

# Induced Polarization

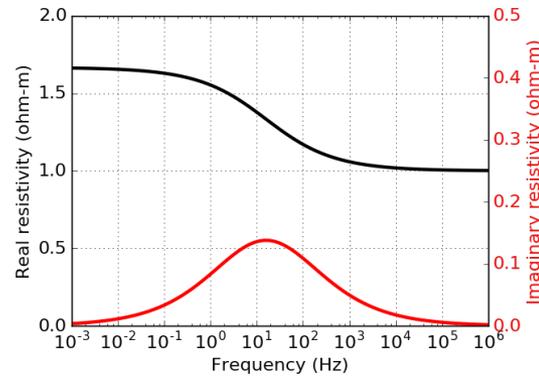

# Motivation

Minerals

Complex resistivity

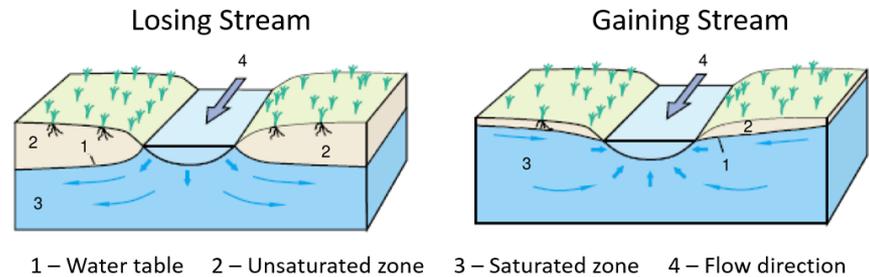

Permafrost

Geotechnical

Groundwater

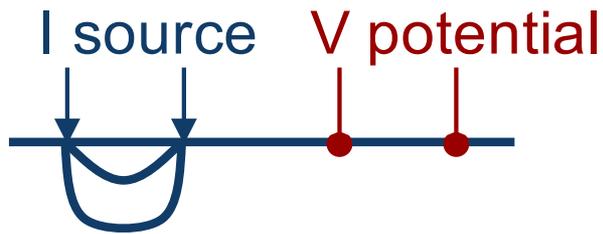

# Outline

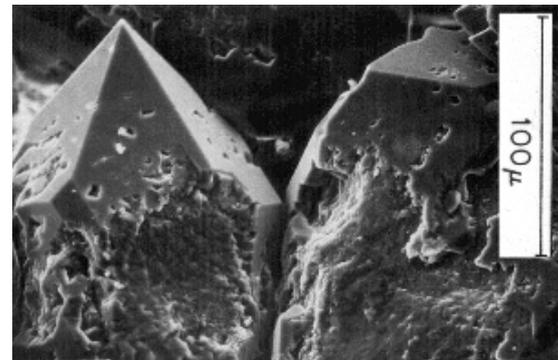

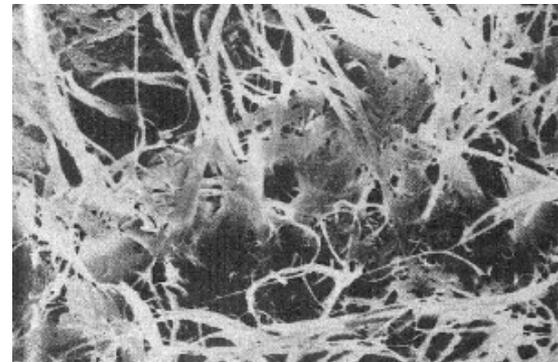

- Sources of IP
- Conceptual model of IP
- Chargeability
- IP data
- Pseudosections
- Two stage DC-IP inversion
- Case history: Mt. Isa

# Induced Polarization

- Injected currents cause materials to become polarized
- Microscopic causes → macroscopic effect
- Phenomenon is called induced polarization

	Not chargeable	Chargeable
Source (Amps)		
Potential (Volts)		

