential city services for a period of 20 years, including: maintaining rapid emergency police and fire response times and anti-gang and anti-drug programs, maintaining adequate numbers of on-duty firefighters and paramedics and police, addressing sea level rise and flooding, maintaining community centers and repairing city streets?

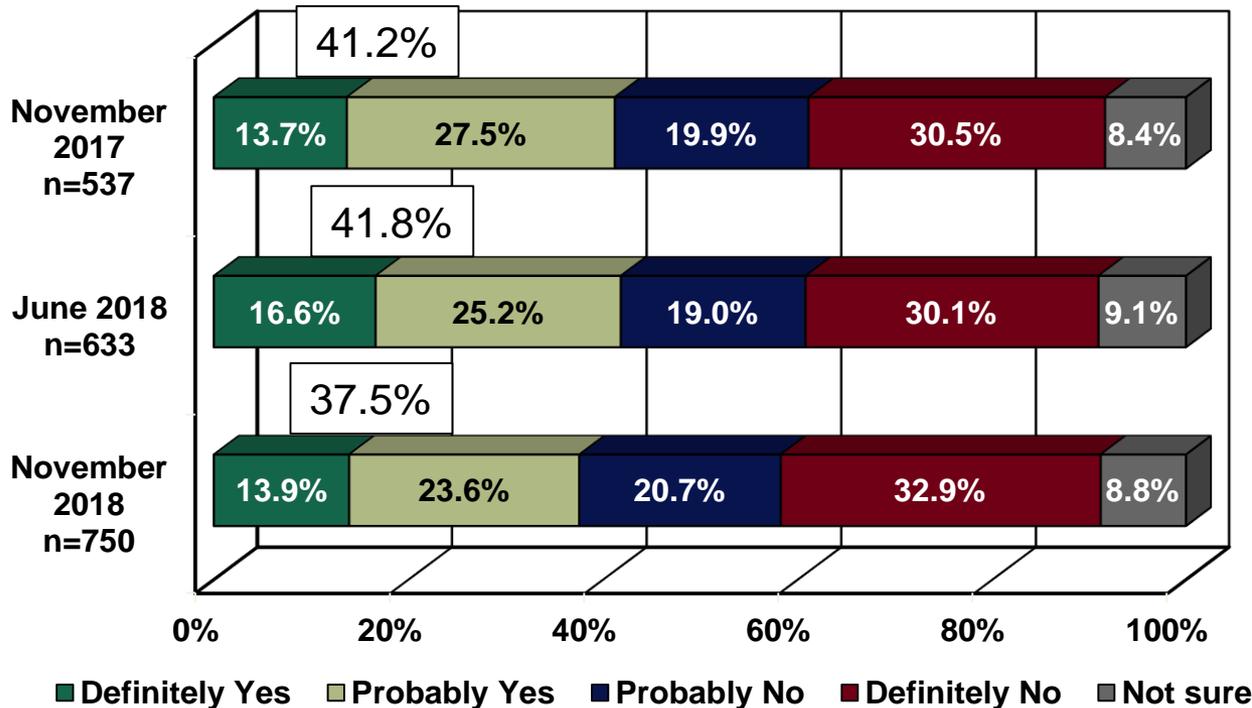

Q13. Support for Alternative Sales Tax Measure with 9 Year Duration

Sample A

INSTEAD of a levy for 20 years, another alternative would be to end the measure after 9 years.

