as photographed

STRONG

POTENTIAL

9.2

the ceiling for this face

EXCEPTIONAL

+1.5 between this face and its ceiling

ESTIMATED AGE **19 (17-22)**

ASSESSMENT

You present a naturally captivating appearance with harmoniously balanced facial features and clear, healthy skin. Your gentle expression and defined bone structure contribute to a high level of natural attractiveness.

Facial Features

Structure, proportion and the features themselves.

FACIAL HARMONY

EXCELLENT 8.5

Your facial features are very well-proportioned and blend seamlessly, contributing to a balanced and pleasing aesthetic. Each feature complements the others, creating an overall harmonious look.

FACIAL SYMMETRY

EXCELLENT 8.9

You exhibit a high degree of facial symmetry, with both sides of your face mirroring each other closely. This excellent balance is a key contributor to your overall attractiveness.

BONE STRUCTURE

EXCELLENT 8.0

You have a visible and well-defined bone structure, particularly in your cheekbones and jawline. This provides a strong foundation for your facial features, enhancing their definition.

JAWLINE & MANDIBLE

STRONG 7.9

Your jawline is well-defined and exhibits a graceful, feminine contour without being overly sharp. It frames your face elegantly and contributes to your refined profile.

CHIN

EXCELLENT 8.0

Your chin is well-proportioned and contributes positively to your facial balance, having a slightly rounded yet defined shape. It projects adequately, aligning harmoniously with your other features.

CHEEBONES & ZYGOMAS

EXCELLENT 8.2

Your cheekbones are nicely prominent, adding attractive contour and definition to your midface. They create appealing shadows and highlight the structure of your face.

EYES

EXCELLENT 8.7

Your eyes are a striking feature, appearing large, expressive, and well-spaced with a beautiful almond-like shape. They possess a captivating gaze that draws attention.

EYEBROWS

EXCELLENT 8.5

Your eyebrows are naturally full and possess a pleasing, well-defined arch that frames your eyes beautifully. Their natural grooming enhances your overall facial expression.

NOSE

EXCELLENT 8.3

Your nose is well-proportioned and harmonious with the rest of your facial features. Its shape is refined and does not detract from your overall attractiveness.

LIPSEXCELLENT **8.6**

Your lips are full and exhibit excellent definition, particularly around the vermilion border and Cupid's bow. They add a soft and inviting quality to your smile.

HAIRLINE & DENSITYEXCELLENT **8.7**

Your hairline is healthy and full, showing no signs of recession, and your hair density appears strong. This contributes to a youthful and vibrant appearance.

HAIR STYLEEXCELLENT **8.2**

Your current hair style, with its natural waves and length, beautifully complements your face shape. It enhances your features without overwhelming them, creating a soft and appealing look.

YOUTHFULNESSEXCEPTIONAL **9.0**

You exude significant youthfulness, reflected in your smooth skin and vibrant appearance. There are no visible signs of aging, indicating excellent skin health.

FACIAL FAT DISTRIBUTIONEXCELLENT **8.8**

Your facial fat distribution is optimal, contributing to a lean and defined appearance without any puffiness. This leanness accentuates your underlying bone structure effectively.

SKINEXCEPTIONAL **9.0**

Your skin appears remarkably clear, with an even tone and a healthy, luminous quality. This excellent skin condition significantly enhances your overall appeal.

NECKSTRONG **7.8**

Your neck appears proportionate to your head and jawline, contributing to a balanced profile. It maintains a slender and defined appearance.

FEMININITYEXCELLENT **8.8**

Your facial features possess graceful curves, soft contours, and delicate bone structure, embodying classic feminine beauty. You project an elegant and inherently attractive feminine charm.

Skin Quality

Surface, tone and how the skin is ageing.

SKIN TEXTURE

EXCELLENT 8.9

Your skin texture is very smooth with fine pores, suggesting a healthy and well-maintained complexion. There are minimal visible imperfections, contributing to a flawless look.

SKIN ELASTICITY & COLLAGEN

EXCEPTIONAL 9.0

Your skin appears firm and tight, indicative of excellent elasticity and collagen levels. There are no visible fine lines or wrinkles, showcasing remarkable skin health.

PIGMENTATION

EXCELLENT 8.5

You have a generally even skin tone with a healthy, natural glow. The presence of natural freckles adds to your unique charm rather than indicating uneven pigmentation.