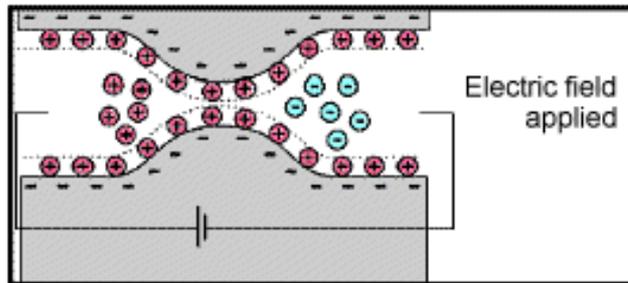

# Conceptual Model of IP

## Membrane polarization

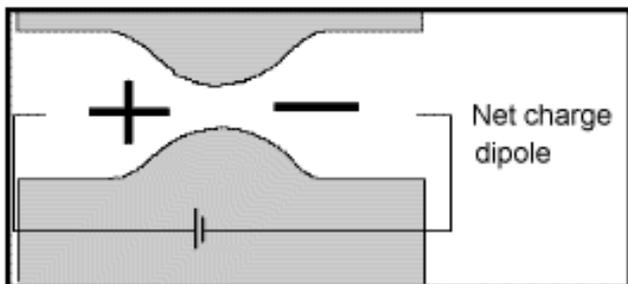

Initially - neutral

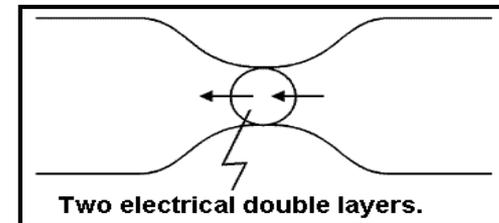

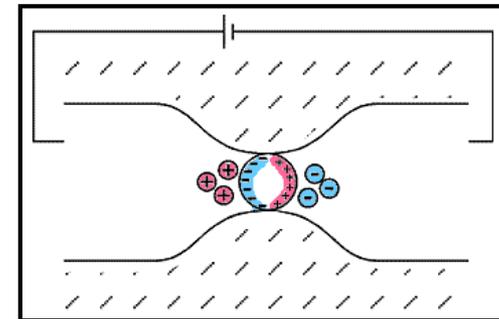

Apply electric field, build up charges

Charge polarization, Electric dipole

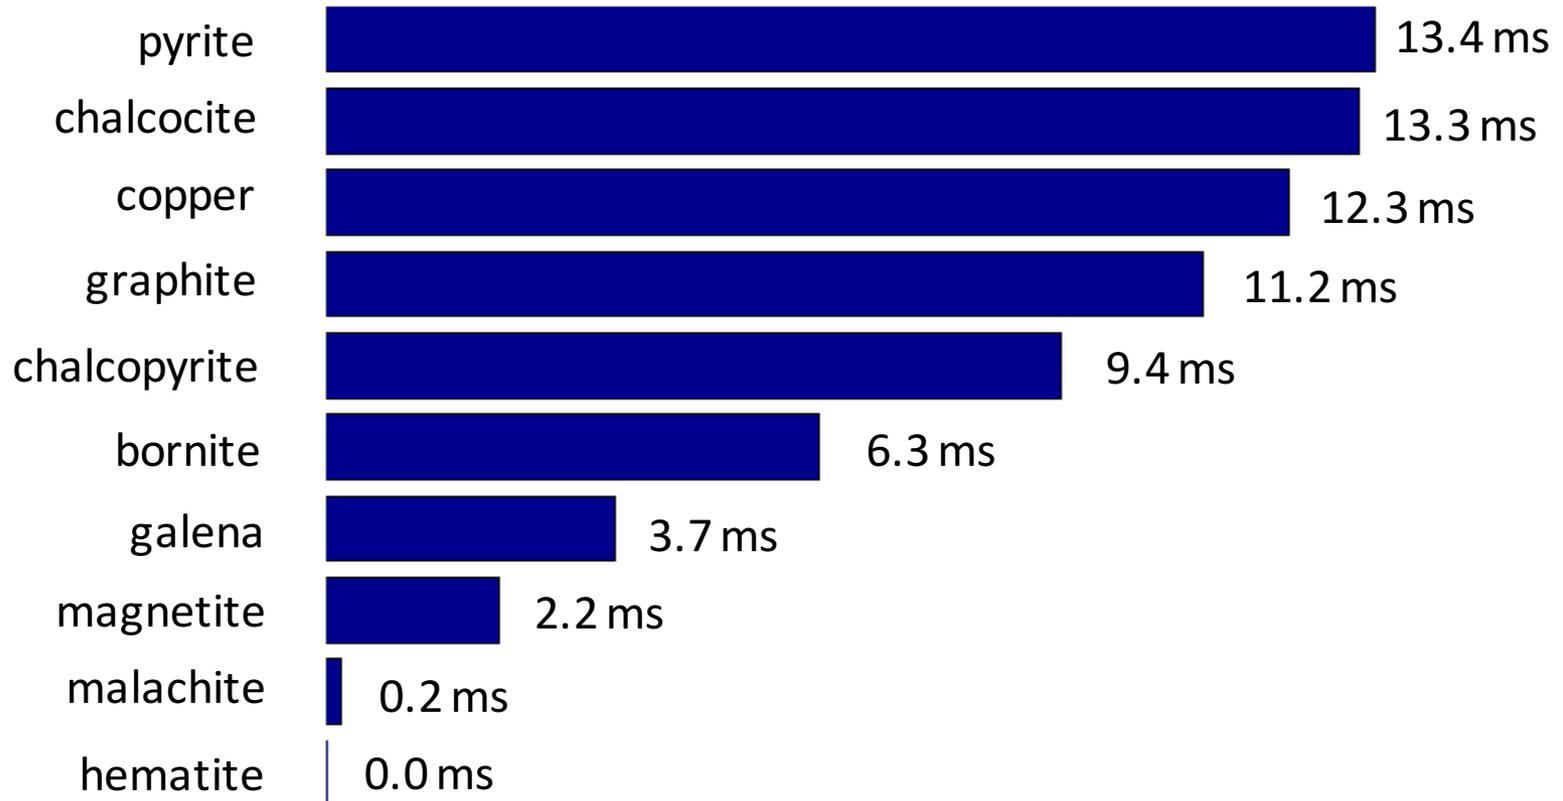

## Electrode polarization

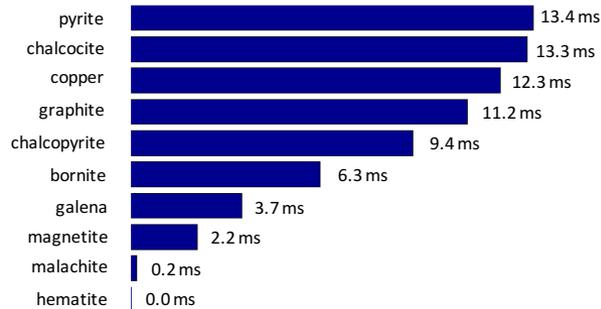

# Chargeability

## Minerals at 1% Concentration in Samples

# Chargeability

Minerals at 1% Concentration in Samples

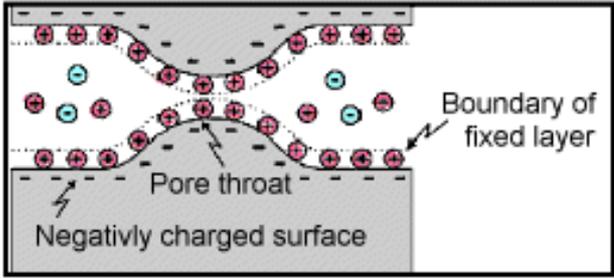

Material type	Chargeability (msec.)
20% sulfides	2000 - 3000
8-20% sulfides	1000 - 2000
2-8% sulfides	500 - 1000
volcanic tuffs	300 - 800
sandstone, siltstone	100 - 500
dense volcanic rocks	100 - 500
shale	50 - 100
granite, granodiorite	10 - 50
limestone, dolomite	10 - 20

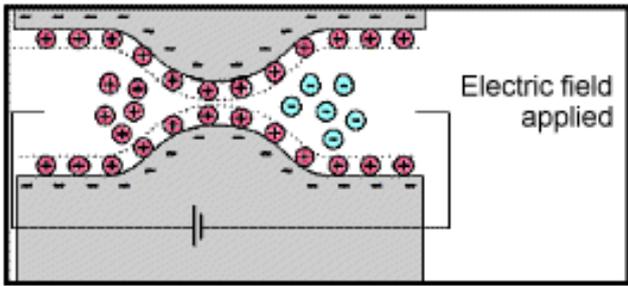

Material type	Chargeability (msec.)
ground water	0
alluvium	1 - 4
gravels	3 - 9
precambrian volcanics	8 - 20
precambrian gneisses	6 - 30
schists	5 - 20
sandstones	3 - 12

# Chargeability

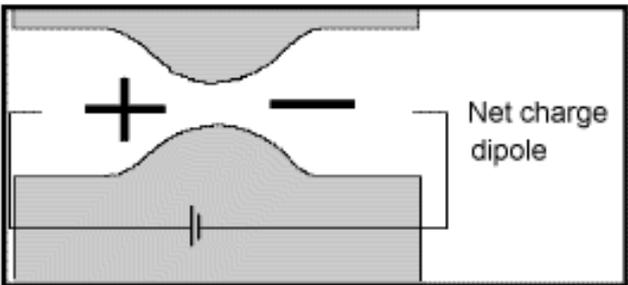

Initially - neutral

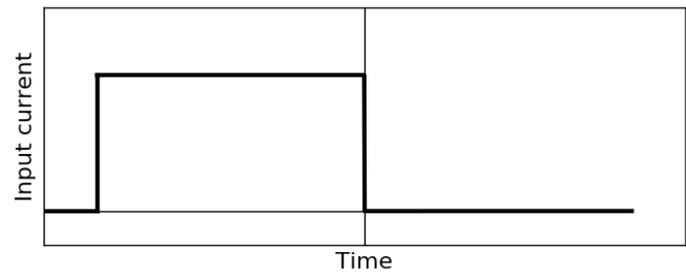

Apply electric field, build up charges

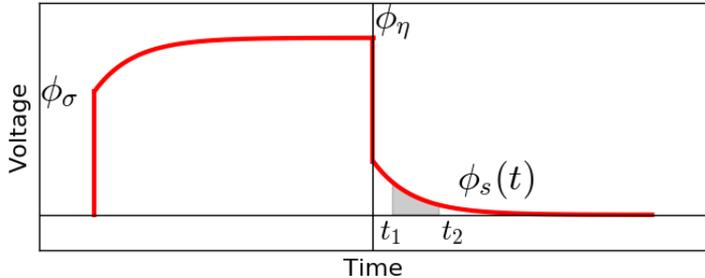

Charge polarization, Electric dipole

Input current

Measured voltage

# IP data

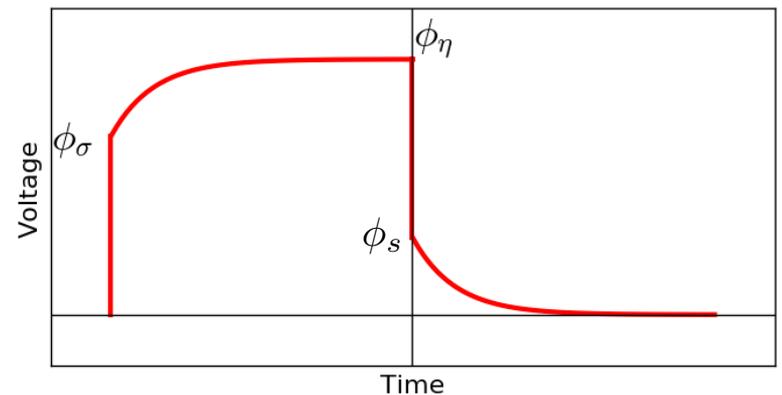

- Seigel (1959):
  - Introduced chargeability:  $\eta$
  - Effect reduces conductivity

$$\sigma_{\eta} = \sigma(1 - \eta) \quad \eta \in [0, 1)$$

- Theoretical chargeability data

$$d^{IP} = \frac{\phi_s}{\phi_{\eta}} = \frac{\phi_{\eta} - \phi_{\sigma}}{\phi_{\eta}}$$

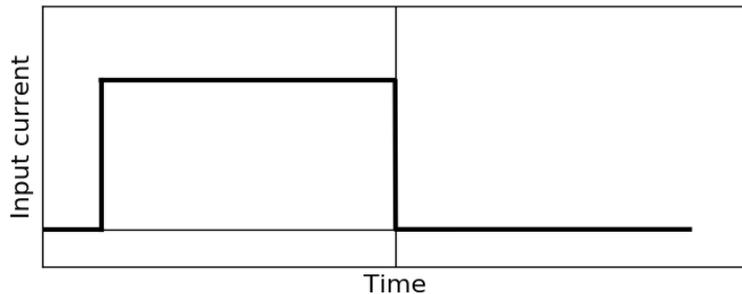

- Not directly measureable

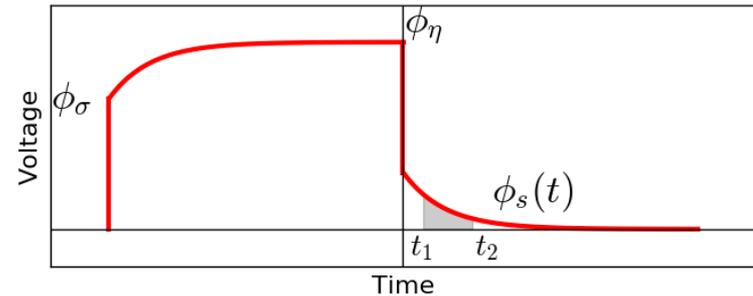

# IP data: time domain

- IP decay

Input current

Measured voltage

- IP datum

---

Dimensionless:

$$\eta = \phi_s / \phi_\eta$$

---

Value at individual time channel:

$$\phi_s(t)$$

---

Area under decay curve:

$$M = \frac{1}{\phi_\eta} \int_{t_1}^{t_2} \phi_s(t) dt$$

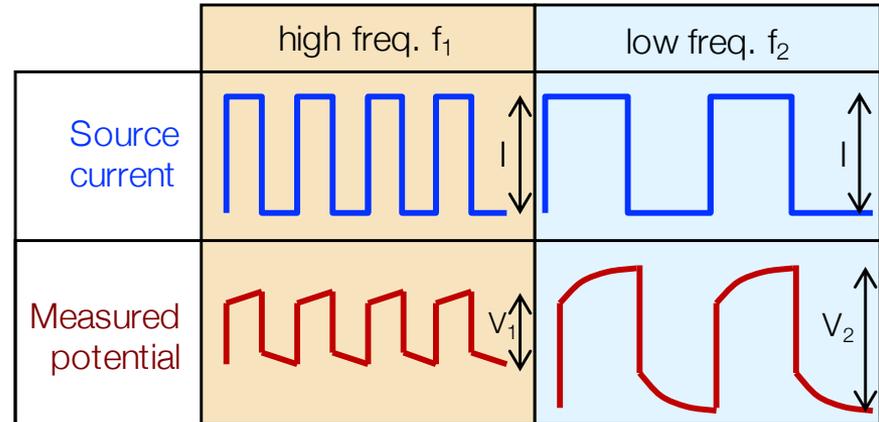

# IP data: frequency domain

- Percent frequency effect:

