Dear Ms. Saunders:

Pasadena
Irvine
San Diego
Woodland Hills

Linscott, Law & Greenspan, Engineers (LLG) is pleased to present the findings of this Focused Traffic Impact Assessment for the proposed 813 N. Euclid Street Gas Station Project (herein after referred to as "Project") located at 813 N. Euclid Street in the City of Santa Ana, California. The project site is currently vacant and the proposed Project will consist of a gas station with eight (8) vehicle fueling positions and a 3,045 square-foot (SF) convenience market. The proposed Project is anticipated to be completed in the Year 2020. Access to the project site will be provided via one right-turn in/right-turn out only driveway located along Euclid Street and via one left-turn in/right-turn in/right-turn out only driveway located along Hazard Avenue.

The Focused Traffic Impact Assessment for the proposed Project will satisfy the traffic impact requirements of the City of Santa Ana and will focus to the key study intersection of Euclid Street at Hazard Avenue. Included in this focused traffic assessment are:

- 1) Existing traffic counts,
- 2) Estimated Project traffic generation/distribution/assignment,
- 3) Estimated cumulative project traffic generation/distribution/assignment,
- 4) AM and PM peak hour analyses for existing traffic conditions,
- 5) AM and PM peak hour analyses for existing plus project traffic conditions,
- 6) AM and PM peak hour analyses for Year 2020 cumulative without and with project traffic conditions,
- 7) Recommended Improvements, and
- 8) Left-turn queuing evaluation for Euclid Street at Hazard Avenue.

PROJECT DESCRIPTION

The proposed Project site is located at 813 N. Euclid Street in the City of Santa Ana, California. The project site is currently vacant. **Figure 1** presents a vicinity map which illustrates the general location of the Project and depicts the surrounding street system. **Figure 2** presents an aerial image of the existing site.

The proposed Project will consist of a gas station with eight (8) vehicle fueling positions and a 3,045 square-foot (SF) convenience market. The proposed Project is anticipated to be completed in the Year 2020. Access to the project site will be provided via one right-turn in/right-turn out only driveway located along Euclid Street and via one left-turn in/right-turn in/right-turn out only driveway located along Hazard Avenue. **Figure 3** presents the proposed site plan for the proposed Project, prepared by ASI Development.

EXISTING CONDITIONS

Existing Roadway Conditions

Figure 4 presents an inventory of the existing roadway conditions for the key study intersection of Euclid Street at Hazard Avenue. This figure identifies the number of travel lanes and controls for the key study intersection.

Existing Traffic Volumes

AM peak hour and PM peak hour traffic counts were collected by Transportation Studies Inc. (TSI) on September 5, 2019 at the intersection of Euclid Street at Hazard Avenue in order to develop the baseline peak hour traffic volume data for the intersection analysis.

Figure 5 illustrates the existing AM and PM peak hour traffic volumes at the intersection of Euclid Street at Hazard Avenue.

Appendix A contains the detailed peak hour traffic count sheets for the intersection of Euclid Street at Hazard Avenue.

Intersection Peak Hour Level of Service Methodology

AM and PM peak hour operating conditions for the key signalized intersection was evaluated using the *Intersection Capacity Utilization* (ICU) methodology.

Intersection Capacity Utilization (ICU) Method of Analysis

The ICU technique is intended for signalized intersection analysis and estimates the volume to capacity (V/C) relationship for an intersection based on the individual V/C ratios for key conflicting traffic movements. The ICU numerical value represents the percent signal (green) time, and thus capacity, required by existing and/or future

traffic. It should be noted that the ICU methodology assumes uniform traffic distribution per intersection approach lane and optimal signal timing.

Per City of Santa Ana requirements, the ICU calculations use a lane capacity of 1,700 vehicles per hour (vph) for through lanes and 1,600 vph for left-turn lanes and right-turn lanes. A clearance adjustment factor of 0.05 was added to each Level of Service calculation. The ICU value translates to a Level of Service (LOS) estimate, which is a relative measure of the intersection performance. The ICU value is the sum of the critical volume to capacity ratios at an intersection; it is not intended to be indicative of the LOS of each of the individual turning movements. The six qualitative categories of Level of Service have been defined along with the corresponding ICU value range and are shown in **Table 1**.

