### **EM** Fundamentals

# Motivation: applications difficult for DC

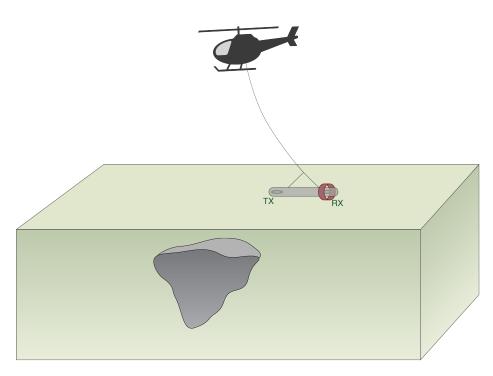

# Outline

- Basic Survey
- Ampere's and Faraday's Laws (2-coil App)
- Circuit model for EM induction
- Frequency and time domain data
- Sphere in homogeneous earth
- Cyl code
- Energy losses in the ground

#### • Setup:

transmitter and receiver are in a towed bird

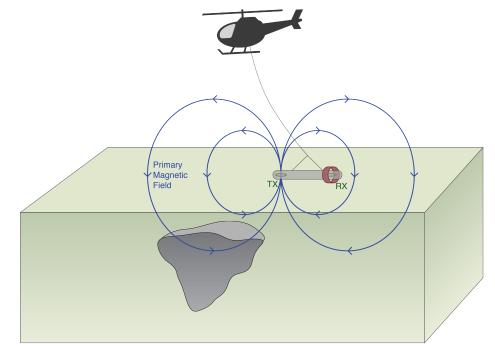

#### • Setup:

 transmitter and receiver are in a towed bird

#### • Primary:

 Transmitter produces a primary magnetic field

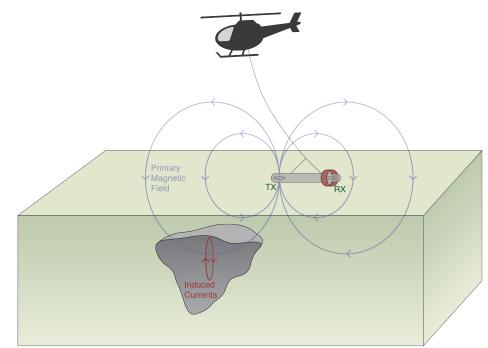

#### • Setup:

- transmitter and receiver are in a towed bird
- Primary:
  - Transmitter produces a primary magnetic field

#### • Induced Currents:

 Time varying magnetic fields generate electric fields everywhere and currents in conductors

#### • Setup:

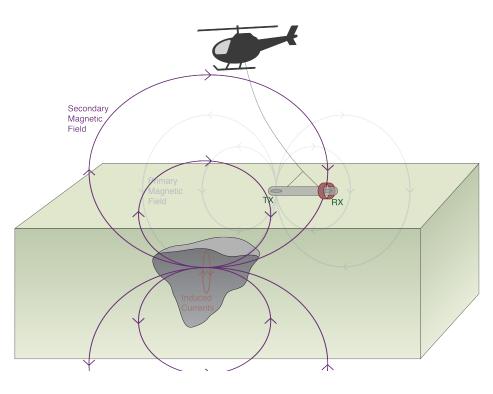

- transmitter and receiver are in a towed bird
- Primary:
  - Transmitter produces a primary magnetic field

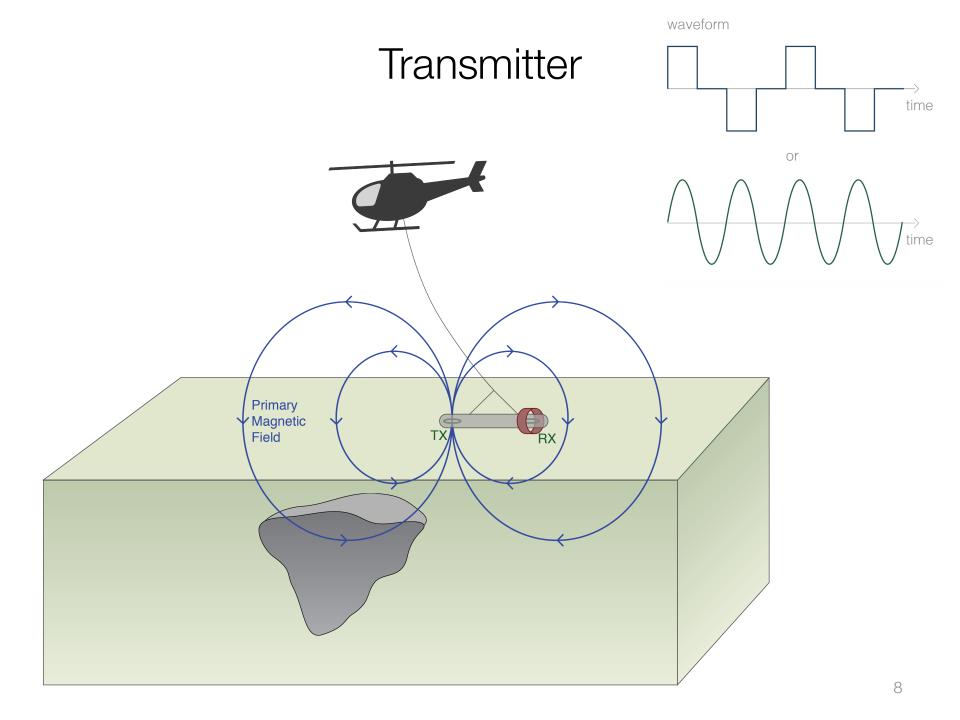

#### • Induced Currents:

 Time varying magnetic fields generate electric fields everywhere and currents in conductors

#### Secondary Fields:

 The induced currents produce a secondary magnetic field.

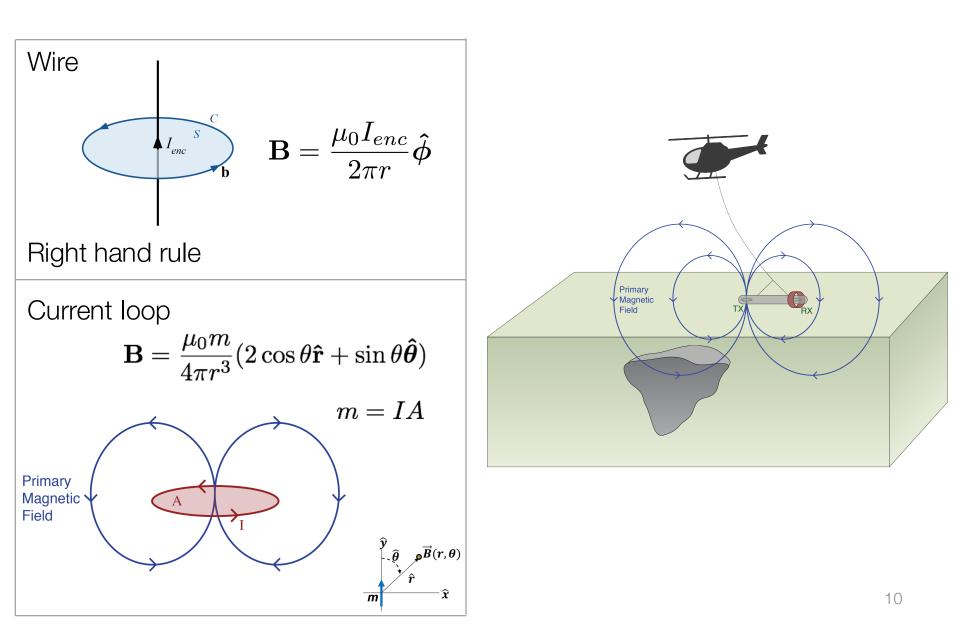

### Basic Equations: Quasi-static

	Time	
Faraday's Law	$\nabla \times \mathbf{e} = -\frac{\partial \mathbf{b}}{\partial t}$	$ abla  imes {f E} = -i\omega {f B}$
Ampere's Law	$ abla  imes \mathbf{h} = \mathbf{j} + \frac{\partial \mathbf{d}}{\partial t}$	$ abla  imes \mathbf{H} = \mathbf{J} + i\omega \mathbf{D}$
No Magnetic Monopoles	$\nabla \cdot \mathbf{b} = 0$	$\nabla \cdot \mathbf{B} = 0$
Constitutive Relationships (non-dispersive)	$\mathbf{j} = \sigma \mathbf{e}$ $\mathbf{b} = \mu \mathbf{h}$ $\mathbf{d} = \varepsilon \mathbf{e}$	$J = \sigma \mathbf{E}$ $\mathbf{B} = \mu \mathbf{H}$ $\mathbf{D} = \varepsilon \mathbf{E}$