UV DAMAGE

EXCEPTIONAL 9.5

There are virtually no visible signs of UV damage, such as sun spots or premature wrinkles, on your skin. This indicates excellent skin protection and health.

Perceptual Impression

What the face communicates before anything is said.

Capture Photo Quality

How well the photograph itself supports an assessment.

HEAD POSITION AT CAPTURE

A near-frontal, level capture keeps the paired measurements (left against right) comparable. Large angles flatten one side of the face and are noted here so the assessment can be read with that in mind.

Detailed Morphological Analysis

Everything above is a judgement about the face. These are 47 measurements of it: geometry read straight off the 478 landmarks, each one placed on the distribution of the same measurement across the reference population, female n=638.

HARMONY & BALANCE

Facial Symmetry

0.0319
OPTIMAL

The 39 landmarks this measurement reads, and the geometry between them

Facial symmetry measures how closely paired features mirror each other across the center of the face. It looks at regions such as the brows, eyes, nose, mouth, and jaw, along with the alignment of central landmarks. Small natural differences are normal, but large differences can change how balanced the face appears.

THIS FACE AGAINST THE COHORT

Symmetry is commonly associated with visual harmony and can make a face appear more polished, calm, and conventionally attractive.

HARMONY & BALANCE

Golden Ratio

1.4919
IN RANGE

Golden ratio evaluates several classic proportional relationships, including face length to width, mouth width to nose width, and chin-to-lip spacing. These ratios are not strict rules, but they are useful references for understanding facial harmony. The score reflects how naturally the central features relate to the overall face.

THIS FACE AGAINST THE COHORT

The 9 landmarks this measurement reads, and the geometry between them

Proportions that sit near familiar aesthetic references can create a sense of order, balance, and visual ease.

HARMONY & BALANCE

Facial Thirds

0.9829
IDEAL

Facial thirds compares the middle third of the face with the lower third. In this implementation, the measurable focus is the glabella-to-subnasale region and the subnasale-to-chin region. It helps show whether the center and lower face feel proportionate to one another.

THIS FACE AGAINST THE COHORT

The 3 landmarks this measurement reads, and the geometry between them

Balanced vertical thirds often make a face look well-composed and can prevent any single region from visually dominating.

HARMONY & BALANCE

Face Shape

OVAL
 CLASSIFICATION

Face shape summarizes the relationship between overall face length, cheekbone width, jaw width, and forehead width. It helps describe whether the face reads as more oval, round, square, heart-shaped, or elongated. The measurement is about structural proportions rather than judging one shape as universally best.

COMPONENT MEASUREMENTS

Face length to cheek width		1.1892
Forehead to cheek width ratio		0.7138
Temple to cheek width ratio		0.8457
Upper jaw to cheek width		0.9475
Jaw to cheek width ratio		0.8818
Lower jaw to cheek width		0.7894
Chin to cheek width ratio		0.3149
Forehead to jaw width ratio		0.8095
Temple to jaw width ratio		0.9592
Chin to jaw width ratio		0.3571
Mean gonial angle		169.515°
Jaw apex angle		103.761°
Side contour bulge ratio		0.0554
Lower jaw curvature ratio		0.0619
Width profile std		0.2111

In attractiveness perception, a face shape that feels internally balanced often makes the features look more cohesive and easier to read.

The 32 landmarks this measurement reads, and the geometry between them

HARMONY & BALANCE

Rule of Five

0.0261
OPTIMAL

Rule of five divides the face horizontally into five visual segments using the face edges and eye corners. It checks whether the eyes and spacing occupy balanced portions of the total facial width. This is a traditional guideline for assessing horizontal facial proportion.

THIS FACE AGAINST THE COHORT

The 6 landmarks this measurement reads, and the geometry between them

Even horizontal spacing can make the eyes and midface feel naturally placed, which supports a harmonious first impression.

HARMONY & BALANCE

Facial Width-to-Height Ratio

1.753
IN RANGE

fWHR stands for facial width-to-height ratio. It compares cheekbone width with the height of the upper face from the brow area to the upper lip. This gives a compact summary of how broad or vertically elongated the upper face appears.

THIS FACE AGAINST THE COHORT

The 5 landmarks this measurement reads, and the geometry between them

A balanced fWHR can influence perceived facial strength, maturity, and structure without relying on any single feature.

