### **EM: Natural Sources**

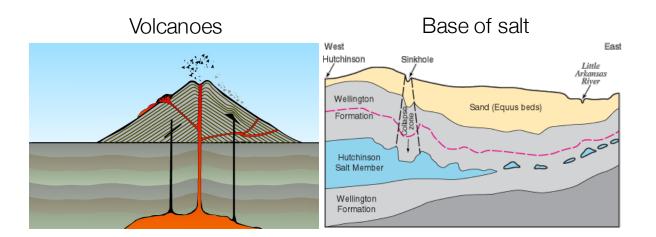

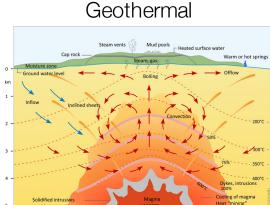

#### Outline

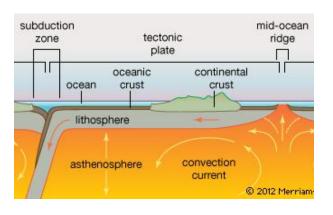

- Background on natural source EM methods
- Magnetotellurics
- MT case history
- Z-axis tipper electromagnetics
- ZTEM case history

#### Motivation

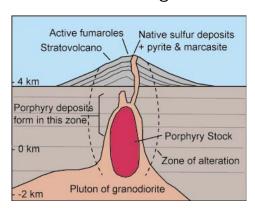

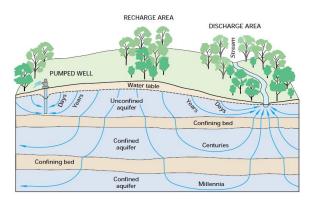

#### Tectonic settings of top few km

#### Mineral targets

#### Groundwater

Common challenge: getting enough energy into the ground

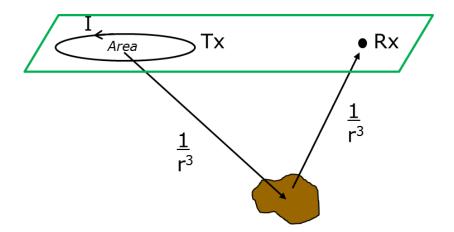

# What is required to see deeper?

- Penetration depth depends upon system power
- Controlled source:
  - Using a small loop
  - Magnetic moment

$$m = IA$$

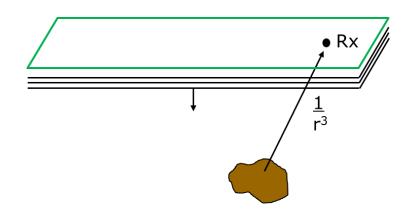

Total geometric decay

$$\sim \frac{1}{r^6}$$

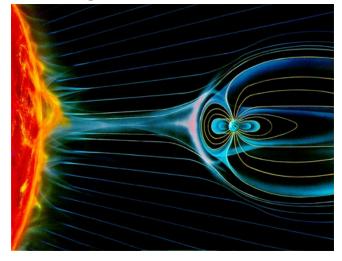

- Infinitely large loop source
  - Sheet currents generate plane waves
  - Total geometric decay

