DC Resistivity

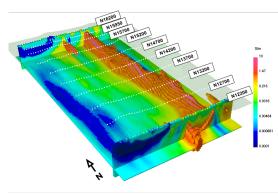

DC Resistivity Survey

Motivation

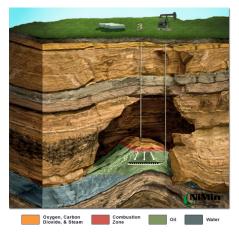

Minerals

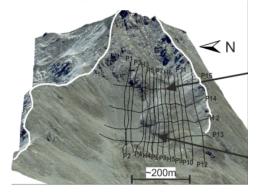

Water inflow in mine

Oil and Gas

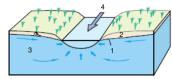

Geotechnical

Groundwater Losing Stream G

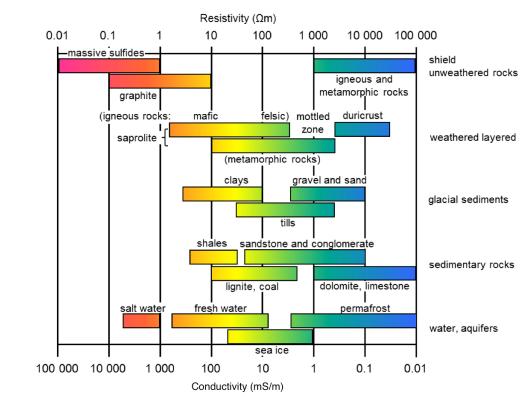

1 – Water table 2 – Unsaturated zone 3 – Saturated zone 4 – Flow direction

Electrical conductivity

- DC resistivity is sensitive to:
 - σ: Conductivity [S/m]
 - ρ: Resistivity [Ωm]
 - $\sigma = 1/\rho$
- Varies over many orders of magnitude
- Depends on many factors:
 - Rock type
 - Porosity
 - Connectivity of pores
 - Nature of the fluid
 - Metallic content of the solid matrix

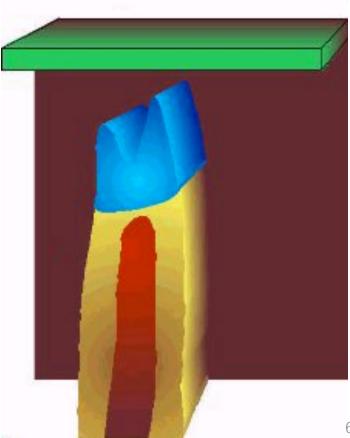

Outline

- Basic experiment
- Currents, charges, potentials and apparent resistivities
- Soundings, profiles and arrays
- Data, pseudosections and inversion
- Sensitivity
- Survey Design
- Case History Mt Isa
- Effects of background resistivity

Target: ٠

Ore body. Mineralized regions less resistive than host

Rock Type	Ohm-m	
Overburden	12	
Host rocks	200	
Gossan	420	
Mineralization (pyritic)	0.6	
Mineralization (pyrrhotite)	0.6	

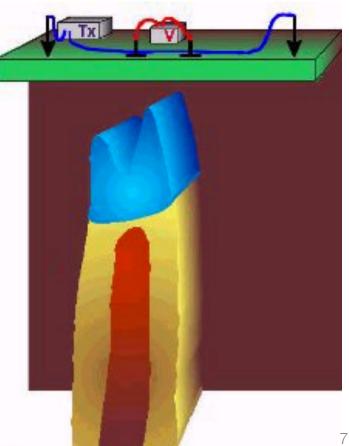

Target: ٠

Ore body. Mineralized regions less resistive than host

Setup: ٠

- Tx: Current electrodes
- Rx: Potential electrodes

Rock Type	Ohm-m	
Overburden	12	
Host rocks	200	
Gossan	420	
Mineralization (pyritic)	0.6	
Mineralization (pyrrhotite)	0.6	

Target: ۲

Ore body. Mineralized regions less resistive than host

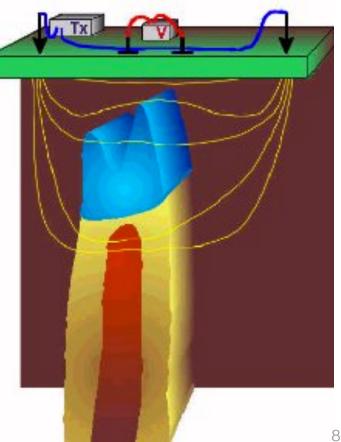

Setup: ۲

- Tx: Current electrodes
- Rx: Potential electrodes

Currents: ۲

- Preferentially flow through conductors

Rock Type	Ohm-m	
Overburden	12	
Host rocks	200	
Gossan	420	
Mineralization (pyritic)	0.6	
Mineralization (pyrrhotite)	0.6	

Target: ٠

Ore body. Mineralized regions less resistive than host

Setup: ۲

- Tx: Current electrodes
- Rx: Potential electrodes

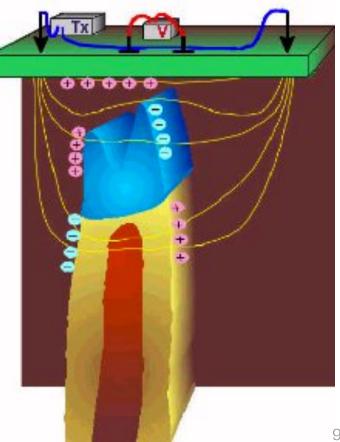

Currents: ٠

- Preferentially flow through conductors

Charges: ullet

- Build up at interfaces

Rock Type	Ohm-m	
Overburden	12	
Host rocks	200	
Gossan	420	
Mineralization (pyritic)	0.6	
Mineralization (pyrrhotite)	0.6	

• Target:

Ore body. Mineralized regions less resistive than host

• Setup:

- Tx: Current electrodes
- Rx: Potential electrodes

Currents:

- Preferentially flow through conductors

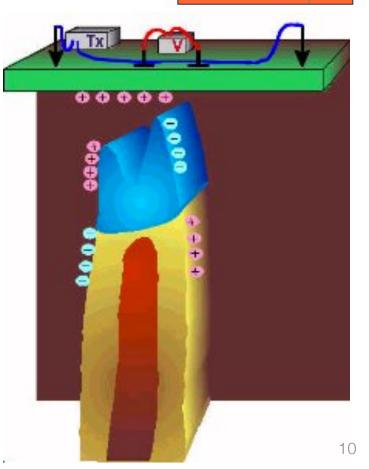

Charges:

- Build up at interfaces

Potentials:

 Associated with the charges are measured at the surface

Rock Type	Ohm-m	
Overburden	12	
Host rocks	200	
Gossan	420	
Mineralization (pyritic)	0.6	
Mineralization (pyrrhotite)	0.6	

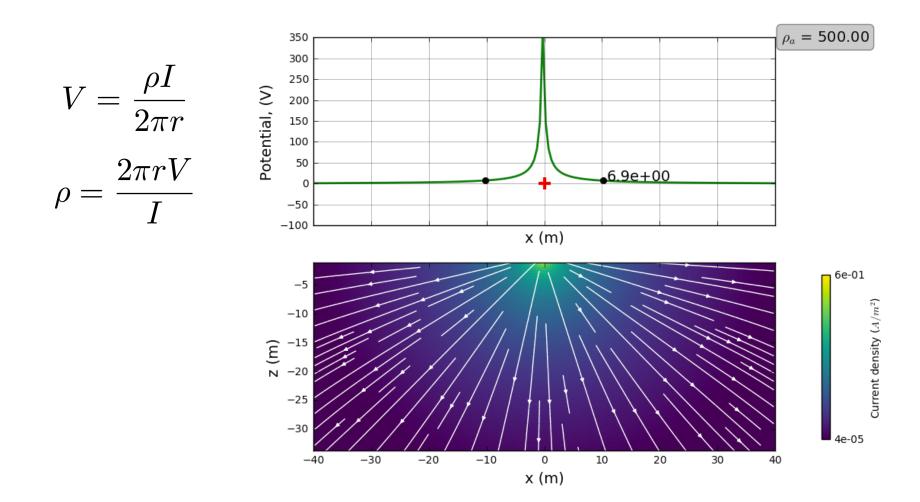

How do we obtain resistivity?

Steady State Maxwell equations

	Full	Steady State	
Faraday	$\nabla \times \vec{e} = -\frac{\partial \vec{b}}{\partial t}$	$ abla imes \vec{e} = 0$	$\vec{e} = -\nabla V$
Ampere	$\nabla \times \vec{h} = \vec{j} + \frac{\partial \vec{d}}{\partial t} + \vec{j}_s$	$\nabla \cdot \dot{z}$	$ec{j} = - abla \cdot ec{j}_s$
Ohm's Law	$\vec{j} = \sigma \vec{e}$	→ > <	
Put it together		$ abla \cdot \sigma abla V =$	$= I\delta(r)$
Potential in a homogeneous ha	alfspace \checkmark V	$=\frac{I}{2\pi\sigma}\frac{1}{r}$	$V = \frac{\rho I}{2\pi r}$

Currents and potentials: halfspace

Summary: soundings

Apparent resistivity (ohm-m)

Inversion

DCR for a confined body

• Useful to formally bring in the concept of charges

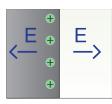

Normal component of current density is continuous

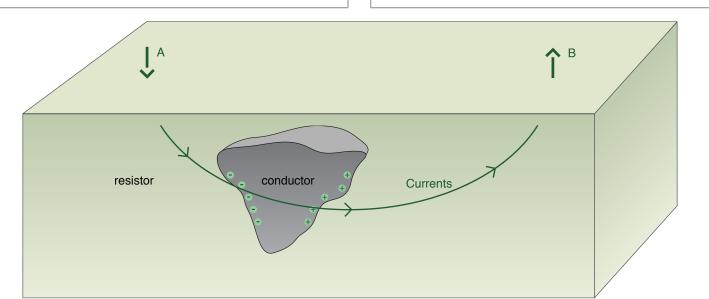

$$J_{1n} = J_{2n}$$
$$\sigma_1 E_{1n} = \sigma_2 E_{2n}$$

Conductivity contrast $\sigma_1
eq \sigma_2$

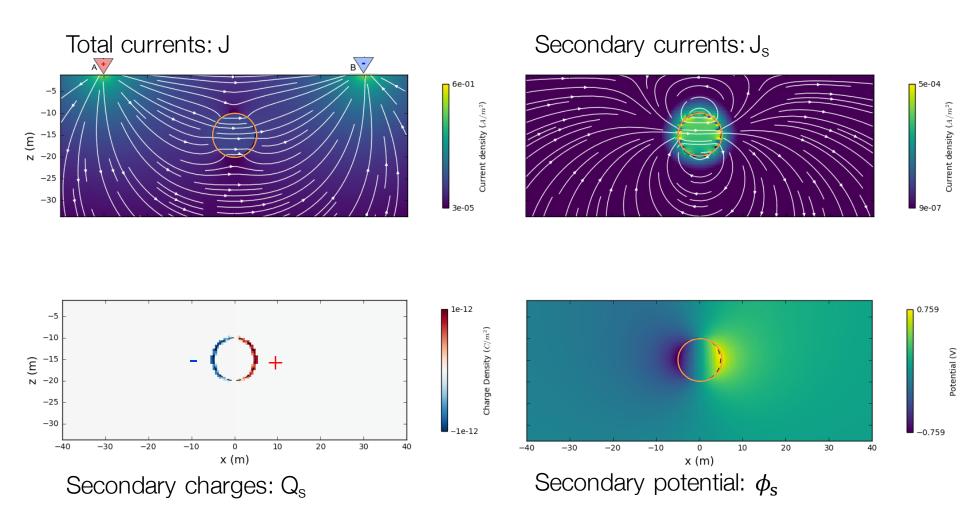

• Electric field discontinuous

$$\mathbf{E} = \frac{Q}{4\pi\varepsilon_0 |\mathbf{r} - \mathbf{r}'|^2} \mathbf{\hat{r}}$$

