## Executive Summary

Fugro was contracted by the Metropolitan Transportation Commission (MTC) of the San Francisco Bay Area for their Pavement Management Technical Assistant Program (P-TAP), Round 20 to provide an update to the City of Sonoma's Pavement Management Program (PMP). This Final Report provides information with regards to network level pavement repair options, budget analysis with annual and multi-year programming, impact of varying levels of budgets, and cost-effective pavement repair recommendations. The primary purpose of this report is to assist jurisdictions to update their Maintenance & Rehabilitation (M&R) programs utilizing the StreetSaver Pavement Management System (PMS).

The City of Sonoma (City) has a StreetSaver pavement management system (PMS) consisting of approximately 34 centerline miles of paved roadways. Prior to data collection, Fugro provided a Quality Management Report (QMR) to the City. The QMR detailed all quality assurance/quality control (QA/QC) steps taken by Fugro to ensure high quality pavement distress data for analysis and reporting. The City's approved QMR is presented in Appendix A of this Final Report. In July 2019, Fugro conducted distress surveys for the network using the modified ASTM D6433 (MTC StreetSaver distresses) standard. The distress data was entered into StreetSaver to calculate the Pavement Condition Index (PCI) for each section as well as the overall network. The PCI is an index ranging from 0 (very poor pavement) to 100 (new pavement). The overall network PCI from the last P-TAP inspection was 74 (as of October 14, 2017). The overall network PCI after Fugro's recent inspection was 72 (as of July 25, 2019).

After data collection, Fugro developed a Budget Options Report (BOR) for the City. The BOR documented the City's budget assumptions, interest and inflation rates, assessed decision trees, and unit costs updates and provided a multi-year network level M&R work plan.

After discussions with the City, Fugro developed several "what-if" analyses using StreetSaver's budget scenario module. This allowed us to evaluate the impacts of various budget scenarios on PCI, deferred maintenance (unfunded backlog), and average remaining service life of the network. The following scenarios were evaluated and presented:

- Scenario 1: No Funds (Do Nothing)
- Scenario 2: Expected Annual Budget
- Scenario 3: Maintain Current PCI
- Scenario 4: Improve PCI by 5
- Scenario 5: Budget Needs Average

For the City's current level of investment (i.e., Scenario 2), the City has indicated that the expected budget will be \$500,000 for each year (25% is preventive maintenance) for a total of \$2.5 million over five years. The results showed that by 2024 the deferred maintenance would increase from \$7.1 million to \$10.2 million and the overall PCI would decrease to 69.

Fugro recommended the City invest in maintaining its current PCI (i.e., Scenario 3) of 72. The budgets would be the following:

- Year 1 - \$500,000
- Year 2 - \$725,000
- Year 3 - \$725,000
- Year 4 - \$900,000
- Year 5 - \$1,000,000
- Total for five years - \$3,850,000

This scenario aimed to ensure that the overall pavement network PCI did not drop below the current PCI of 72 and slowed the growth of the deferred maintenance over the next five years. A total of \$3.85 million would be required; of which 75% would be allocated to rehabilitation treatments. The deferred maintenance would increase from \$7.1 million to \$9.2 million in 2024.

Fugro also recommended that the City fully fund its preventive maintenance program. The City's pavement maintenance strategies include slurry and crack seals. Since a large percentage of pavements are in "Good" to "Very Good" condition, it is important to preserve these pavements. For preventive maintenance, the City should continue to utilize cost effective treatments where appropriate such as slurry seals and crack seals. Crack sealing is relatively inexpensive and can keep moisture out of pavements and prevent the underlying aggregate base from premature failures. Life-extending surface seals such as slurry seals are also cost-effective for pavements currently in "Good" to "Very Good" condition. As MTC has stated preventive maintenance is where the City will get the most from its money.

## Background

In July 2019, Fugro performed pavement condition distress surveys for the City's entire network based on MTC's distress definitions and descriptions published in "Pavement Condition Index Distress Identification Manual for Flexible Pavements," 4th Edition, March 2016, and the "Pavement Condition Index Distress Identification Manual for Rigid Pavements," 3rd Edition, March 2016. The City maintains approximately 33.85 centerline miles of paved roadways. Table 1 shows the breakdown of the entire network by functional class.

*Table 1. Network Summary Statistics.*

Functional Class	Sections	Center Miles	Lane Miles	Total Area (square feet)	% of the Entire Network (by Pavement Area)
Arterial	34	5.13	10.81	1,060,472	17.5%
Collector	48	6.51	13.02	1,180,217	19.5%
Residential/Local	218	22.21	44.48	3,807,281	63.0%
<b>Total</b>	<b>300</b>	<b>33.85</b>	<b>68.31</b>	<b>6,047,970</b>	<b>100.0%</b>

The City uses a software called StreetSaver ([www.streetsaver.com](http://www.streetsaver.com)) developed by MTC to inventory streets, assess and forecast pavement condition, record M&R activities, evaluate budget needs, evaluate impacts of funding on network wide pavement condition overtime. This software is used to update the City's Pavement Management Program (PMP) periodically.

## Pavement Management Program (PMP)

Pavement structures represent one of the largest capital investments for any jurisdiction. Maintaining and operating pavements on a citywide system involves complex decisions about how and when to resurface or apply treatments to keep the pavement performance and operating costs at reasonable levels.

A properly designed pavement management program provides managers of a pavement network the tools necessary for making consistent, cost-effective, and defensible decisions to preserve their pavement network. The timing of pavement maintenance is critical, as the maintenance cost increases exponentially with time. A pavement management program can be utilized to conduct "responsive" preventive maintenance to maintain a reasonable level of service (i.e., road quality) at all times. There has been extensive research in the area of pavement management since the 1970's. Some of the research findings are:

- Pavement Deterioration – Pavements tend to deteriorate very slowly during the first few years after placement and very rapidly when they are aged. Even though pavement designs and materials varied widely, the deterioration of pavements follow a standard curve as shown in Figure 1. Pavement Condition Index (PCI) is an index that is "100" for a brand new pavement with no distress and reduces to "0" for a pavement that has failed.
- Costly Maintenance Practices – Typically, state and local governments invest more funds for maintaining pavements than for any other public purpose. While much of this is due to the high

cost of repairs and heavy usage of the public pavements, there is strong evidence that some of the high operating costs originate from inappropriate or poorly timed maintenance decisions.

- Preserve vs. Reconstruct – Successive years of collecting pavement condition data shows that it is far more economical to preserve roads than to delay repairs and reconstruct roads. In addition, as traffic levels increases the costs of delaying repair work increases greatly. Typically, the cost of maintenance is 10-15% of the expected cost to repair the ultimate failure that will occur without the application of maintenance activities. For example, national data indicate that every \$1 spent on maintaining the pavement surface saves \$5 on major rehabilitation that will be required if the maintenance activities are not conducted.

