

Induced Polarization

Motivation

Minerals

Complex resistivity

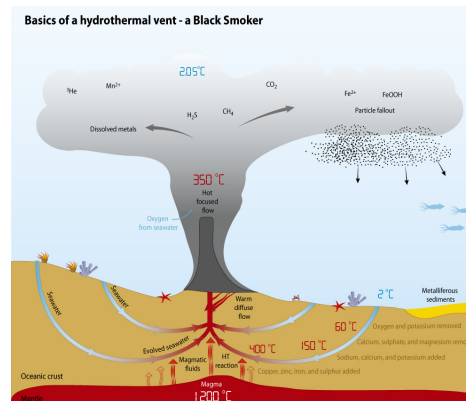

Permafrost

Geotechnical

Seafloor massive sulfide

Groundwater

Outline

- Sources of IP
- Conceptual model of IP
- Chargeability
- IP data
- Pseudosections
- Two stage DC-IP inversion
- Case history: Mt. Isa
- Example: Landfills

Induced Polarization

- Injected currents cause materials to become polarized
- Microscopic causes \rightarrow macroscopic effect
- Phenomenon is called induced polarization

	Not chargeable	Chargeable
Source (Amps)		
Potential (Volts)		

Conceptual Model of IP

Membrane polarization

Initially - neutral

Apply electric field, build up charges

Charge polarization, Electric dipole

Electrode polarization

Chargeability

Minerals at 1% Concentration in Samples

Chargeability

Minerals at 1% Concentration in Samples

Material type	Chargeability (msec.)
20% sulfides	2000 - 3000
8-20% sulfides	1000 - 2000
2-8% sulfides	500 - 1000
volcanic tuffs	300 - 800
sandstone, siltstone	100 - 500
dense volcanic rocks	100 - 500
shale	50 - 100
granite, granodiorite	10 - 50
limestone, dolomite	10 - 20

Material type	Chargeability (msec.)
ground water	0
alluvium	1 - 4
gravels	3 - 9
precambrian volcanics	8 - 20
precambrian gneisses	6 - 30
schists	5 - 20
sandstones	3 - 12

Chargeability

Initially - neutral

Apply electric field, build up charges

Charge polarization, Electric dipole

Input current

Measured voltage

IP data

- Seigel (1959):
 - Introduced chargeability: η
 - Effect reduces conductivity

$$\sigma_{\eta} = \sigma(1 - \eta) \quad \eta \in [0, 1)$$

- Theoretical chargeability data

$$d^{IP} = \frac{\phi_s}{\phi_{\eta}} = \frac{\phi_{\eta} - \phi_{\sigma}}{\phi_{\eta}}$$

- Not directly measureable

IP data: time domain

- IP decay

- IP datum

Dimensionless:

$$\eta = \phi_s / \phi_\eta$$

Value at individual time channel:

$$\phi_s(t)$$

Area under decay curve:

$$M = \frac{1}{\phi_\eta} \int_{t_1}^{t_2} \phi_s(t) dt$$

IP data: frequency domain

- Percent frequency effect:

$$PFE = 100 \left(\frac{\rho_{a2} - \rho_{a1}}{\rho_{a1}} \right)$$

ρ_{a1} : apparent resistivity at f_1

ρ_{a2} : apparent resistivity at f_2

- Phase ψ

IP data

- IP signals due to a perturbation (small change) in conductivity

$$\sigma_\eta = \sigma(1 - \eta) \quad \eta \in [0, 1)$$

- An IP datum can be written as

$$d_i^{IP} = \sum_{j=1}^M J_{ij} \eta_j \quad i = 1, \dots, N$$

$$J_{ij} = \frac{\partial \log \phi^i}{\partial \log \sigma_j} \quad \text{sensitivities for the DC resistivity problem}$$

- In matrix form

$$\mathbf{d}^{IP} = \mathbf{J}\boldsymbol{\eta}$$

J is an N×M matrix

Summary of IP data

- Time domain:
 - Theoretical chargeability (dimensionless)
 - Integrated decay time (msec)
- Frequency domain:
 - PFE (dimensionless)
 - Phase (mrad)
- For all data types: linear problem