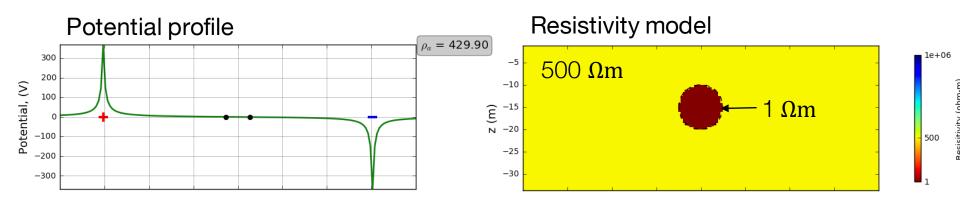

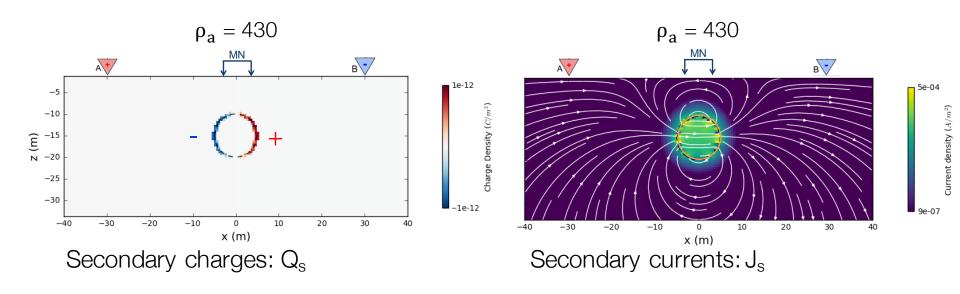

Currents, charges, and potentials

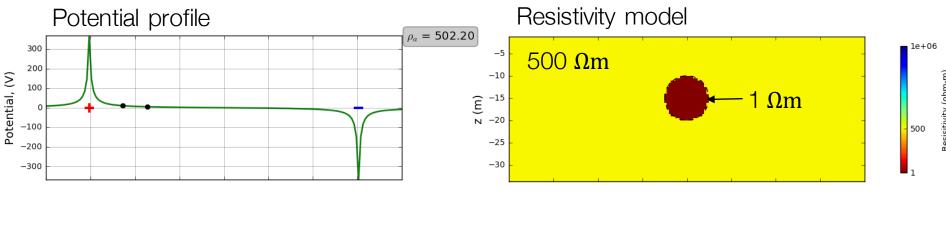

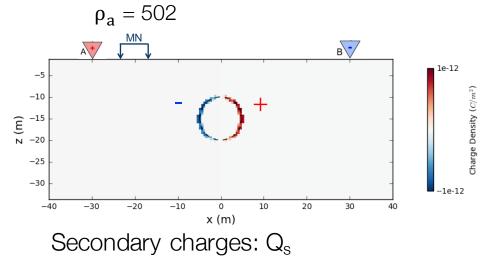

Measurements of DC data: gradient array

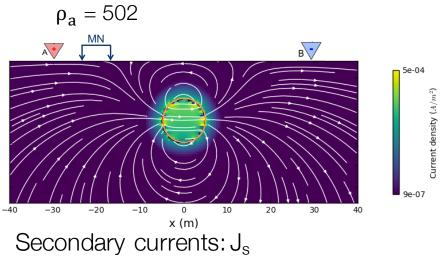

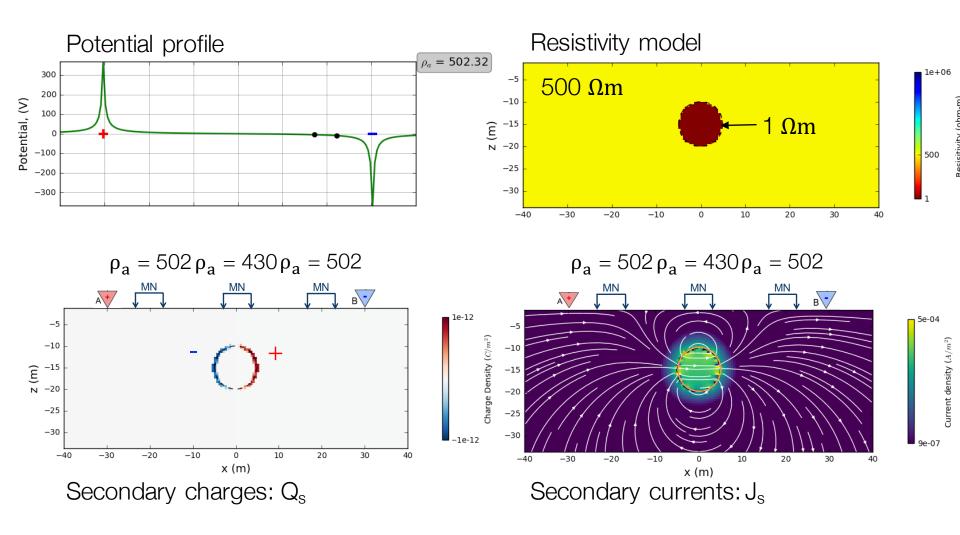

Measurements of DC data: gradient array

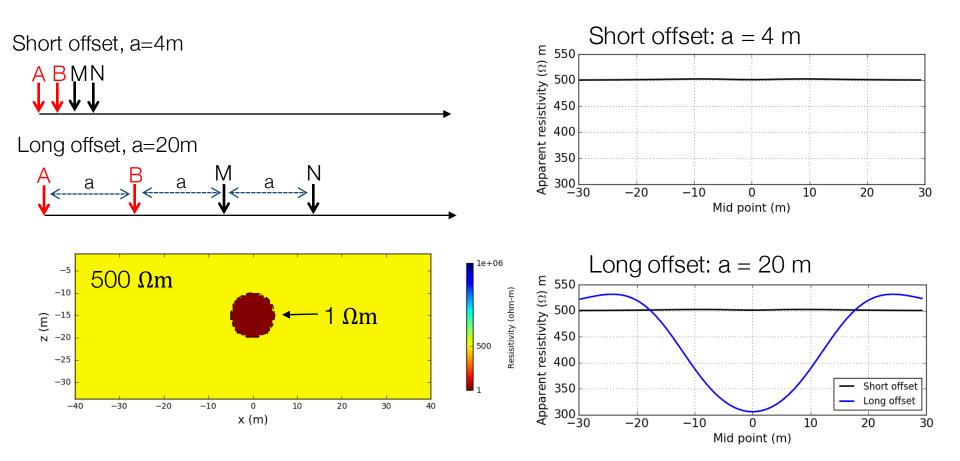

Measurements of DC data: gradient array