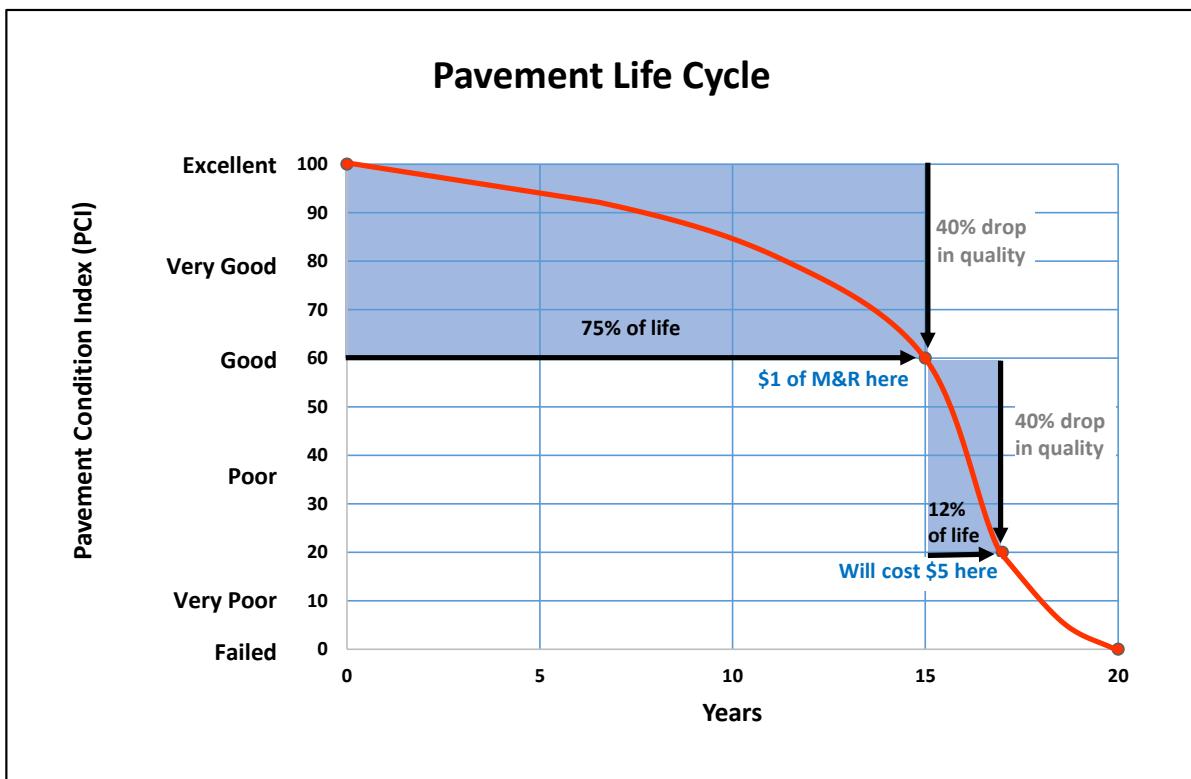

Figure 1. Effect of Treatment Timing on Costs.

## Network Level Analysis

This final report examines the overall PCI condition of the entire network and provides recommendations to improving the current network level PCI. These recommendations are developed by conducting various budget and/or target driven scenarios. By varying the budget amounts available for pavement M&R, the impact of the different funding strategies can be shown on the City's network overtime (i.e., 5 years). Although this report will provide a 5 year street and road repair program, the PMP should be reassessed on an annual basis due to unforeseen funding events.

In addition, recommendations provided in this report are for network level budgeting and planning purposes. The treatments that are assigned to sections of the City network are based on a decision tree.

When a project has been selected by the City, engineering judgment and project level analysis should be applied to ensure that the treatment is appropriate and cost effective for the section. This can include revisiting and reevaluating the visual distress ratings, coring and deflectometer tests to establish underlying structural problems, etc.

## Terminology

**Pavement Condition Index** or PCI is a measurement of the pavement network condition and ranges from 0 – 100. A newly constructed street would have a PCI of 100, while a failed street would have a PCI of 25 or less. The PCI is calculated based on pavement distresses identified in the field from a visual survey as per MTC's most current distress manuals.

**Unit costs** in StreetSaver are the treatment cost per linear foot or square yard. As a minimum the unit cost should be based on local and regional bids. In addition, the unit cost should take into account items such as material costs, labor costs to do repair, rental equipment cost related to the project, pavement striping costs, repair of curbs and gutters, staff costs, project design costs, construction engineering costs, mobilization costs, etc.

**Decision tree** in StreetSaver lists all the treatments and corresponding unit costs that are utilized by the jurisdiction. It also assigns an appropriate M&R strategy to a section based on its functional classification, surface type, and condition category. It is important to utilize the City's or regional information to match the City's repair strategies.

**Deferred maintenance** or unfunded backlog consists of pavement maintenance that is needed, but it cannot be performed due to lack of funding. Shrinking budgets have forced many agencies to defer much needed street maintenance.

**Preventive maintenance program** is a schedule of cost-effective planned maintenance actions aimed at the prevention of failure of the City's network. The purpose of preventive maintenance is to extend the service life of a street by detecting, precluding and mitigating any degradation of a street section. If preventive maintenance work is done correctly and in a timely manner, the service life of a street can be greatly extended. In StreetSaver, preventive maintenance primarily includes surface treatments such as slurry seals, chip seals or crack seals that are applied to pavements in "Good" condition or above. This strategy focuses on cost effective treatments on good roads to maintain their condition and serviceability throughout their lifespan.

## Pavement Condition

### Network Replacement Value

It is important to consider the overall investment the City has in its pavements. The cost to reconstruct all streets (full replacement of the pavement, base, and structure of the streets) is over \$72.2 million.

### Historical Network PCI

Figure 2 shows the overall network PCI between 2010 and 2019. The PCI values are a combination of field inspected values from surveys and values from the StreetSaver modeling. Figure 2 shows that the average network PCI for the City has fluctuated between 68 and 75 from 2010 to 2019. In addition, the Sonoma County average PCI is also shown.

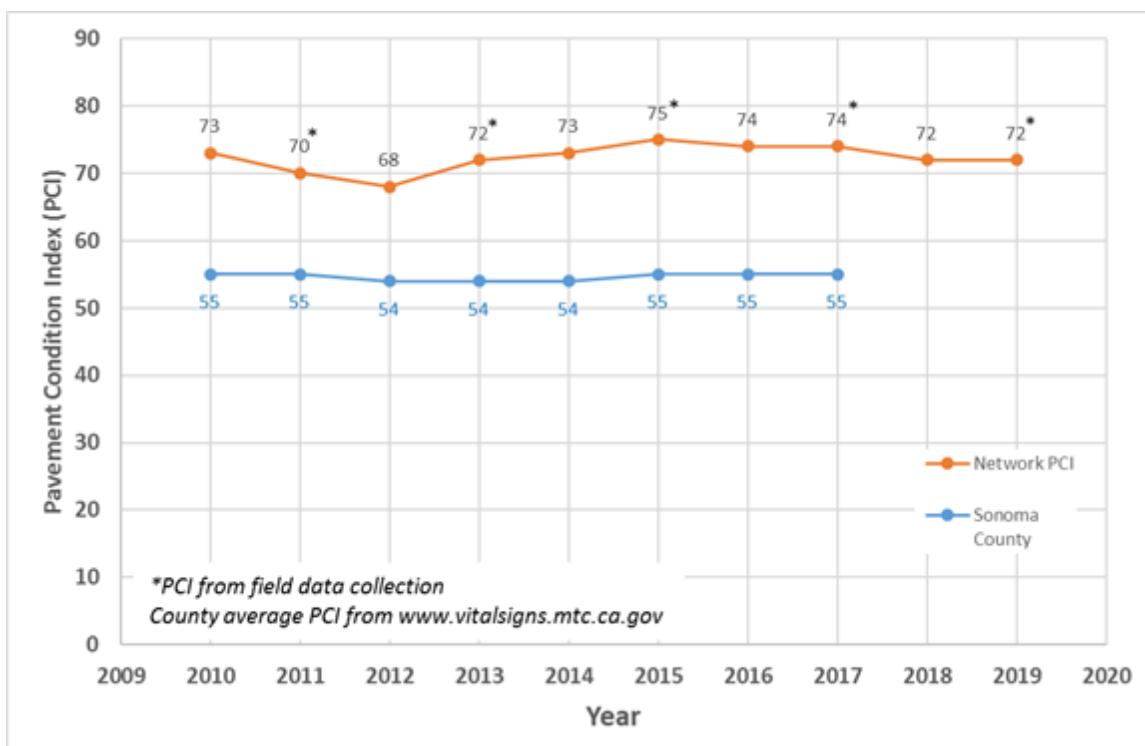

Figure 2. Historical Network PCI from 2010 to 2019.

## Current Overall Network PCI

The overall network PCI is 72 as of July 25, 2019. Appendix B provides the section inventory as well as the PCI for each section. Please note that these values are projected and area-weighted calculations from StreetSaver. Figure 3 shows the five pavement condition categories and PCI breakpoints, which are critical decision points at which different treatments would be applied to the pavement sections by functional class and surface types.