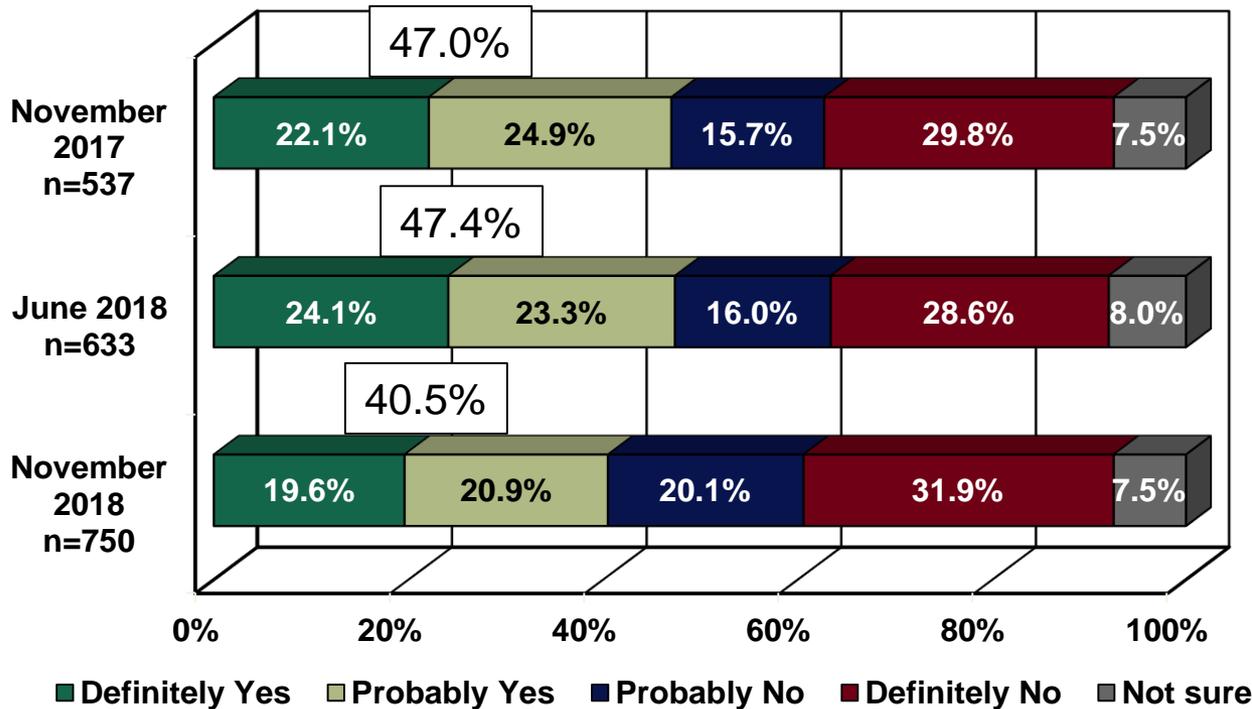

Q14. Uninformed Support: Utility Users Tax Sample B

Shall the City of San Rafael levy a 5 percent utility users tax on telecommunications, gas, electric, water and sewer services to provide funding that cannot be taken by the State, and can be used to preserve essential city services for a period of 20 years, including: maintaining rapid emergency police and fire response times, maintaining adequate numbers of on-duty firefighters and paramedics and police, addressing sea level rise and flooding, maintaining community centers and repairing city streets?