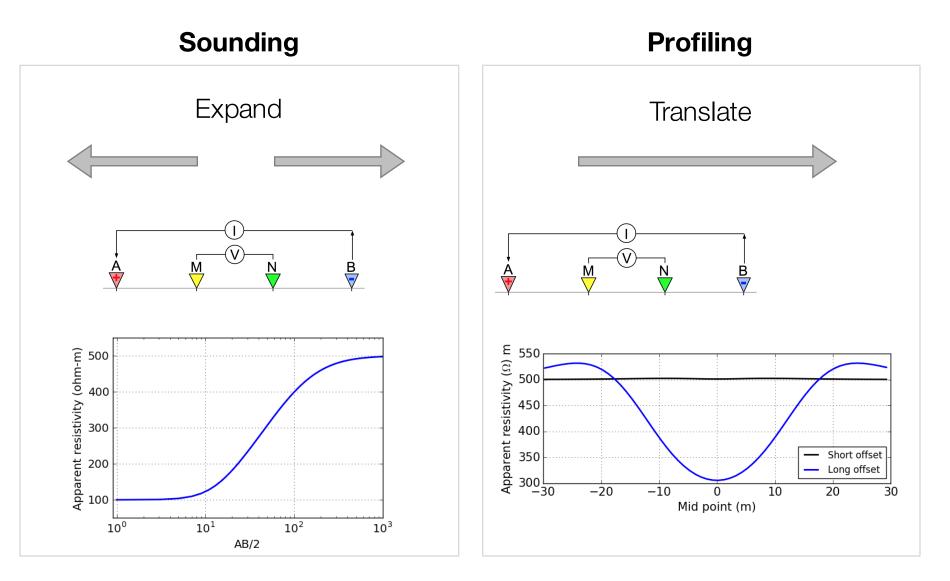

Profiling

Fixed geometry: Move laterally

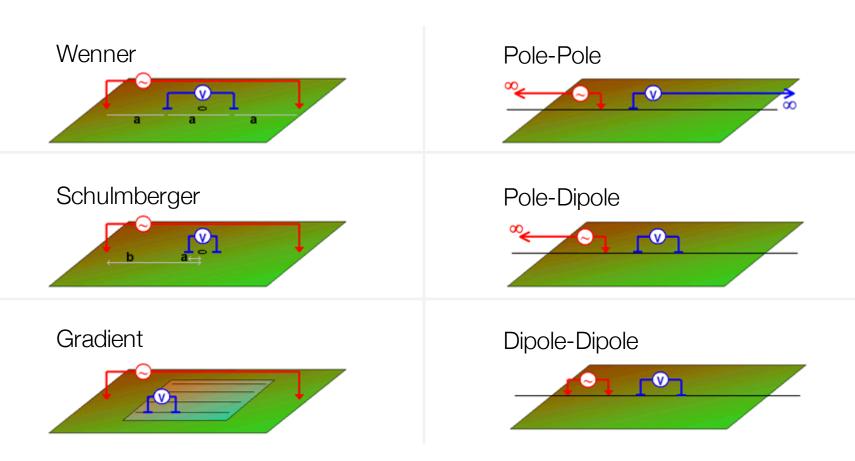

Depth of investigation depends upon offset or array length

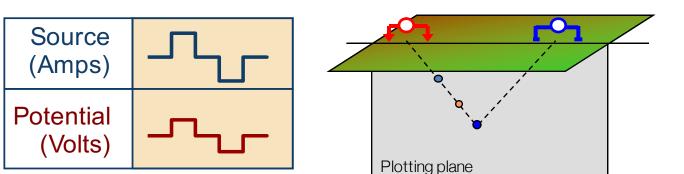

Summary: Soundings and Profiles

Basic Survey Setups

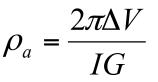

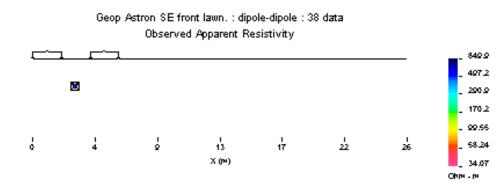

DC resistivity data

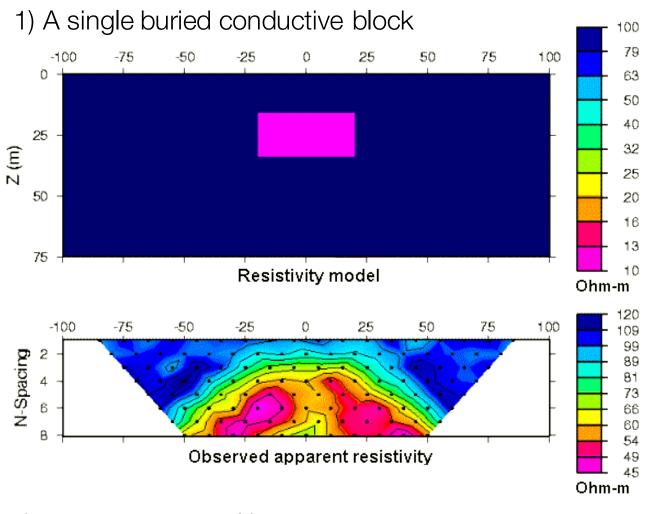

Each data point is an apparent resistivity:

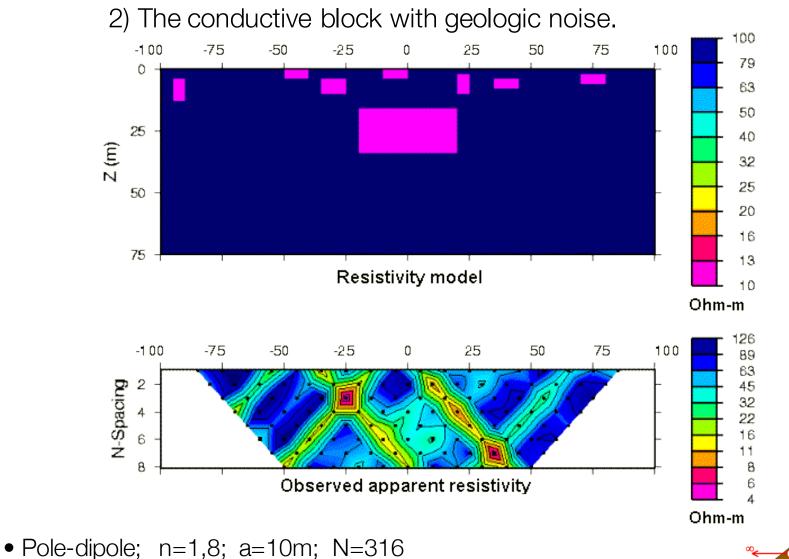

Example pseudosections

• Pole-dipole; n=1,8; a=10m; N=316

Pole-Dipole

Example pseudosections

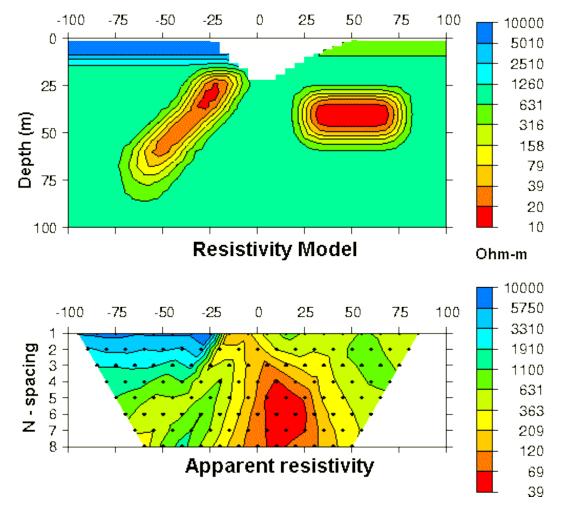

Pole-Dipole

V

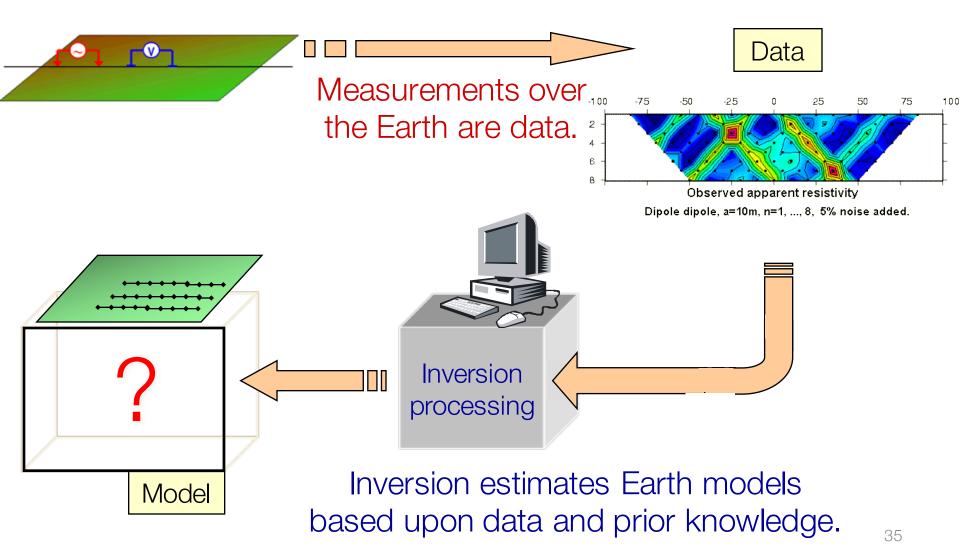

Example pseudosections

3) The "UBC-GIF model"

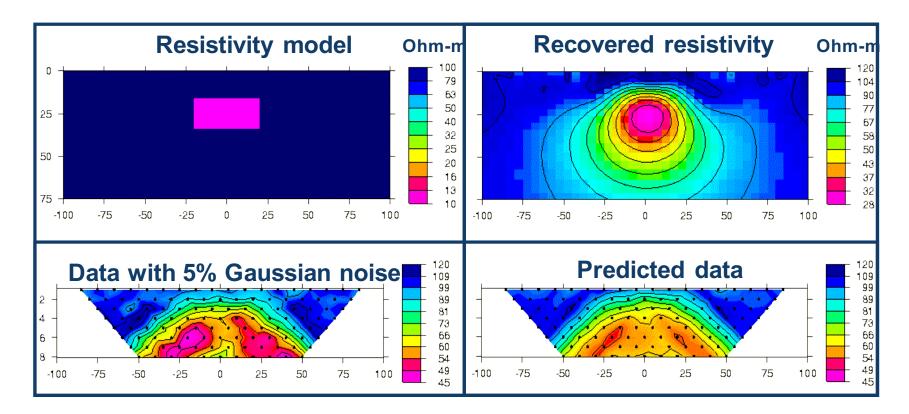

Pole-Dipole

Inversion

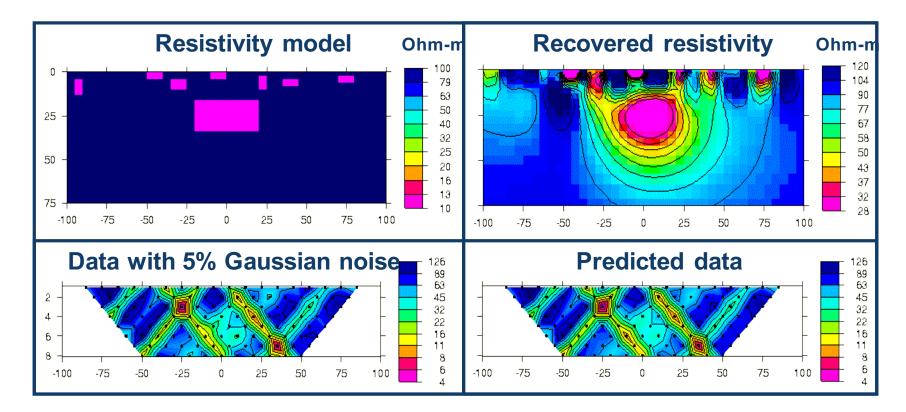

Example 1: buried prism

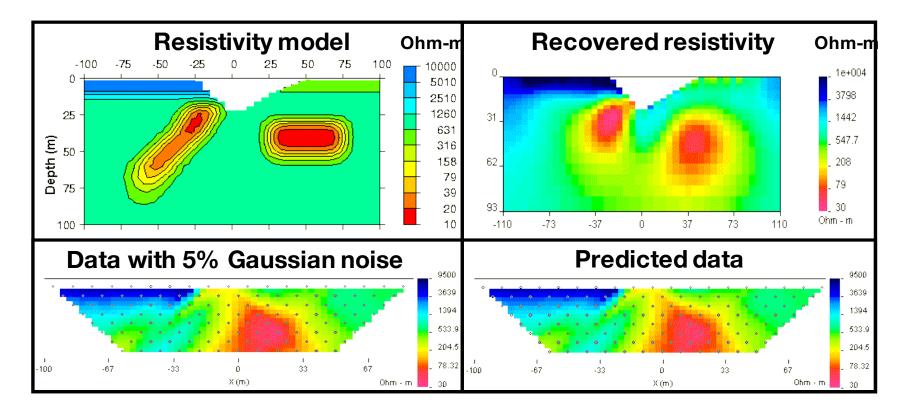

• Pole-dipole; n=1,8; a=10m; N=316; (α_s , α_x , α_z)=(.001, 1.0, 1.0)

Example 2: prism with geologic noise

• Pole-dipole; n=1,8; a=10m; N=316; (α_s , α_x , α_z)=(.001, 1.0, 1.0)

Example 3: UBC-GIF model

• Pole-dipole; n=1,8; a=10m

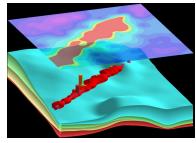

The world is 3D

- Target
 - Size, shape, depth
- Background
 - Variable resistivity
- Questions
 - Where to put currents? 2D acquisition? 3D?
 - Where to make measurements?
 - Which measurements?
 - Effects of topography?
- These are survey design questions
- Crucial element is the **sensitivity**

Host

Ore body

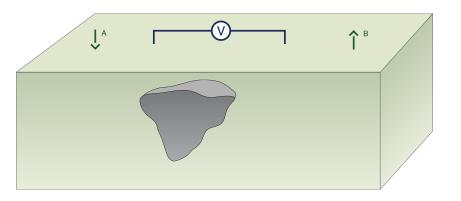

Water underground

Sensitivity

Sensitivity Function

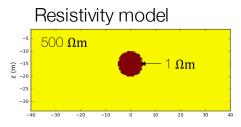

Is the measured potential *sensitive* to the target?