\* Solve with sources and boundary conditions

### Ampere's Law $\nabla \times \mathbf{H} = \mathbf{J}$

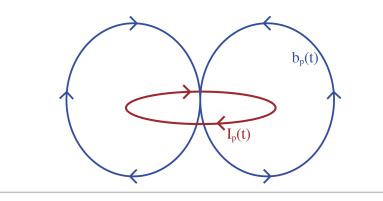

### Faraday's Law and Induced Currents

# Two Coil Example: Harmonic

Source (red loop)

Time varying current → Time varying magnetic flux

Faraday's Law

$$abla imes \mathbf{e} = -\frac{\partial \mathbf{b}}{\partial t}$$

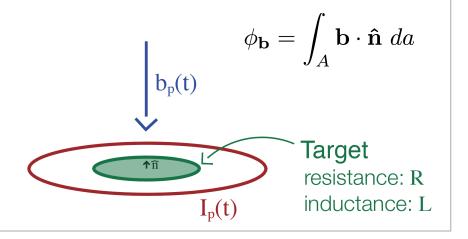

าโ

Ohm's Law

$$\mathbf{j} = \sigma \mathbf{e}$$

Target (green loop)

• Time varying magnetic flux

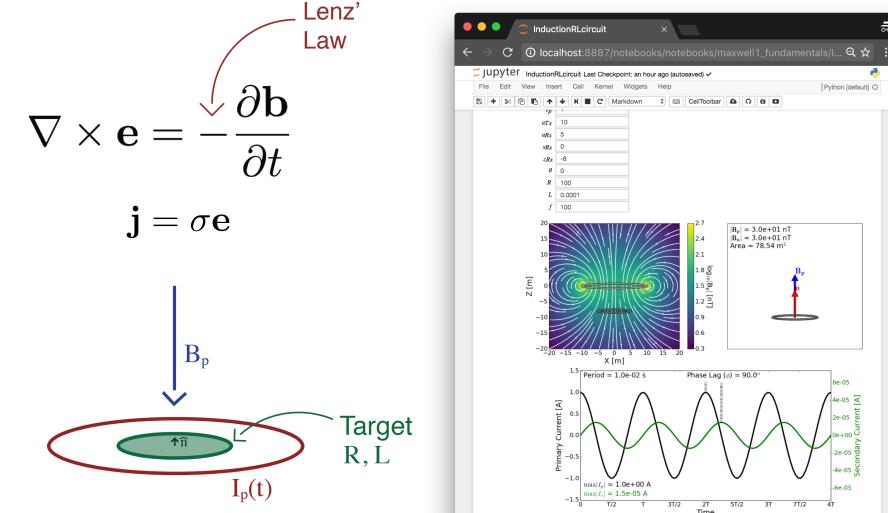

**EMF** (voltage) is related to time rate of change in flux.

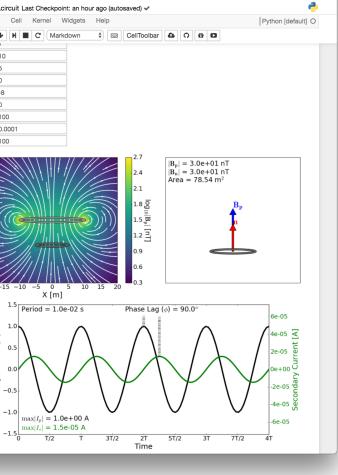

V

$$V = EMF = -\frac{d\phi_{\mathbf{b}}}{dt}$$

R

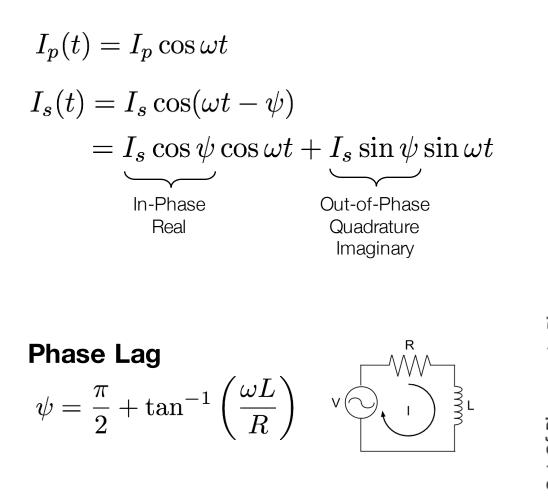

### App for Faraday's Law

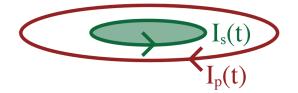

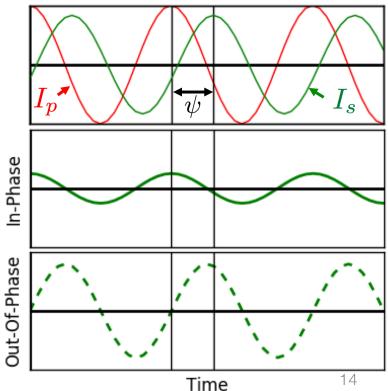

### Two Coil Example: Harmonic

#### **Induced Currents**

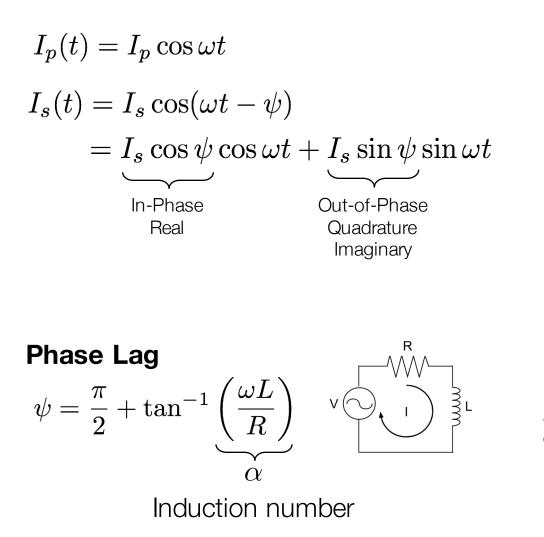

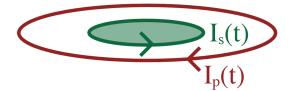

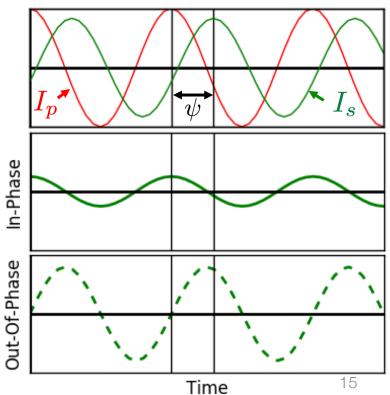

### Two Coil Example: Harmonic

#### **Induced Currents**

# **Response Function**

- Quantifies how a target responds to a time varying magnetic field
- Partitions real and imaginary parts