$$\mathbf{d}^{IP} = \mathbf{J}\boldsymbol{\eta}$$

J is an N×M matrix

IP pseudosections

1) A chargeable block

- Pole-dipole; $n=1,8$; $a=10\text{m}$; $N=316$

IP pseudosections

2) A chargeable block with geologic noise

- Pole-dipole; $n=1,8$; $a=10\text{m}$; $N=316$

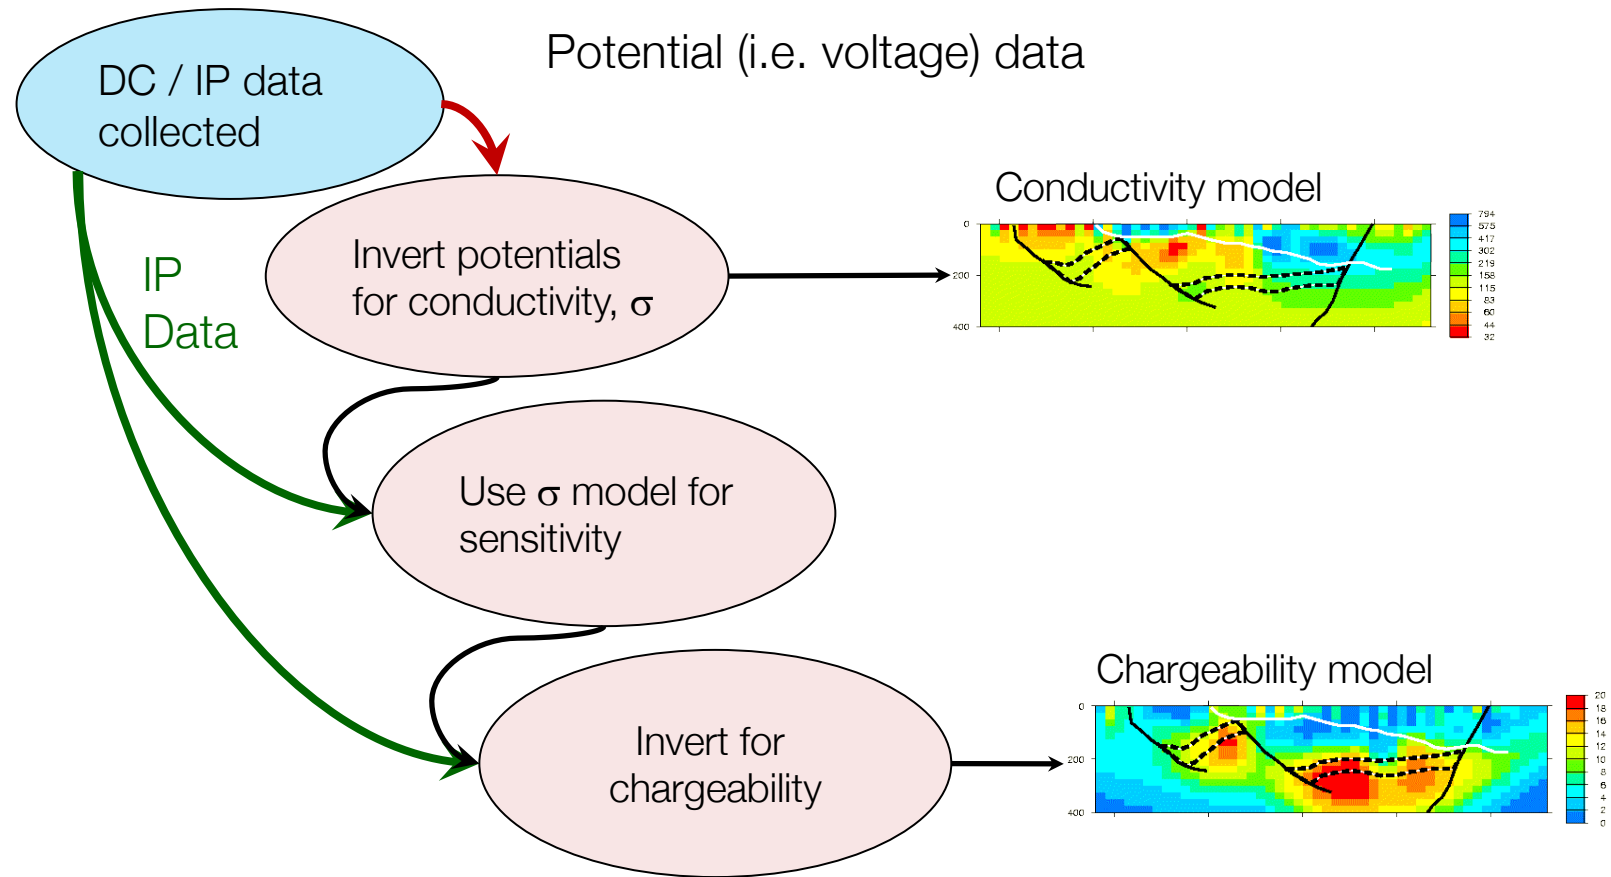

IP pseudosections

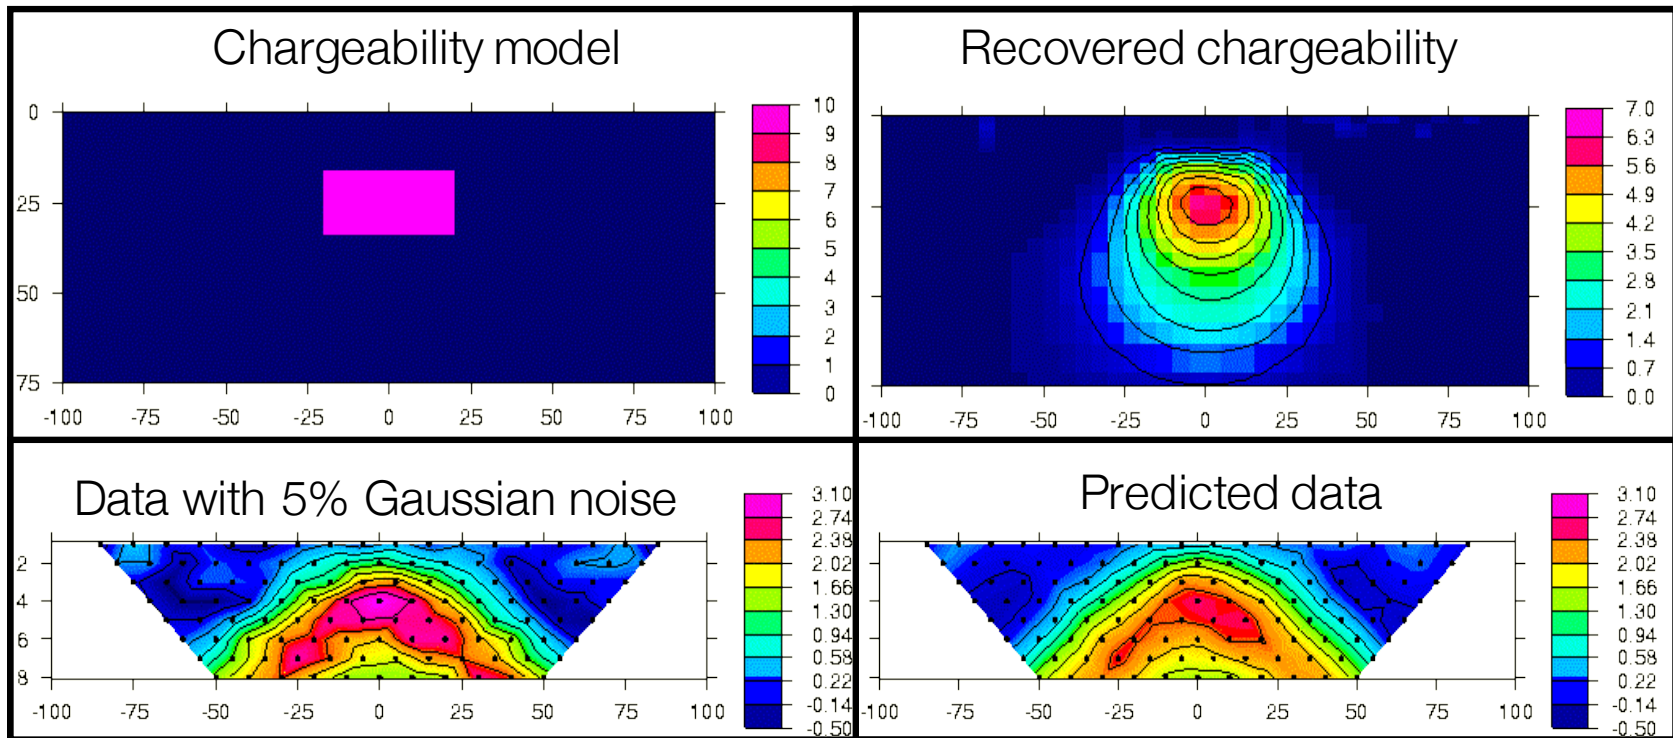

3) The “UBC-GIF model”