Q15. Support for Alternative UUT Measure with 9 Year Duration

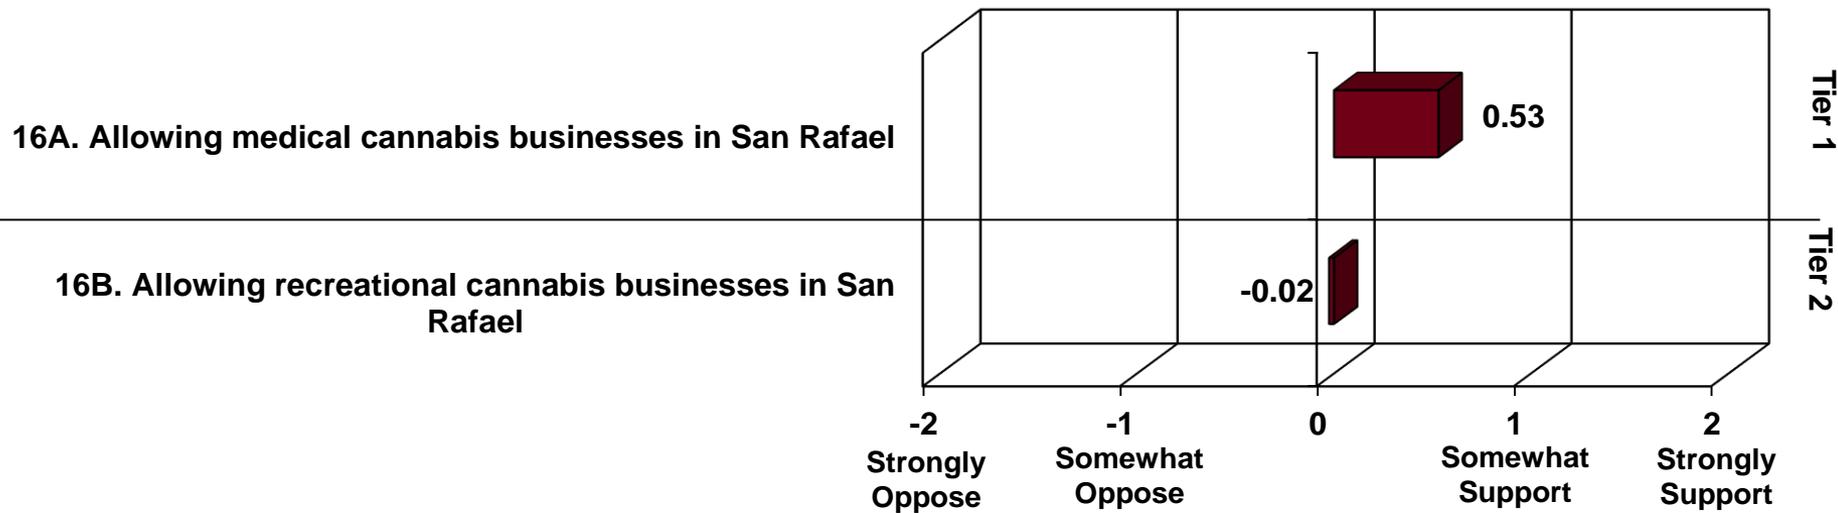

Sample B

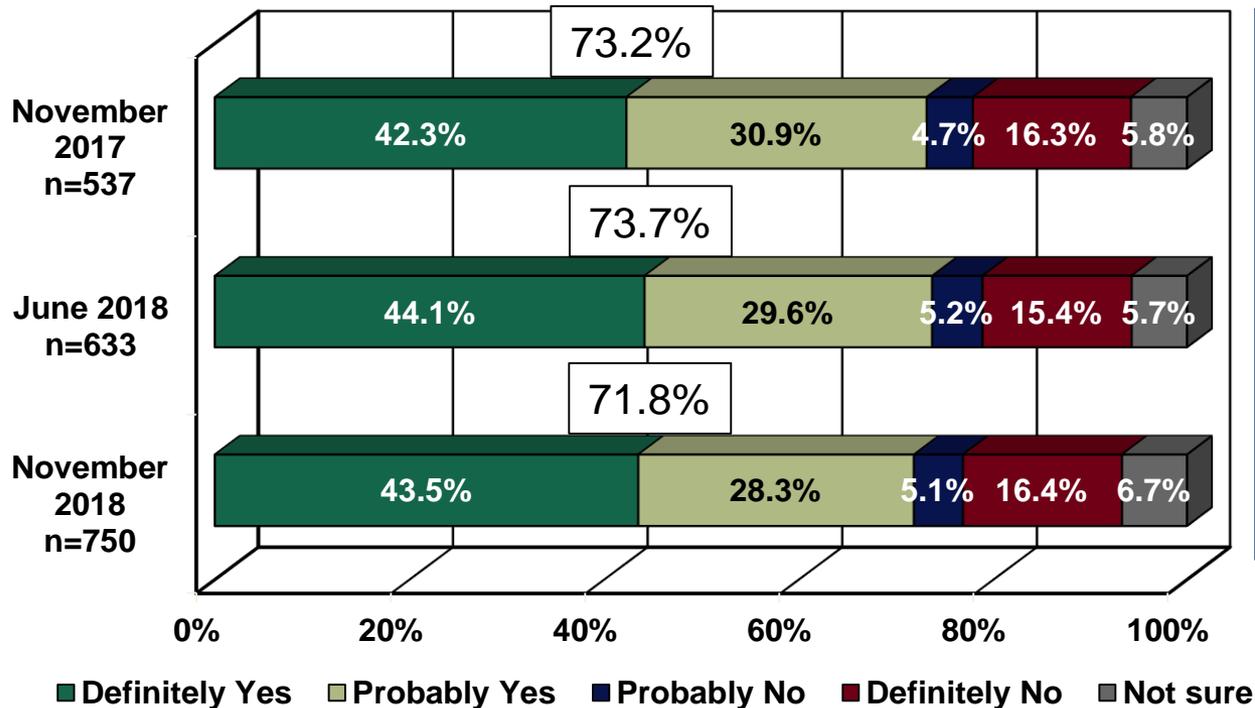

INSTEAD of a levy for 20 years, another alternative would be to end the measure after 9 years.

Q16. Support for Future Cannabis Ordinances

Likely November 2017 Voters (n=537)

Q17. Support for Tax on Cannabis Businesses

Shall the City of San Rafael levy an ongoing tax of up to 10% of gross receipts of potential future cannabis (marijuana) businesses in the city, which could provide over \$5 million dollars annually, requiring independent citizen oversight, financial audits, and that all funds stay in the City of San Rafael and cannot be taken by the State, to be used to maintain and enhance City services, including maintaining rapid emergency police and fire response times, maintaining community centers, repairing city streets and other general city services?

Appendix B: Detailed Methodology

Survey Parameters

Godbe Research conducted a total of 858 interviews representing 46,787 adult (age 18 and older) residents in the City of San Rafael (weighted to the 2015 ACS). This includes subsamples of 537 likely November 2017 voters, 633 likely June 2018 voters, and 750 likely November 2018 voters. The error rate is plus or minus 3.31% for the sample of 858 adult residents, plus or minus 4.14% for the sample of likely November 2017 voters, plus or minus 3.80% for the sample of likely June 2018 voters, and plus or minus 3.51% for the sample of likely November 2018 voters. Interviews were conducted from February 7 through February 19, 2017. The average interview time was approximately 25 minutes.