HARMONY & BALANCE

Morphological Facial Index

83.4061
OPTIMAL

Morphological facial index compares facial height from nasion to chin against cheekbone width. It is an anthropometric way to describe whether a face is relatively short, average, or long. The feature focuses on overall face format rather than individual details.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A pleasing height-to-width relationship can make the face feel proportionate and naturally framed.

HARMONY & BALANCE

Bizygomatic Width Index

2.1019
OPTIMAL

Bizygomatic width index measures cheekbone-to-cheekbone width in normalized facial units. It captures the breadth of the midface and cheekbone area. This width is a major anchor for the face's overall silhouette.

THIS FACE AGAINST THE COHORT

The 2 landmarks this measurement reads, and the geometry between them

Well-defined cheekbone width can contribute to facial presence, structure, and a balanced outline.

HARMONY & BALANCE

Sexual Dimorphism

COMPOSITE

The 13 landmarks this measurement reads, and the geometry between them

Sexual dimorphism combines structural cues often associated with masculine or feminine facial presentation. It includes inputs such as facial width-to-height ratio, jaw width, chin width, midface compactness, and brow thickness. The feature describes broad structural character rather than identity or value.

COMPONENT MEASUREMENTS

Width-to-height ratio		1.753
Jaw to cheek width ratio		0.8817
Chin width		0.6617
Midface height to width ratio		0.43
Mean brow thickness		0.0814

Clear but balanced dimorphic cues can shape whether a face reads as softer, stronger, more mature, or more youthful, all of which affect mainstream attractiveness impressions.

HARMONY & BALANCE

Neoteny Index

COMPOSITE

Neoteny index captures youth-associated structural cues such as eye openness, jaw taper, and midface compactness. It does not measure age, but rather proportions that can make a face read as softer or more youthful. The feature is best interpreted in combination with harmony and jaw structure.

COMPONENT MEASUREMENTS

Mean palpebral height		0.1294
Jaw to cheek width ratio		0.8817
Midface height to width ratio		0.43

A measured level of youthful softness can make a face appear approachable, fresh, and expressive.

The 11 landmarks this measurement reads, and the geometry between them

EYES

Interpupillary Distance

0.4758
OPTIMAL

Interpupillary distance measures the space between the pupils relative to overall face width. It describes how widely or narrowly the eyes are placed within the face. The ratio is normalized so it can be compared across different face sizes.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Eye spacing strongly affects facial balance because the eyes are one of the first features people notice.

EYES

Eye Spacing Index

0.4758
OPTIMAL

Eye spacing index also compares interpupillary distance with cheekbone width. It gives another view of how the eye area sits within the full facial frame. In this codebase, it is numerically similar to interpupillary distance but kept as its own presentation feature.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Well-proportioned eye spacing can make the face look open, centered, and naturally balanced.

EYES

Eye Shape

0.3033
IN RANGE

Eye shape compares eye opening height with eye width for each eye. Lower ratios read as more almond-shaped, while higher ratios read as rounder or more open. It also captures side-to-side differences.

THIS FACE AGAINST THE COHORT

The 8 landmarks this measurement reads, and the geometry between them

Eye shape influences expression, softness, and perceived alertness, which are central to facial attractiveness.

EYES

Canthal Tilt

4.9175
OPTIMAL

Canthal tilt measures the angle from the inner eye corner to the outer eye corner on each side. Positive values mean the outer corner sits higher, while lower or negative values indicate a flatter or downward tilt. It also tracks whether the tilt is balanced between both eyes.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A gentle upward or well-balanced canthal tilt is often associated with alertness, lift, and a more defined eye area.

EYES

Palpebral Fissure Ratio

3.3817
IN RANGE

Palpebral fissure ratio compares eye width with eye opening height. Higher values indicate a narrower eye opening relative to width, while lower values indicate a rounder opening. This feature describes the visible shape of the eye aperture.

THIS FACE AGAINST THE COHORT

The 8 landmarks this measurement reads, and the geometry between them

Balanced eye aperture can make the eyes look expressive without appearing overly narrow or overly round.

EYES

Upper Eyelid Exposure

0.8036
IN RANGE

Upper eyelid exposure estimates the visible space between the upper lid margin and the lid fold. It is measured relative to eye opening height so it remains size-invariant. This helps describe whether the upper eyelid area appears compact, moderate, or highly exposed.