IP Inversion

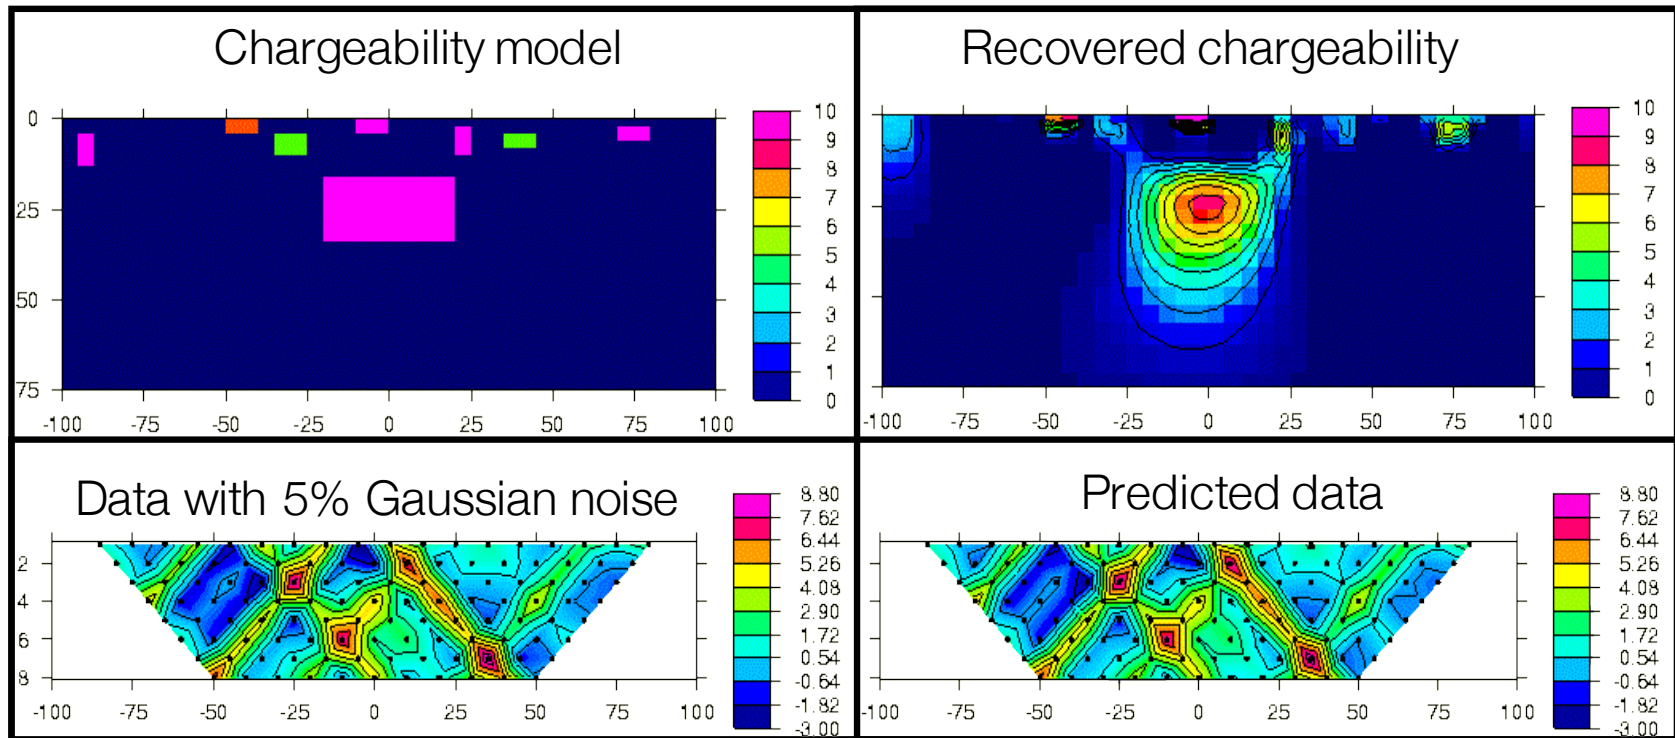

Example 1: buried prism

- Pole-dipole; $n=1,8$; $a=10\text{m}$; $N=316$; $(\alpha_s, \alpha_x, \alpha_z)=(.001, 1.0, 1.0)$