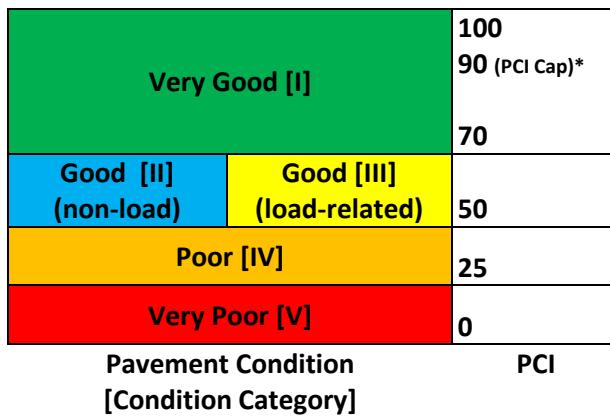

Figure 3. Pavement Condition Categories by PCI.

Table 2 shows the City's PCI per functional class. The overall network PCI is in the MTC designated "Very Good" pavement condition. All functional classes are in the MTC designated "Very Good" pavement condition as well.

Table 2. PCI per Functional Class.

Functional Class	Sections	Centerline Miles	Lane Miles	PCI <sup>[1]</sup>	Pavement Condition
Arterial	34	5.13	10.81	74	Very Good
Collector	48	6.51	13.02	76	Very Good
Residential	218	22.21	44.48	70	Very Good
Total	300	33.85	68.31	72	Very Good

<sup>[1]</sup> As of 7/25/2019.

Figure 4 shows the centerline miles by pavement condition. Around 65% of the centerline miles are "Excellent" or "Very Good" pavement condition categories (between PCI 100-70), 23% of the centerline miles are in the "Good" pavement condition category (between PCI 69-50), and 12% of the centerline miles are in the "Poor" or "Very Poor/Failed" pavement condition categories (between PCI 49-0).

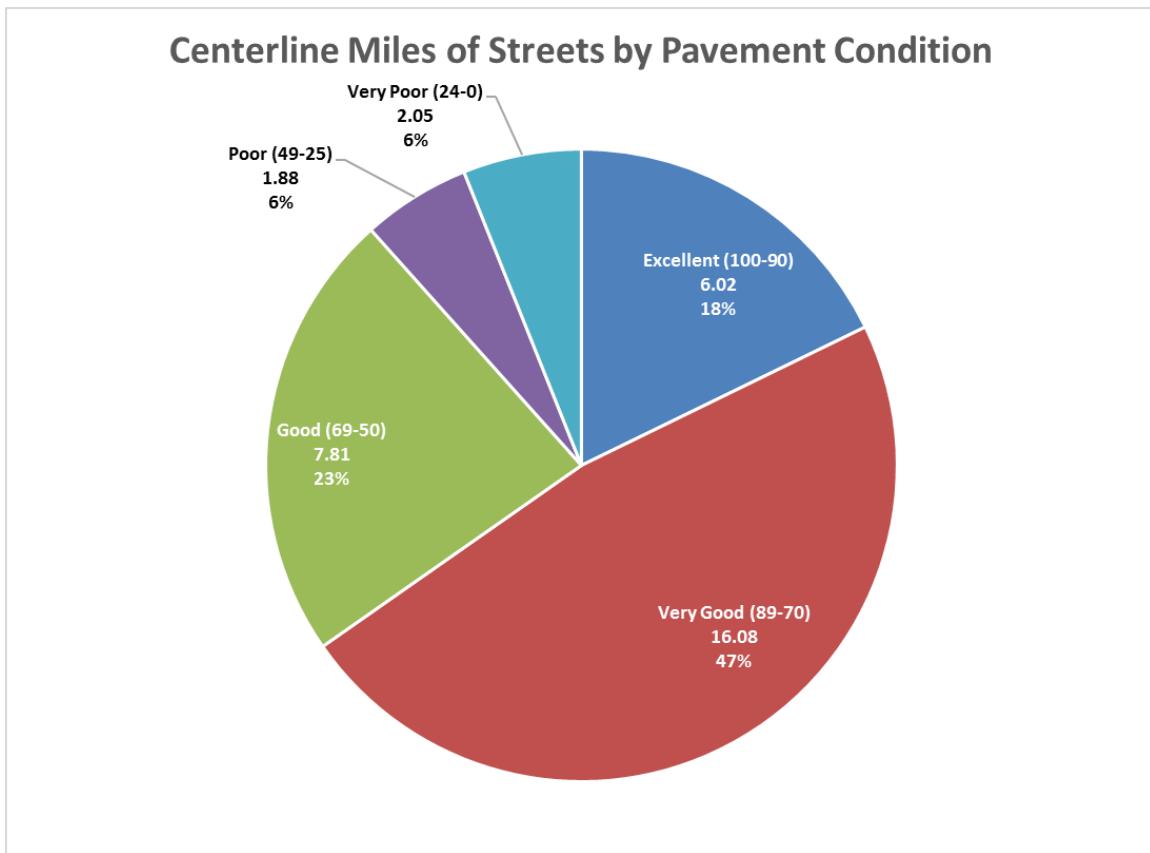

Figure 4. Centerline Miles of Streets by Pavement Condition.

## Budget Needs

### Maintenance Strategies

Table 3 shows the City's maintenance strategy for arterials as shown in its decision tree. Surface treatments, such as crack and slurry seals, have usually been utilized as a preventive maintenance technique when the pavements are in "Very Good" condition or above. As the pavement condition deteriorates, asphalt concrete (AC) overlays are applied. For pavements in very poor condition, reconstruction is considered. The City's decision trees for each functional class are provided in Appendix C.

Table 3. Maintenance Strategy for Arterial Functional Class.

Pavement Condition	PCI Range	Typical Maintenance Treatment
Excellent	100-90	Do Nothing
Very Good	89-70	Seal Cracks, Slurry Seal
Good	69-50	Crack Seal and Slurry Seal, Edge Grind & 2 Inch Overlay with Fabric
Poor	49-25	3 Inch Overlay with Fabric and 33% Digout
Very Poor	0-24	Reconstruct Structure (AC)

## Budget Needs Analysis (Unconstrained)

Based on the City's M&R decision tree and the PCIs of the sections, StreetSaver selected a maintenance or rehabilitation action and computed the total costs over a period of five years. The budget needs analysis represents the "ideal world" or unconstrained funding levels. An interest rate of 3% and an inflation factor of 3% were used to project the costs for the next five years. The summary results from the analysis are shown in Table 4 and the details are presented in Appendix D.

*Table 4. Budget Needs Project PCI and Cost Summary.*

	Year					Total Cost
	2020	2021	2022	2023	2024	
<b>PCI Treated</b>	84	84	85	84	84	
<b>PCI Untreated</b>	71	69	67	65	63	
<b>Preventive Cost</b>	\$542,933	\$130,488	\$241,324	\$76,104	\$161,172	\$1,152,021
<b>Rehab Cost</b>	\$7,058,541	\$1,823,183	\$1,995,568	\$507,551	\$1,063,104	\$12,447,947
<b>Total Cost</b>	\$7,601,474	\$1,953,671	\$2,236,892	\$583,655	\$1,224,276	\$13,599,968

If the City followed the maintenance and rehabilitation strategies recommended by the program and had unconstrained funding, the average network PCI will increase to 84 by the end of year 2024. If, however, no maintenance or rehabilitation occurred in the next five years, the average network PCI would deteriorate to 63 by the end of year 2024.

With respect to the unconstrained funding, \$13.6 million in maintenance and rehabilitation was needed. Approximately \$1.2 million (9%) was allocated to preventive maintenance treatments while the majority of the funding, \$12.4 million, was allocated to the more costly rehabilitation or reconstruction treatments.

## Budget Scenarios & Results

Based on the unconstrained analysis and input from the City, Fugro developed several "what-if" analyses using StreetSaver's budget scenario module. This allows us to evaluate the impacts of various budget "scenarios" on PCI, deferred maintenance (unfunded backlog), and average remaining service life of the network. The budget scenario analyses have weighting factors that modify the prioritization process in StreetSaver. Arterials are given the highest weighting factor followed by collectors and then residential and locals. Please note that for the scenarios 1) excess rehabilitation funds are added to preventive maintenance funds and 2) stop gap funds are not taken from preventive maintenance funds, and 3) surplus preventive maintenance funds are limited. The following scenarios were evaluated.

### Scenario 1: No Funds (Do Nothing)

This scenario shows the overall network PCI over five years if no funds are available and no work is performed. The result shows that by 2024 the deferred maintenance increases from \$7.6 million to \$12.7 million and the overall PCI will decrease to 63 as shown in Figure 5. All detailed reports are provided in Appendix E.