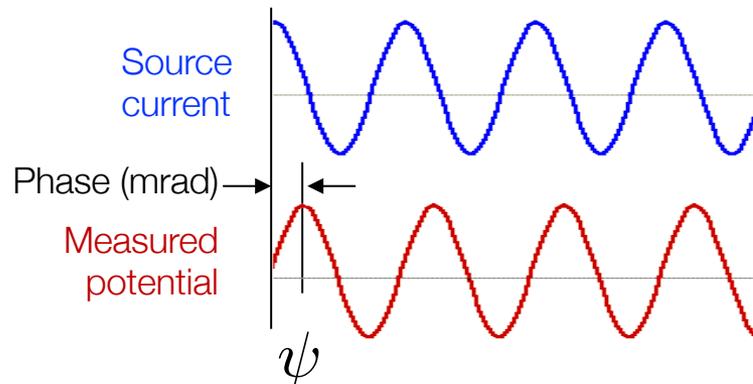

$$PFE = 100 \left( \frac{\rho_{a2} - \rho_{a1}}{\rho_{a1}} \right)$$

$\rho_{a1}$ : apparent resistivity at  $f_1$

$\rho_{a2}$ : apparent resistivity at  $f_2$

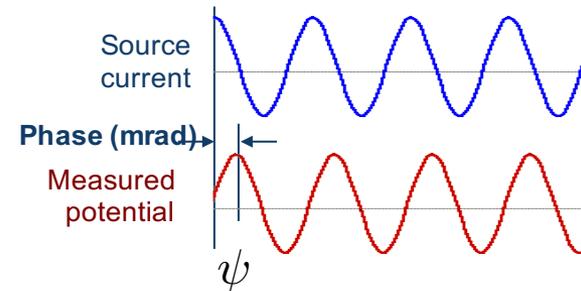

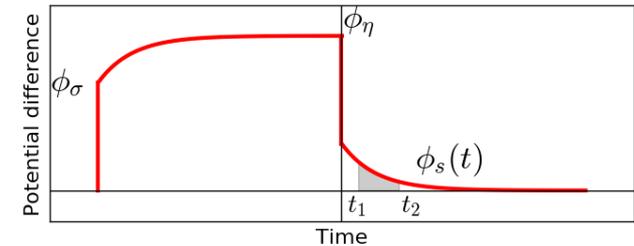

- Phase  $\psi$

# Summary of IP data types

- Time domain:
  - Theoretical chargeability (dimensionless)
  - Integrated decay time (msec)
- Frequency domain:
  - PFE (dimensionless)
  - Phase (mrad)

# IP data

- IP signals due to a perturbation (small change) in conductivity

$$\sigma_\eta = \sigma(1 - \eta) \quad \eta \in [0, 1)$$

- An IP datum can be written as

$$d_i^{IP} = \sum_{j=1}^M J_{ij} \eta_j \quad i = 1, \dots, N$$

$$J_{ij} = \frac{\partial \log \phi^i}{\partial \log \sigma_j} \quad \text{sensitivities for the DC resistivity problem}$$

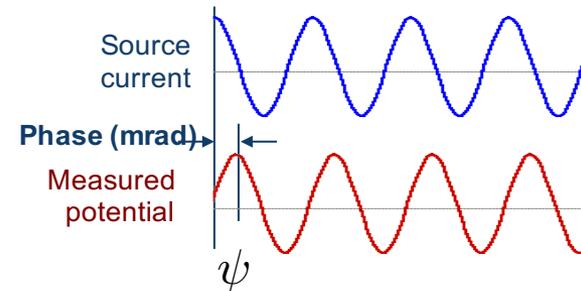

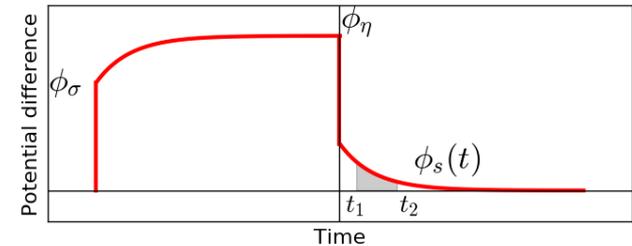

- In matrix form

$$\mathbf{d}^{IP} = \mathbf{J}\boldsymbol{\eta}$$

$\mathbf{J}$  is an  $N \times M$  matrix

# Summary of IP data

- Time domain:
  - Theoretical chargeability (dimensionless)
  - Integrated decay time (msec)
- Frequency domain:
  - PFE (dimensionless)
  - Phase (mrad)
- For all data types: linear problem