THIS FACE AGAINST THE COHORT

The 6 landmarks this measurement reads, and the geometry between them

Moderate upper eyelid exposure can support a fresh, rested appearance and prevent the eye area from feeling heavy or overly exposed.

EYES

Inferior Scleral Show

-0.0087
IDEAL

Inferior scleral show measures the visible gap between the bottom of the iris and the lower eyelid. Positive values suggest visible white below the iris, while negative values suggest the lower lid overlaps the iris. The feature is measured separately for each eye and averaged.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Lower scleral show is often perceived as more relaxed and harmonious, while excessive show can make the eyes appear tired or tense.

EYES

Iris Palpebral Ratio

0.7612
IN RANGE

Iris-palpebral ratio compares the vertical eye opening with iris height. It describes how much of the iris is visibly exposed within the eyelids. Lower values suggest a more narrowed look, while higher values suggest a more open look.

THIS FACE AGAINST THE COHORT

The 8 landmarks this measurement reads, and the geometry between them

A balanced iris exposure can make the eyes look lively, clear, and naturally expressive.

EYES

Canthal-to-Alar Ratio

0.8254
OPTIMAL

Canthal-to-alar ratio compares the distance between the inner eye corners with the width of the nose base. It links eye spacing to the central nose structure. This helps assess whether the inner eye area and nose base feel proportionate.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Good alignment between the inner eyes and nose base can make the central face look organized and aesthetically coherent.

BROWS

Brow Eye Distance

0.2952
OPTIMAL

Brow-eye distance measures the vertical space between the pupil center and the lower brow margin. It shows whether the brows sit relatively low, moderate, or high above the eyes. The feature is measured on both sides and averaged.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A balanced brow-to-eye distance can add definition to the eye area and influence whether the expression reads as soft, intense, or open.

BROWS

Glabella Width

0.3988
IN RANGE

Glabella width measures the spacing between the innermost brow points. It describes the central brow gap above the nose. This region affects how connected or separated the brows appear.

THIS FACE AGAINST THE COHORT

The 2 landmarks this measurement reads, and the geometry between them

A proportionate glabella width helps the upper midface look clean, balanced, and approachable.

BROWS

Eyebrow Tilt

-5.4511
IN RANGE

Eyebrow tilt measures the angle from the inner brow head to the brow tail on each side. It also captures arch prominence and left-right differences. This feature describes both direction and shape of the brows.

THIS FACE AGAINST THE COHORT

The 6 landmarks this measurement reads, and the geometry between them

Brow tilt strongly shapes expression, and balanced brows can make the eyes look lifted, framed, and more engaging.

BROWS

Eyebrow Arch

142.394
OPTIMAL

Eyebrow arch degree measures the angle at the brow peak between the brow head and tail. Angles closer to 180 degrees are straighter, while smaller angles indicate a more pronounced arch. It summarizes arch definition in a clean geometric way.

THIS FACE AGAINST THE COHORT

The 6 landmarks this measurement reads, and the geometry between them

A well-suited arch can frame the eyes, add expression, and improve the perceived refinement of the upper face.

BROWS

Eyebrow Thickness

0.0814
OPTIMAL

Eyebrow thickness estimates the vertical height of the brow band using mesh rows around the arch. It measures geometric thickness, not hair density or grooming quality. The result helps describe whether the brow structure appears fine, moderate, or strong.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Brow thickness affects facial framing and can contribute to either softness or definition depending on the rest of the face.

NOSE & CENTER

Midface Ratio

0.9957
IN RANGE

Midface ratio measures the distance from each pupil to the same-side mouth corner relative to interpupillary distance. It captures how compact or vertically extended the central face appears. The feature also checks whether the two sides are similar.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A compact, balanced midface is often perceived as more harmonious because the eyes, nose, and mouth feel naturally connected.

NOSE & CENTER

Midface Compactness

0.43
OPTIMAL

Midface compactness compares the vertical distance from the pupil line to the upper lip against overall cheekbone width. Lower values suggest a more compact central face, while higher values suggest more vertical length. This helps describe the visual spacing between the eyes and mouth.

THIS FACE AGAINST THE COHORT

The 5 landmarks this measurement reads, and the geometry between them

Balanced midface compactness can make the face appear more youthful, cohesive, and photogenic.