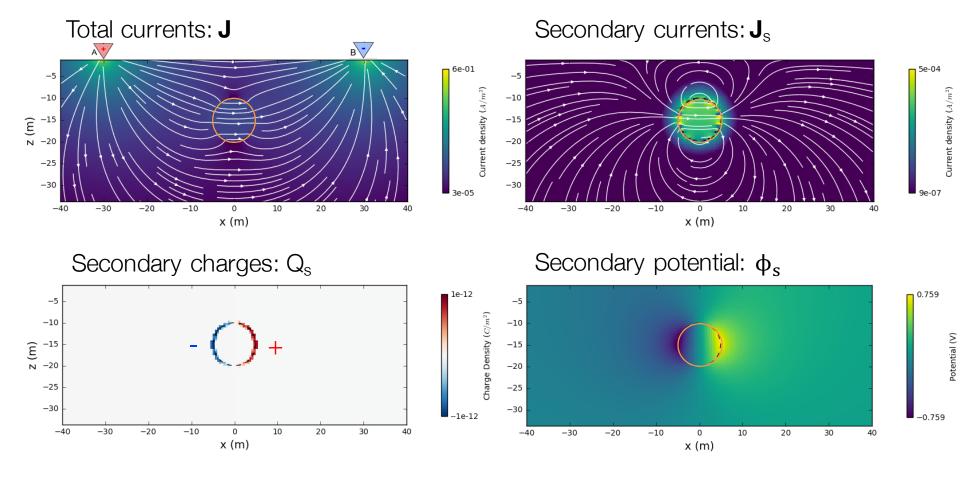

Quantified by the sensitivity

 $G = \frac{\Delta d}{\Delta p} = \frac{\text{change in data}}{\text{change in model}}$

- Collect the data that are sensitive to the target
 - Need to **excite** the target
 - Need to have sensor **close** to the target

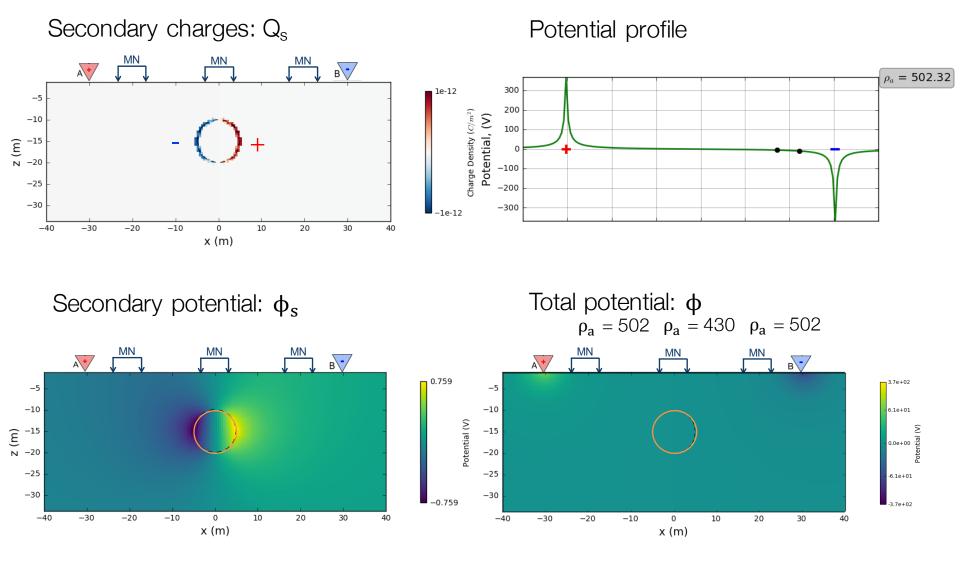

Exciting the target

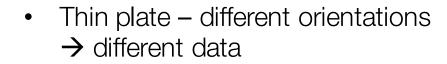

Measurements

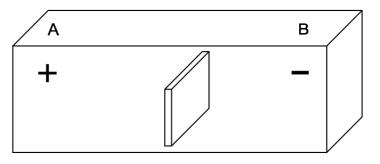

Resistivity model $500 \Omega m$ E -30

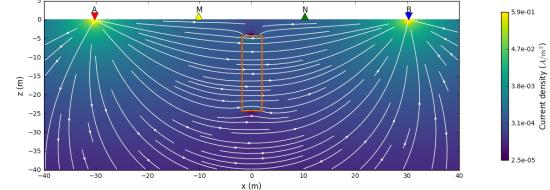

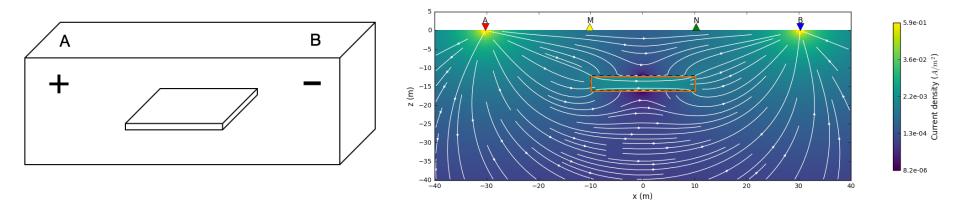

Coupling

Total currents: J

Conductive vs. Resistive Target

5.9e-01

4.7e-02 ($W_{m_{3}}^{2}$ 4.7e-02 ($W_{m_{3}}^{2}$) 4.7e-02 ($W_{m_{3}}^{2}$) 4.7e-03 ($W_{m_{3}}^{2}$)