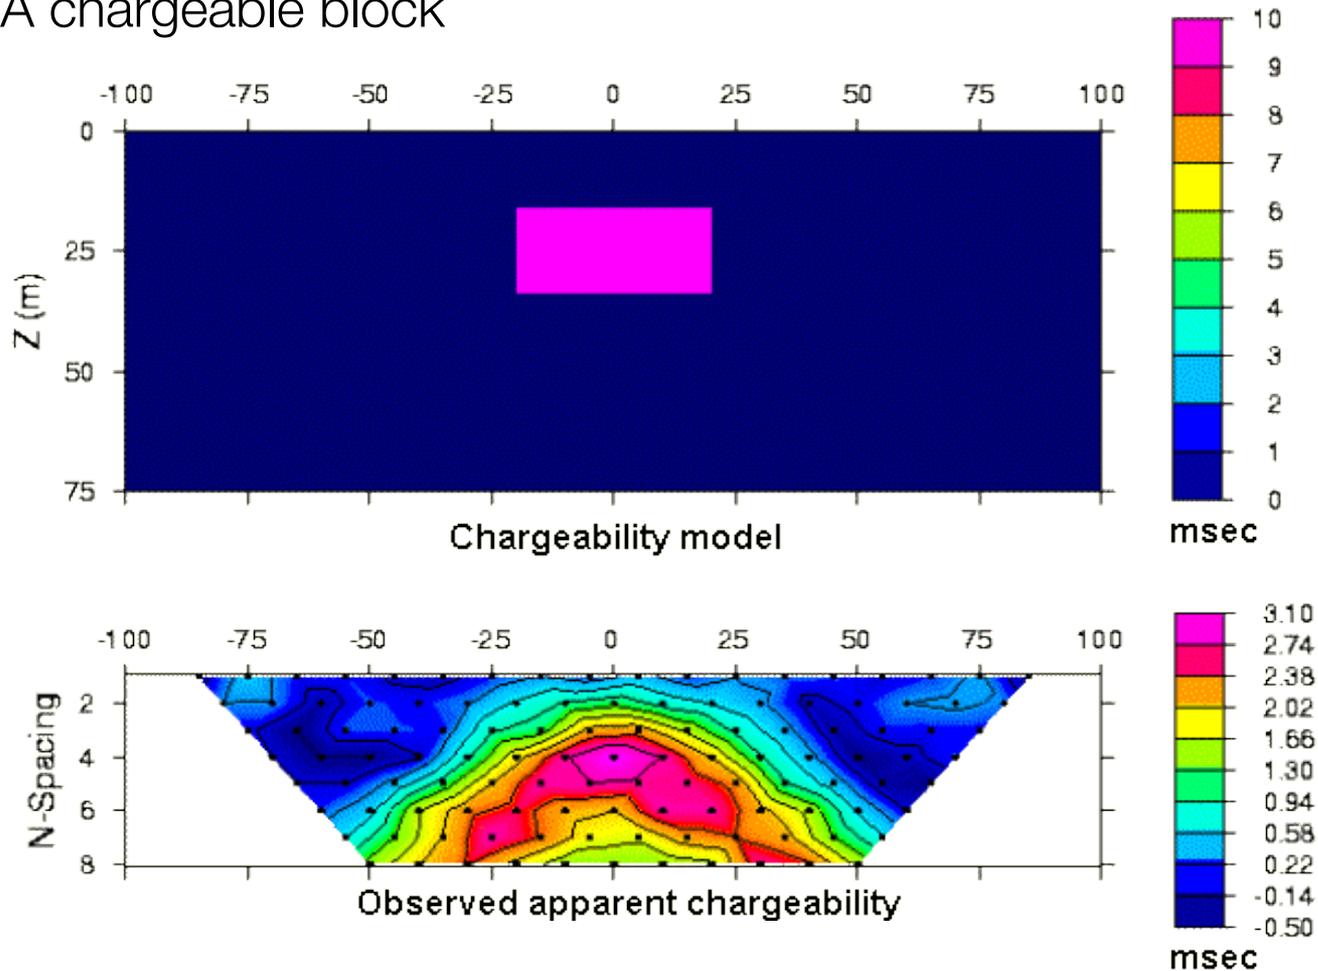

$$\mathbf{d}^{IP} = \mathbf{J}\boldsymbol{\eta}$$

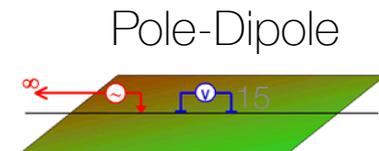

$\mathbf{J}$  is an N×M matrix

# IP pseudosections

1) A chargeable block

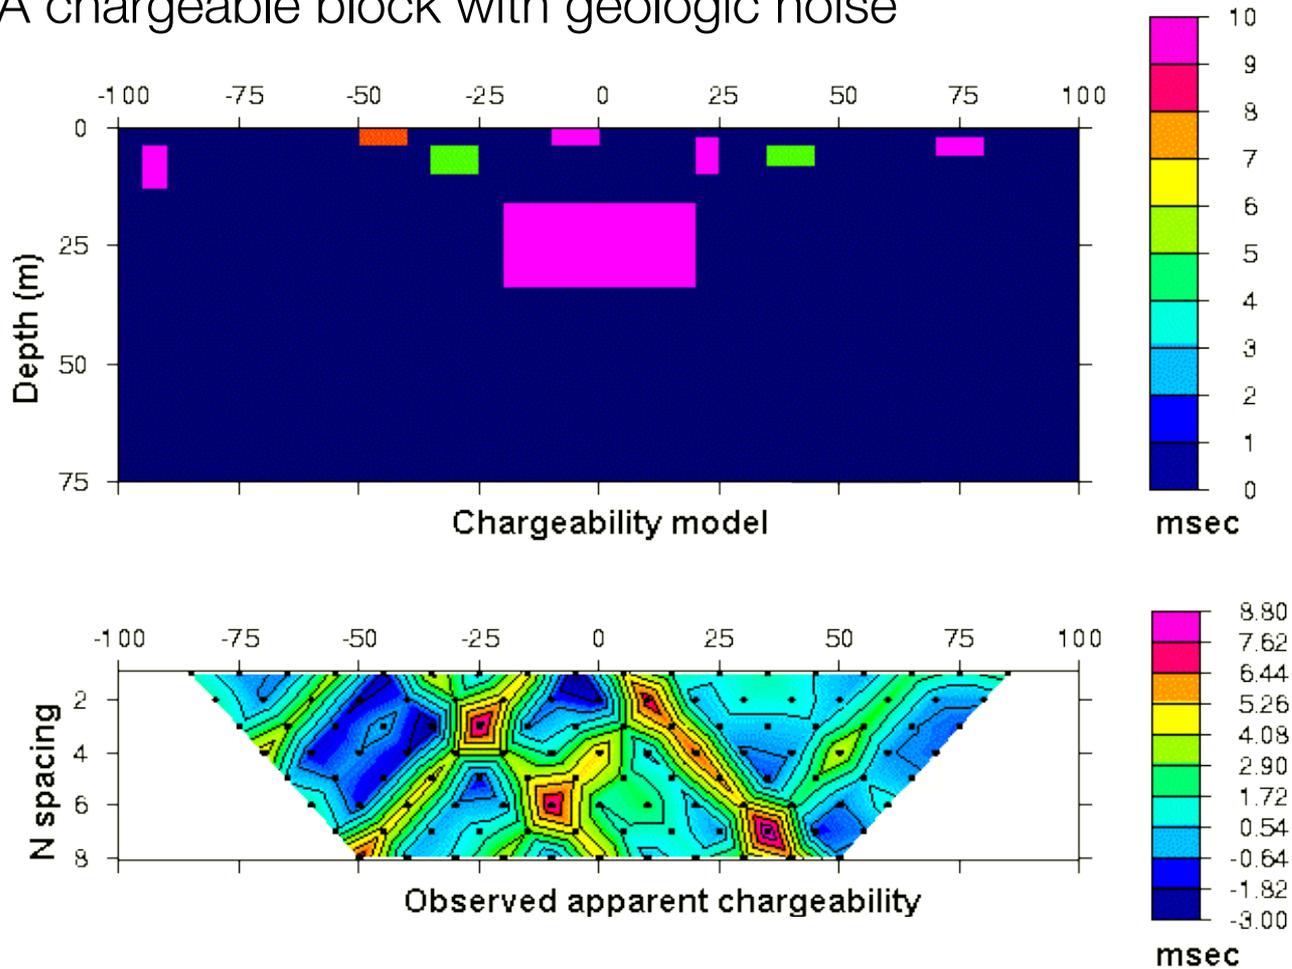

- Pole-dipole;  $n=1,8$ ;  $a=10\text{m}$ ;  $N=316$

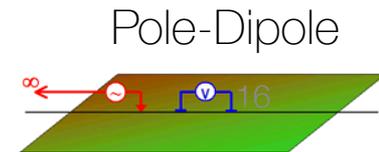

# IP pseudosections

2) A chargeable block with geologic noise

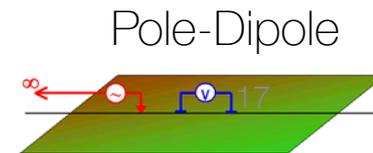

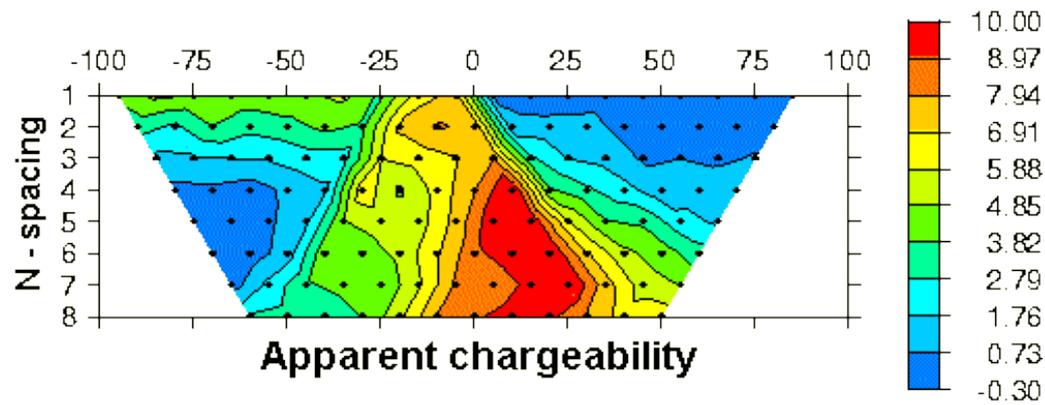