NOSE & CENTER

Nasal Index

98.9874
IN RANGE

Nasal index compares nose width with nose length. It describes whether the nose reads as narrower and longer or wider and shorter. This is a classic proportional measure rather than a judgment of nose size alone.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A nose width and length that fit the surrounding features can help the center of the face look refined and balanced.

NOSE & CENTER

Nasal Length Ratio

0.4225
IN RANGE

Nasal length ratio compares nose length with the height of the face from nasion to chin. It shows how much vertical space the nose occupies within the central face. This helps distinguish a proportionate nose from one that visually feels long or short for the face.

THIS FACE AGAINST THE COHORT

The 3 landmarks this measurement reads, and the geometry between them

When nasal length is in harmony with facial height, the profile of the central face tends to look more natural and composed.

NOSE & CENTER

Dorsal Bridge Index

0.2654
OPTIMAL

Dorsal bridge index compares the width of the mid-nose bridge with the width of the alar base. It approximates how the bridge relates to the lower nose in frontal view. Because mesh landmarks are proxies, it should be read as a proportional signal rather than a precise clinical measurement.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A bridge width that fits the nose base can make the nose appear cleaner, straighter, and better integrated with the face.

NOSE & CENTER

Alar Flare Angle

149.497°
OPTIMAL

Alar flare angle measures the angle formed by the outer nostril edges and the nose tip. Wider angles suggest more visible flare relative to the tip, while narrower angles suggest a more contained base. This describes nose base shape in frontal view.

THIS FACE AGAINST THE COHORT

The 3 landmarks this measurement reads, and the geometry between them

A balanced alar base helps the nose look proportional without pulling too much attention from the eyes or lips.

NOSE & CENTER

Nose Mouth Width Ratio

0.715
OPTIMAL

Nose-mouth width ratio compares the width of the nose with the width of the mouth. It captures how the central facial features scale against each other. This is especially useful for assessing balance across the nose, lips, and lower midface.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

When nose and mouth widths feel proportionate, the center and lower face usually appear more coordinated and attractive.

LIPS & PHILTRUM

Philtrum Length

0.312
OPTIMAL

Philtrum length measures the space from the base of the nose to the upper lip and compares it with chin height. It describes how much vertical space sits above the lips. This is a key proportion in the lower midface.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A proportionate philtrum can make the lips look better positioned and can support a more youthful, balanced lower face.

LIPS & PHILTRUM

Lip Volume Proportion

1.5043
OPTIMAL

Lip volume proportion compares upper-lip vermillion height with lower-lip vermillion height. It describes whether the lips appear balanced, lower-lip dominant, or upper-lip dominant. The feature measures shape proportion rather than cosmetic fullness alone.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Balanced upper and lower lip volume can make the mouth look natural, expressive, and aesthetically pleasing.

LIPS & PHILTRUM

Lip Aspect Ratio

0.3427
OPTIMAL

Lip aspect ratio compares total visible lip height with mouth width. It summarizes how full or slim the lips appear relative to their horizontal span. This helps distinguish lip shape from overall mouth width.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A lip height-to-width relationship that suits the face can make the mouth look proportionate and attractive without appearing exaggerated.

LIPS & PHILTRUM

Cupid's Bow Angle

157.398°
OPTIMAL

Cupid's bow angle measures the angle formed by the two upper-lip peaks and the central dip. Smaller angles suggest a sharper, more defined bow, while wider angles suggest a flatter upper-lip line. It captures one of the main contour details of the lips.

THIS FACE AGAINST THE COHORT

The 3 landmarks this measurement reads, and the geometry between them

A clear but natural Cupid's bow can add refinement and definition to the mouth area.

LIPS & PHILTRUM

Lip Line Asymmetry

0.0016
IDEAL

Lip line asymmetry measures the vertical offset between the two mouth corners. A value near zero means the lip line is level, while larger values show one corner sitting higher or lower. It captures balance in the mouth's resting shape.

THIS FACE AGAINST THE COHORT
0.0016

The 2 landmarks this measurement reads, and the geometry between them

A more even lip line can make expression look calmer, friendlier, and more visually balanced.

LIPS & PHILTRUM

Mouth to Interpupillary Ratio

0.8163
OPTIMAL

Mouth-IPD ratio compares mouth width with the distance between the pupils. It shows whether the mouth corners align proportionately with the eye area. This links the lower face to one of the most important reference widths in the upper face.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

When mouth width fits the eye spacing, the face tends to look more coordinated and naturally expressive.