## Scenario 2: Expected Annual Budget

The City has indicated that the expected budget will be \$500,000 for each year (25% is preventive maintenance) for a total of \$2.5 million over five years. The result shows that by 2024 the deferred maintenance increase from \$7.1 million to \$10.2 million and the overall PCI will decrease to 69 as shown in Figure 5. All detailed reports are provided in Appendix F.

## Scenario 3: Maintain Current PCI

This scenario aims to ensure that the overall pavement network PCI does not drop below the current PCI of 72 over the next five years. A total of \$3.85 million will be required; of which 75% will be allocated to rehabilitation treatments. The deferred maintenance will increase from \$7.1 million to \$9.2 million in 2024 as shown in Figure 5. All detailed reports are provided in Appendix G.

## Scenario 4: Improve PCI by 5

This scenario aims to ensure that the overall pavement network PCI will improve 5 points to 77 over five years. A total of \$8 million is required and the deferred maintenance will decrease from \$6.6 million to \$5.9 million in 2024 as shown in Figure 5. All detailed reports are provided in Appendix H.

## Scenario 5: Budget Needs Average

This scenario is the Budget Needs total budget of \$11,760,588 equally distributed over five years, i.e., \$2,352,118 per year. The deferred maintenance will decrease from \$4.9 million to \$0.58 million by 2024 and the PCI will increase to 84 as shown in Figure 5. All detailed reports are provided in Appendix I.

## Pavement Condition Changes Based on Budget Scenarios

Figure 6 shows what the pavement condition of the City will be in 2024 based on the different budget scenarios. The greatest expenses that the City would foresee are in the “Poor” and “Very Poor” pavement condition categories because these would likely require reconstruction. For the purposes of this discussion, Fugro is highlighting the differences seen in the “Poor” and “Very Poor” pavement condition categories for each scenario.

In Figure 6, if no treatments were performed (i.e., Scenario 1 – No Funds), the “Poor” pavement condition would increase approximately 5% from 4.7% to 10.1% when compared to the current condition. The “Very Poor” pavement condition would increase approximately 3% from 5.5% to 8.2%. For Scenario 2 – Expected Annual Budget, the “Poor” would increase approximately 4% from 4.7% to 8.8%. The “Very Poor” pavement condition would increase approximately 3% from 5.5% to 8.3%. For Scenario 3 – Maintain Current PCI, the “Poor” would increase approximately 2% from 4.7% to 7.0%. The “Very Poor” pavement condition would increase approximately 3% from 5.5% to 8.2%. For Scenario 4 – Increase PCI by 5, the “Poor” would decrease approximately 3% from 4.7% to 2.2%. The “Very Poor” pavement condition would increase approximately 2% from 5.5% to 7.6%. For Scenario 5 – Budget Needs Average, the “Poor” would decrease approximately 4% from 4.7% to 1.2%. The “Very Poor” pavement condition would decrease approximately 5% from 5.5% to 0.7%.

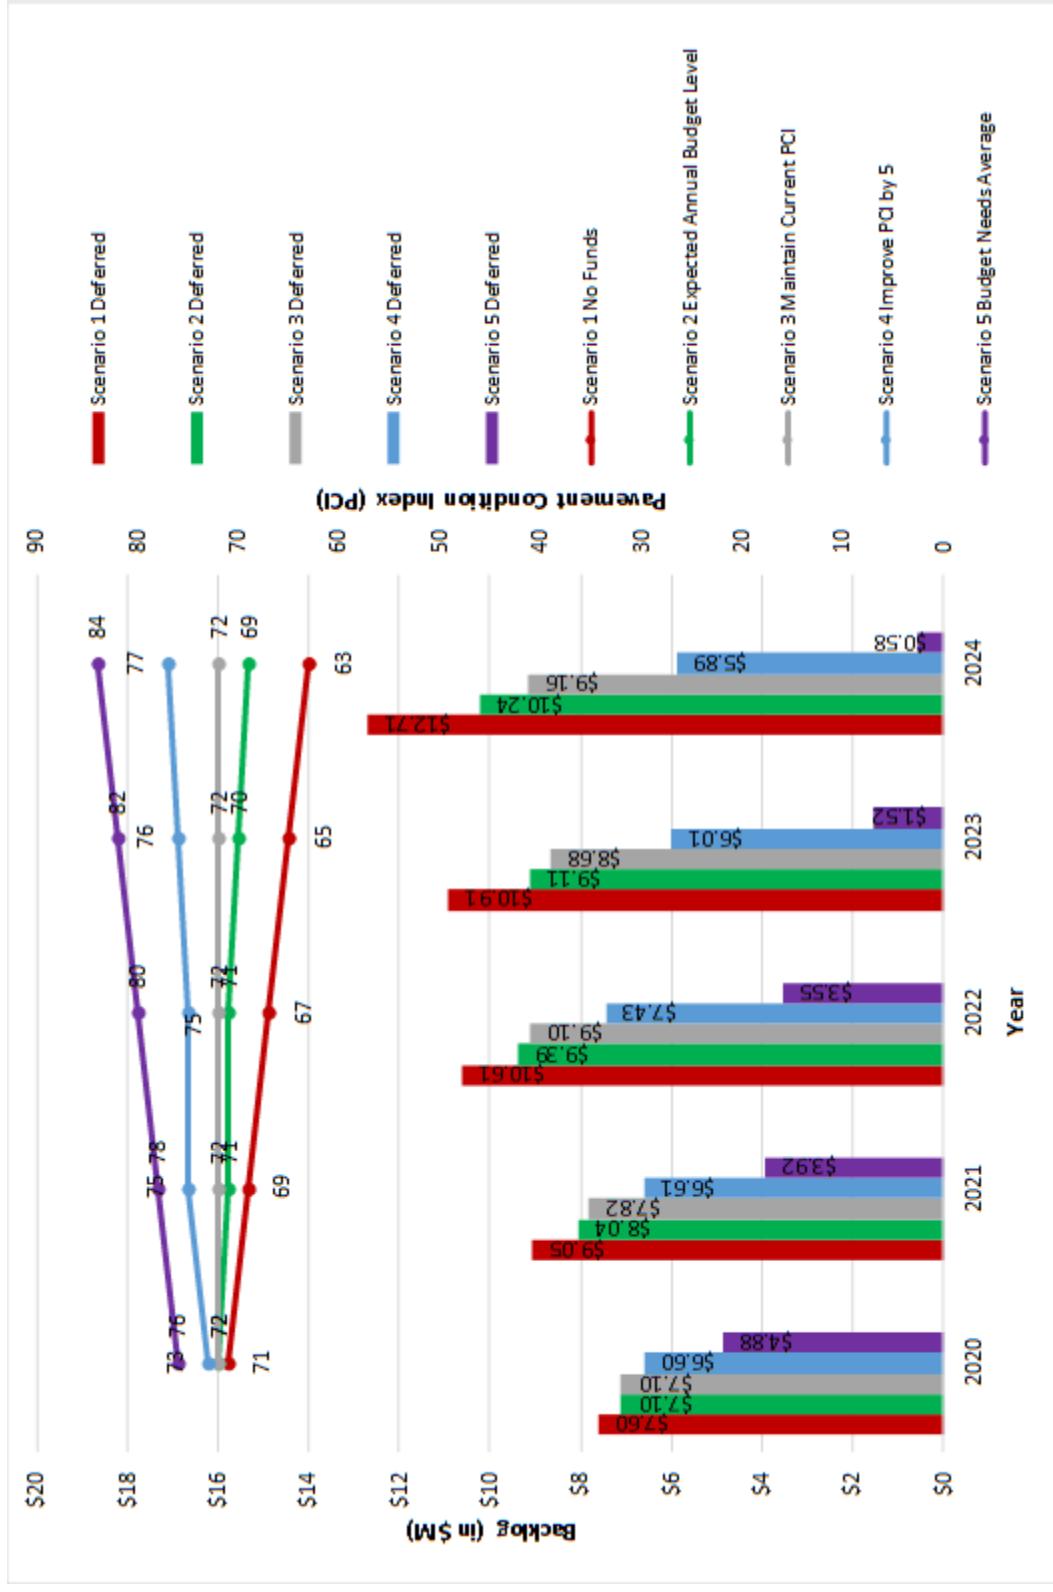

Figure 5. Scenario Breakdown of PCI and Deferred Maintenance for 2020 to 2024.