Minimum LOS Thresholds and Significant Traffic Impact Criteria

Per City of Santa Ana requirements, impacts to local and regional transportation systems are considered significant if:

- An unacceptable peak hour Level of Service (LOS) at any of the key intersections is projected. The City of Santa Ana considers LOS D (ICU = 0.801 - 0.900) to be the minimum acceptable LOS for all intersections, except for those locations located within the City's defined major development areas, where LOS E is considered acceptable. Based on the above, LOS D is the requirement for the intersection of Euclid Street at Hazard Avenue.
- The project increases traffic demand at the study intersection by 1% of capacity (ICU increase ≥ 0.010), causing or worsening LOS E or LOS F ($V/C > 0.900$).

TRAFFIC FORECASTING METHOD OF ANALYSIS

In order to estimate the traffic impact characteristics of the proposed Project, a multi-step process has been utilized. The first step is traffic generation, which estimates the total arriving and departing traffic on a peak hour and daily basis. The traffic generation potential is forecast by applying the appropriate vehicle trip generation equations or rates to the Project development tabulation.

The second step of the forecasting process is traffic distribution, which identifies the origins and destinations of inbound and outbound project traffic. These origins and destinations are typically based on demographics and existing/expected future travel patterns in the study area.

The third step is traffic assignment, which involves the allocation of Project traffic to study area streets and intersections. Traffic assignment is typically based on minimization of travel time, which may or may not involve the shortest route, depending on prevailing operating conditions and travel speeds. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area.

With the forecasting process complete and Project traffic assignments developed, the impact of the Project is isolated by comparing operational (LOS) conditions at selected key intersections and road segment using expected future traffic volumes with and without forecast Project traffic. The need for site-specific and/or cumulative local area traffic improvements can then be evaluated.

PROJECT TRAFFIC CHARACTERISTICS

Project Trip Generation

Traffic generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. Generation rates used in this analysis are based on information found in the 10th Edition of *Trip Generation*, published by the Institute of Transportation Engineers (ITE) [Washington, D.C., 2017].

Table 2 summarizes the trip generation rates used in forecasting the vehicular trips generated by the proposed Project and presents the forecast daily and peak hour project traffic volumes for a “typical” weekday. As shown in the upper portion of *Table 2*, the trip generation potential of the proposed Project was estimated based on ITE Land Use Code 853: Convenience Market with Gasoline Pumps trip rates.

Review of the lower portion of *Table 2* indicates that the proposed Project is forecast to generate 1,935 daily trips, with 62 trips (31 inbound, 31 outbound) produced in the AM peak hour and 62 trips (31 inbound, 31 outbound) produced in the PM peak hour on a “typical” weekday. Please note that the aforementioned overall project trip generation includes adjustments for pass-by as recommended by ITE. The pass-by reduction factors that are utilized in this letter report are based on information published in the *Trip Generation Handbook, 3rd Edition*, published by ITE (2014) and are summarized in the footnotes of *Table 2*.

It should be noted that the trip generation methodology and forecasts were approved by City of Santa Ana staff prior to proceeding with further analysis.

Project Trip Distribution and Assignment

The directional traffic distribution pattern for the proposed Project is presented in **Figure 6**. Project traffic volumes both entering and exiting the site have been distributed and assigned to the adjacent street system based on the following considerations:

- the site's proximity to major traffic carriers and regional access routes,
- expected localized traffic flow patterns based on adjacent street channelization, and presence of traffic signals,
- existing traffic volumes, and
- ingress/egress availability at the Project site.

The anticipated AM and PM peak hour traffic volumes associated with the proposed Project at the key study intersection of Euclid Street at Hazard Avenue and at the project driveways are presented in **Figure 7**. The traffic volume assignments presented in **Figure 7** reflect the traffic distribution characteristics shown in **Figure 6** and the traffic generation forecast presented in **Table 2**.

FUTURE TRAFFIC CONDITIONS

Existing Plus Project Traffic Volumes

The Existing plus Project traffic conditions have been generated based upon existing conditions and the estimated Project traffic. These forecast traffic conditions have been prepared pursuant to the City's requirement, which requires that the potential impacts of a Project be evaluated upon the circulation system, as it currently exists. This traffic volume scenario and the related analysis will identify the roadway improvements necessary to mitigate the direct traffic impacts of the Project, if any.

Figure 8 presents the projected AM and PM peak hour traffic volumes at the key study intersection and at the project driveways with the addition of the trips generated by the proposed Project to existing peak hour traffic volumes.