 $\omega L$ 

R

 $\alpha =$ 

1.0

0.8

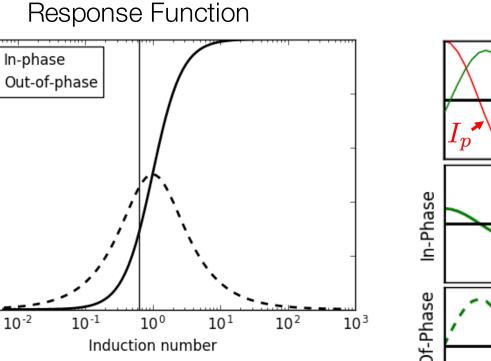

0.6

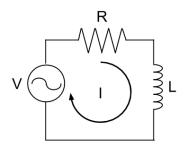

0.4

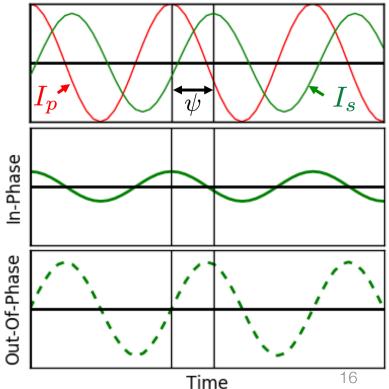

0.2

0.0 L 10<sup>-3</sup>

Harmonic response

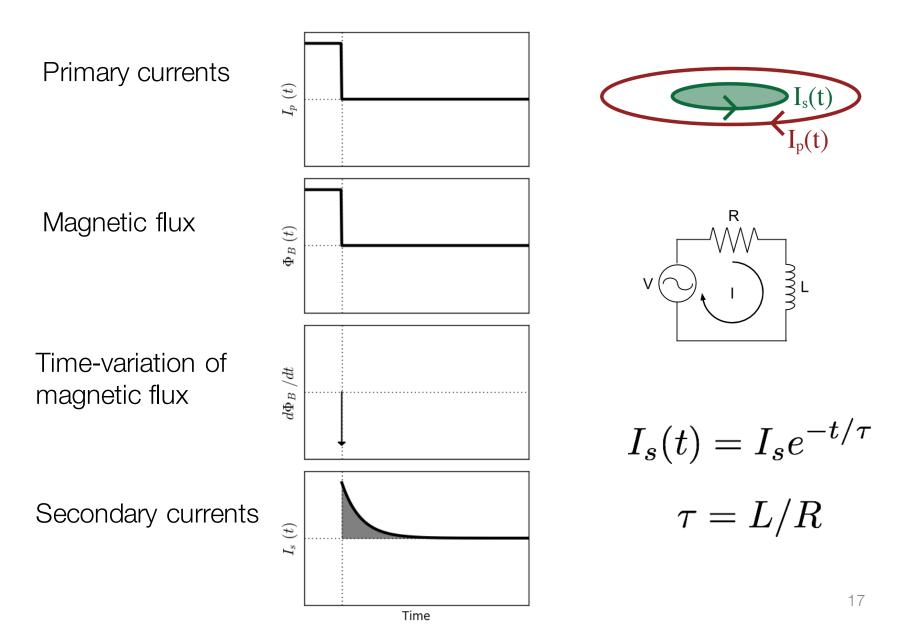

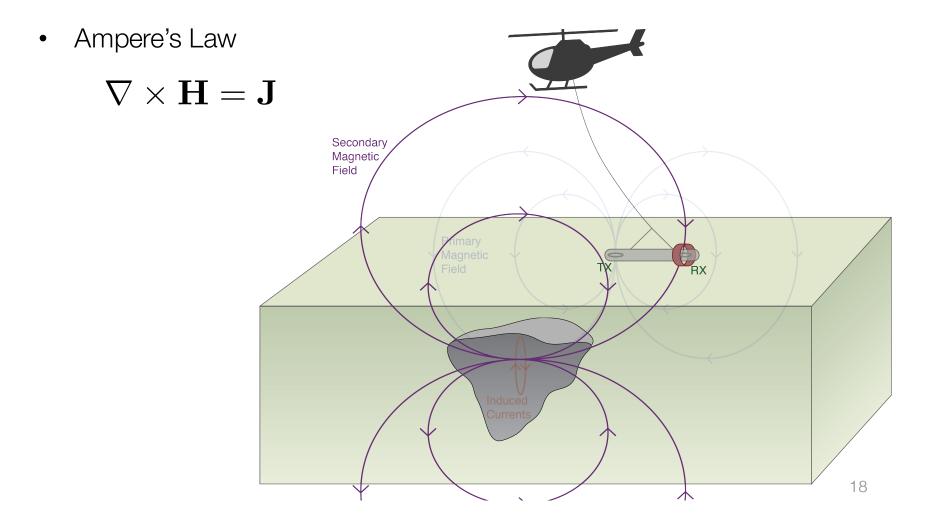

### Two Coil Example: Transient

TDEM

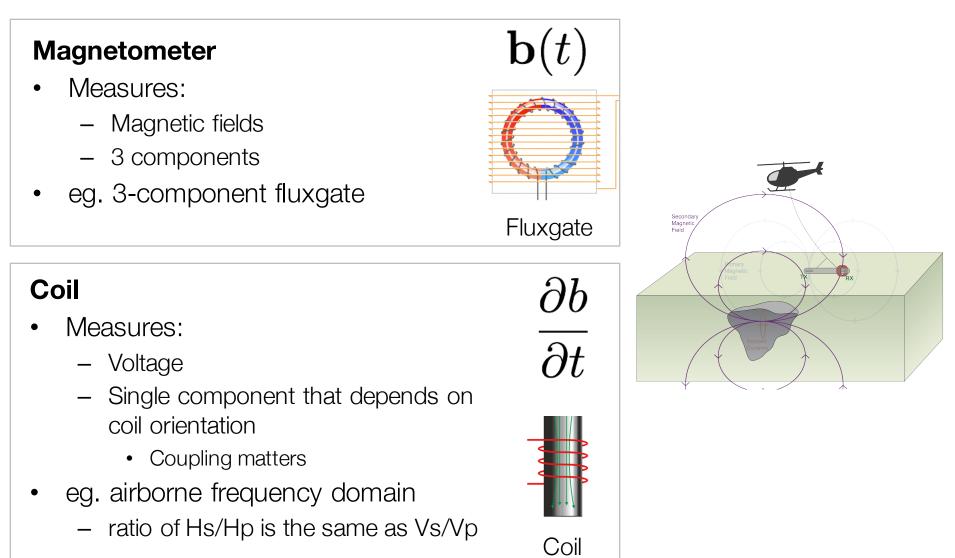

### Secondary magnetic fields

Induced currents generate magnetic fields

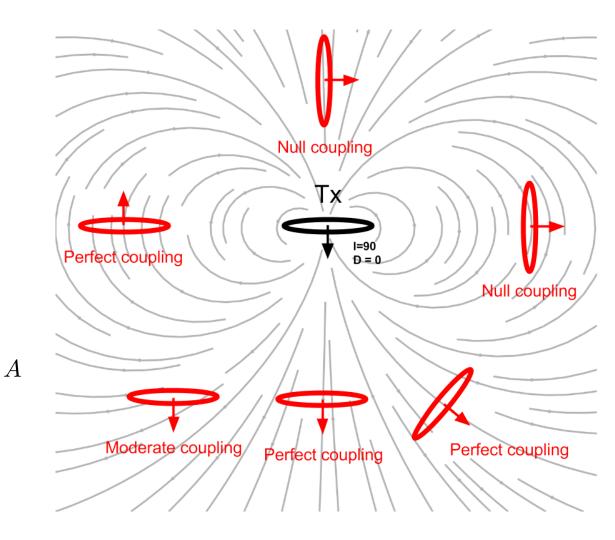

# Receiver and Data

# Coupling

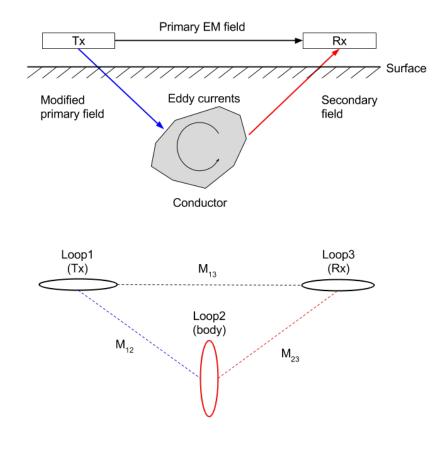

- Transmitter: Primary  $I_p(t) = I_p \cos(\omega t)$  $\mathbf{B}_p(t) \sim I_p \cos(\omega t)$
- Target: Secondary

$$EMF = -\frac{\partial \phi_{\mathbf{B}}}{\partial t}$$
$$= -\frac{\partial}{\partial t} \left( \mathbf{B}_{p} \cdot \hat{\mathbf{n}} \right)$$