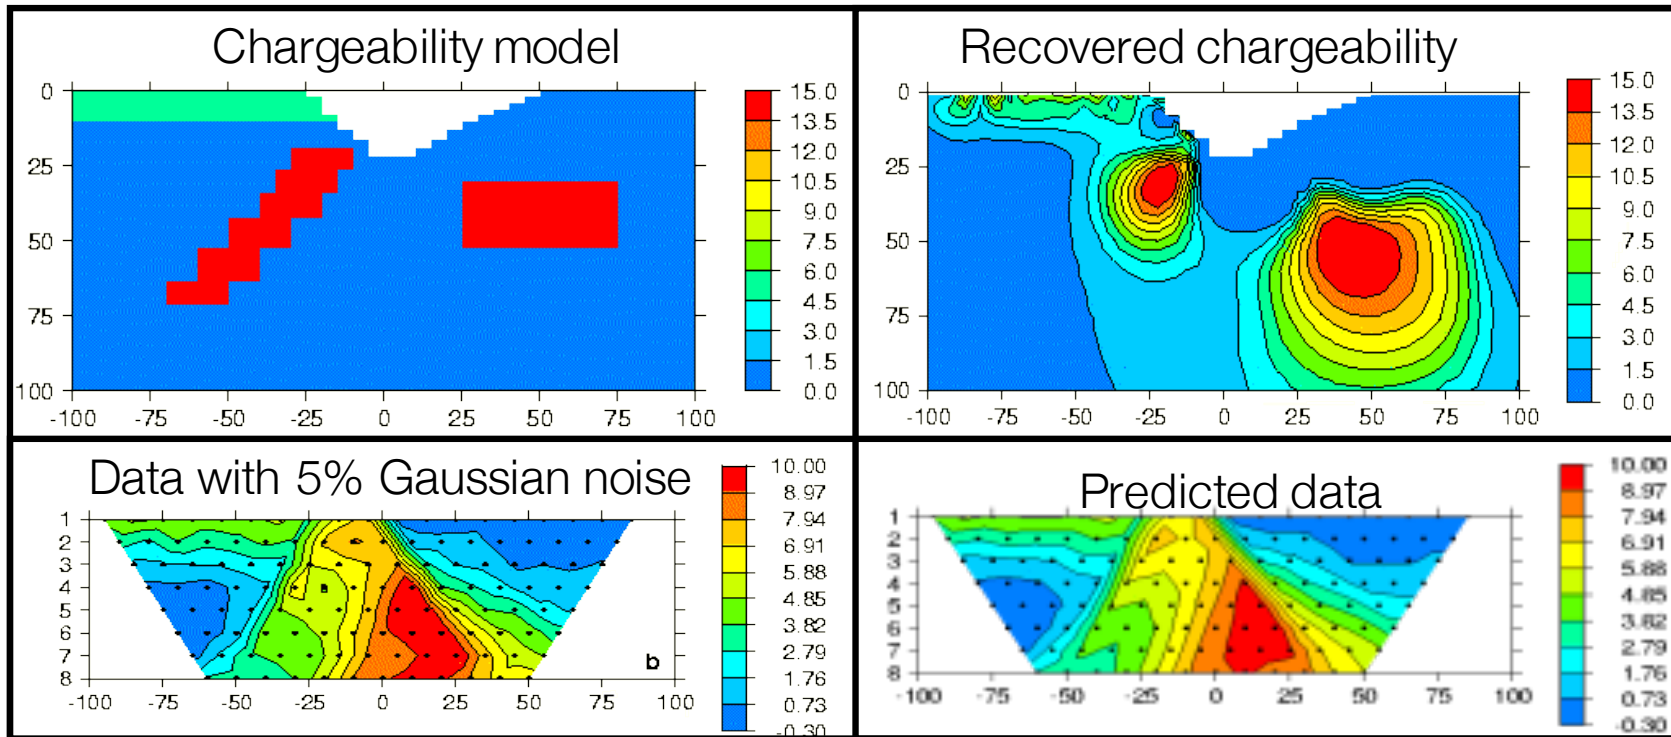

Example 2: prism with geologic noise

- Pole-dipole; $n=1,8$; $a=10\text{m}$; $N=316$; $(\alpha_s, \alpha_x, \alpha_z)=(.001, 1.0, 1.0)$

Example 3: UBC-GIF model

- Pole-dipole; $n=1,8$; $a=10\text{m}$

Induced Polarization: Summary

- Sources of IP
- Conceptual model of IP
- Chargeability
- IP data
- Pseudosections
- Two stage DC-IP inversion

- Questions

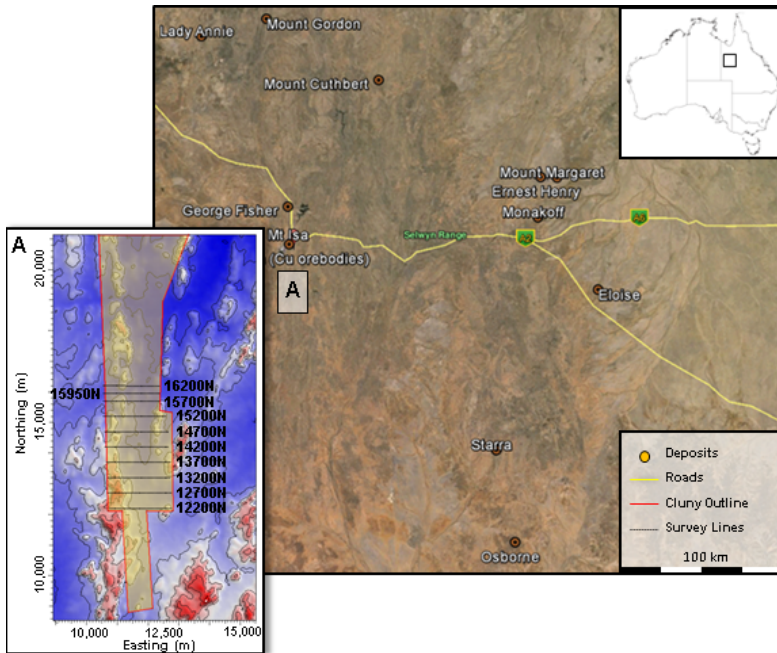

- Case history: Mt. Isa
- Example: Landfills

Case history: Mt. Isa

Rutley et al., 2001

Setup

- Mt. Isa (Cluny project)

- Geologic model

Question

- Can conductive, chargeable units, which would be potential targets within the siltstones, be identified with DC / IP data?

Properties

Geologic model

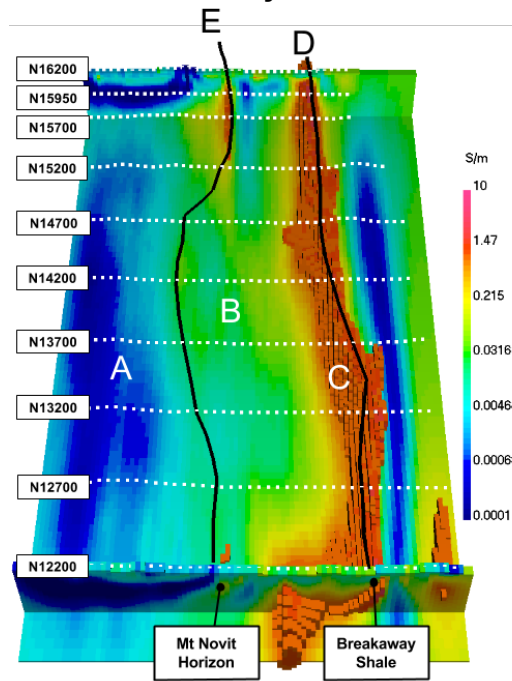

Resistivity and Chargeability

Rock Unit	Conductivity	Chargeability
Native Bee Siltstone	Moderate	Low
Moondarra Siltstone	Moderate	Low
Breakaway Shale	Very High	Low-None
Mt Novit Horizon	High	High
Surprise Creek Formation	Low	None
Eastern Creek Volcanics	Low	None

Recap: Synthesis from DC

- Identified a major conductor → black shale unit
- Some indication of a moderate conductor

3D resistivity model

Geologic section

Resistivity section

Can a **chargeable**, moderate conductor in the siltstones be identified?

Survey and data

- Eight survey lines
- Two configurations

Apparent chargeability, dipole- pole.