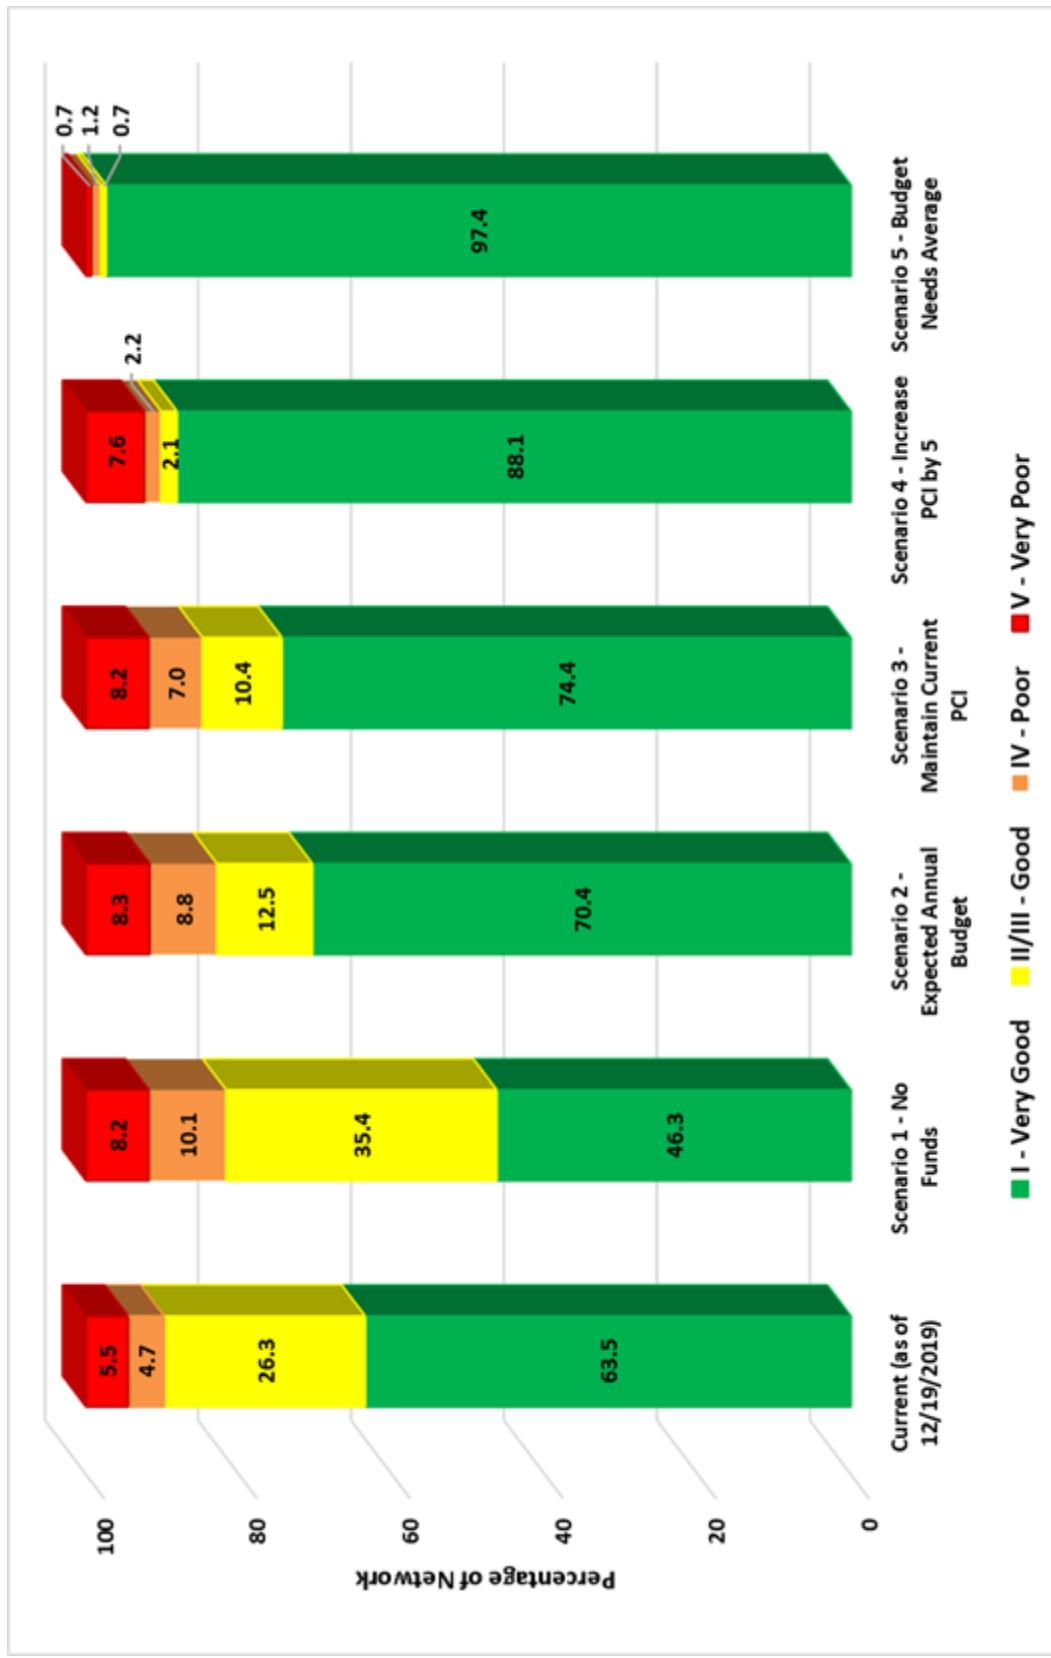

Figure 6. Pavement Condition for Each Scenario in 2024.

## PCI Maps

Appendix J presents PCI maps for the following conditions: Current, Scenario 1: No Funds (Do Nothing), Scenario 2: Expected Annual Budget, Scenario 3: Maintain Current PCI, Scenario 4: Improve PCI by 5, and Scenario 5: Budget Needs Average.

## Recommendations

The City has a substantial investment of \$72.2 million in their pavement network of 33.85 centerline miles. The City's overall network PCI is 72 (as of 7/25/2019), which is "Very Good" in the MTC pavement condition categories. Approximately 88% of the network is "Excellent", "Very Good" or "Good" and 12% is "Poor" and "Very Poor." The budget needs analysis indicated that the City would have to spend approximately \$13.6 million in M&R over the next five years to basically repair all streets. This is the ideal situation where all streets are in "Very Good" or "Good" condition and just need regular preventive maintenance. For this report, Fugro has evaluated and presented several scenarios for the City to consider.

## Budget

Based on the PCI (i.e., 72 and "Very Good" condition) and slowing the growth of the deferred maintenance (unfunded backlog), Fugro recommends Scenario 3 – Maintain Current PCI. This scenario has a total budget of \$3.85 million over five years. The breakdown is \$500,000 for year 1, \$725,000 for years 2 and 3, \$900,000 for year 4, and \$1 million for year 5. There is also 25% preventive maintenance each year. The PCI will remain at 72 and the deferred maintenance will increase from \$7.1 million to \$9.2 million.

## Pavement Maintenance Strategies

The City's pavement maintenance strategies include slurry seals and crack seals. Since a large percentage of pavements are in "Good" to "Very Good" condition, it is important to preserve these pavements. For preventive maintenance, the City should continue to utilize cost effective treatments where appropriate such as slurry seals and crack seals. Crack sealing is relatively inexpensive and can keep moisture out of pavements and prevent the underlying aggregate base from premature failures. Life-extending surface seals such as slurry seals are also cost-effective for pavements currently in "Good" to "Very Good" condition. Fugro recommends that the City fully fund its preventive maintenance program. This is necessary to at least maintain the portion of the road network that is in "Very Good" condition and avoid increasing the deferred maintenance. As MTC has stated preventive maintenance is where the City will get the most from its money. If there is a funding shortfall, Fugro recommends that priority be given to arterials before collectors and collectors before residential roads. Fugro also recommends evaluating emerging cost effective techniques like rubberized chip seals, thin- bonded wearing courses and rubberized overlays.