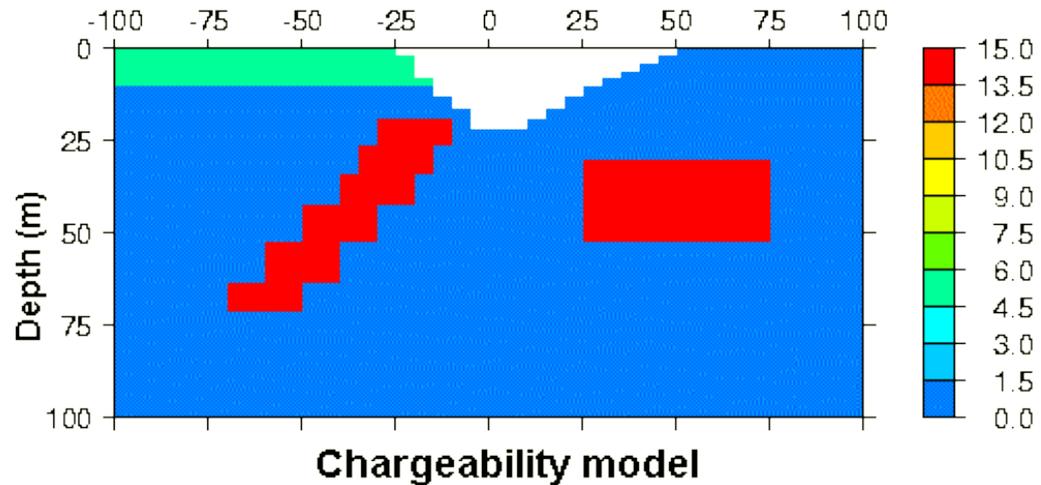

- Pole-dipole;  $n=1,8$ ;  $a=10\text{m}$ ;  $N=316$

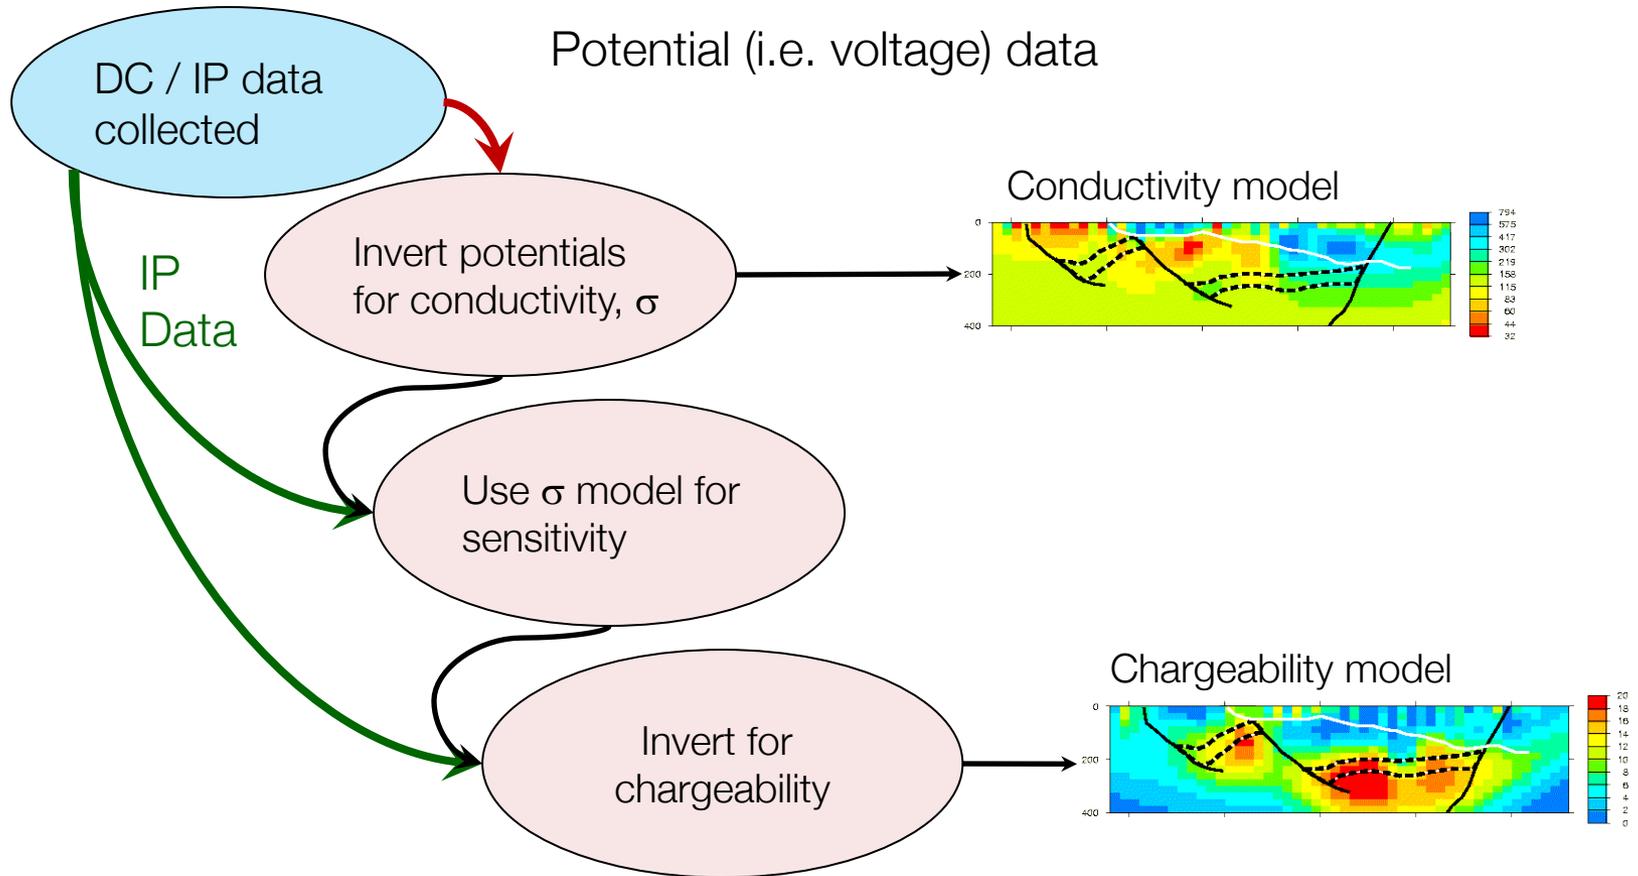

# IP pseudosections

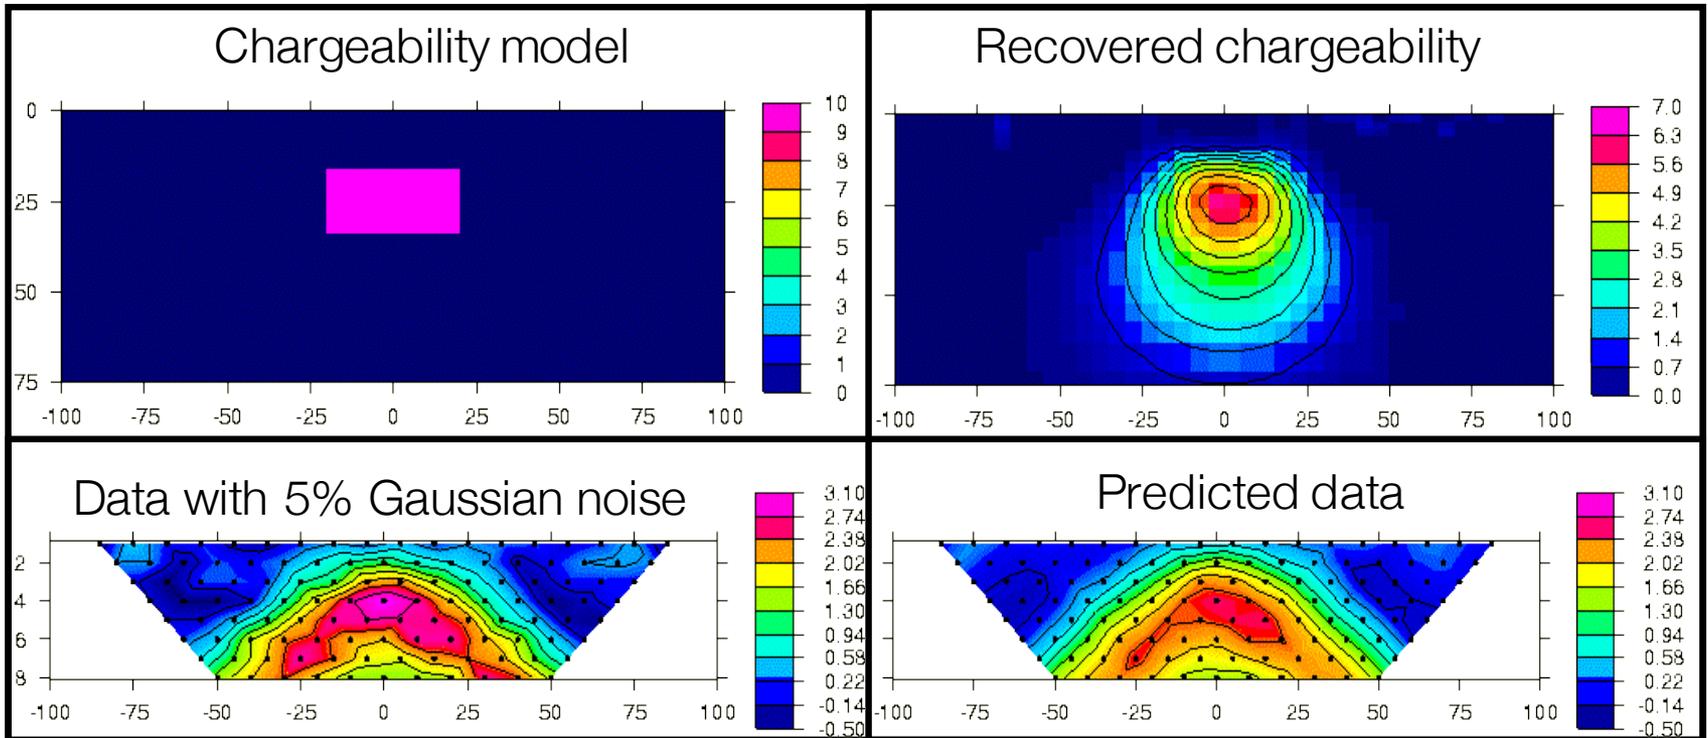

## 3) The “UBC-GIF model”

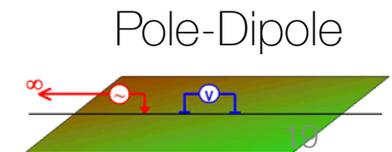

# IP Inversion

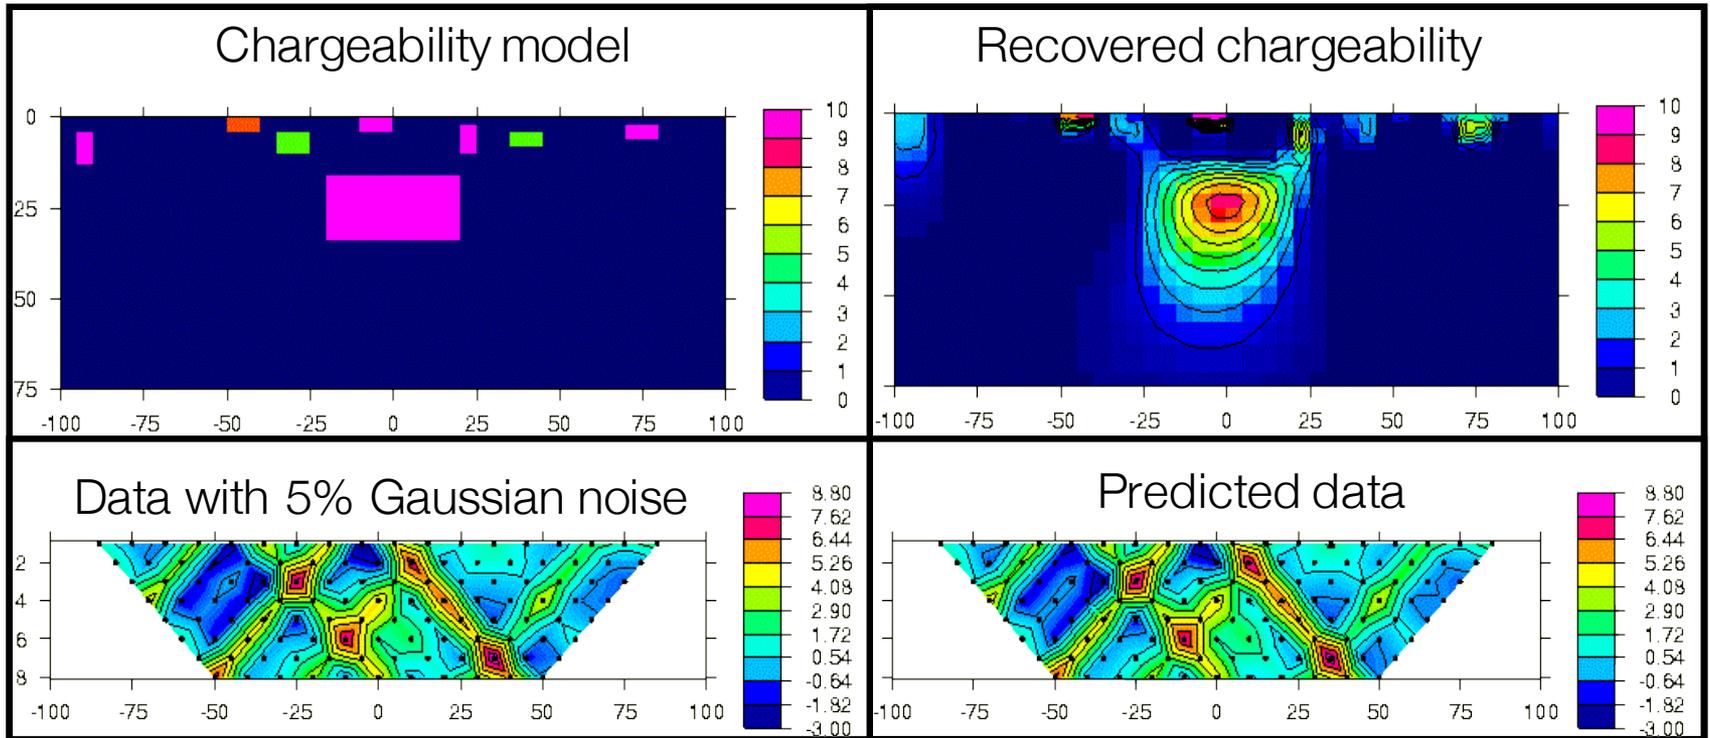

# Example 1: buried prism

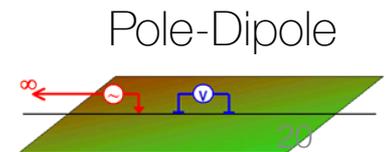

- Pole-dipole;  $n=1,8$ ;  $a=10\text{m}$ ;  $N=316$ ;  $(\alpha_s, \alpha_x, \alpha_z)=(.001, 1.0, 1.0)$