JAW & CHIN

Facial Hexagon

0.0418
OPTIMAL

Facial hexagon describes the outline formed by the temples, cheekbones, and jaw corners. It measures symmetry across those width pairs and how the face tapers from temple to cheek to jaw. This provides a broad read of facial contour and lower-face structure.

THIS FACE AGAINST THE COHORT

The 6 landmarks this measurement reads, and the geometry between them

A clean, balanced outline can make the face look structured, photogenic, and visually stable.

JAW & CHIN

Jawline Angle

38.1192
OPTIMAL

Jawline angle measures the slope from the chin to each jaw corner in frontal view. Lower angles suggest a broader or squarer jawline, while higher angles suggest a steeper or more tapered jawline. It also captures side-to-side jawline balance.

The 3 landmarks this measurement reads, and the geometry between them

Jawline angle influences perceived definition, strength, and face shape, making it a major part of attractiveness impressions.

JAW & CHIN

Zygomaticomandibular Ratio

1.1341
OPTIMAL

Zygomaticomandibular ratio compares cheekbone width with jaw width. Higher values suggest stronger taper from cheekbones to jaw, while lower values suggest a blockier lower face. It describes the relationship between midface width and lower-face width.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A flattering cheek-to-jaw relationship can enhance facial contour and make the face look more sculpted.

JAW & CHIN

Mandibular Width

0.8817
OPTIMAL

Mandibular width compares jaw width with cheekbone width. It shows whether the lower face is narrow, moderate, or broad relative to the midface. This helps clarify how much visual weight the jaw contributes.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

Jaw width that fits the cheekbones can create a stronger, cleaner, and more balanced facial frame.

JAW & CHIN

Bigonial Width

1.8532
OPTIMAL

Bigonial width measures the distance between the left and right jaw angles. It captures the absolute lower-face width in normalized facial units. This feature focuses on the breadth of the jaw corners.

THIS FACE AGAINST THE COHORT

The 2 landmarks this measurement reads, and the geometry between them

Appropriate jaw-corner width can add definition and structure without making the lower face feel visually heavy.

JAW & CHIN

Lower Face Height Ratio

0.4483
IN RANGE

Lower face height ratio compares the upper and lower portions of the lower facial third. It uses the distance from subnasale to stomion and from stomion to chin. The classic reference is a smaller upper portion and a larger lower portion.

THIS FACE AGAINST THE COHORT

The 3 landmarks this measurement reads, and the geometry between them

A balanced lower third can make the mouth, chin, and jaw look naturally proportioned.

JAW & CHIN

Chin Jaw Taper

103.761
OPTIMAL

Chin-jaw taper measures the convergence angle formed by the jaw corners and the chin. It also includes chin width to distinguish a sharper taper from a broader rounded shape. This feature describes the visual V-line or U-shape of the lower face.

THIS FACE AGAINST THE COHORT

The 5 landmarks this measurement reads, and the geometry between them

A taper that suits the cheekbones and jaw can make the lower face look elegant, defined, and balanced.

JAW & CHIN

Chin Width Index

0.6617
OPTIMAL

Chin width index measures the width across the flatter central part of the chin. It describes whether the chin reads as narrow, moderate, or broad. This is separate from chin height and jaw width.

THIS FACE AGAINST THE COHORT

The 2 landmarks this measurement reads, and the geometry between them

A chin width that fits the jaw and lips helps anchor the lower face and improves overall proportion.

JAW & CHIN

Chin Philtrum Ratio

2.2403
IN RANGE

Chin-philtrum ratio compares chin height with philtrum length. It reflects a classic lower-face proportion where the chin area is typically longer than the philtrum. The measure helps describe vertical balance below the nose.

THIS FACE AGAINST THE COHORT

The 4 landmarks this measurement reads, and the geometry between them

A balanced chin-to-philtrum relationship can make the lips and chin look better placed within the lower face.

JAW & CHIN

Chin Lower Lip Ratio

3.1816
IN RANGE

Chin-lower-lip ratio compares chin height with lower-lip height. It helps evaluate the vertical transition from the mouth to the chin. The measurement is useful for understanding lower-face support and proportion.

THIS FACE AGAINST THE COHORT

The 3 landmarks this measurement reads, and the geometry between them

Good balance between the lower lip and chin can make the mouth area look more refined and naturally supported.