## Re-inspection

Fugro recommends that the City continue to maintain its pavement management program to be eligible for grants and state gas tax funding. Per MTC requirements, pavement sections for arterial and collector streets should be re-inspected every two years and residential streets should be re-inspected every five years. The costs for the re-inspection should be included in the annual pavement management budget.

## StreetSaver Updates

Fugro has the following recommendations regarding StreetSaver:

- Review and update decision tree M&R strategies annually.
- Review and update decision tree unit costs annually to reflect new construction bid costs and ensure the budget analysis is more accurate. For example, asphalt prices have been volatile in the past. If asphalt prices change drastically, it could affect the number of projects the City can build.
- Update the pavement network when streets are annexed or newly constructed including GIS shape files.
- Enter in M&R activities annually, which will help the City track performance of past treatment strategies to determine their effectiveness.

## Executive Summary

Fugro is pleased to provide this Quality Management Report (QMR) to the City of Sonoma as part of its activities under a contract with the Metropolitan Transportation Commission (MTC) of San Francisco Bay Area for their Pavement Management Technical Assistant Program (P-TAP), Round 20. This QMR provides detailed information with regards to all quality assurance/quality control (QA/QC) steps taken by Fugro per the QA/QC plan submitted to the City in June of 2019 and prior to its pavement condition survey and StreetSaver database update.

The City of Sonoma has a StreetSaver pavement management system (PMS) consisting of approximately 33.79 centerline miles of paved roadways. The City's PMS was last inventoried and updated as part of the P-TAP Round 18. Fugro performed the pavement conditions distress surveys in July 2019. The overall network PCI before inspection was 71 on July 21, 2019. The overall PCI after Fugro's inspection was 72.

The City's PMS database consists of information related to its roadway assets including street sections, names, geometrics, pavement types, maintenance & rehabilitation activities, and pavement distress survey data. During the distress survey activities, Fugro performed distress survey inspections on all streets listed on the City's database. A minimum of 10% of the entire street section area was inspected using the MTC representative sampling method for street inspections. All inspections were entered into a handheld device with MobileRater software, which was developed by MTC/StreetSaver. This software allowed Fugro to download the most current City database, collect the proper number of inspection units, and increase the efficiency of the data collection process.

During Fugro's distress survey inspections, Fugro randomly re-inspected at least 5 percent of the sections previously inspected by a Fugro survey team. These re-inspections were performed by a distress certified supervisor. For all re-inspections, the PCI score for the original inspection was compared to the PCI score for the re-inspection. The goal was for the PCI scores for each street section to be within the following tolerances:

- 50% of the re-inspections will be within  $\pm$  five (5) PCI points of the original inspections.
- No more than 12% of the re-inspections will be more than fifteen (15) PCI points different from the original inspections. All sections with a difference greater than 15 PCI points will be reviewed further to determine sources of discrepancy.

Table 1 presents a summary of the re-inspection results. For the City, all criteria were met.

*Table 1. Re-Inspection Results by Survey Team.*

PCI Difference	Number of Re-Inspection Sections	Number Meeting Goal	Percentage Meeting Goal	Goal
Within $\pm$ 5	15	14	93%	At least 50%
Greater than $\pm$ 15	15	0	0%	Less than 12%

During Fugro's distress survey inspections, Fugro randomly re-inspected at least 5 percent of the sections to be inspected by a supervisor. For all re-inspections, the PCI score for the original inspection was compared to the PCI score for the re-inspection. The goal was for the PCI scores for each street section to be within the following tolerances:

- 50% of the re-inspections will be within  $\pm$  five (5) PCI points of the original inspections.
- No more than 12% of the re-inspections will be more than fifteen (15) PCI points different from the original inspections. All sections with a difference greater than 15 PCI points will be reviewed further to determine sources of discrepancy.

Table 2 presents a summary of the re-inspection results. For the City, all criteria were met.

*Table 2. Re-Inspection Results by Supervisor.*

PCI Difference	Number of Re-Inspection Sections	Number Meeting Goal	Percentage Meeting Goal	Goal
Within $\pm$ 5	16	16	100%	At least 50%
Greater than $\pm$ 15	16	0	0%	Less than 12%

Fugro investigated any section with a PCI variance of greater than 15 points to determine the source of the large variance. It was found that 12 sections had a PCI variance over 15 points. Among those 12 sections, 9 sections had a PCI increase of over 15 points. Sections may have had M&R activities not updated into the StreetSaver (i.e., 2016 to 2018 activities). Among those 12 sections, 3 sections had a PCI decrease of over 15 points due to significantly more distresses being present than was recorded at the previous inspection (2017).

## 1.0 Quality Management Approach

Fugro was tasked with the StreetSaver pavement management system (PMS) update of the City of Sonoma (City) as part of the Metropolitan Transportation Commission (MTC) Pavement Management Technical Assistance Program (P-TAP) Round 20. During P-TAP Round 20 data collection, quality assurance (QA) and quality control (QC) was performed on all pavement management condition assessment surveys as per the QA/QC document provided to the City in June 2019. This document details the activities Fugro undertook to ensure that high quality PMS data is provided to the City. The following areas are discussed in this QMR:

- Section 2. Deliverables, Protocols, and Quality Standards
- Section 3. Quality Control (QC)
- Section 4. Acceptance Criteria
- Section 5. Quality Team Roles & Responsibilities
- Section 6. Quality Reporting Plan Results
- Section 7. Acceptance of QMR

## 2.0 Deliverables, Protocols, and Quality Standards

### 2.1 Introduction

During P-TAP Round 20, Fugro inspected approximately 34 centerline miles of paved streets maintained by the City. The City has an established MTC StreetSaver online database containing its pavement management system (PMS). Fugro understands that the quality of collected pavement distress data is the key to successful implementation and maintenance of an agency's PMS.

### 2.2 Protocols

Fugro's QA/QC Plan uses effective procedures during the data collection and processing steps to provide high quality pavement condition data. Fugro's QA/QC Plan was developed to validate "accuracy", "resolution" and "precision" of the data collected, which MTC describes as:

- "Accuracy" indicates that the distress is identified correctly (e.g., alligator cracking is identified as alligator cracking instead of block cracking).
- "Resolution" indicates that severity levels are identified accurately (e.g., low severity longitudinal cracking is identified and recorded rather than omitted).
- "Precision" indicates that repeated inspections produce reasonably similar recorded distress type, severity and density combinations.

Fugro used its highly trained and experienced professionals that are MTC StreetSaver certified raters to collect the pavement distress data. Each street section was inspected in accordance with the most recent versions of the MTC published "Pavement Condition Index Distress Identification Manual for Flexible Pavements" and the "Pavement Condition Index Distress Identification Manual for Rigid Pavements." Pavement condition inspections were performed using a walking distress survey, where each inspection unit was walked by the inspector. Inspection sample sizes were either 50 or 100 linear feet in length and between 1,000 to 4,000 square feet (sf) for asphalt pavements and approximately 20 slabs for rigid pavements.

A minimum of 10% of the entire street section area was inspected using the MTC representative sampling method for street inspections. The amount (square feet or linear feet, depending on distress) and severity (low, moderate, high) of the following distresses was recorded for flexible pavements: (1) alligator cracking, (2) block cracking, (3) distortions, (4) longitudinal and transverse cracking, (5) patch and utility cut patch, (6) rutting/depression, (7) weathering, and (8) raveling. The amount (# of slabs affected) and severity of the following distresses was recorded for rigid pavements: (1) corner break, (2) divided slab, (3) faulting, (4) linear cracking, (5) patching & utility cuts, (6) scaling/map cracking/crazing, and (7) spalling.

Fugro's data verification processes are described in Section 3.0 on Quality Control. Part of the process includes setting up project Control Sections, which is described next.

## 2.3 Control Sections

As an important QC step and to maintain reasonable distress data accuracy, resolution and precision, Fugro set up a series of “control” sections for raters to inspect. The control sections were approximately 2,500 sf in area, which is a typical inspection unit size. The Rater’s Supervisor or their designee (an MTC certified rater) inspected and recorded all amounts and severities of distresses found within each control section. This data was used as the basis of comparison for each control section (i.e., ground truth).