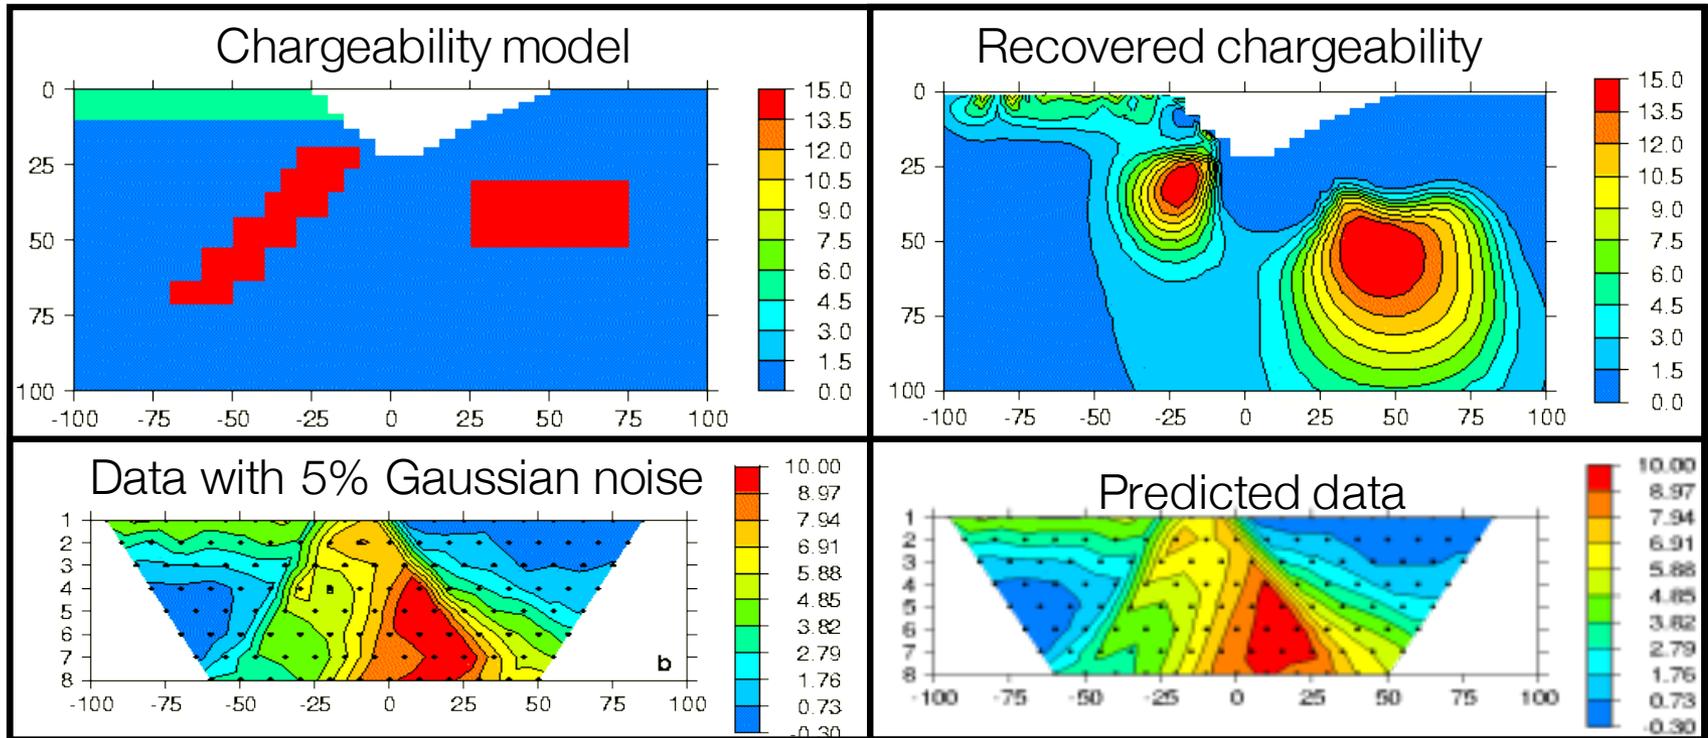

# Example 2: prism with geologic noise

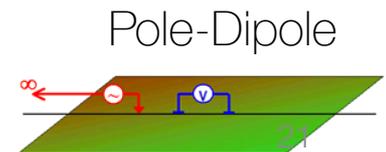

- Pole-dipole;  $n=1,8$ ;  $a=10\text{m}$ ;  $N=316$ ;  $(\alpha_s, \alpha_x, \alpha_z)=(.001, 1.0, 1.0)$

# Example 3: UBC-GIF model

- Pole-dipole;  $n=1,8$ ;  $a=10\text{m}$

# Induced Polarization: Summary

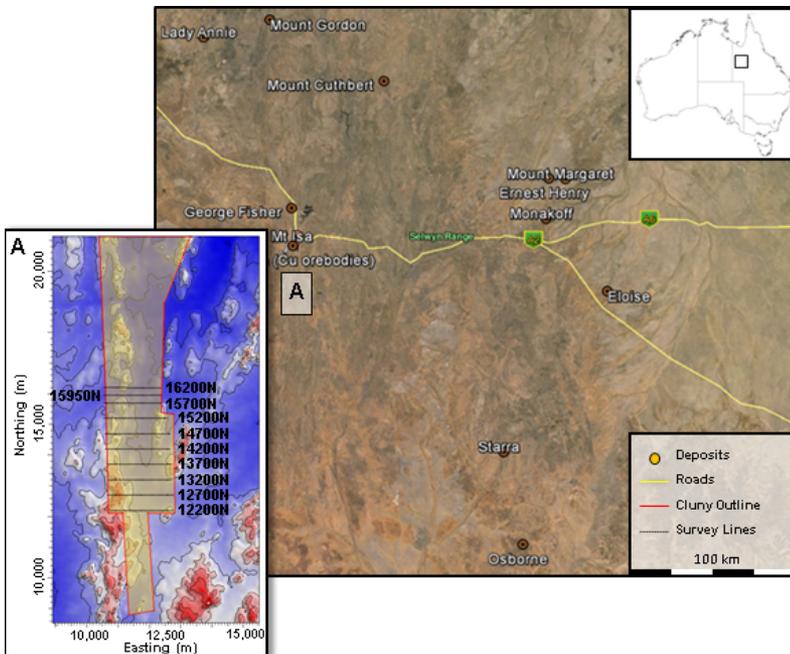

- Sources of IP
- Conceptual model of IP
- Chargeability
- IP data
- Pseudosections
- Two stage DC-IP inversion
- Case history: Mt. Isa
  
- Questions
  
- Case history: Mt. Isa

# Case history: Mt. Isa

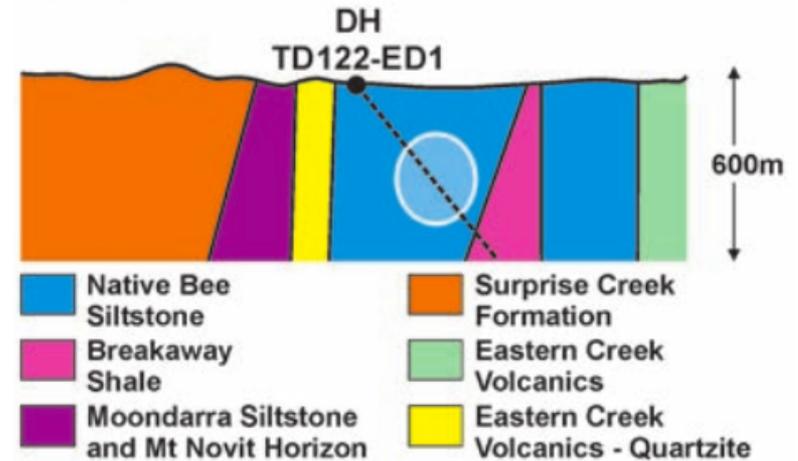

Rutley et al., 2001

# Setup

- Mt. Isa (Cluny project)

- Geologic model

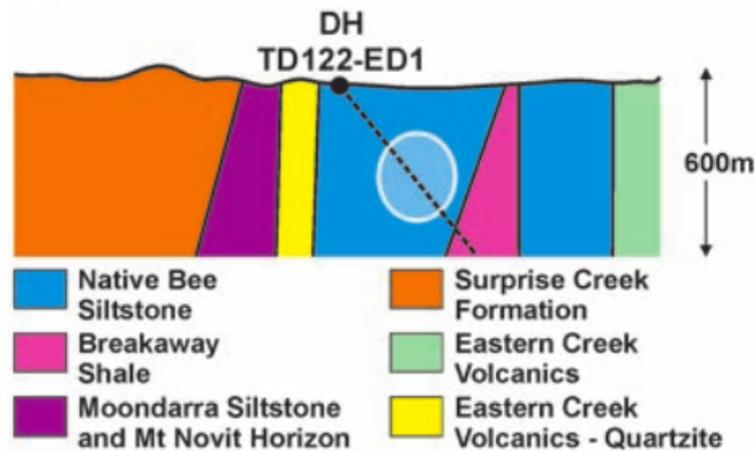

## Question

- Can conductive, chargeable units, which would be potential targets within the siltstones, be identified with DC / IP data?