# Circuit model of EM induction

Coupling coefficient

• Depends on geometry

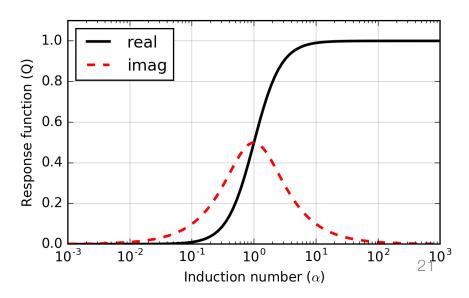

$$M_{12} = \frac{\mu_0}{4\pi} \oint \oint \frac{dl_1 \cdot dl_2}{|\mathbf{r} - \mathbf{r}'|^2}.$$

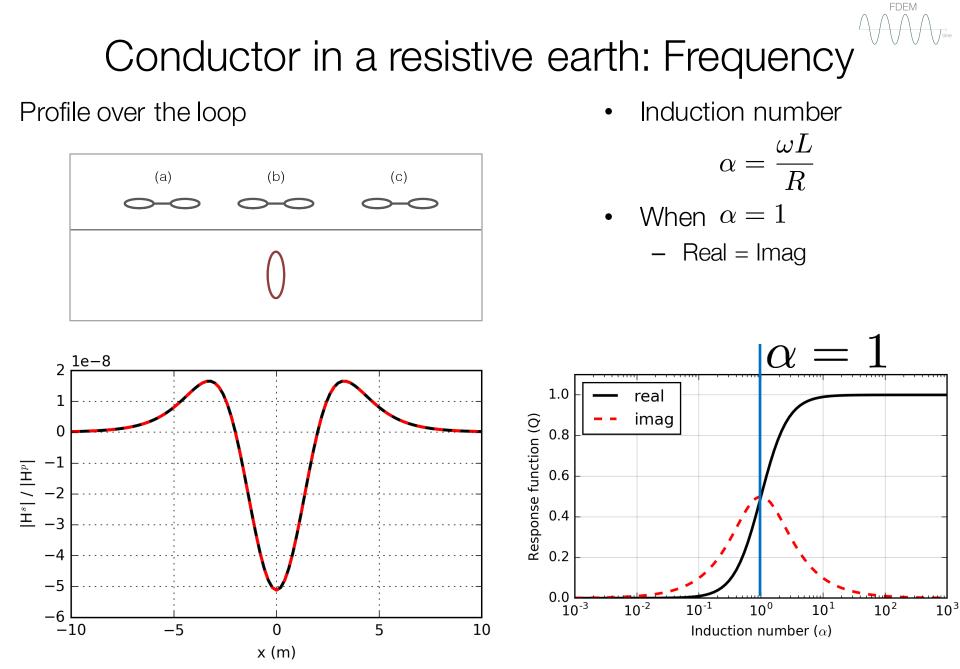

Magnetic field at the receiver

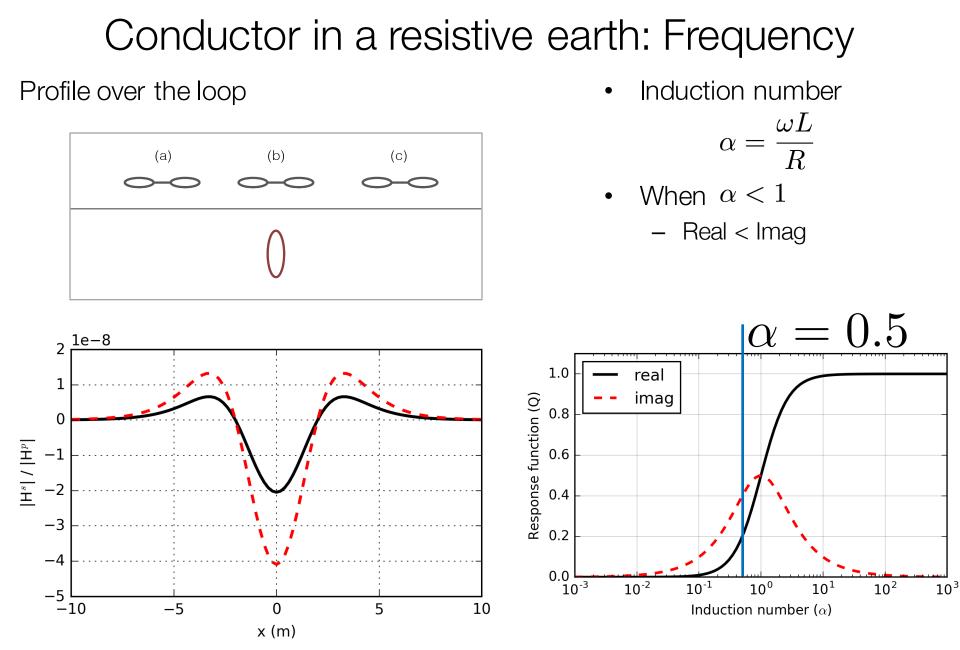

$$\frac{H^s}{H^p} = -\frac{M_{12}M_{23}}{M_{13}L} \underbrace{\left[\frac{\alpha^2 + i\alpha}{1 + \alpha^2}\right]}_Q$$

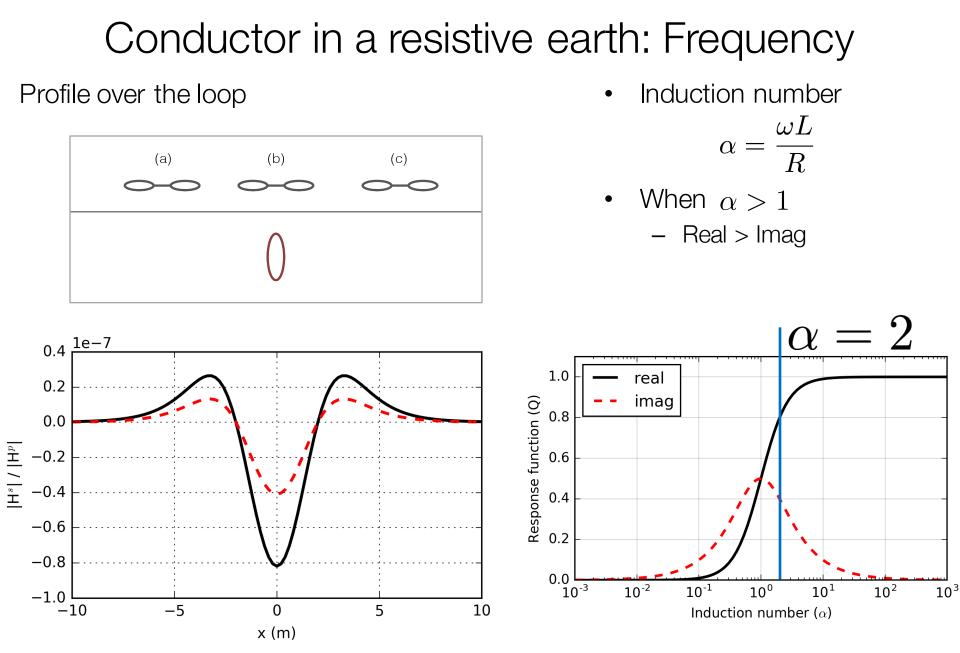

Induction Number

• Depends on properties  $\alpha = \frac{\omega L}{R}$  of target

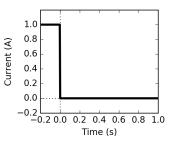

### Conductor in a resistive earth: Transient

#### (b) (a) (C) 0.4 <u>le-6</u> 0.2 0.0 -0.2db/dt (V) $\iota_2$ -0.4-0.6-0.8-1.0 $\mathcal{T}$ ()-1.2∟ -10 -5 5 10 0 x (m)