$$\sim rac{1}{r^3}$$

#### Natural EM sources

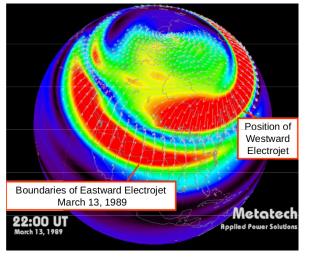

#### Sun and magnetosphere, solar storms

Lightning

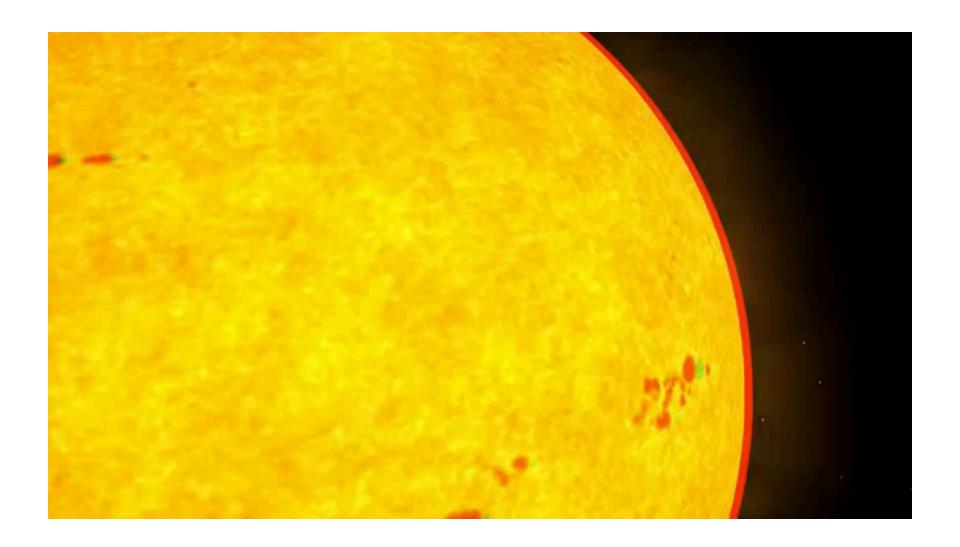

#### Auroral electrojet; aurora

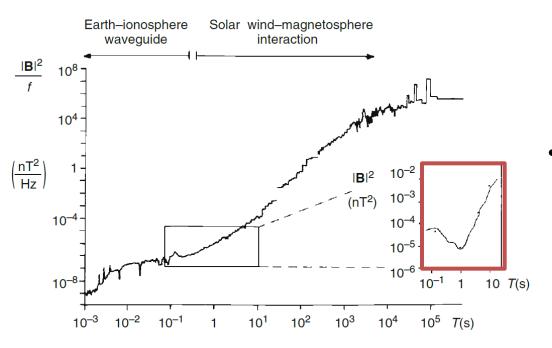

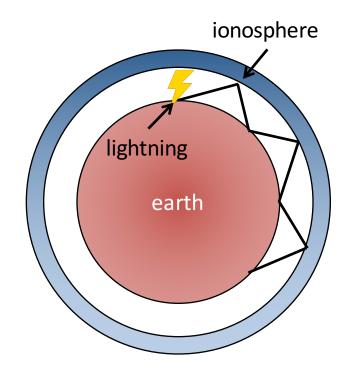

# Aurora movie

# Earth as a waveguide

- EM waves bounce between earth and highly conductive ionosphere
- Travel as plane waves

 Dead band: difficult to collect frequencies in notch (~1 Hz)

#### Refraction of waves

Snell's law

$$k_i \sin \theta_i = k_t \sin \theta_t$$

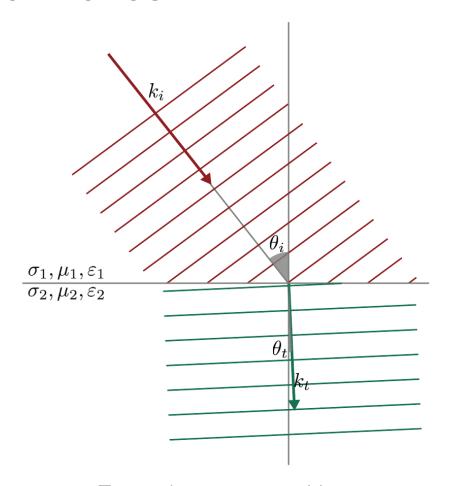

k is complex wave number

$$k^2 = \omega^2 \mu \varepsilon - i\omega \mu \sigma$$

• Quasi-static:  $\frac{\omega \varepsilon_0}{\sigma} \ll 1$ 

$$\sin \theta_t = \sqrt{\frac{2\omega\varepsilon_0}{\sigma}} \sin \theta_i$$

• Angle of refraction is  $\theta_t = 0^\circ$  in almost every instance

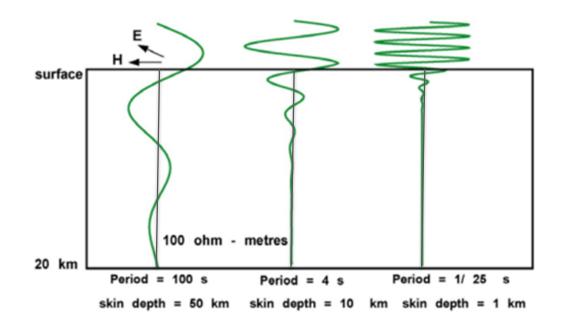

Example for 10,000 Hz  $\sigma = 10^{-3} \text{ S/m}$   $\theta_i = 89^\circ$  Then  $\theta_t = 1.35^\circ$ 

## Plane waves and skin depth

Skin depth (meters)

$$\delta = \sqrt{\frac{2}{\omega\mu\sigma}} = 503\sqrt{\frac{1}{\sigma f}}$$

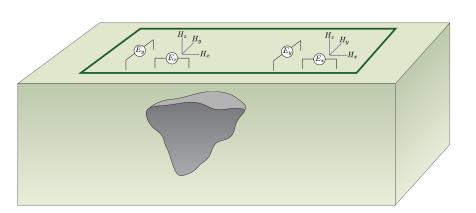

- Low frequency waves propagate further
- Depth of propagation
  - A few skin depths
  - Only a portion of a wavelength

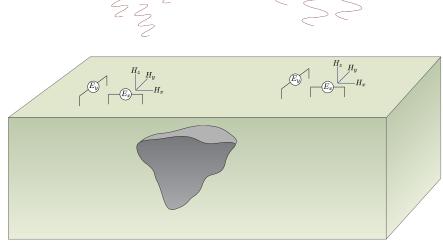

#### Control source vs Natural source

- Controlled source
  - Well-defined location, geometry, and amplitude

- Natural sources
  - Sources are random in space and time

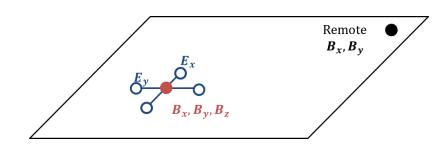

#### MT Station

- Maxwell's equations:
  - Linear in  $J_s$
  - E and H affected in the same way
- Effects of unknown source removed by taking ratio
- Transfer function