Year 2020 Plus Project Traffic Volumes

Horizon year, background traffic growth estimates have been calculated using an ambient growth factor. The ambient traffic growth factor is intended to include unknown and future cumulative projects in the study area, as well as account for regular growth in traffic volumes due to the development of projects outside the study area. The future growth in traffic volumes has been calculated at one percent (1.0%) per year. Applied to existing Year 2019 traffic volumes results in a one percent (1.0%) growth in existing volumes to horizon year 2020.

In order to make a realistic estimate of future on-street conditions prior to implementation of the proposed Project, the status of other known development projects (cumulative projects) in the vicinity of the proposed Project has been researched at the Cities of Santa Ana, Garden Grove and Westminster. With this information, the potential impact of the proposed Project can be evaluated within the context of the cumulative impact of all ongoing development. Based on our research, there are eighteen (18) cumulative projects in the City of Santa Ana, four (4) cumulative projects in the City of Garden Grove and one (1) cumulative project in the City of Westminster within the vicinity of the Project site that have either been built, but not yet fully occupied, or are being processed for approval. These twenty-three (23) cumulative projects have been included as part of the cumulative background setting in addition to the inclusion of an ambient traffic growth factor, which provides a conservative forecast. The locations of the twenty-three (23) cumulative projects are presented in **Figure 9**.

Table 3 provides the location and a brief description for each of the twenty-three (23) cumulative projects. **Table 4** summarizes the trip generation potential for all twenty-three (23) cumulative projects on a daily and peak hour basis for a typical weekday. As shown, the cumulative projects are expected to generate 8,303 daily trips, with 633 trips (266 inbound, 367 outbound) anticipated during the AM peak hour and 648 trips (355 inbound, 293 outbound) produced during the PM peak hour.

The AM and PM peak hour traffic volumes associated with the twenty-three (23) cumulative projects in the Year 2020 are presented in **Figure 10**. **Figure 11** presents the Year 2020 AM and PM peak hour cumulative traffic volumes at the key study intersection. **Figure 12** illustrates the Year 2020 forecast AM and PM peak hour traffic volumes at the key study intersection and at the project driveways with the inclusion of the trips generated by the proposed Project.

EXISTING PLUS PROJECT CAPACITY ANALYSIS

Table 5 summarizes the peak hour level of service results at the intersection of Euclid Street at Hazard Avenue for Existing plus Project traffic conditions. Review of column (1) of *Table 5* indicates that the intersection of Euclid Street at Hazard Avenue currently operates at unacceptable LOS E during the AM peak hour and at acceptable LOS C during the PM peak hour. Review of columns (2) and (3) of *Table 5* indicates that traffic associated with the proposed Project will significantly impact the intersection of Euclid Street at Hazard Avenue, when compared to the LOS standards and significant impact criteria specified in this report. As shown in column (4) of *Table 5*, the implementation of improvements at the impacted key study intersection completely offsets the impact of project traffic and the key study

intersection is forecast to operate at an acceptable LOS during the AM and PM peak hours.

Appendix B contains the existing and existing plus project AM peak hour and PM peak hour ICU/LOS calculation worksheets for the key study intersection.

YEAR 2020 PLUS PROJECT CAPACITY ANALYSIS

Table 6 summarizes the peak hour level of service results at the intersection of Euclid Street at Hazard Avenue for Year 2020 Cumulative plus Project traffic conditions. Review of column (2) of *Table 6* indicates that the addition of ambient traffic growth and cumulative project traffic will adversely impact the intersection of Euclid Street at Hazard Avenue. The key study intersection is forecast to continue to operate at an unacceptable LOS E during the AM peak hour and at acceptable LOS C during the PM peak hour with the addition of ambient traffic growth and cumulative project traffic.

Review of columns (3) and (4) of *Table 6* indicates that traffic associated with the proposed Project will cumulatively impact the intersection of Euclid Street at Hazard Avenue, when compared to the LOS standards and significant impact criteria specified in this report. As shown in column (5) of *Table 6*, the implementation of improvements at the impacted key study intersection completely offsets the impact of project traffic and the key study intersection is forecast to operate at an acceptable LOS during the AM and PM peak hours.

Appendix B also contains the Year 2020 AM peak hour and PM peak hour ICU/LOS calculation worksheets for the key study intersection.