# Properties

Geologic model

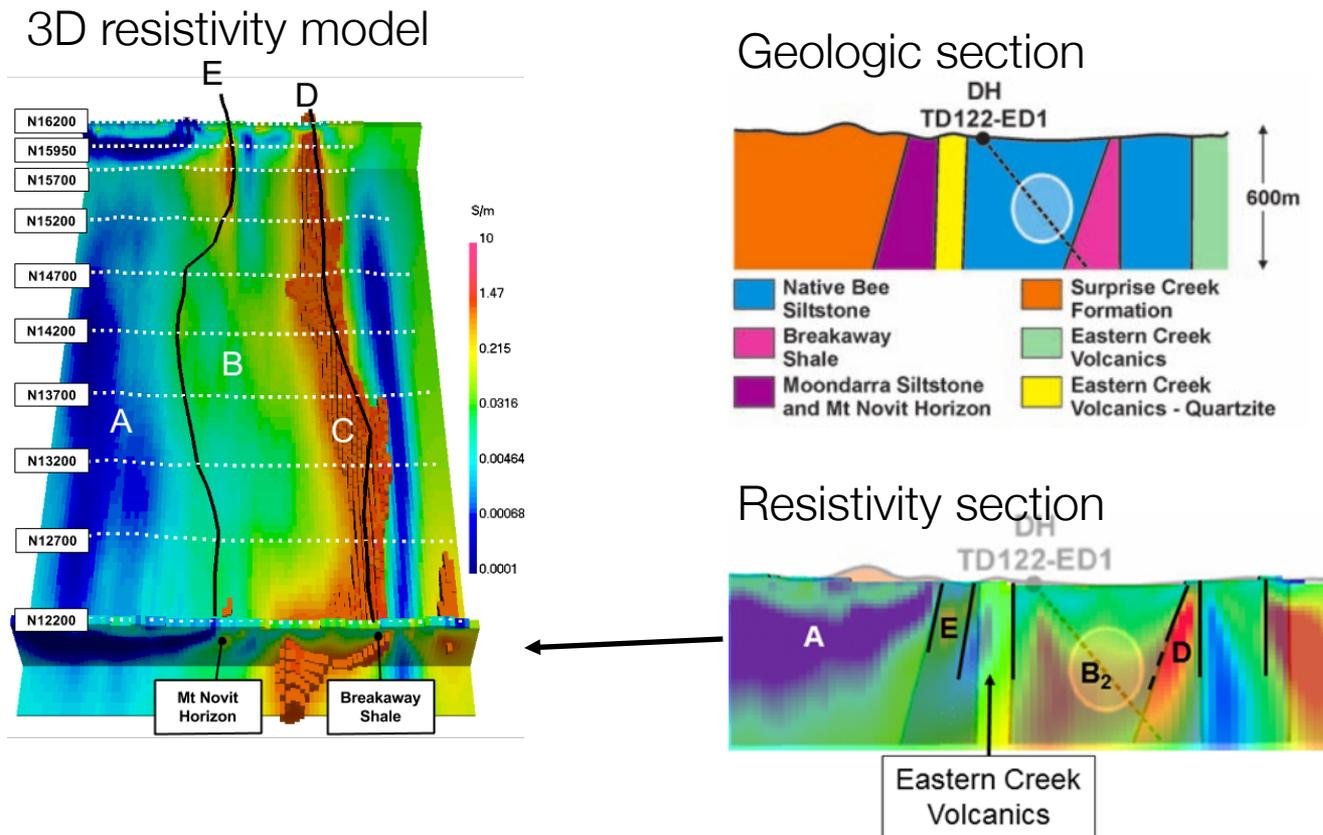

Resistivity and Chargeability

Rock Unit	Conductivity	Chargeability
Native Bee Siltstone	Moderate	Low
Moondarra Siltstone	Moderate	Low
Breakaway Shale	Very High	Low-None
Mt Novit Horizon	High	High
Surprise Creek Formation	Low	None
Eastern Creek Volcanics	Low	None

# Recap: Synthesis from DC

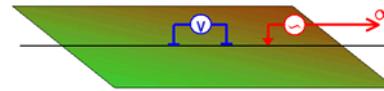

- Identified a major conductor → black shale unit
- Some indication of a moderate conductor

Can a **chargeable**, moderate conductor in the siltstones be identified?

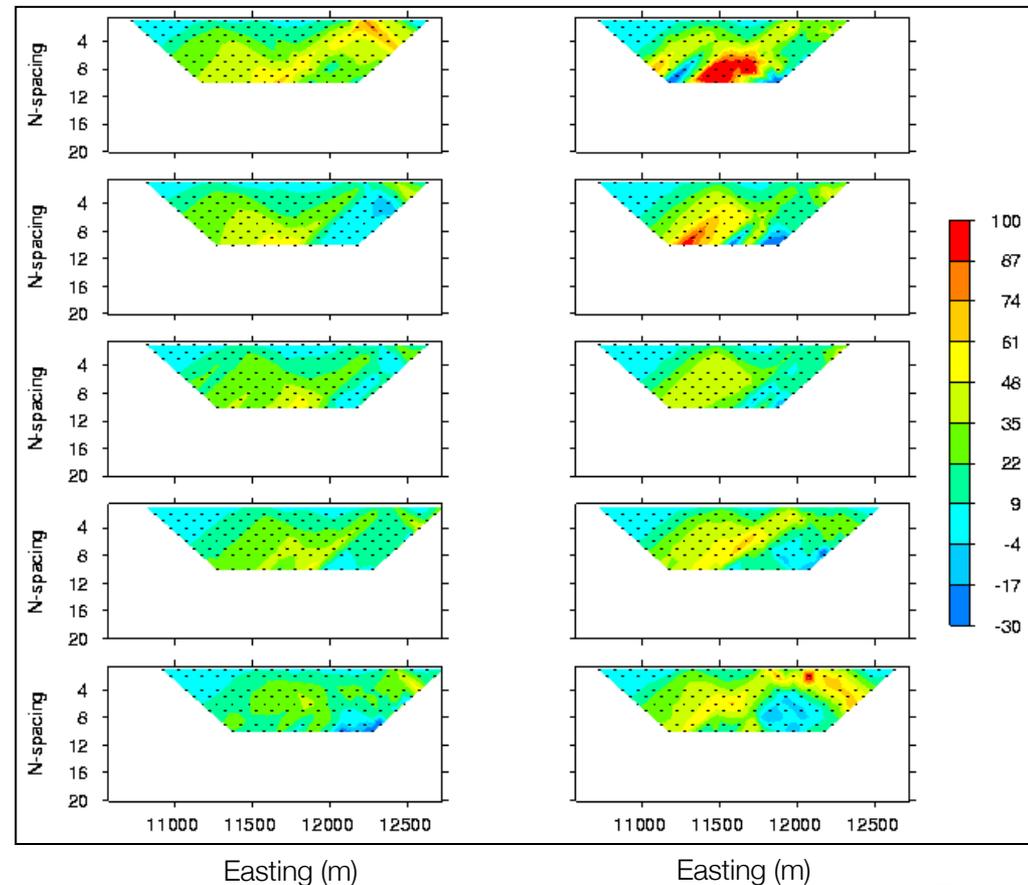

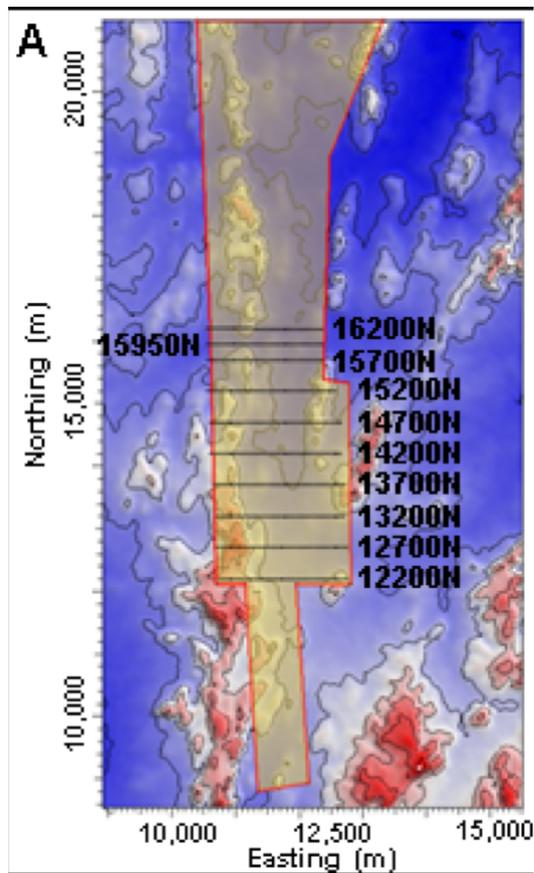

# Survey and data

- Eight survey lines
- Two configurations

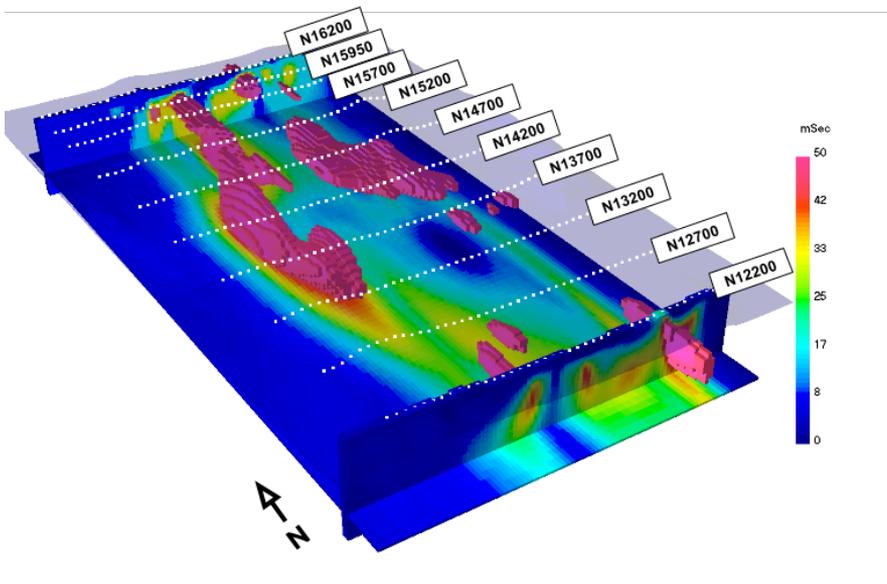

Apparent chargeability, dipole- pole.

