

# DC for Opal Exploration

Coober Pedy, South Australia

Eureka Minerals, AMG Surveys, ZZ Resistivity

Matthew Hutchens

# The Setup

Flat Terrain,  
Horizontal Layering,  
50x100 & 100x200 Claims

Overlying units include  
Russo Beds - 'biscuit'  
Silcrete - 'green death'

Opal is mined from Bulldog Shale,  
known locally as 'sandstone', with  
'good sandstone' hosting opal  
-along & near structures or 'slips'  
-as replacement of bio features  
(shells, burrows)  
'bad sandstone' & 'blue ground'  
are not considered as prospective

~20m

# Physical Properties

**Not well known (other resistivity survey inversion results)**

**Relatively...**

**Silcrete – High Resistivity**

**Russo Beds – Low Resistivity**

**Bulldog Shale – Very Low Resistivity**

**Opal Bearing Structure - ???**

# Surveys

Type – DC/EM

DC Survey – ZZ Resistivity  
64 channel 'Full Waveform'  
3m spaced electrodes  
25 x ~180m lines in 10 days  
ZZ array & Dipole-Dipole

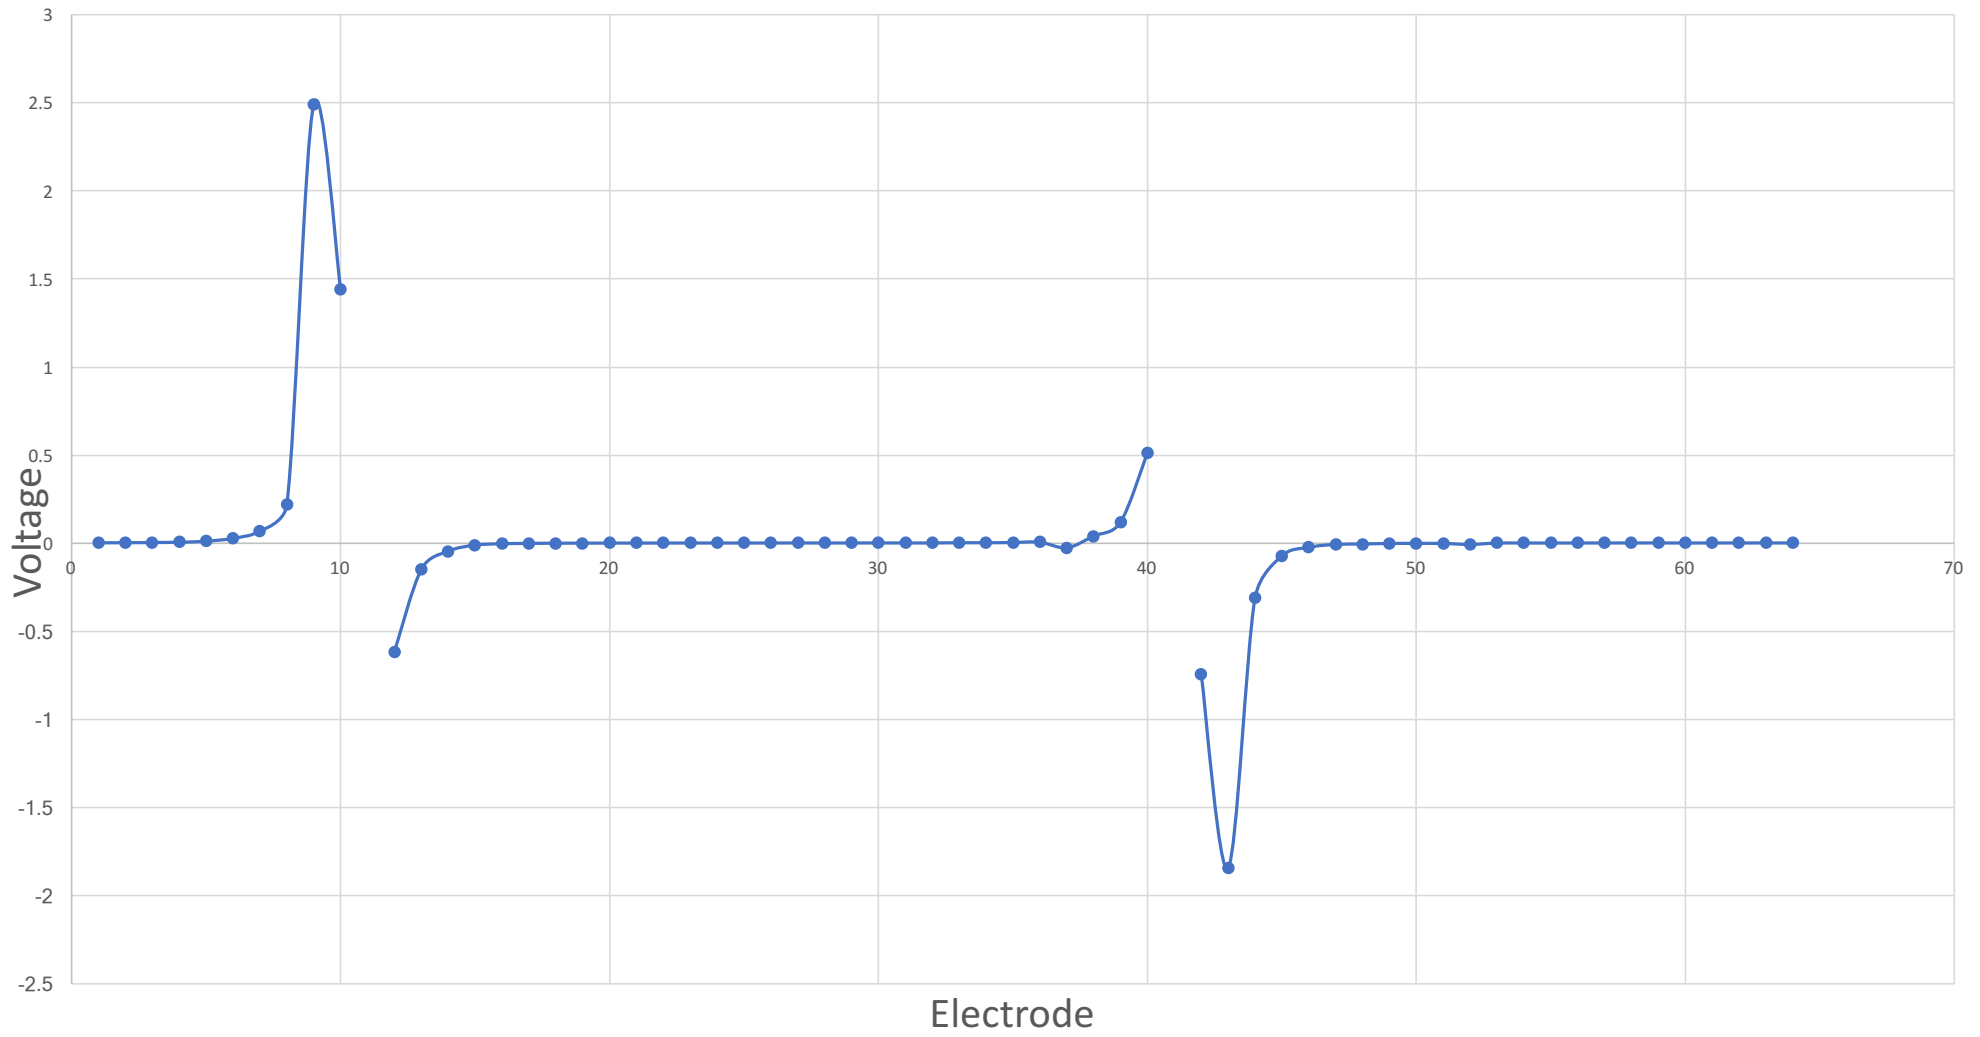

# Data & Processing

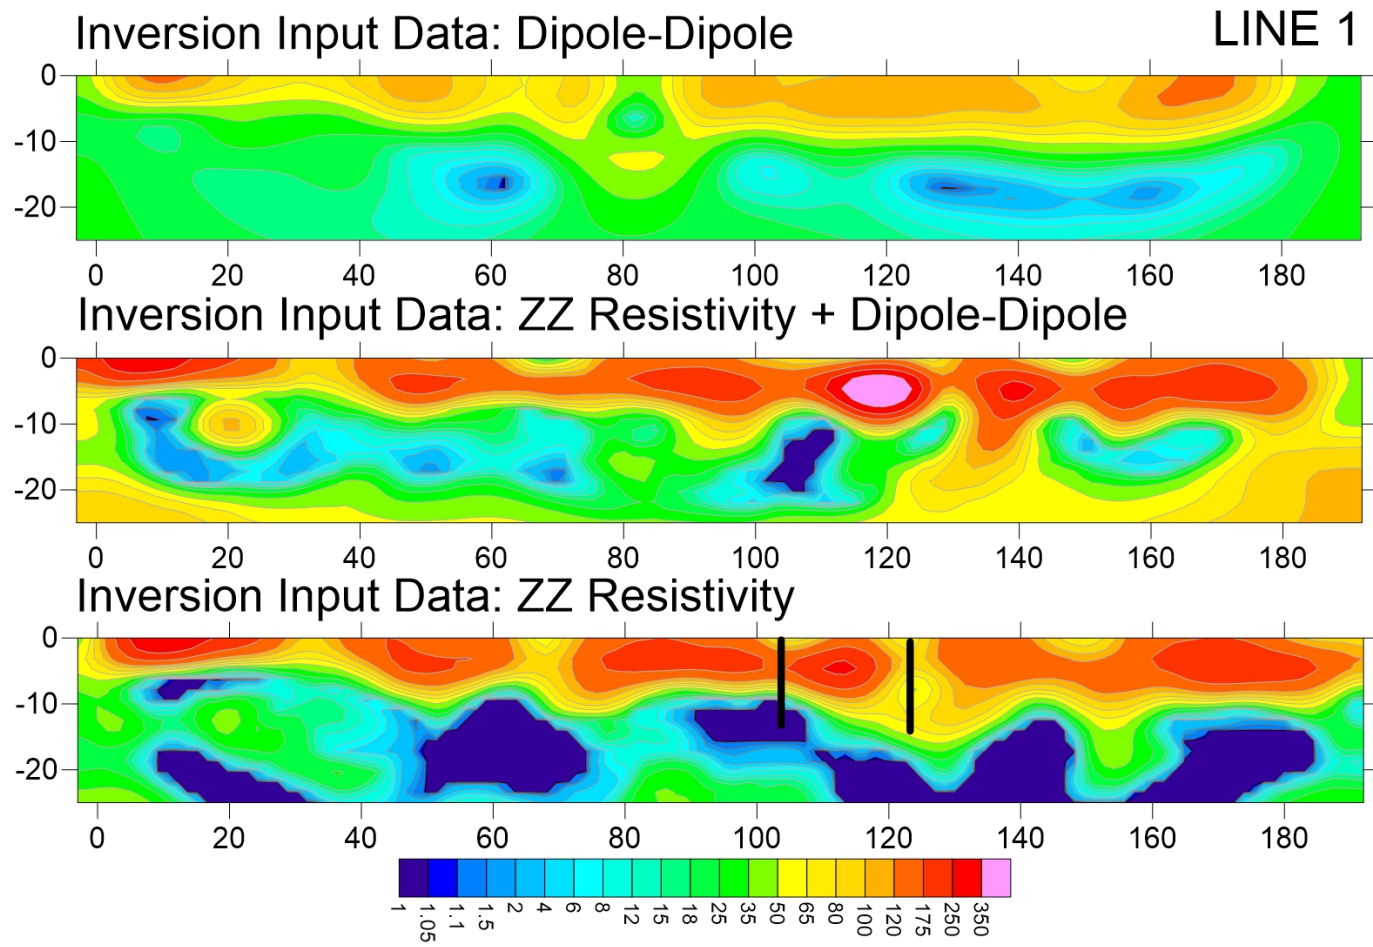

- Data were processed and inverted on a line by line basis using ZZ Resistivity Software
- The Inversion Results were then plotted as sections using a custom colour scale
- Sections presented in 2D & 3D

Single Reading 'Full Waveform'

# Interpretation

Spot1 - Line 4 : Y=60  
Version 2

# Synthesis

- The inversion results match observed geology
- Apparent relationship between resistivity and quality of sandstone
- Results similar to but not exactly the same as previous survey
- Did we solve the problem?
  - Apparent guide to prospective areas
  - Need to feed geological information back in
- Would like to try 3D modelling existing data
- Would like to re-survey with many more array types and geometries
- Would like to collect data at 1.5m electrode spacing on rolling lines