Fugro distress raters, which are all MTC certified raters, periodically re-inspected the control section (at least once every two weeks) during data collection period. The results of the re-inspection were compared to the original inspection distresses and resulting PCI values. Inspections were within the following tolerances, which are the same as the MTC’s acceptance criteria for prequalification:

- 50% of the re-inspections shall be within +/- 8 PCI points of the ground truth.
- No more than 12% of the re-inspections will be more than 18 PCI points different from the ground truth.

If the re-inspections PCI values were outside the criteria range, the supervisor or their designee would determine reasons for difference and take corrective action, which may include additional instruction in office and field. This control section calibration was done to assure that reasonable accuracy, resolution, and precision of inspection data is maintained.

## 2.4 Deliverables

After the pavement distress data collection, the data was imported into the City’s StreetSaver database and PCI values for each database section was determined. The PCI value reported for each section is based on the distress types and their corresponding severity and quantity observed and recorded during the field surveys.

## 3.0 Quality Control

Fugro's data verification process was based on a number of quality control (QC) activities before, during, and after network level distress data collection activities. As described in Section 2.0, key deliverables under this QMP are high quality pavement distress data for a jurisdiction's asphalt and concrete roadways per MTC protocols and acceptable standards. Table 3 provides a list of QC activities, quality expectations, and frequency of occurrences.

*Table 3. Fugro QC activities for pavement distress data.*

Deliverable	QC Activity	Quality Expectations	Frequency/Interval
Pavement Distress Ratings	Distress rater training	MTC distress rater certification	Pre-collection
	Control site rating calibration	1.50% of sections are within $\pm 8$ PCI points. 2. No more than 12% greater than $\pm 18$ PCI points of the reference value.	Pre-collection  At least once every two weeks during data collection period
	Office checks	Section PCI within 15 points of previous survey.	Once per week or per jurisdiction
	Re-survey of 5% of sections in each jurisdiction by a survey team	1.50% of sections are within $\pm 5$ PCI points. 2. No more than 12% greater than $\pm 15$ PCI points of the reference value.	Weekly
	Re-survey of 5% of sections in each jurisdiction by a supervisor	1.50% of sections are within $\pm 5$ PCI points. 2. No more than 12% greater than $\pm 15$ PCI points of the reference value.	Prior to Delivery

Each QC activity is further described in the following sections.

### 3.1 Distress Rater Training

Every Fugro distress data collection team was led by an MTC certified rater. If there were any new raters, they would work directly under the supervision of a MTC certified rater during field data collection activities. The new distress raters would go through a number of in-house training activities before they accompany the certified raters in the field. The training involves Fugro Academy training modules on safety and code of conduct. Fugro pavement engineers would work with new distress raters to train them

on technical concepts related to pavement distress identification and rating. New distress raters would be trained on distress identification per MTC latest manuals for flexible and rigid pavements. All new raters would need to successfully complete the MTC rater certification process before they can collect distress data without direct supervision of an MTC certified rater.

### **3.2 Control Site Rating Calibration**

Please refer to Section 2.3.

### **3.3 Office Checks**

Fugro used MTC StreetSaver Mobile Rater program on a tablet computer to record distress data in the field and upload data to the office at the end of each work day. The reported data was checked for completeness and then processed. The distress data was evaluated for reasonableness from the last survey. Updated maintenance and rehabilitation (M&R) records were utilized to study the PCI differences for reasonableness. StreetSaver reporting module was used to create a report on “PCI Differences Between Inspections.” Section PCI value was calculated for current survey and compared with projected PCI value based on previous survey. All sections with PCI differences greater than 15 points were flagged and further evaluated by the Project Manager. If necessary, the section was re-inspected to ensure the reliability of the Fugro survey.

### **3.4 Re-Inspection of Sections in Each Jurisdiction by a Survey Team**

Fugro re-inspected minimum 5 percent of the sections previously inspected by an inspection team. The sections were sections that had recently been inspected, within a month. The re-inspection was performed by other raters or the inspection team that collected the data previously.

For all re-inspections, the PCI value for the original inspection was compared to the PCI value for the re-inspection. The goal was for the PCI values for each street section to be within the following tolerances:

- 50% of the re-inspections will be within +/- 5 PCI points of the original inspections.
- No more than 12% of the re-inspections will be more than 15 PCI points different from the original inspections. All sections with a difference greater than 15 PCI points will be reviewed further to determine sources of discrepancy.

If the re-inspection values were not within the above tolerances, then the Project Manager or their designee would meet with the inspector(s) and review the data. Distress data discrepancies would be discussed to determine what the source of the PCI differences are. That day's inspections may then be discarded and inspections performed again. In addition, 5% of the inspections were spot checked by the supervisor for the following week, to assure that any sources of discrepancies had been resolved. If they have been found to be resolved, then the original re-inspection of 5% of the street segments was resumed.

### **3.5 Re-Inspection of Sections in Each Jurisdiction by a Supervisor**

Similar to the re-inspection by raters or inspection teams, the distress rating supervisor inspected at least 5 percent of the sections that were inspected by an inspection team. For all re-inspections, the PCI values for the supervisor's inspection were compared to the PCI values for the survey team. The goal was for the PCI values for each street section to be within the following tolerances:

- 50% of the inspections will be within +/- 5 PCI points of the supervisor's inspections.
- No more than 12% of the inspections will be more than 15 PCI points different from the supervisor's inspections. All sections with a difference greater than 15 PCI points will be reviewed further to determine sources of discrepancy.

If the re-inspections were not within the above tolerances, then the Project Manager or their designee would meet with the inspector(s) and review the data in the field. Distress data discrepancies were discussed to determine what the source of the PCI differences are. That day's inspections may then be discarded and inspections performed again. In addition, 5% of the inspections were spot checked by the Project Manager or their designee for the following week, to assure that any sources of discrepancies had been resolved. If they have been found to be resolved, then the original re-inspection of 5% of the street segments were resumed.

## 4.0 Acceptance

Pavement distress data that has passed the quality control verification process described in Section 3.0 will be deemed acceptable for final delivery into the jurisdiction's StreetSaver database. Of particular importance is a thorough investigation of validity of collected distress data for surveyed sections with PCI values with a difference of more than 15 PCI points from the projected PCI values based on prior survey as described in Section 3.3.

## 5.0 Quality Team Roles & Responsibilities

The following table shows the quality-related responsibilities of the data collection team and lists specific quality responsibilities.

*Table 4. Fugro Team Roles and Responsibilities.*

Team Role	Assigned Personnel	Quality Management Responsibilities
<b>Project Manager</b>	Sirous Alavi	Distress training Completeness checks Reasonableness checks Provide QMP documentation to jurisdiction and MTC
<b>Senior Engineer</b>	Michael Tavares	Distress training Control site reference values Supervisor reference values Completeness checks Reasonableness checks Coordinate field collection crew
<b>Distress Rater(s)</b>	Thomas Burchett Mohammad Ilias Michael Tavares	Receive training Complete control sites Perform inspections Perform re-inspections Submit distress data daily

## 6.0 Quality Reporting Plan Results

Data quality was monitored throughout the project following the QMP. During project data collection activities, the Project Manager discussed any data quality issue with the jurisdiction if and when necessary. All activities performed under the QMP including the results of quality control and acceptance processes have been documented in this comprehensive Quality Management Report (QMR) that will be reviewed and approved by jurisdiction. A copy of the approved QMR will also be submitted to MTC.

### 6.1 Control Site Rating QC

Fugro distress raters periodically re-inspected the control sites in the Bay Area (at least once every two weeks) during data collection period. The results of the re-inspection were compared to the original inspection distresses and resulting PCI values. Inspections were to meet the following tolerances, which are the same as the MTC's acceptance criteria for prequalification:

- 50% of the re-inspections shall be within +/- 8 PCI points of the ground truth.
- No more than 12% of the re-inspections will be more than 18 PCI points different from the ground truth.

For each periodic re-inspection, the distress raters met the required criteria. Appendix A has the results of the control site QC.