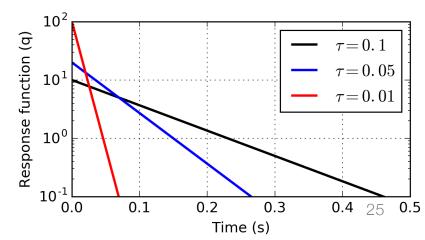

Profile over the loop

- Time constant  $\tau = L/R$
- Step-off current in Tx

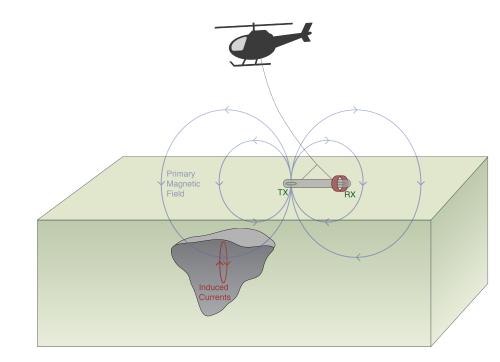

• Response function depends on time, au

$$q(t) = e^{-t/\tau}$$

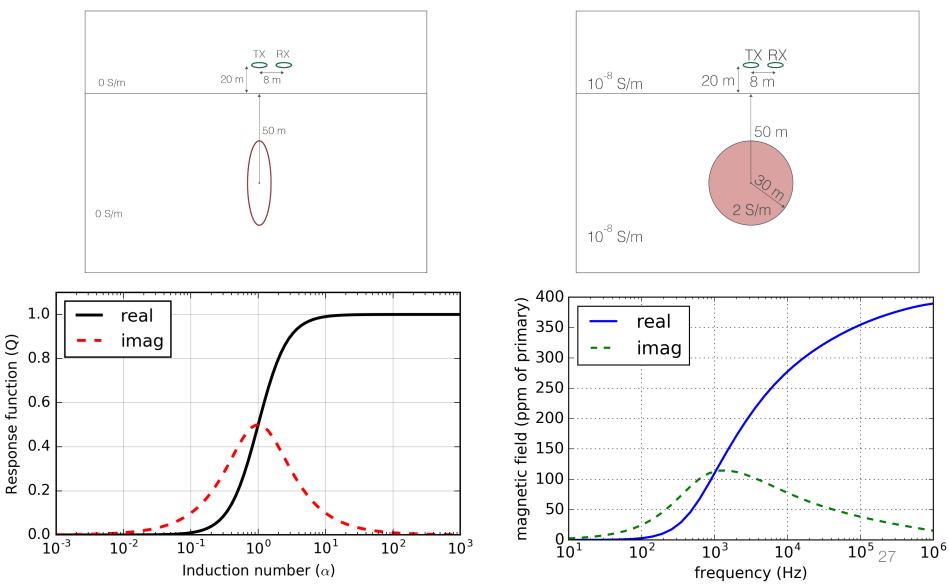

### Recap: what have we learned?

- Basics of EM induction
- Response functions
- Mutual coupling
- Data for frequency or time
   domain systems
- Circuit model provides
   representative results
  - Applicable to geologic targets?

### Sphere in a resistive background

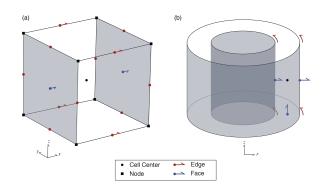

How representative is a circuit model?

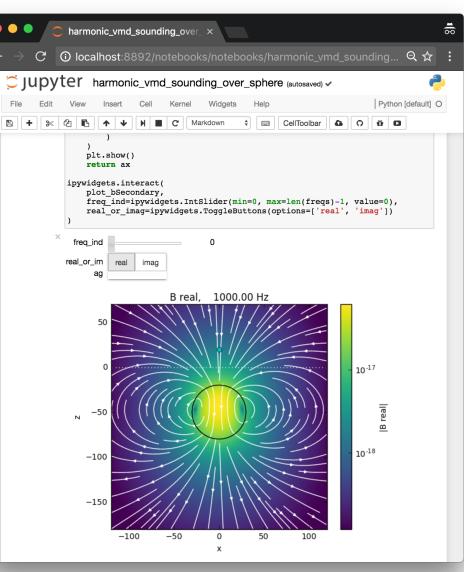

# Cyl Code

- Finite Volume EM
  - Frequency and Time

- Built on SimPEG
- Open source, available at: <u>http://em.geosci.xyz/apps.html</u>

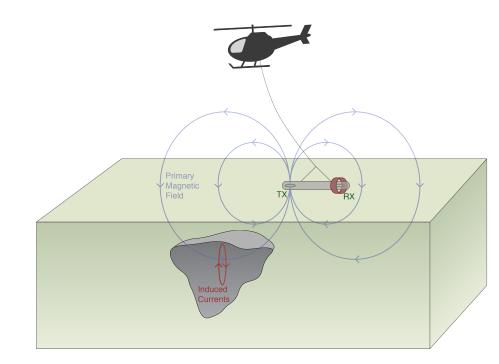

### Recap: what have we learned?

- Basics of EM induction
- Response functions
- Mutual coupling
- Data for frequency or time
   domain systems
- Circuit model is a good proxy

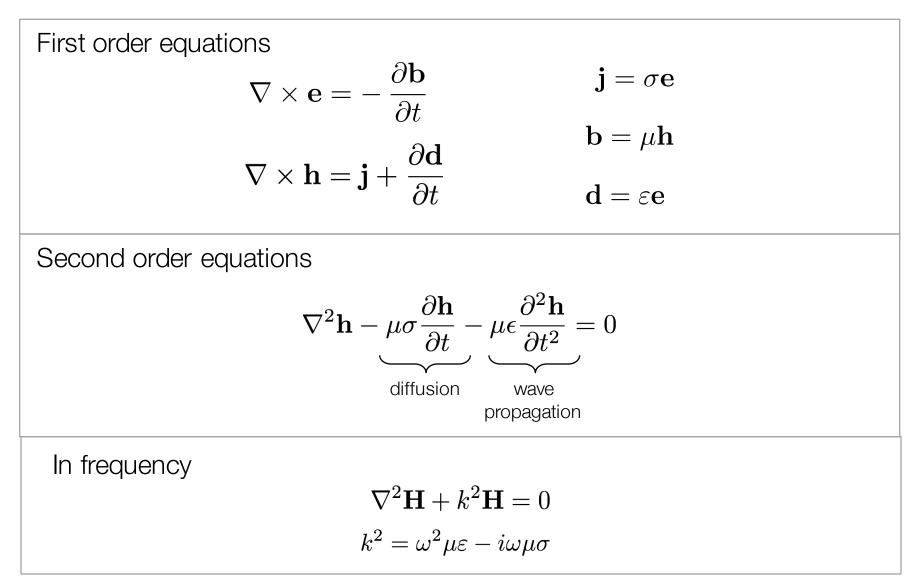

Major item not yet accounted for...