Surface topography

Processing

3D chargeability model

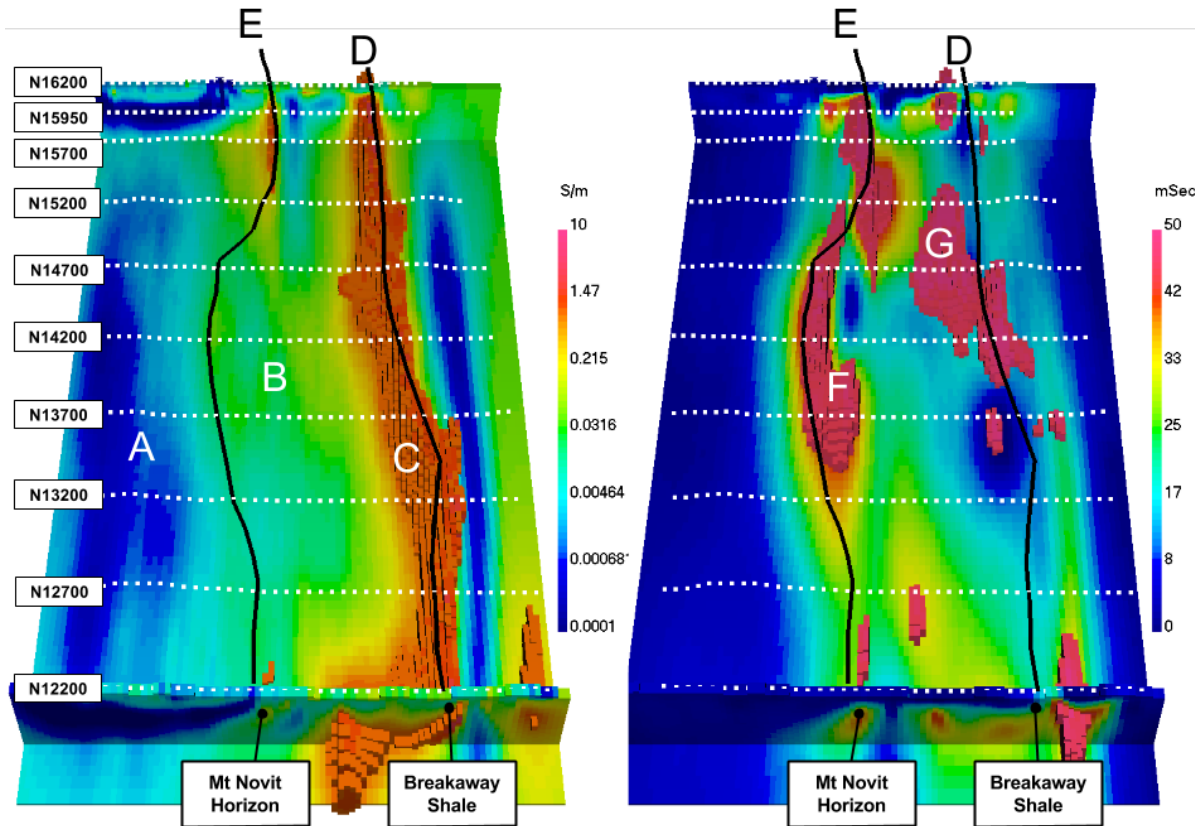

Animation

Interpretation

Resistivity model

Chargeability model

A: Resistive, Non-chargeable

B: Moderate conductivity; low chargeability

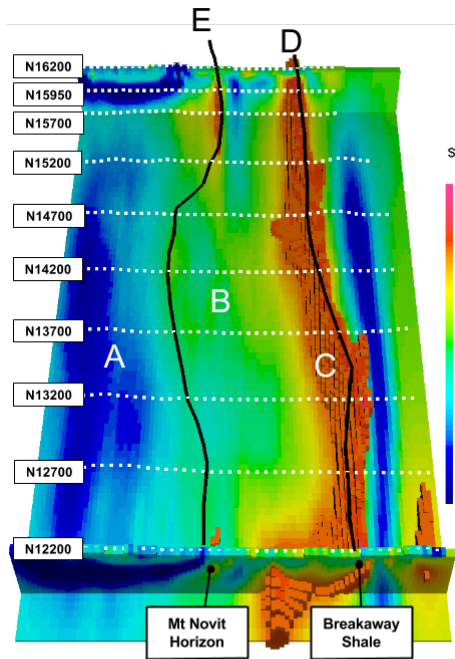

C: Very high conductivity (> 10 S/m)

E and F: High conductivity and high chargeability

G: Other chargeable regions

Synthesis

Resistivity model

Chargeability model

A: Surprise Creek Formation
– Resistive, non-chargeable

B: Moondarra and Native Bee siltstones

C: Breakaway Shales
– Very high conductivity

E and F: Mt Novit Horizon
– High conductivity and high chargeability

G: Other chargeable regions within siltstone complex

Geologic section

Resistivity section

Induced Polarization: Summary

- Sources of IP
- Conceptual model of IP
- Chargeability
- IP data
- Pseudosections
- Two stage DC-IP inversion
- Case history: Mt. Isa

- Questions

- Example: Landfills

IP over Landfills

Landfills: Hazards and Goals

- Pollutants
 - Toxic leachates (mercury, arsenic, cadmium, lead, PVC, solvents)
- Concerns
 - Health
 - Water contamination
 - Construction hazard
 - Devalues property
- Goals
 - Locate abandoned landfills
 - Assess size
 - Characterize the waste
 - Monitor reclamation

Nearmont and Congress landfills, Tucson, Arizona

Tucson city limits and regional landfills

Physical Properties

Waste Type	Description	Resistivity	Susceptible	Chargeable
Electronic/ Technological	Metallic objects, heavy metals in solution	Low	Yes	Yes
Construction Debris	Wood, cement, iron rebar, wall board, asbestos, glass, plastics	High	Frequently	Weakly
Earth Materials	Clays, various fill	Low/Moderate	Occasionally	Yes
Green waste	trees, wood clippings etc	Variable	No	Weakly

Traditional Landfill Surveys

Magnetic

DC Resistivity

Near-Surface Electromagnetic

- Most popular surveys have limited success
- IP might be a better diagnostic
- Responsive to: metallic debris, green waste, organic matter, some construction materials

Ryan Airfield (Eastern Pit)

- Waste material: Mixed solid waste (MSW)
- Observations:
 - Resistivity not correlated with pit margins (non-diagnostic)
 - Chargeability (IP) correlates well with historical pit margins (diagnostic)

Ryan Airfield (Western Pit)

- Waste material: Construction / demolition
- Observations:
 - Waste correlates with region of high resistivity
 - Waste correlates with chargeable region (significant IP anomaly).