Sample and Weighting

Once collected, the sample of voters was compared with the respective voter population in the City to examine possible differences between the demographics of the sample and the actual universe of voters. The data were weighted to correct these differences, and the results presented are representative of the voter characteristics of the City of San Rafael in terms of gender, age, political party type, and election timing.

Questionnaire Methodology

To avoid the problem of systematic position bias, where the order in which a series of questions is asked systematically influences the answers, several questions in the survey were randomized such that the respondents were not consistently asked the questions in the same order. The series of items in Questions 4, 5, 7, 8, 11, 16, and 18 were randomized to avoid such position bias. Question 8 allowed the voters surveyed to mention multiple responses and may sum to more than 100.

Because a survey typically involves a limited number of people who are part of a larger population group, by mere chance alone there will almost always be some differences between a sample and the population from which it was drawn. These differences are known as “sampling error” and they are expected to occur regardless of how scientifically the sample has been selected. The advantage of a scientific sample is that we are able to calculate the sampling error. Sampling error is determined by four factors: the population size, the sample size, a confidence level, and the dispersion of responses.

For example, the following table shows the possible sampling variation that applies to a percent result reported from a probability type sample. Because the sample of 858 adult residents was drawn from the estimated population of the City of San Rafael of approximately 46,787 voters, one can be 95% confident that the margin of error due to sampling will not vary, plus or minus, by more than the indicated number of percent points from the result that would have been obtained if the interviews had been conducted with all persons in the universe. As the table on the following page indicates, the margin of error for all aggregate responses is between 1.99 and 3.31% for the survey.

This means that, for a given question with dichotomous response options (e.g., Yes/No) answered by 858 respondents, one can be 95% confident that the difference between the percent breakdowns of the sample and those of the total population is no greater than 3.31%. The percent margin of error applies to both sides of the answer, so that for a question in which 50% of respondents said yes, one can be 95% confident that the actual percent of the population that would say yes is between 47% (50 minus 3.31) and 53% (50 plus 3.31).

The margin of error for a given question also depends on the distribution of responses to the question. The 3.31% refers to dichotomous questions where opinions are evenly split in the sample with 50% of respondents saying yes and 50% saying no. If that same question were to receive a response in which 10% of the respondents say yes and 90% say no, then the margin of error would be no greater than plus or minus 1.99%. As the number of respondents in a particular subgroup (e.g., age) is smaller than the number of total respondents, the margin of error associated with estimating a given subgroup’s response will be higher. Due to the high margin of error, Godbe Research cautions against generalizing the results for subgroups that are comprised of 25 or fewer respondents.

Margin of Error II

<i>n</i>	Distribution of Responses				
	90% / 10%	80% / 20%	70% / 30%	60% / 40%	50% / 50%
1000	1.84%	2.45%	2.81%	3.00%	3.07%
900	1.94%	2.59%	2.97%	3.17%	3.24%
858	1.99%	2.65%	3.04%	3.25%	3.31%
600	2.39%	3.18%	3.64%	3.89%	3.98%
500	2.62%	3.49%	4.00%	4.27%	4.36%
400	2.93%	3.90%	4.47%	4.78%	4.88%
300	3.38%	4.51%	5.17%	5.53%	5.64%
200	4.15%	5.53%	6.34%	6.78%	6.91%

Reading Crosstabulation Tables

The questions discussed and analyzed in this report comprise a subset of various crosstabulation tables available for each question. Only those subgroups that are of particular interest or that illustrate particular insights are included in the discussion. Should readers wish to conduct a closer analysis of subgroups for a given question, the complete breakdowns appear in Appendix E. These crosstabulation tables provide detailed information on the responses to each question by demographic and behavioral groups that were assessed in the survey. A typical crosstabulation table is shown here.

A short description of the item appears on the left-hand side of the table. The item sample size (n = 250) is presented in the first column of data under “Total.”

The results to each possible answer choice of all respondents are presented in the first column of data under “Total.” The aggregate number of respondents in each answer category is presented as a whole number, and the percent of the entire sample that this number represents is just below the whole number. In this example, among the total respondents, 96 voters reported their “definitely yes” vote on the measure, and this number of respondents equals 39% of the total sample size of 250. Next to the “Total” column are the other columns representing responses from the low-, medium-, and high-propensity voters. The data from these columns are read in exactly the same fashion as the data in the “Total” column, although each group makes up a smaller percent of the entire sample.

