

RECOVERY NETWORK
when anyone, anywhere, reaches out for help

Architectural Integrity by Design

Chief Compliance Officer / Risk Manager

A technical control for the modern regulatory landscape.

Every platform claims to take HIPAA seriously, but Recovery Network built the boundary directly into the architecture. We utilize a three-tier data structure where patient-facing surfaces never touch protected health information and facility-scoped surfaces remain isolated to your organization alone. Your data never touches another organization's pipeline, ensuring a sovereign data environment. Dr. Chen holds compliance veto authority over every system release, ensuring that every update meets the highest standards of technical and legal scrutiny.

THE P-CODE EVIDENCE LEDGER

The P-Code Ledger serves as your financial and clinical proof engine, logging every verified win with full attribution and a permanent timestamp. Every intervention that prevents a readmission or avoids a crisis is captured as an exportable, payer-ready document. This provides your organization with a defensible trail of outcome data that changes the nature of the conversation during audits. You no longer have to hope the data supports your claims; you have an immutable record of every prevented cost.

DE-IDENTIFIED GLOBAL INTELLIGENCE

Our internal surfaces only receive de-identified signal data, maintaining a strict wall between patient identity and the clinical intelligence network. Every de-identified signal across every facility on the network feeds a shared learning infrastructure that improves the Council's accuracy. Every member contributes to and benefits from this intelligence in real-time without compromising individual privacy. This allows your facility to leverage global insights while maintaining local, sovereign control over your sensitive data.

TECHNICAL VETO & AUDITABILITY

Dr. Chen's role is not a policy or a checklist; it is a technical control integrated into the software deployment pipeline. Every output and every AI-driven recommendation must pass through a compliance filter that ensures the logic remains within regulated boundaries. This provides your compliance team with a transparent, fully audited chain of custody at every layer of the data journey. Your team can review the architecture diagram in thirty minutes and approve the system before the meeting ends.

SOVEREIGN DATA SECURITY

Recovery Network operates as a sovereign intelligence layer that sits above your current infrastructure, requiring zero source system changes. This non-invasive approach minimizes the risk that typically accompanies new software integrations. We provide the security and compliance standards your organization already requires while offering a self-improving network. Your data remains your own, protected by a system designed to be as unshakeable as the clinical mission it supports.

Compliance is not a hurdle — it is the foundation of clinical trust