- Propagation of energy from
  - Transmitter to target
  - Target to receiver

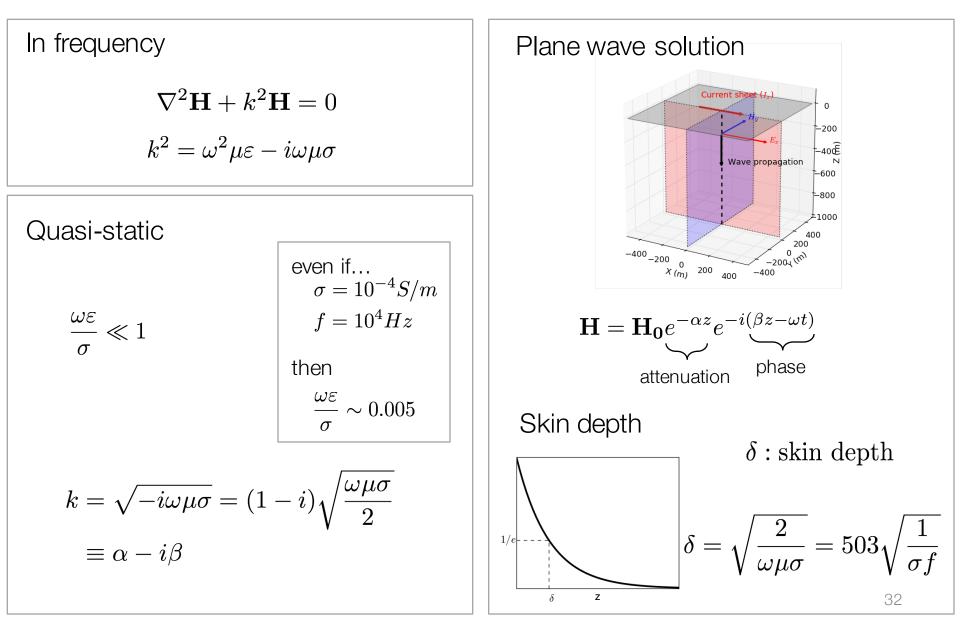

# How do EM fields and fluxes behave in a conductive background?

### Revisit Maxwell's equations

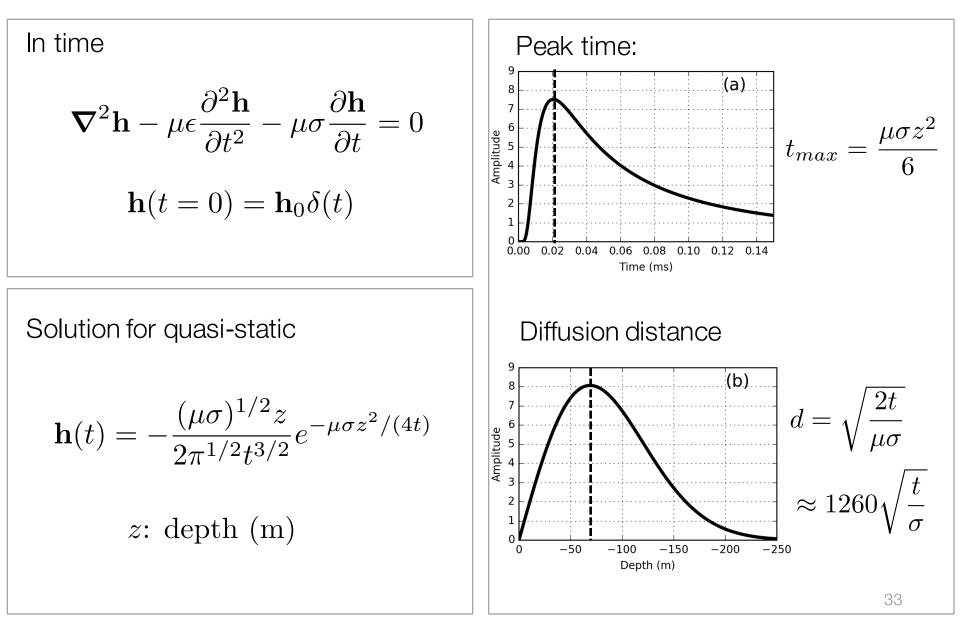

\* Same equation holds for E

### Plane waves in a homogeneous media

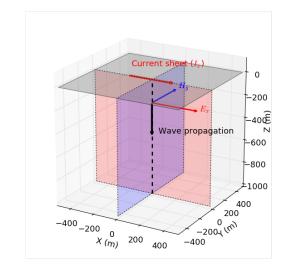

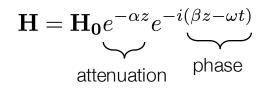

### Plane waves in a homogeneous media

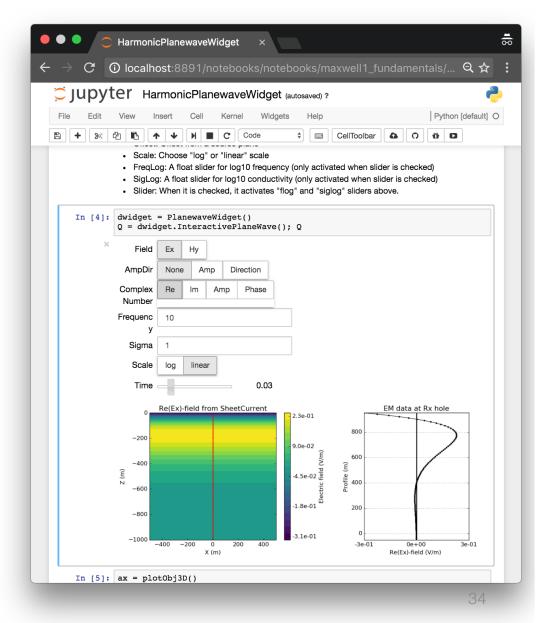

### Frequency Domain App: Plane waves

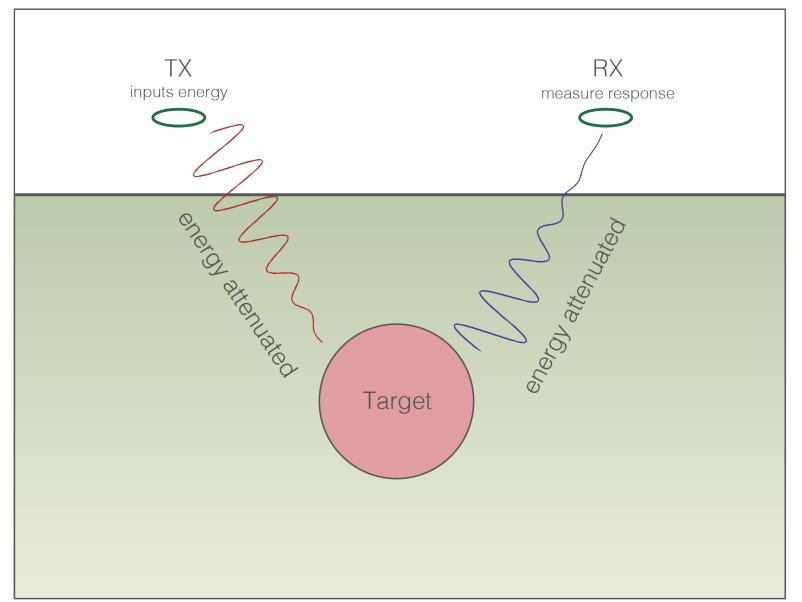

Plane wave

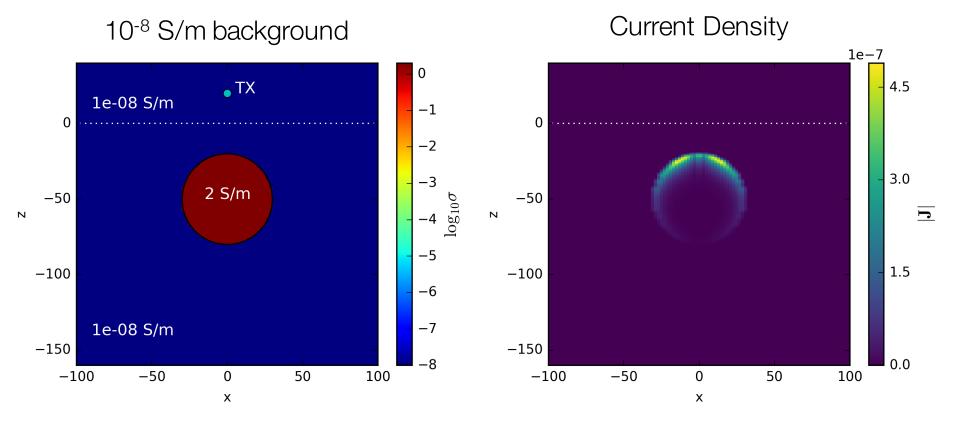

### Effects of background resistivity

### Effects of background resistivity: Frequency

- Buried, conductive sphere
- Vary background conductivity
- Frequency: 10<sup>4</sup> Hz