EXAMPLE OF DATA CROSTABULATION TABLE		Voting Propensity			
		Total	Low	Medium	High
If the election were held today, would you vote yes or no on this measure?	Total	250	68	80	101
	Definitely Yes	96	24	35	37
		38.5%	34.4%	44.2%	36.7%
	Probably Yes	60	25	16	19
		23.9%	36.1%	19.6%	19.2%
	Probably No	20	3	8	9
		7.9%	4.3%	9.5%	8.9%
Definitely No	63	14	16	33	
	25.3%	20.9%	19.7%	32.6%	
DK/NA	11	3	6	3	
	4.4%	4.2%	7.0%	2.6%	

Subgroup Comparisons

To test whether or not the differences found in percent results among subgroups are likely due to actual differences in opinions or behaviors – rather than the results of chance due to the random nature of the sampling design – a “z-test” was performed. In the headings of each column are labels, “A,” “B,” “C,” etc. along with a description of the variable. The “z-test” is performed by comparing the percent in each cell with all other cells in the same row within a given variable (within Voting Propensity in the pictured table, for example).

The results from the “z-test” are displayed in a separate table below the crosstabulation table. If the percent in one cell is statistically different from the percent in another, the column label will be displayed in the cell from which it varies significantly. For instance, in the adjacent table, a significantly higher percent of low-propensity voters (36%) reported “probably yes” than high-propensity voters (19%). Hence, the letter “C,” which stands for high-propensity voters, appears under Column “A,” which stands for low-propensity voters. The letters in the table indicate the differences where one can be 95% confident that the results are due to actual differences in opinions or behaviors reported by subgroups of respondents.

It is important to note that the percent difference among subgroups is just one piece in the equation to determine whether or not two percentage figures are significantly different from each other. The variance and sample size associated with each data point is integral to determining significance. Therefore, two calculations may be different from each other, yet the difference may not be statistically significant according to the “z” statistic.

EXAMPLE OF DATA FOR SUBGROUP COMPARISONS		Voting Propensity			
		Total	Low	Medium	High
If the election were held today, would you vote yes or no on this measure?	Total	250	68	80	101
	Definitely Yes	96	24	35	37
		38.5%	34.4%	44.2%	36.7%

	Probably Yes	C		
	Probably No			
	Definitely No			
	DK/NA			

Understanding a Mean

In addition to the analysis of the percent of the responses, some results are discussed with respect to an average score. To derive the overall importance of an issue, Q4 for example, a number value was assigned to each response category – in this case, “Very Satisfied” = +2, “Somewhat Satisfied” = +1, “Somewhat Dissatisfied” = -1 and “Very Dissatisfied” = -2.

The number values that correspond to respondents’ answers were then averaged to produce a final score that reflects the overall importance of an issue. The resulting mean score makes the interpretation of the data considerably easier.

In the crosstabulation tables for Questions 4, 7, 11, 16, and 18 of the survey, the reader will find mean scores. These mean scores represent the average response of each group. The table to the right shows the scales for each corresponding question. Responses of “DK/NA” were not included in the calculations of the means for any question.

Question	Measure	Scale	Values
Q4 and Q18	Satisfaction Ratings	-2 to +2	+2 = “Very Satisfied” +1 = “Somewhat Satisfied” -1 = “Somewhat Dissatisfied” -2 = “Very Dissatisfied”
Q7	Frequency Ratings	-2 to +2	+3 = “Almost Always” +2 = “Most of the Time” +1 = “Some of the Time” 0 = “Never”
Q11	Features	+2 to -2	+2.0 = “Much More Likely” +1.0 = “Somewhat More Likely” 0.0 = “No Effect” -1.0 = “Somewhat Less Likely” -2.0 = “Much Less Likely”
Q16	Likely Support and Opposition	+2 to -2	+2.0 = “Strongly Support” +1.0 = “Somewhat Support” -1.0 = “Somewhat Oppose” -2.0 = “Strongly Oppose”

Means Comparisons

A typical crosstabulation table of mean scores is shown in the adjacent table. All subgroups of interest concerning questions 4, 7, 11, 16, and 18 are included in Appendix E.

The aggregate mean score for each item in the question series is presented in the first column of the data under “Total.” For example, among all the survey respondents, the feature A, “Overall appearance of City,” earned a mean score of 1.8. Next to the “Total” column are other columns representing the mean scores assigned by the respondents grouped by Gender.

The data from these columns are read in the same fashion as the data in the “Total” column. To test whether two mean scores are statistically different, a “t-test” is performed. As in the case of the “z-test” for percentage figures, a statistically significant result is indicated by the letter representing the data column.