Resistivity

Resistive waste
within landfill

Chargeability

IP correlates with
landfill

Dipole-dipole ($a=7.5\text{ft}$, $n=0.5-6$)

Ryan Airfield (Composite)

Chargeability isosurface

- Waste material:
 - MSW and construction / demolition
- Observations:
 - Well locations picked with aim of **not** intercepting waste
 - Verified by drilling

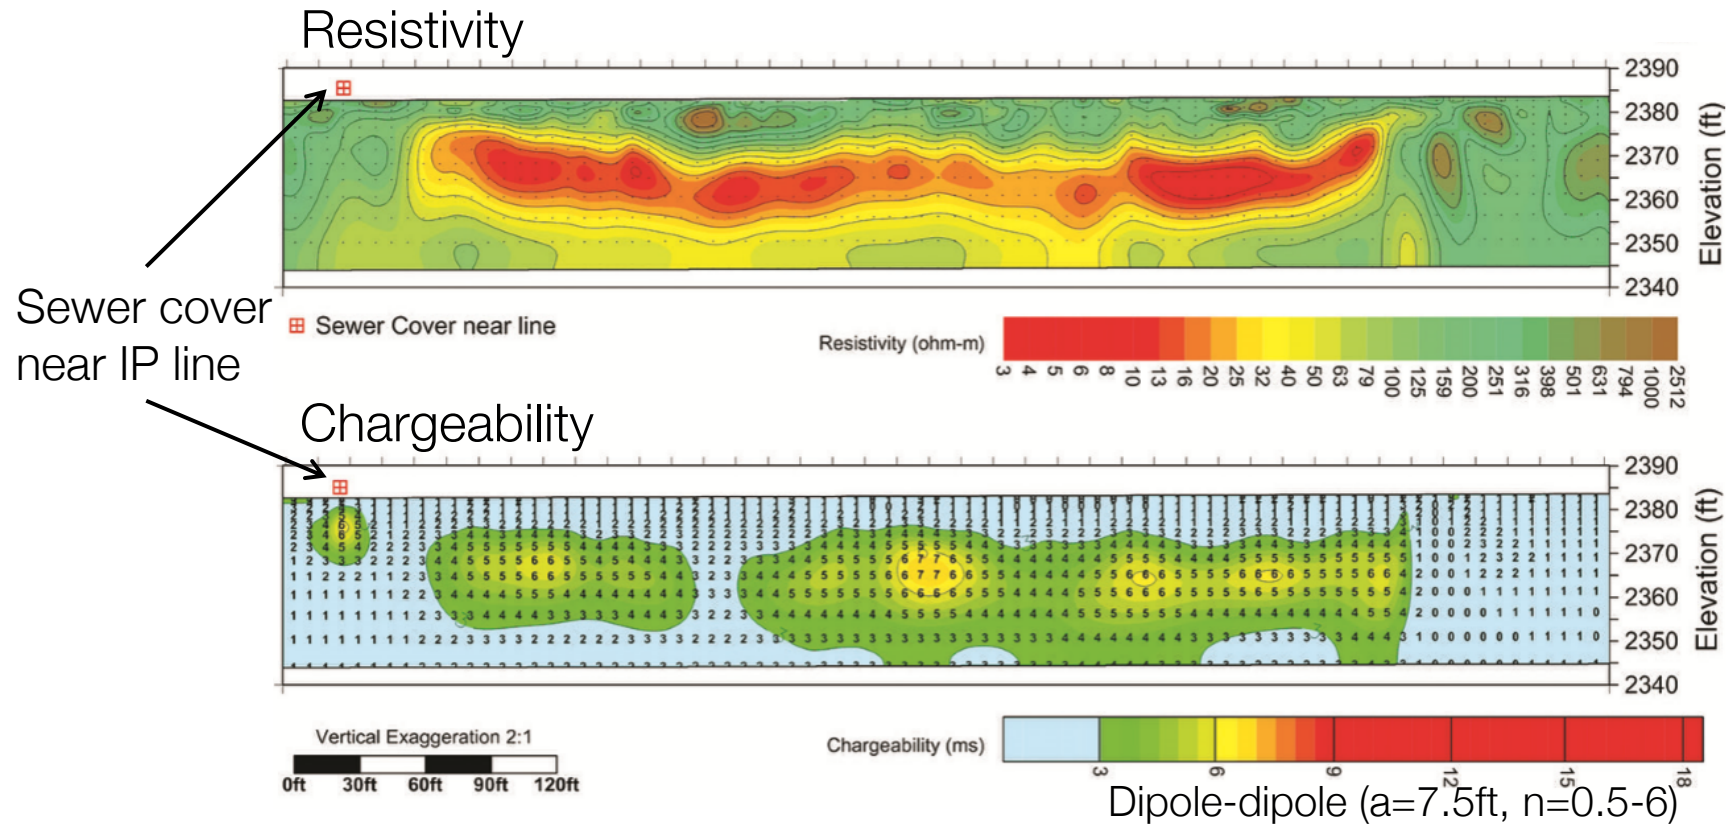

Tumamoc Landfill

- Waste material: Construction / demolition
- Observations:
 - Low resistivity down-gradient from waste → likely conductive leachate
 - Low resistivity and IP offset from one another
 - IP falls within historic landfill boundaries

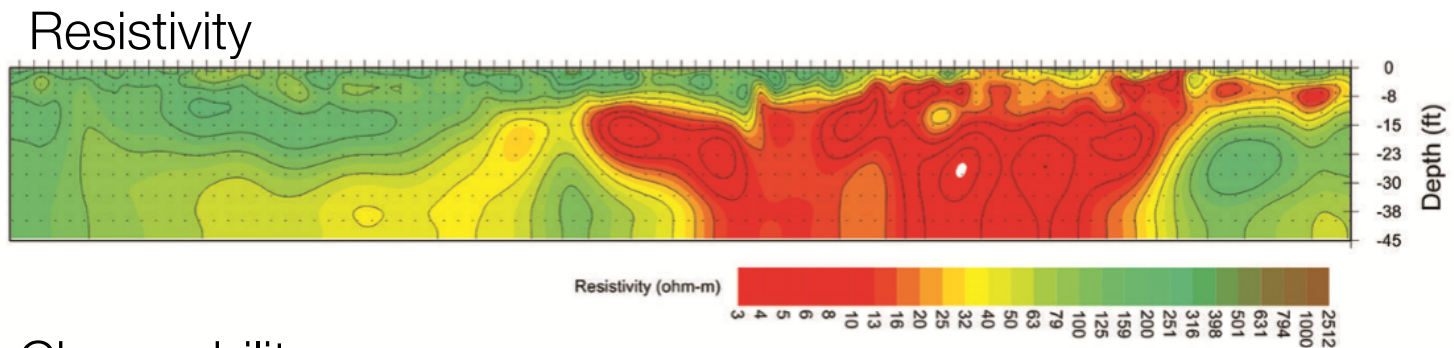

Tucson region: Organic material

- Waste material: green-waste, trees, clippings
- Observations:
 - Resistivity low
 - Weak but elevated IP signature