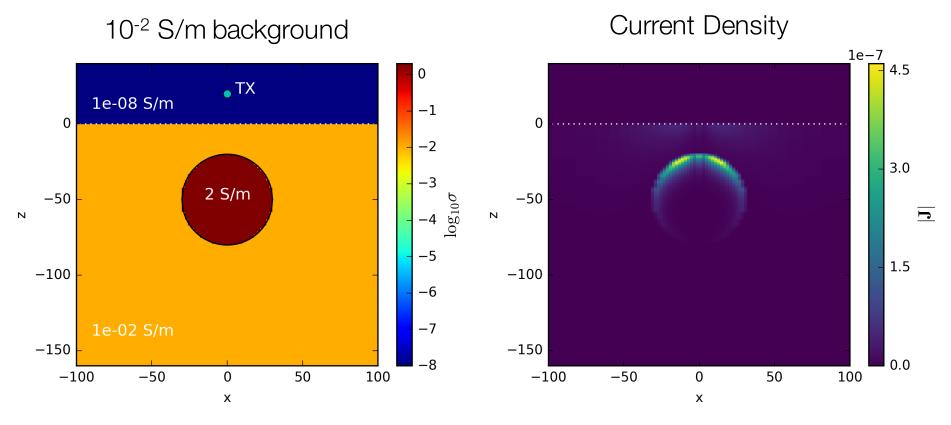

٠

- Buried, conductive sphere
- Vary background conductivity

Frequency: 10<sup>4</sup> Hz

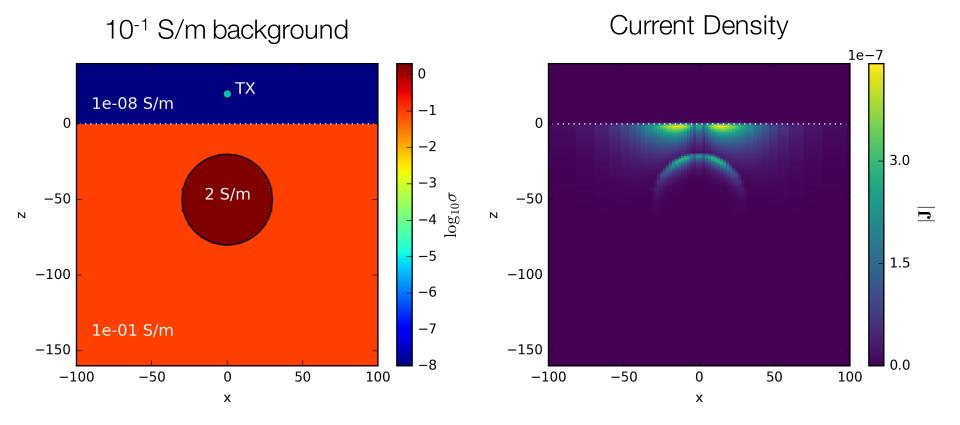

37

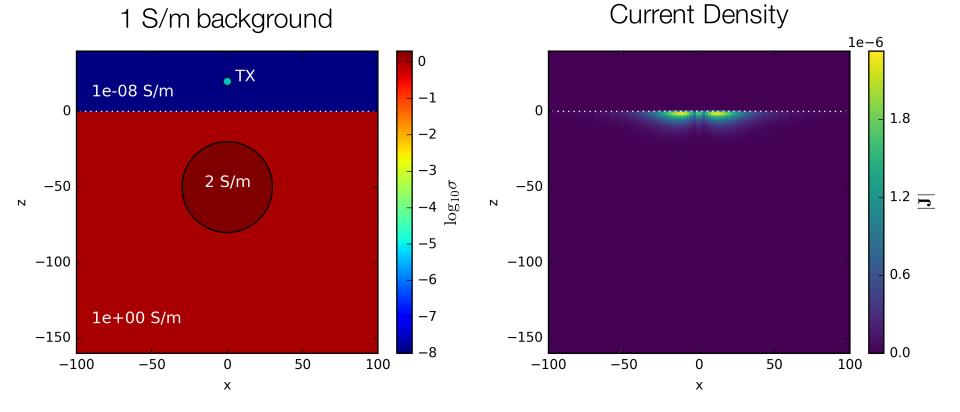

- Buried, conductive sphere
- Vary background conductivity
- Frequency: 10<sup>4</sup> Hz

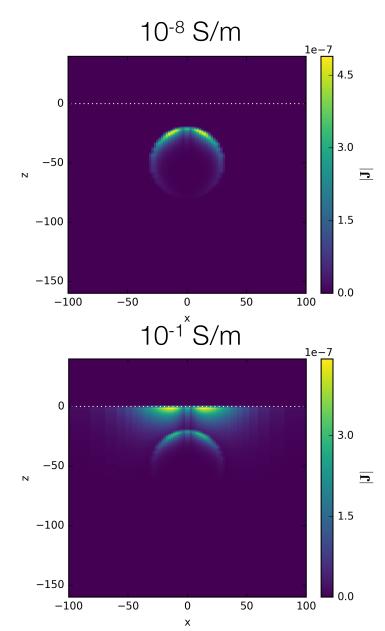

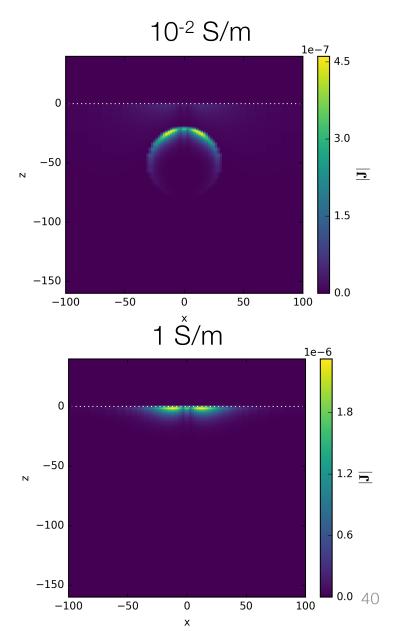

- Buried, conductive sphere
- Vary background conductivity
- Frequency: 10<sup>4</sup> Hz