Surface topography

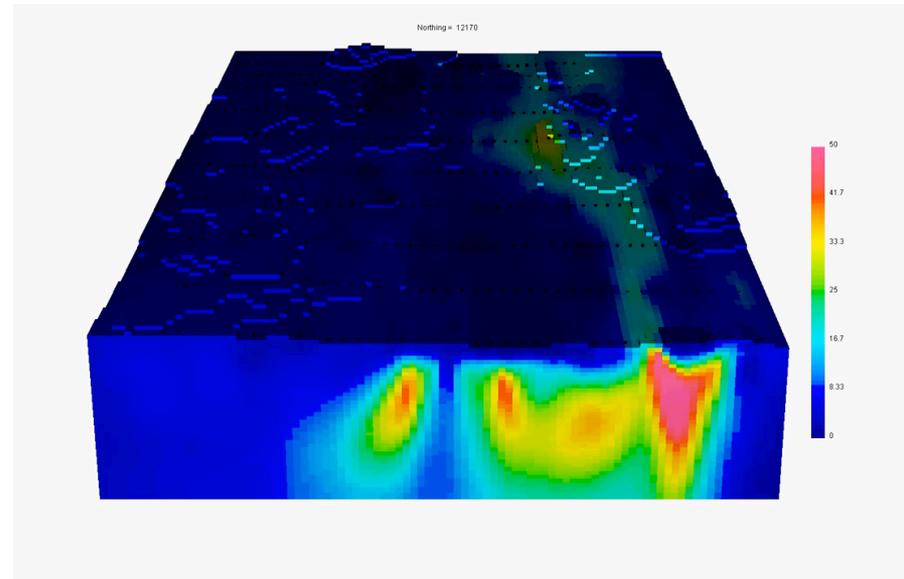

# Processing

3D chargeability model

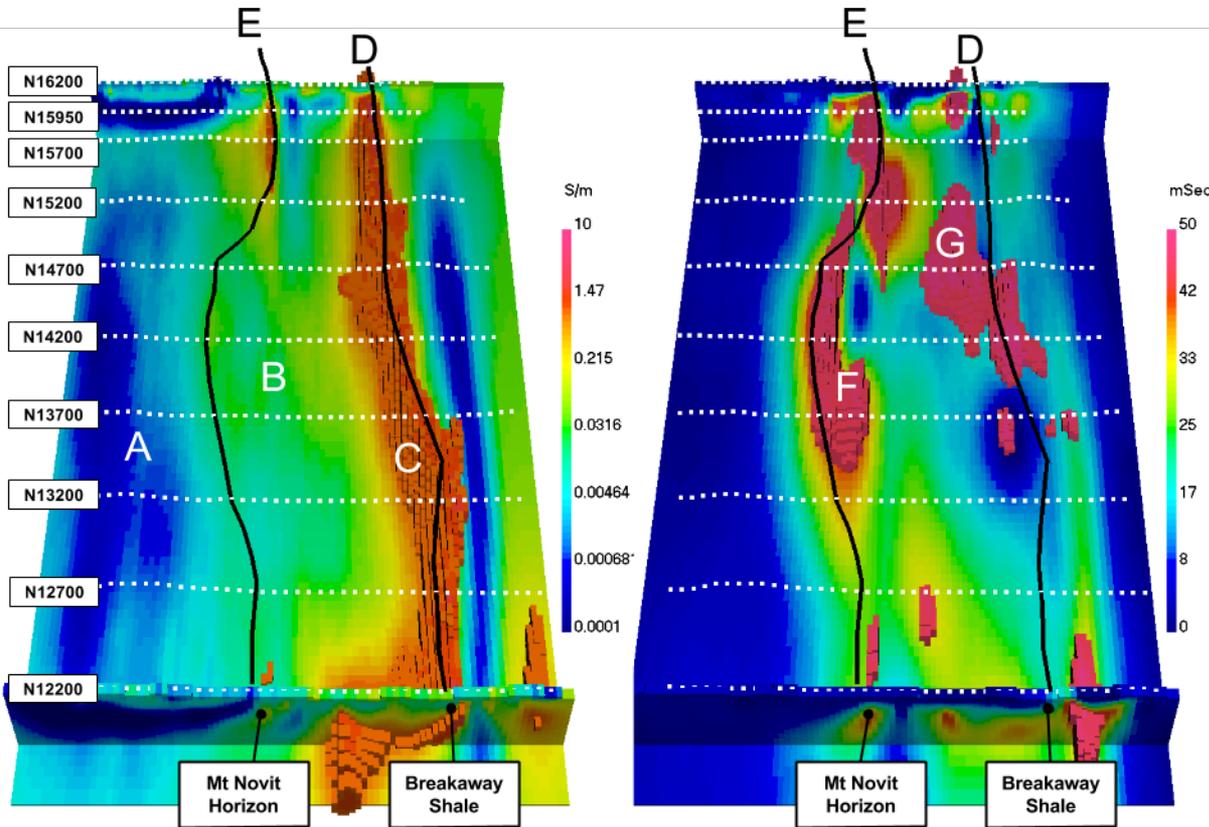

Animation

# Interpretation

Resistivity model

Chargeability model

A: Resistive, Non-chargeable

B: Moderate conductivity; low chargeability

C: Very high conductivity (> 10 S/m)

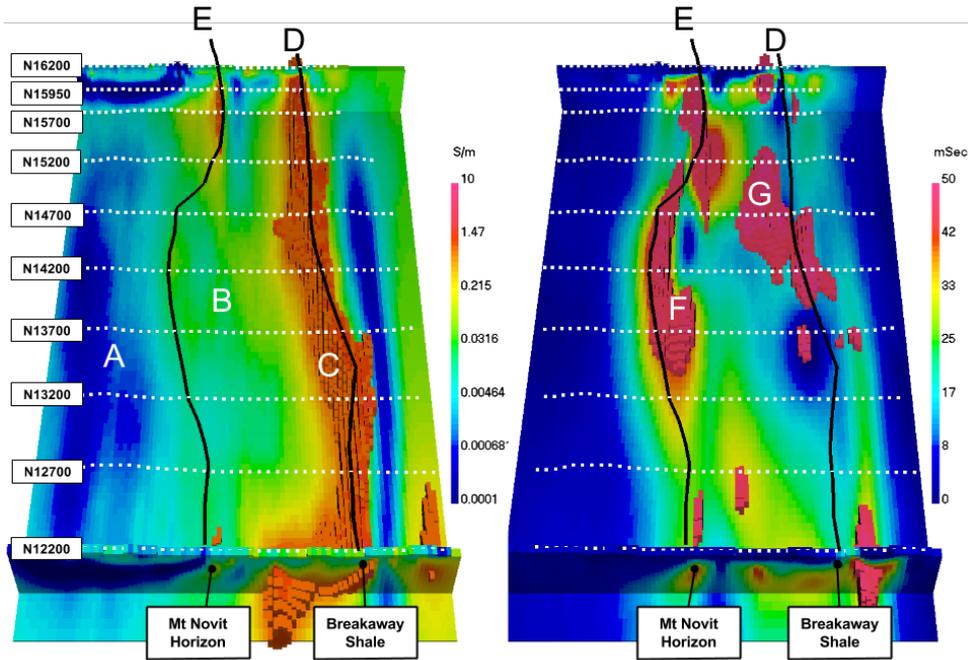

**E and F:** High conductivity and high chargeability

G: Other chargeable regions

# Synthesis

Resistivity model

Chargeability model

A: Surprise Creek Formation  
– Resistive, non-chargeable

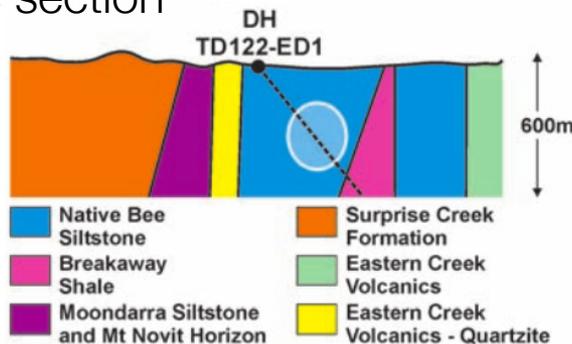

B: Moondarra and Native Bee siltstones

C: Breakaway Shales  
– Very high conductivity

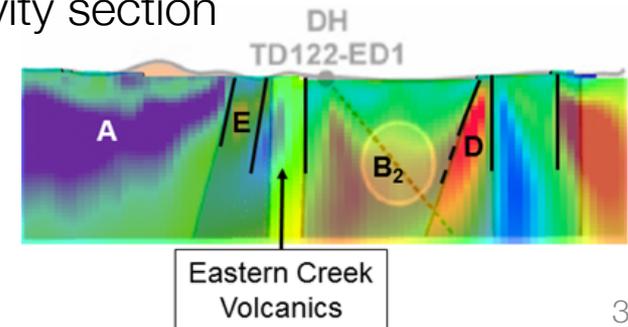

**E and F:** Mt Novit Horizon  
– High conductivity and high chargeability

G: Other chargeable regions within siltstone complex