Nearmont Landfill

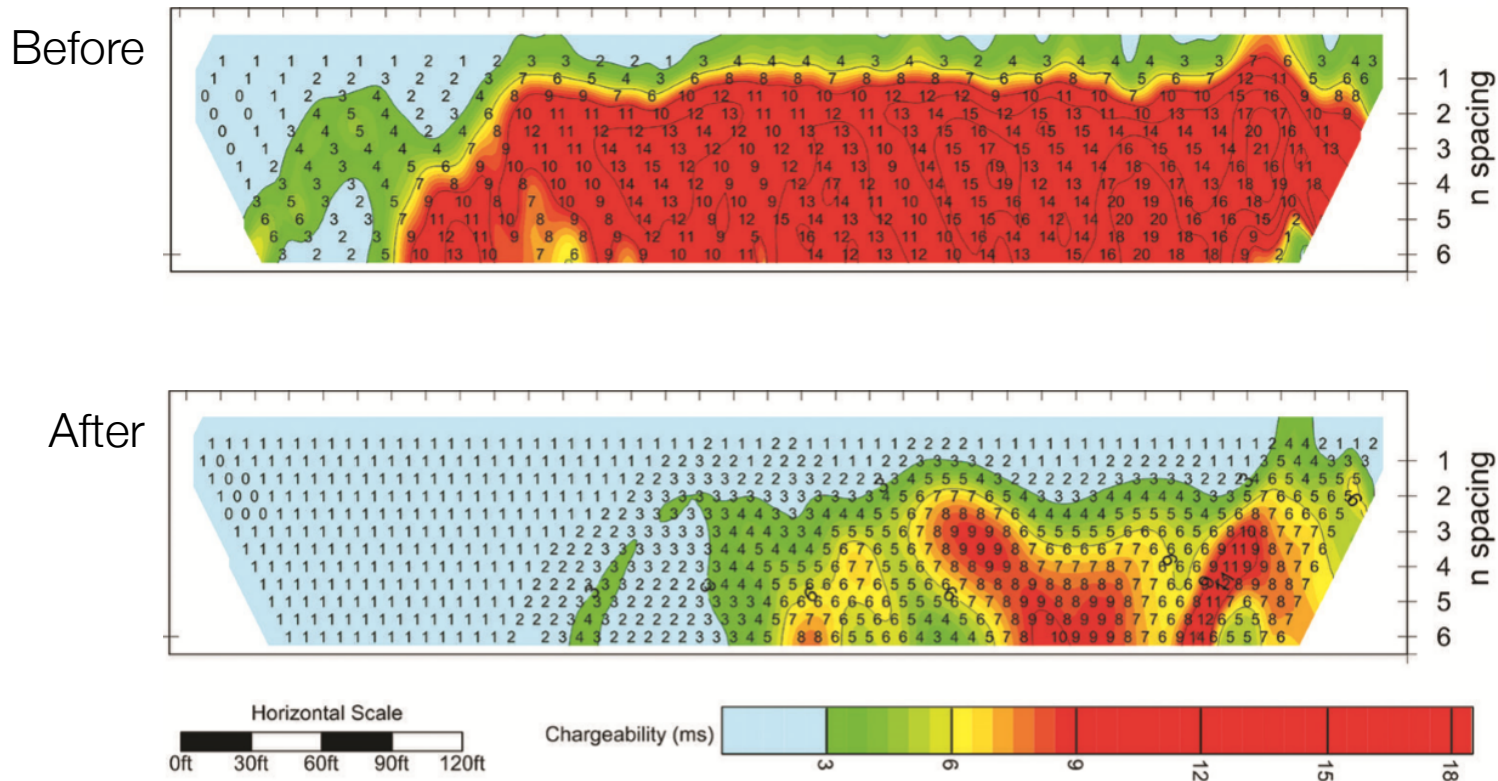

- Waste material: Municipal solid waste (MSW)
- Observations:
 - low resistivity + high IP (ideal “fingerprint”)
 - MSW waste confirmed with drilling

Dipole-dipole ($a=7.5\text{ft}$, $n=0.5-6$)