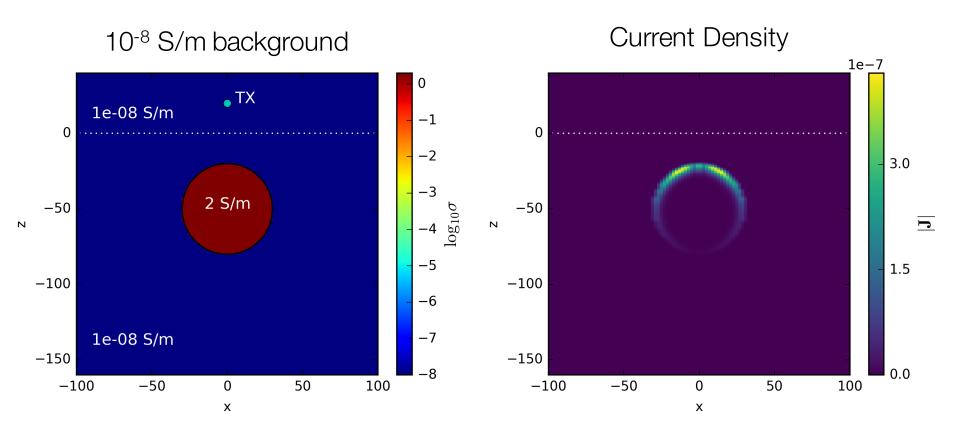

10<sup>4</sup> Hz

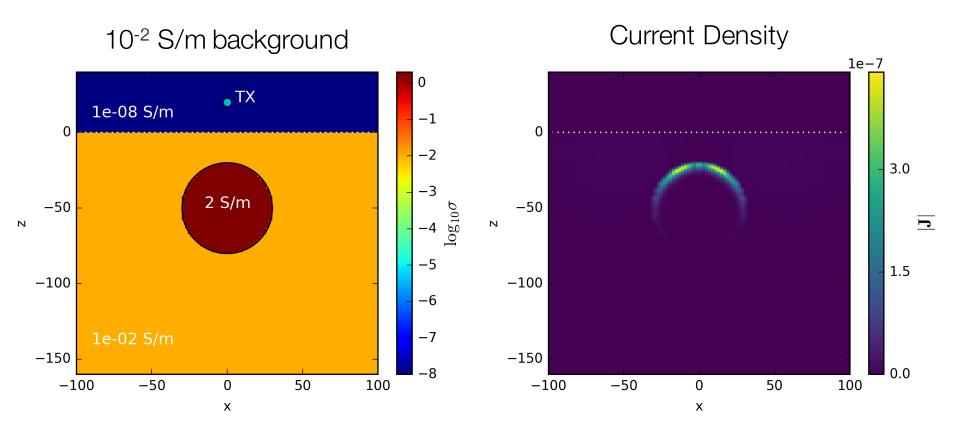

- Buried, conductive sphere
- Vary background conductivity
- Time: 10<sup>-5</sup> s

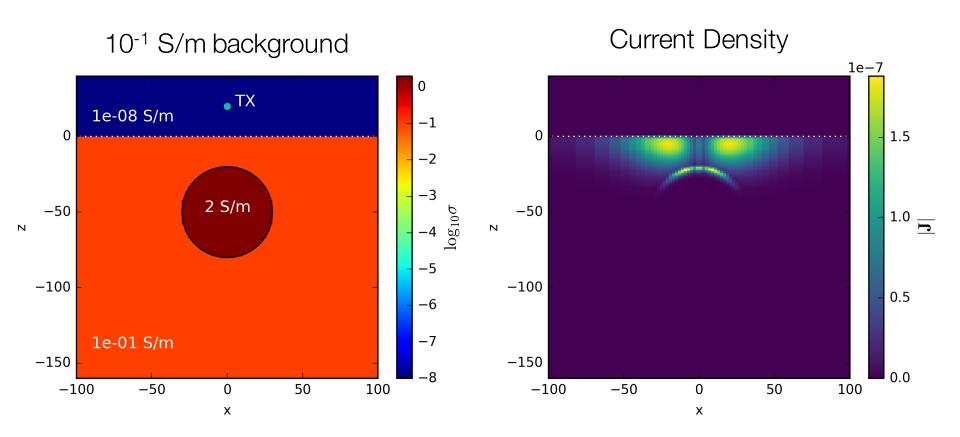

- Buried, conductive sphere
- Vary background conductivity
- Time: 10<sup>-5</sup> s

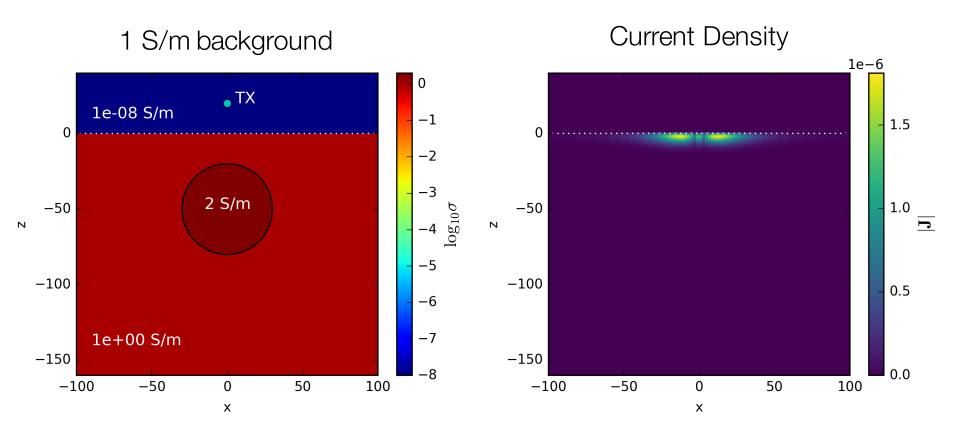

- Buried, conductive sphere
- Vary background conductivity
- Time: 10<sup>-5</sup> s

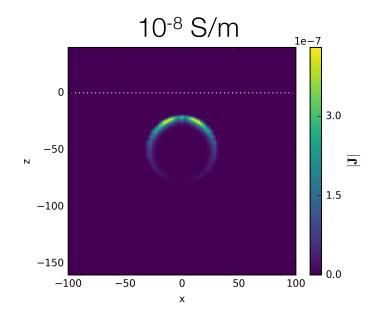

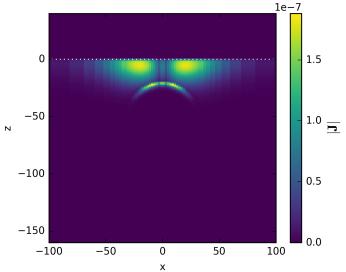

- Buried, conductive sphere
- Vary background conductivity
- Time: 10<sup>-5</sup> s

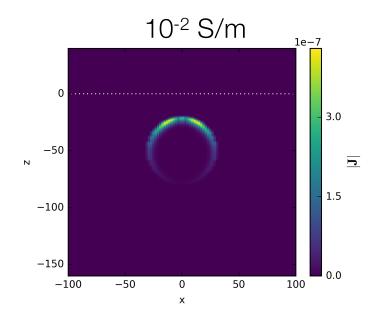

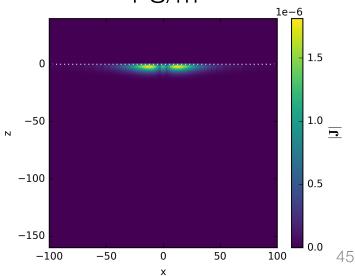

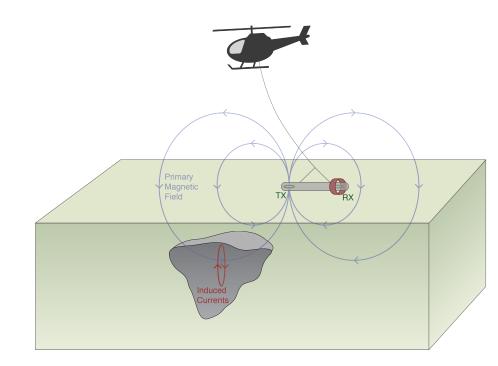

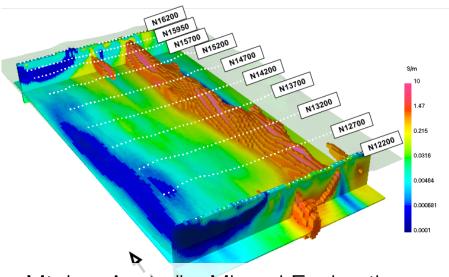

### Recap: what have we learned?

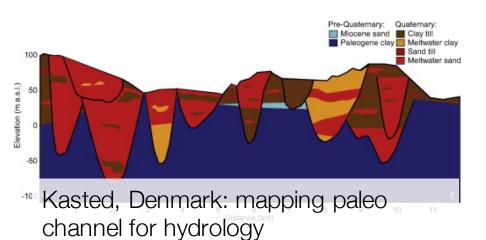

- Basics of EM induction
- Response functions
- Mutual coupling
- Data for frequency or time
   domain systems
- Circuit model is a good proxy
- Need to account for energy losses
- Ready to look at some field examples

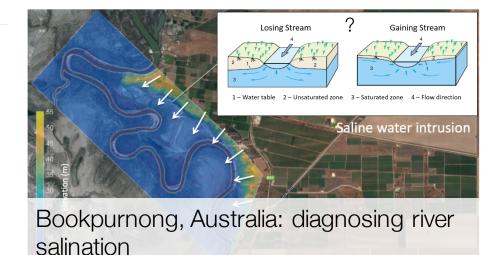

#### Today's Case Histories