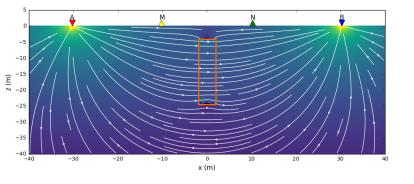

3.1e-04

.5e-05

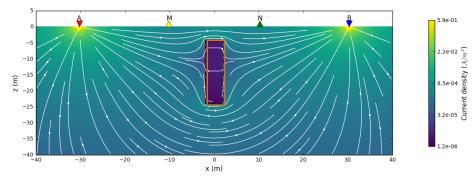

Conductive Target

Resistive Target

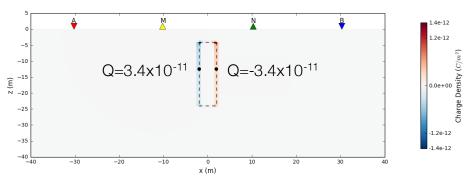

Total currents: J

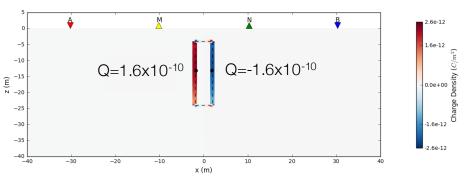

Total currents: J

Secondary charges: Q_s

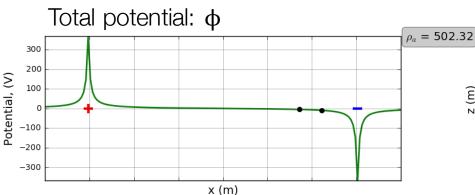

Secondary charges: Q_s

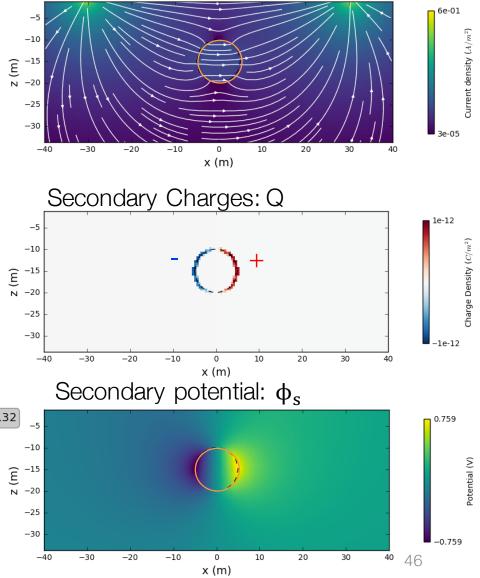

Summary: Sensitivity

- "Excite" the target
 - Drive currents to target
 - Need good coupling with target
- Measuring a datum
 - Proximity to target
 - Electrode orientation and separation
- Background resistivity is
 important

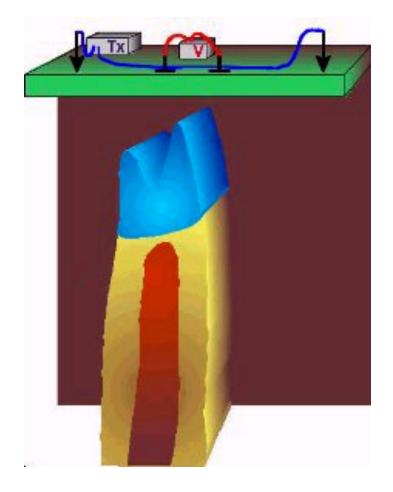

Total currents: J

Survey Design: Questions

- What is objective?
 - Layered earth (1D)
 - ightarrow do a sounding
 - Target body (2D)
 → profile, sounding perpendicular to geology
 - Target body (3d)
 → need 3D coverage
 - What is the background resistivity?
 - What are the noise sources? fences, power lines, ...

Survey Design: in general

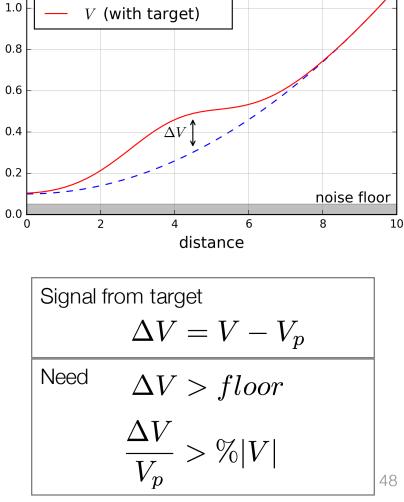

1.2

ootential (V)

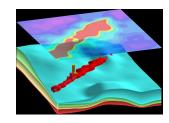

- Numerical simulation can we **see** the target?
- Steps:

۲

- Define a geologic model
- Assign physical properties
- Select a survey
- Simulate with (V) and without (V_p) target
- Best practice
 - Assign uncertainties to simulated data
 - Invert with code you will use for the field data

 V_p (without target)

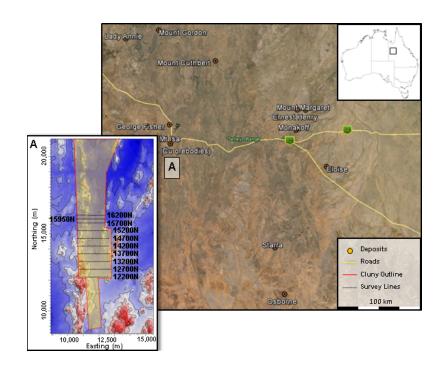

Outline

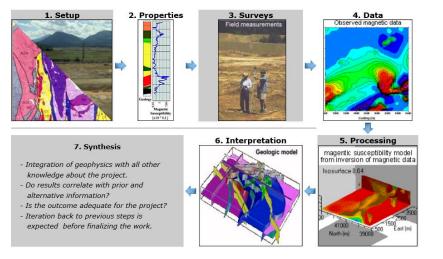

- Basic experiment
- Currents, charges, potentials and apparent resistivities
- Soundings, profiles and arrays
- Data, pseudosections and inversion
- Sensitivity
- Survey Design
- Questions
- Case History Mt Isa
- Effects of background resistivity

Mt. Isa

Mt. Isa (Cluny prospect)

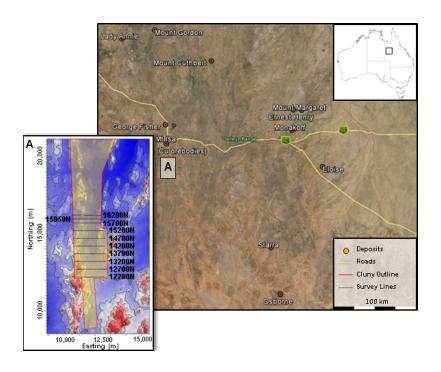

Seven Steps

Setup

Geologic model

Mt. Isa (Cluny prospect)