EXAMPLE OF DATA FOR MEANS COMPARISON	Gender		
	Total	Male	Female
Overall appearance of the City	1.8	1.7	1.9
Recreational opportunities	1.6	1.5	1.6
Access to quality affordable housing	-0.4	-0.3	-0.5
Overall image and reputation of City	1.4	1.3	1.4

EXAMPLE OF DATA FOR T-TEST	Gender	
	Male	Female
	(A)	(B)
Overall appearance of the City		A
Recreational opportunities		
Access to quality affordable housing

Godbe Research
2015 San Rafael Resident Satisfaction Survey

CITY EMAIL SETUP INFORMATION

Step 1

The City of San Rafael will need to create a new email address for use by Godbe Research to send out email invitations. Unless already in use, this new email address should be:

city.manager@cityofsanrafael.org

Step 2

After the email has been created, have your IT Department auto forward all of the emails sent to the new account to: surveys.gra@gmail.com. We will handle validation of the email address with our mailing software and address any tech support questions sent to this account. We will forward any substantive emails that may require a response from a City representative back to a designated City staff member.

Step 3

Provide Godbe Research your email list for matching with the voter file. The data needs to include separate fields for first name, last name, street address, and email address. However, if cell and landlines phones are available that is also very useful. The format in an excel files should be:

First Name	Last Name	Email Address	Street Address	City	Zip	Work Phone	Cell Phone	Home Phone
Bryan	Godbe	wbgodbe@godberesearch.com	1660 So Amphilett Blvd	San Mateo	94402	650-288-3027	650-520-9150	
Leslie	Godbe	leslie@godberesearch.com	1660 So Amphilett Blvd	San Mateo	94402	650-288-3041	650-533-2321	

Client Check List

- Set up email address.
- Auto forward all email from new account to surveys.gra@gmail.com.
- Notify Godbe Research on completion of above so the email can be tested.
- Send email list as discussed to Godbe Research.

GENERAL EMAIL INVITATION

From: city.manager@cityofsanrafael.org
Reply to: city.manager@cityofsanrafael.org

Subject: Participate in this important study about our community
Dear [insert name],

The City of San Rafael has commissioned GRA and McGuire Research, independent research firms, to conduct research on important issues in the City of San Rafael.

Your individual responses are entirely confidential and will be used for research purposes only. Your data will not be sold or provided to anyone. You will not be approached for any other reason - we are only interested in your opinions.

To access the survey, simply click on the link below. If your email does not support links, cut and paste the entire link into your browser.

<survey link with unique voter file id>

We ask that you please complete the survey on or before _____, 2016, after which it will be closed.

Thank you in advance for your participation.

Sincerely,

Jim Schutz
City Manager
City of San Rafael

Technical Issues: If you have technical issues or questions with the survey link, password or completing the survey form please contact [Technical Assistance \(pwood@mcquire-research.com\)](mailto:pwood@mcquire-research.com).

Questions about the City or this Survey: If you have questions about the City of San Rafael, or the purpose of this survey please contact: city.manager@cityofsanrafael.org

Note: Email addresses for this survey were obtained from public records at the Registrar of Voters in Marin County and the City of San Rafael. If you no longer wish to receive invitations or reminders for this research, please click [HERE](#) to unsubscribe.

EMAIL & AOL OPT-IN EMAIL INVITATION

From: city.manager@cityofsanrafael.org
Reply to: city.manager@cityofsanrafael.org

Subject: Participate in this important study about our community

The City of San Rafael has commissioned GRA and McGuire Research, independent research firms, to conduct research on important issues in your area. If you would like to be included in this email list to receive and be able to participate in important community surveys such as this and future ones, then please click on this link below.

<survey link with unique voter file id>

If you click on the link above, then an email invite for this specific survey will be sent to you shortly. Thank you.

Your individual responses will be entirely confidential and will be used for research purposes only. SCREENERS

[ONLINE INTRODUCTION]

Thank you for your interest in taking our survey to help understand issues in the City of San Rafael. All of your answers to the survey will be kept strictly anonymous and confidential.

Survey Instructions:

Once you have answered all the questions on a page, click the "Next" button to continue. If you have any technical difficulties with the survey, please email: [Technical Assistance \(pwood@mcquire-research.com\)](mailto:pwood@mcquire-research.com).

[PHONE INTERVIEW]

Hello, May I speak with _____? Hello, my name is _____ and I'm calling on behalf of the city of San Rafael. We're conducting a survey concerning some important issues in the City of San Rafael, and we would like to hear your opinions, we really appreciate your time. [IF NEEDED]: This is a study about issues of importance in your area. It is a survey only and I am not selling anything.