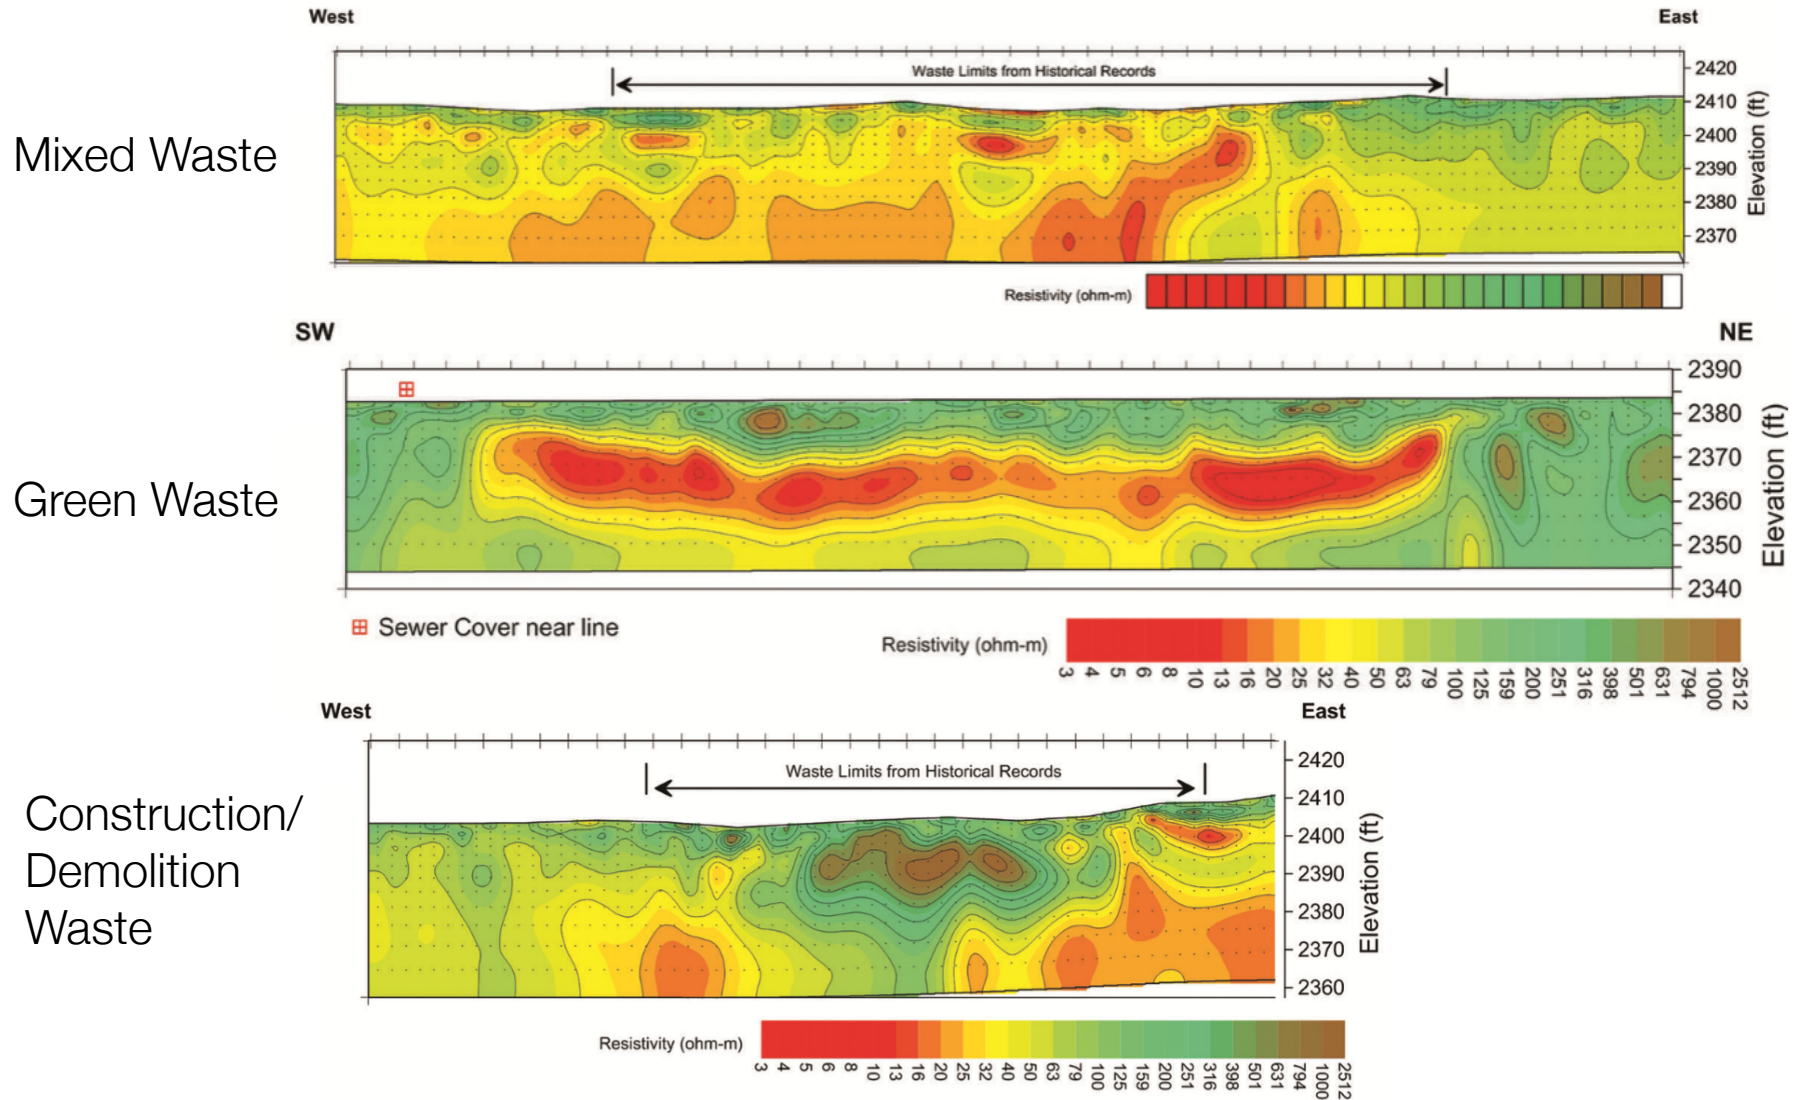

Example: Landfill Monitoring

- Waste material: municipal solid waste (MSW)
- Surveys:
 - 2003: IP survey
 - 2003-2007: 4 year biodegradation program
 - 2009: Repeat IP survey
- Observations:
 - Reduction in IP anomaly indicates the effectiveness of biodegradation

Summary

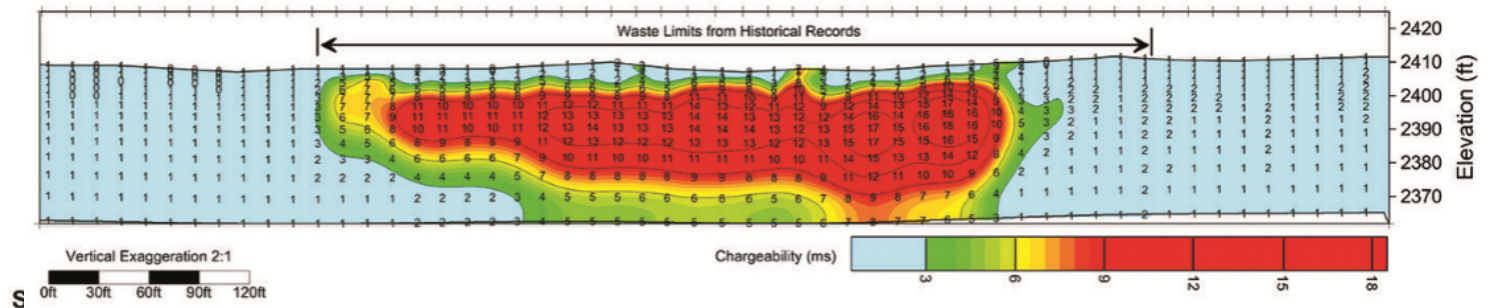

- Resistivity may not be a good indicator of waste

Summary

- Chargeability may be a more consistent indicator of waste

Mixed Waste

Green Waste

Construction/
Demolition
Waste

End of IP