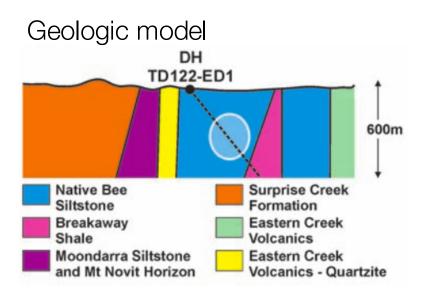

DH TD122-ED1 Mative Bee Siltstone Breakaway Shale Moondarra Siltstone and Mt Novit Horizon

Question

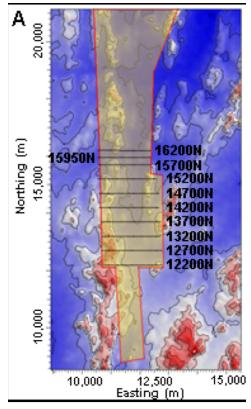

• Can conductive units, which would be potential targets within the siltstones, be identified with DC data?

Properties

Rock Unit	Conductivity
Native Bee Siltstone	Moderate
Moondarra Siltstone	Moderate
Breakaway Shale	Very High
Mt Novit Horizon	High
Surprise Creek Formation	Low
Eastern Creek Volcanics	Low

Surface topography

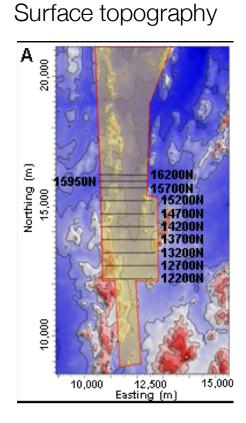

Survey and Data

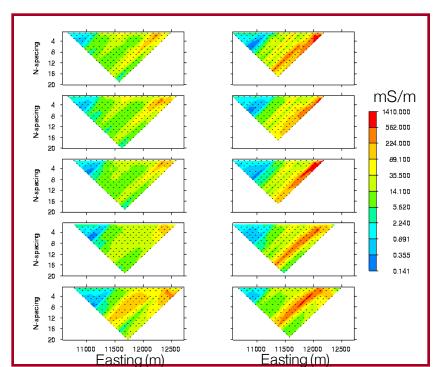

V

- Eight survey lines
- Two survey configurations.

Data set #1:

Apparent resistivity, pole - dipole.

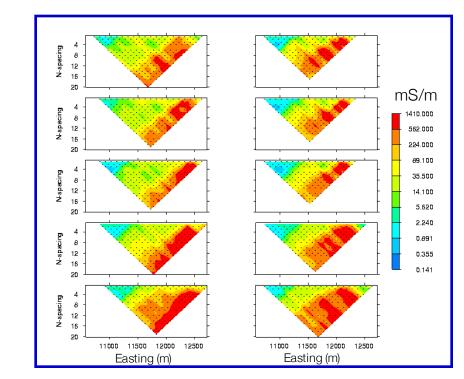

Survey and Data

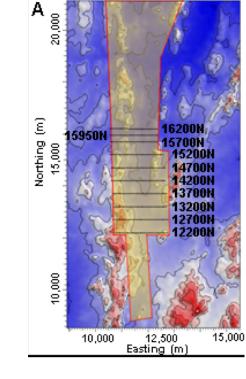

V

- Eight survey lines
- Two survey configurations.

Data set #2:

Apparent resistivity, dipole - pole

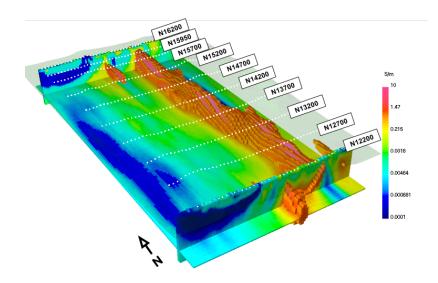

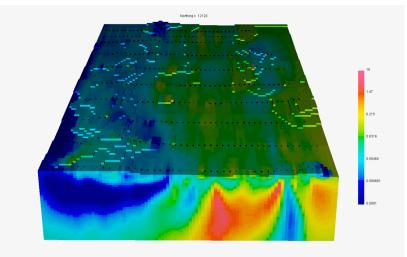

Surface topography

Processing and interpretation

3D resistivity model

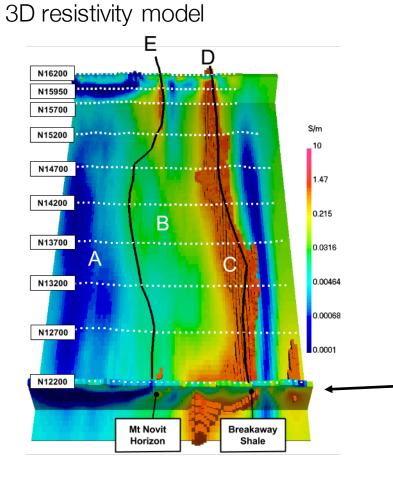

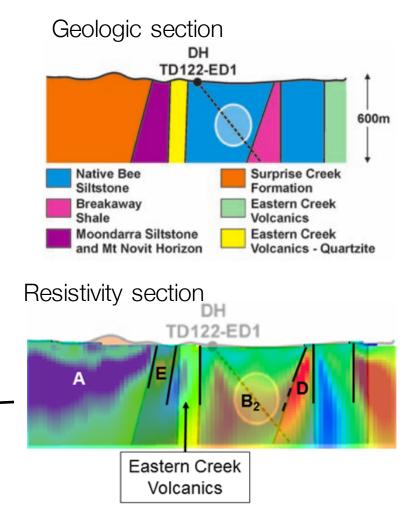

Animation

Synthesis

- Identified a major conductor \rightarrow black shale unit
- Some indication of a moderate conductor

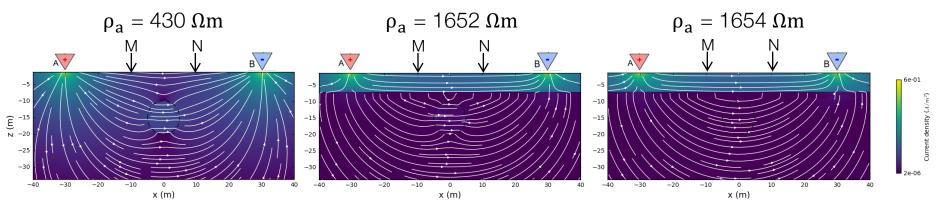

Outline

- Basic experiment
- Currents, charges, potentials and apparent resistivities