[IF THE PERSON ASKS WHY YOU ONLY WANT TO TALK TO THE INDIVIDUAL LISTED ON THE SAMPLE, OR ASKS IF THEY ARE ABLE TO PARTICIPATE INSTEAD OF THE INDIVIDUAL, THEN SAY: "I'm sorry, but for statistical purposes this survey must only be completed by this particular individual."] [IF THE INDIVIDUAL SAYS THEY ARE ON THE NATIONAL DO NOT CALL LIST, RESPOND WITH GUIDELINES FROM THE MARKETING RESEARCH ASSOCIATION. IF THE INDIVIDUAL SAYS: "There's a law that says you can't call me," RESPOND WITH: "This research study is exempt under the law that congress passed. That law was passed to regulate the activities of the telemarketing industry. This is a legitimate research call. Your opinions count!"]

Before we get started, I'd like to verify that you are eligible to complete the survey.

- i. But first, I need to know if I have reached you on a cell phone, and if so, are you in a place where you can talk safely without endangering yourself or others?
- Yes, cell and can talk safely ----- 1
Yes, cell but cannot talk safely ----- 2 [CALL BACK LATER]
No, not on cell ----- 3
[DON'T READ] DK/NA/REFUSED -----99 [CALL BACK LATER]

[ALL RESPONDENTS]

- ii. Do you work for the City of San Rafael or are you appointed to any City of San Rafael or county board, committee or commission?
- Yes ----- 1 [CONTINUE TO Qiii TEXT]
No ----- 2 [GO TO Q1]
[ONLINE] Not sure /
[PHONE DON'T READ] DK/NA -----99
- iii. Thank you for your time, but the focus of this survey is on the general public's opinion of local issues. Due to your response to this question, you are not eligible to complete the survey. Thank you again for your time. [TERMINATE]

OVERALL SATISFACTION

To begin, what is your overall opinion of living in San Rafael.

1. In general, are you satisfied or dissatisfied with the overall quality of life in San Rafael? [PHONE GET ANSWER, THEN ASK:] Is that very (satisfied/dissatisfied) or somewhat (satisfied/dissatisfied)?

FIRST BALLOT TEST

In the future, voters in your area may be asked to vote on local ballot measures. Here is the summary of a potential measure.

[SPLIT SAMPLE A]

9. Shall the City of San Rafael increase the local sales tax rate by one-quarter percent to provide funding that cannot be taken by the State, and can be used to preserve essential city services for a period of 20 years, including: maintaining rapid emergency police and fire response times and anti-gang and anti-drug programs, maintaining adequate numbers of on-duty firefighters and paramedics and police, addressing sea level rise and flooding, maintaining community centers and repairing city streets? [74 WORDS; City of San Rafael count as 1 word]

[ONLINE] If the election were held today, would you definitely vote yes, probably vote yes, probably vote no, or definitely vote no on this measure?

[PHONE] If the election were held today, would you vote yes or no on this measure? [GET ANSWER, THEN ASK]: Would that be definitely [yes/no] or probably [yes/no]?

- Definitely yes ----- 1
- Probably yes----- 2
- Probably no ----- 3
- Definitely no----- 4
- [ONLINE] Not sure
- [PHONE DON'T READ]DK/NA -----99

[SPLIT SAMPLE B]

10. Shall the City of San Rafael levy a 5 percent utility users tax on telecommunications, gas, electric, water and sewer services to provide funding that cannot be taken by the State, and can be used to preserve essential city services for a period of 20 years, including: maintaining rapid emergency police and fire response times, maintaining adequate numbers of on-duty firefighters and paramedics and police, addressing sea level rise and flooding, maintaining community centers and repairing city streets? [75 WORDS; City of San Rafael count as 1 word]

[ONLINE] If the election were held today, would you definitely vote yes, probably vote yes, probably vote no, or definitely vote no on this measure?

[PHONE] If the election were held today, would you vote yes or no on this measure? [GET ANSWER, THEN ASK]: Would that be definitely [yes/no] or probably [yes/no]?

- Definitely yes ----- 1
- Probably yes----- 2
- Probably no ----- 3
- Definitely no----- 4
- [ONLINE] Not sure
- [PHONE DON'T READ]DK/NA -----99

FEATURES OF THE MEASURE

11. [ONLINE] This measure would fund different types of city programs and services, and you will see arguments for and against the measure. For each of the following statements below would you be much more likely, somewhat more likely, somewhat less likely or much less likely to vote for the measure?

[PHONE] The measure we've been discussing would fund different types of city programs and services, and you will hear arguments for and against the measure. For each of the following statements please tell me if you would be more or less likely to vote for the measure.

[PHONE] If you heard that the measure would fund _____, would you be more or less likely to vote for the measure? [GET ANSWER, THEN ASK]: Is that much [more/less] likely or somewhat [more/less] likely?