INTERSECTION LEFT-TURN QUEUING ANALYSIS

This section of the letter report addresses City staff concerns regarding AM peak hour and PM peak hour left-turn stacking/storage lengths for the intersection of Euclid Street at Hazard Avenue. The queuing evaluation was conducted based on projected Year 2020 peak hour traffic volumes (without and with the proposed Project) and the Highway Capacity Manual (HCM) signalized methodology.

Table 7 presents the Year 2020 left-turn queuing analysis results for the intersection of Euclid Street at Hazard Avenue. Column (1) presents Year 2020 Cumulative traffic conditions and column (2) presents Year 2020 Cumulative plus Project traffic conditions. Column (3) presents Year 2020 Cumulative plus Project with improvements traffic conditions. It should be noted that the storage provided shown in *Table 7* is based on the formally striped left-turn pocket. However, the effective

storage is much longer given that each striped left-turn lane continues into a two-way-left-turn-lane. Review of *Table 7* shows that based on the effective storage, adequate storage is provided to satisfy the Year 2020 plus Project 95th percentile queues for all four (4) left-turn lanes at the intersection of Euclid Street at Hazard Avenue.

Figure 13 graphically illustrates the results of the intersection left-turn queuing analysis for the intersection of Euclid Street at Hazard Avenue. As shown, the 95th percentile queues can be accommodated within the effective left-turn pocket storage, which includes the two-way-left-turn lanes.

Appendix C contains the Year 2020 AM peak hour and PM peak hour HCM/LOS calculation worksheets for the key study intersection.

SITE ACCESS ANALYSIS

Table 8 summarizes the levels of service at the two (2) Project driveways for Year 2020 Cumulative plus Project traffic conditions. The operations analysis for the two (2) Project driveways is based on the *Highway Capacity Manual 6* (HCM 6) Method of Analysis for unsignalized intersections. Review of *Table 8* shows that the two (2) Project driveways are forecast to operate at acceptable LOS D or better during the AM and PM peak hours under Year 2020 Cumulative plus Project traffic conditions. As such, project access will be adequate. Motorists entering and exiting the Project site will be able to do so comfortably, safely, and without undue congestion.

Appendix D contains the Year 2020 AM peak hour and PM peak hour HCM/LOS calculation worksheets for the project driveways.

RECOMMENDED IMPROVEMENTS

The following improvements are recommended to offset the proposed Project's Existing plus Project and Year 2020 Cumulative plus Project impact at the intersection of Euclid Street/Hazard Avenue.

- **No. 1 – Euclid Street at Hazard Avenue:** Restripe Hazard Avenue to provide an exclusive eastbound right-turn lane. Modify the existing traffic signal, if necessary. The installation of this improvement is subject to the approval of the City of Santa Ana.

Figure 14 graphically illustrates the recommended improvements for Existing plus Project and Year 2020 Cumulative plus Project traffic conditions at the intersection of Euclid Street/Hazard Avenue.

The proposed Project can be expected to pay a proportional “fair-share” of the improvement costs of the cumulatively impacted intersection to mitigate the project’s traffic impacts. **Table 9** presents the percentage of net traffic impact at the study intersection cumulatively impacted by the proposed Project for Year 2020 traffic conditions. As presented in this table, the first column (1) presents a total of all intersection peak hour movements for existing traffic conditions. The second column (2) presents Project only traffic conditions. The third column (3) presents future Year 2020 traffic conditions with Project traffic. The fourth column (4) represents what percentage of total intersection peak hour traffic is Project-related traffic.

Review of *Table 9* shows that the Project’s fair share contribution towards the intersection of Euclid Street/Hazard Avenue totals **35.0%**.