### 6.2 QC of Re-Inspection of Sections by a Survey Team

Table 5 presents the number of sections for the City and the required number of re-inspection sections. Table 6 presents a summary of the re-inspection results and whether the re-inspections met the criteria in Section 3.0. The Fugro Survey Teams performed re-inspections on 15 sections (approximately 5% of sections). For the City, all criteria were met. Appendix B has the results of each individual re-inspection by the Survey Team.

Table 5. Sections and Re-Inspection Sections.

Jurisdiction	Centerline Miles	Total # of Sections	# of Re-Inspection Sections (5% of Sections)
Sonoma	33.79	300	15

Table 6. Re-Inspection Results by Survey Team.

PCI Difference	Number of Re-Inspection Sections	Number Meeting Goal	Percentage Meeting Goal	Goal
Within $\pm$ 5	15	14	93%	At least 50%
Greater than $\pm$ 15	15	0	0%	Less than 12%

### 6.3 QC of Re-Inspection of Sections by a Supervisor

Table 7 presents a summary of the re-inspection results and whether the re-inspections met the criteria in Section 3.0. The Fugro Supervisor performed re-inspections on 16 sections (approximately 5% of sections). For the City, all criteria were met. Appendix C has the results of each individual re-inspection by the Supervisor.

*Table 7. Re-Inspection Results by Supervisor.*

PCI Difference	Number of Re-Inspection Sections	Number Meeting Goal	Percentage Meeting Goal	Goal
<b>Within <math>\pm 5</math></b>	16	16	100%	At least 50%
<b>Greater than <math>\pm 15</math></b>	16	0	0%	Less than 12%

### 6.4 Office Checks

PCI values for all newly inspected sections were compared to the StreetSaver projected PCI values right before the Fugro inspection. Any section with a PCI variance of greater than 15 points was investigated to determine the source of the large variance. It was found 12 sections had a PCI variance over 15 points. Among those 12 sections, 9 sections had a PCI increase of over 15 points. Sections may have had M&R activities not updated into the StreetSaver (i.e., 2016 to 2018 activities). Five of the sections have had a slurry seal in 2017 or 2018. Among those 12 sections, 3 sections had a PCI decrease of over 15 points due to significantly more distresses being present than was recorded at the previous inspection (2017). Appendix D shows the sections with a PCI variance of greater than 15 points and inspection notes. Fugro prepared the inspection notes to show possible reasons for the PCI variance.

## 7.0 Acceptance of Quality Management Report

## **Appendix B – Section Inventory Report**

(Sorted Alphabetically by Street ID)

(Sorted by Descending PCI)

### Section Inventory Report Description

This report lists section information for each of the City's pavement sections. It lists the street ID, Section ID, section limit, functional class, surface type, number of lanes, length, width, area, and PCI. The report is sorted alphabetically by Street Name and Section ID. The field descriptions in this report are listed below:

COLUMN	DESCRIPTION
Street ID	Street Identification - A code up to ten characters/digits to identify the street. Generally, the street name is truncated to six characters. The Street ID should be unique for each street.
Section ID	Section Identification - A code up to ten characters/digits to identify the section number. The Section ID must be unique for each section of one street.
Street Name	The name of the street.
Begin Location	Beginning limit of the section.
End Location	Ending limit of the section.
Lanes	Number of travel lanes.
Functional Class	Functional Classification (A = Arterial, C = Collector, R = Residential).
Length (feet)	Length of the section in feet.
Width (feet)	Average width of the section in feet.
Area (square foot)	Calculated area based on average length and width.
Surface Type	Surface Type (AC = AC Pavement, O = AC Overlay of AC Pavement, AC/PCC = AC Overlay of PCC Pavement, PCC = PCC Pavement, ST = Surface treatment over gravel base/subgrade).
PCI Date	Date of PCI is from inspection or maintenance data.
PCI	Average PCI for the section. The value is inspected/projected for 2017 and is based on the last calculated PCI (i.e. from inspection or maintenance data).

## Sorted Alphabetically by Street ID

## Appendix C – Decision Tree

### Maintenance and Rehabilitation (M&R) Decision Tree

This appendix presents the current M&R decision tree in StreetSaver. The decision tree forms the basis for all of the budgetary computations that are included in this final report. The decision tree lists the treatments and costs selected for preventive maintenance and rehabilitation activities. Each line represents a specific combination of functional classification and surface type.

The preventive maintenance portion of the report is identified as Pavement Condition Category I – Very Good. All preventive maintenance treatment listings are assigned only to sections in Condition Category I where the PCI greater than 70. Sections with PCI values less than 70 are assigned to treatments listed in Categories II through V.

For the preventive maintenance category ( $\text{PCI} \geq 70$ ), there are several treatments that can be performed. A time sequence is used to identify the appropriate treatment and cost. Each preventive maintenance treatment description consists of three treatments: 1) Crack, 2) Surface, and 3) Restoration. These three treatments can have different time periods between applications. For example, before a restoration treatment is performed, the user can specify that a number of slurry seals should be performed first.

Rehabilitation treatments are assigned to sections in Condition Categories II through V ( $\text{PCI} \leq 70$ ). Each line is defined by a specific combination of functional classification, surface type, and condition category.

COLUMN	DESCRIPTION
Functional Class	Functional classification.
Surface	Surface type.
Condition Category	Condition Category (I through V).
Treatment Type	First Row (Crack Treatment) indicates localized treatment (e.g. crack sealing). Second Row (Surface Treatment) indicates surface treatment (e.g. slurry sealing). Third Row (Restoration Treatment) indicates surface restoration (e.g. overlay).
Treatment	Name of treatments from the "Treatment Descriptions" report.
Cost/Sq. Yd.	Unit cost (\$ per square yard) for the treatment shown. In the case of crack sealing, the unit cost is \$ per linear foot.
Yrs. Between Crack Seals	First Row - number of years between successive treatment applications specified in the first row (i.e., Crack treatment).
Yrs. Between Surface Seals	Second Row - number of years between successive treatment applications specified in the second row (i.e., Surface treatment).
Number of Sequential Seals	Number of times that the treatment application in the second row (i.e., Surface treatment) will be performed prior to performing the treatment application in the third row.

## **Appendix D – Budget Needs Analysis**

### Budget Needs Reports

Budget Needs reports included in this appendix are listed below:

- Needs - Projected PCI/Cost Summary
- Needs - Preventative Maintenance Treatment/Cost Summary
- Needs - Rehabilitation Treatment/Cost Summary

#### Needs - Projected PCI/Cost Summary

This report summarizes and projects the City's network PCI values over a five-year period, both with and without treatments applied. These costs are based on those in the M&R decision tree. It also projects the costs over a five-year period.

COLUMN	DESCRIPTION
Year	Year in the analysis period.
PCI Treated	Projected network average PCI with all needed treatments applied.
PCI Untreated	Projected network average PCI without any treatments applied.
PM Cost	Total preventive maintenance treatment cost.
Rehab Cost	Total rehabilitation treatment cost.
Cost	The budget required for each year in the analysis period to meet the City's standard as shown on the M&R decision tree.
Total Cost	Total budget required over a five-year period.

City of Sonoma  
Number 1 The Plaza  
Sonoma, CA 95475  
(707) 938-3332

## Needs - Projected PCI/Cost Summary

## **Appendix E – Budget Analysis Scenario 1 – No Funds (Do Nothing)**

## Budget Analysis Reports

Budget analysis reports included in this appendix are listed below:

- Scenarios Cost Summary
- Scenarios Network Condition Summary
- Scenarios Sections Selected for Treatment

### Scenarios Cost Summary

This report provides a breakdown of the estimated costs for the recommended treatments by year and condition category. It also totals the costs by functional classification and shows the amount of deferred maintenance arising from the input budget and City's decision tree.

### Scenarios Network Condition Summary

This report provides a breakdown of the network condition by functional classification and condition category before and after the recommended treatments are applied. It also shows the projected network PCI if the recommended treatments are applied and if they are not.

### Scenarios Sections Selected for Treatment

This report is provides a listing of sections selected for treatment based on decision tree and budget constraints. It contains the following information: street name, beginning and ending locations, street ID, section ID, functional classification, surface type, estimated cost of the recommended treatment, and treatment. The records are grouped by year and then in alphabetical order by street name and section ID. Please note that these are network level recommendations. A project level evaluation must be performed before applying a treatment.