[RANDOMIZE]

	Much More Likely	Swt. More Likely	[ONLINE SHOW] [PHONE: DON'T READ] No Effect	Swt. Less Likely	Much Less Likely	[ONLINE: Not Sure] [PHONE DON'T READ] DK/NA
A. Maintaining rapid emergency police and fire response times -----	1	2	3	4	5	99

	Somewhat satisfied	.
	Somewhat dissatisfied	.
	Very dissatisfied	.
	DK/NA	.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

DK/NA			A	a

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

3. In your opinion, would you say the City's financial situation is excellent, good, fair, or poor?	Excellent Good Fair Poor DK/NA	B C D

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	Illegal immigrants or day laborers	B	
	Poor financial situation/condition	B	
	Public safety (includes crime)		
	Quality of education		
	Traffic congestion		
	Other (SPECIFY: DK/NA		

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Godbe Research /// San Rafael Resident Satisfaction Survey /// Crosstabs 02-27-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

		(A)	(B)
8. What would you say are the main reasons why you, or members of your household, have not adopted some of these practices?	Inconvenient to practice	B	
	Unaware of the practice		
	Unsure of how to adopt the practice	B	
	Too costly		A
	Other		A
	DK		A

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	DK/NA	B		

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Godbe Research /// San Rafael Resident Satisfaction Survey /// Crosstabs 02-27-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	Definitely no	B	
	DK/NA		A

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
 a.This category is not used in comparisons because its column proportion is equal to zero or one.
 b.This category is not used in comparisons because the sum of case weights is less than two.
 c.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
 d.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

12. Second Ballot Test - Sales Tax	Definitely yes Probably yes Probably no Definitely no DK/NA	B	A

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

		Date			
		Feb. 16	Feb. 17	Feb. 18	Feb. 19
		(J)	(K)	(L)	(M)
C. Do you have any children 18 years or younger living in your household?	YES		a	a, b	a, b
	NO		.	a, b	a, b
	DK/NA	.b	a, b	a, b	a, b

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	NO	B D	A E		A E	B D
	DK/NA	a		a		a

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	DK/NA	a

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. This category is not used in comparisons because the sum of case weights is less than two.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Godbe Research /// San Rafael Resident Satisfaction Survey /// Crosstabs 02-27-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	1980 or before	.b	.b	.b	.b		a.,b

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	1980 or before	B	

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

	1997 to 2000					
	1993 to 1996					
	1981 to 1992					
	1980 or before					

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

P. Times Voted in Last Elections

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

		(A)	(B)	(C)	(D)
S. Likely November 2017 Voter	Yes	D	C D		
	No			B	A B

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

U. Likely Absentee Voter	Yes		. ^a	. ^{a, b}	. ^{a, b}
	No		. ^a	. ^{a, b}	. ^{a, b}

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. This category is not used in comparisons because its column proportion is equal to zero or one.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions^{a,b}

		Shift - Utility Users Tax					
		Shift to Yes	Shift to No	Yes on both	No on both	DK on both	Shift to DK
		(A)	(B)	(C)	(D)	(E)	(F)
U. Likely Absentee Voter	Yes				C		
	No			D			

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Godbe Research /// San Rafael Resident Satisfaction Survey /// Mean Score Crosstabs 02-27-17

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Godbe Research /// San Rafael Resident Satisfaction Survey /// Mean Score Crosstabs 02-27-17

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

4V. Providing recreational and cultural arts programs	D					
4W. Providing child care services	a		D		CD	a
4X. Meeting the needs of ethnic minorities						
4Y. Providing garbage collection and recycling services						C
4Z. Enforcing traffic and parking laws						CDE
4AA. Reducing the impacts of homelessness			DE			
4BB. Having your voice heard in City government	D		D			
4CC. Effectively providing building planning and permitting services			AD			AD

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

- a. This category is not used in comparisons because the sum of case weights is less than two.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

7A. Compost kitchen food scraps in Marin Sanitary Service's green bin	A	
7B. Bring and use reusable grocery bags to grocery store	A	A
7C. Bring and use reusable grocery bags to other stores such as clothing, household, or department stores		A
7D. Took steps in 2016 to reduce water use such as using a low flow shower or faucet regulator, or reducing watering times or amounts in yard or garden		
7E. Use alternative modes of transportation such as walking, biking, public transit, and carpool		

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

7E. Use alternative modes of transportation such as walking, biking, public transit, and carpool		A		A	

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

11K. The City has been very fiscally responsible, but cost increases threaten our city's long-term financial viability. This measure will ensure the funds are there to prevent cuts to city services	C			
11L. If the measure passes, San Rafael will have the highest sales tax in Marin County, driving shoppers to other cities and hurting local small businesses	C			
11M. The tax will be used to support a bloated and costly pension program for City employees	C D	C D		

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.