CONCLUSIONS

- The proposed Project site is located at 813 N. Euclid Street in the City of Santa Ana, California. The project site is currently vacant. The proposed Project will consist of a gas station with eight (8) vehicle fueling positions and a 3,045 SF convenience market. The proposed Project is anticipated to be completed in the Year 2020. Access to the project site will be provided via one right-turn in/right-turn out only driveway located along Euclid Street and via one left-turn in/right-turn in/right-turn out only driveway located along Hazard Avenue.
- The proposed Project is forecast to generate 1,935 daily trips, with 62 trips (31 inbound, 31 outbound) produced in the AM peak hour and 62 trips (31 inbound, 31 outbound) produced in the PM peak hour on a “typical” weekday.
- The twenty-three (23) cumulative projects are expected to generate 8,303 daily trips, with 633 trips (266 inbound, 367 outbound) anticipated during the AM peak hour and 648 trips (355 inbound, 293 outbound) produced during the PM peak hour.
- The proposed Project will significantly impact the intersection of Euclid Street at Hazard Avenue under Existing plus Project traffic conditions. The implementation of improvements at the impacted key study intersection completely offsets the impact of project traffic and the key study intersection is forecast to operate at an acceptable LOS during the AM and PM peak hours.
- The proposed Project will cumulatively impact the intersection of Euclid Street at Hazard Avenue under Year 2020 Cumulative plus Project traffic conditions. The implementation of improvements at the impacted key study intersection

completely offsets the impact of project traffic and the key study intersection is forecast to operate at an acceptable LOS during the AM and PM peak hours.

- Based on the effective storage, adequate storage is provided to satisfy the Year 2020 plus Project 95th percentile queues for the four (4) left-turn lanes at the intersection of Euclid Street at Hazard Avenue.
- The two (2) Project driveways are forecast to operate at acceptable LOS D or better during the AM and PM peak hours under Year 2020 Cumulative plus Project traffic conditions. As such, project access will be adequate. Motorists entering and exiting the Project site will be able to do so comfortably, safely, and without undue congestion.
- The following improvements are recommended to offset the proposed Project's Existing plus Project and Year 2020 Cumulative plus Project impact at the intersection of Euclid Street/Hazard Avenue.
 - **No. 1 – Euclid Street at Hazard Avenue:** Restripe Hazard Avenue to provide an exclusive eastbound right-turn lane. Modify the existing traffic signal, if necessary. The installation of this improvement is subject to the approval of the City of Santa Ana. The Project's fair share contribution towards the intersection of Euclid Street/Hazard Avenue totals **35.0%**.

TABLE 1
LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS¹
813 N. EUCLID STREET GAS STATION PROJECT, SANTA ANA

Level of Service (LOS)	Intersection Capacity Utilization Value (V/C)	Level of Service Description
A	≤ 0.60	EXCELLENT. No vehicle waits longer than one red light, and no approach phase is fully used.
B	0.61 – 0.70	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.71 – 0.80	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.81 – 0.90	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.91 – 1.00	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.00	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Potentially very long delays with continuously increasing queue lengths.

YEAR 2020 PEAK HOUR INTERSECTION LEFT-TURN QUEUING ANALYSIS⁶
813 N. EUCLID STREET GAS STATION PROJECT, SANTA ANA

Key Study Intersection	Storage Provided (ft.)	(1) Year 2020 Cumulative Traffic Conditions				(2) Year 2020 Cumulative Plus Project Traffic Conditions				(3) Year 2020 Cumulative Plus Project With Improvements Traffic Conditions			
		AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
		Max. Queue	Adequate Storage (ft.)	Max Queue	Adequate Storage (ft.)	Max. Queue	Adequate Storage (ft.)	Max. Queue	Adequate Storage (ft.)	Max. Queue	Adequate Storage (ft.)	Max. Queue	Adequate Storage (ft.)
1. Euclid Street at Hazard Avenue													
▪ Northbound Left-Turn	150' [a]	283'	Yes	213'	Yes	330'	Yes	252'	Yes	306'	Yes	252'	Yes
▪ Southbound Left-Turn	170' [a]	133'	Yes	106'	Yes	203'	Yes	144'	Yes	172'	Yes	135'	Yes
▪ Eastbound Left-Turn	100' [a]	227'	Yes	182'	Yes	232'	Yes	183'	Yes	226'	Yes	181'	Yes
▪ Westbound Left-Turn	70' [a]	155'	Yes	49'	Yes	218'	Yes	50'	Yes	103'	Yes	43'	Yes

Notes:

[a] = The storage shown is only for the striped left-turn pocket. However, the effective storage is much longer given that the striped left-turn lane continues into a two-way-left-turn-lane.

⁶ Queue is based on the 95th Percentile Queue and is reported in total queue length (feet) per lane for signalized intersections.

TABLE 8
PROJECT DRIVEWAY LEVELS OF SERVICE SUMMARY
813 N. EUCLID STREET GAS STATION PROJECT, SANTA ANA