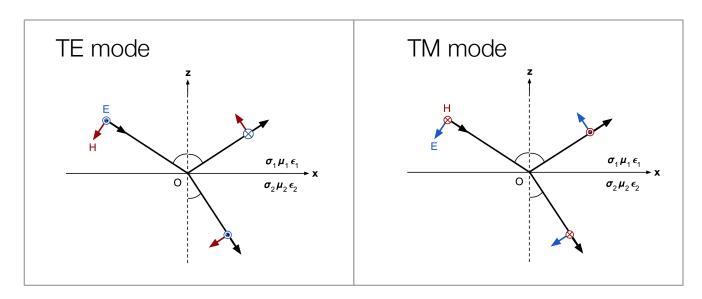

$$\mathbf{E}=\mathbf{ZH}$$
impedance (matrix)
$$\begin{pmatrix} E_x \ E_y \end{pmatrix} = \begin{pmatrix} Z_{xx} & Z_{xy} \ Z_{yx} & Z_{yy} \end{pmatrix} \begin{pmatrix} H_x \ H_y \end{pmatrix}$$

$$\nabla \times \mathbf{E} + i\omega \mu \mathbf{H} = 0$$
$$\nabla \times \mathbf{H} - \sigma \mathbf{E} = \mathbf{J_s}$$

# Impedance and resistivity

- Plane wave in homogenous media:
  - E and H fields are perpendicular

#### Homogeneous half space

Impedance Resistivity Phase 
$$Z_{xy} = \frac{E_x}{H_y} \qquad \rho = \frac{1}{\omega \mu} |Z_{xy}|^2 \qquad \Phi = \tan^{-1} \left( \frac{Im(Z_{xy})}{Re(Z_{xy})} \right) = \frac{\pi}{4}$$

# MT soundings in 1D

• In general:

$$Z = \begin{pmatrix} Z_{xx} & Z_{xy} \\ Z_{yx} & Z_{yy} \end{pmatrix}$$

Apparent resistivity:

$$\rho_a = \frac{1}{\omega \mu_0} \left| Z_{xy} \right|^2$$

Phase:

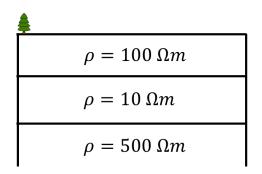

$$\Phi = \tan^{-1} \left( \frac{Im(Z_{xy})}{Re(Z_{xy})} \right)$$

• In 1D:

$$Z = \begin{pmatrix} 0 & Z_{xy} \\ Z_{yx} & 0 \end{pmatrix}$$

$$Z_{xy} = \overline{H_y}$$

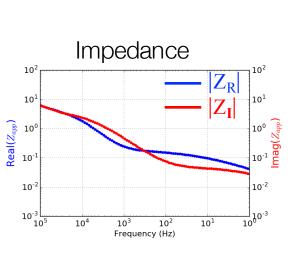

$$Z_{xxy} = -Z_{xyy}$$

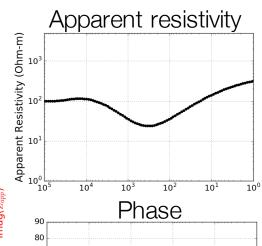

10

10<sup>4</sup>

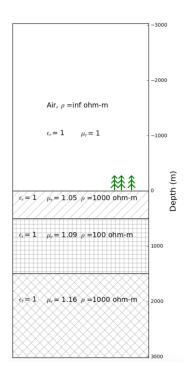

10<sup>3</sup>

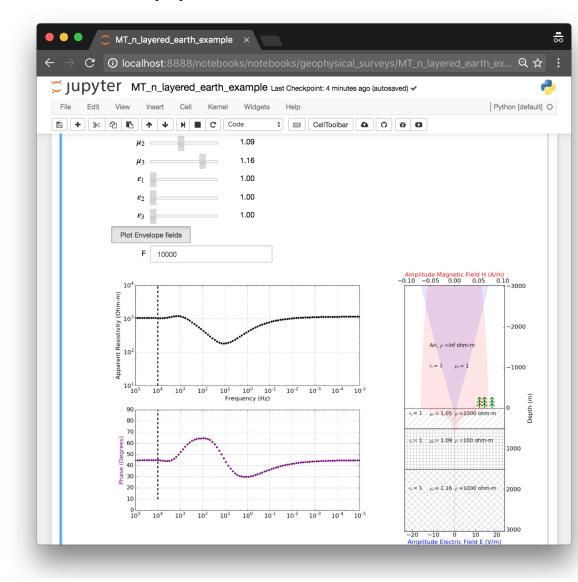

# 1D MT app

$$\nabla \times \mathbf{E} + i\omega \mu \mathbf{H} = 0$$
$$\nabla \times \mathbf{H} - \sigma \mathbf{E} = \mathbf{J_s}$$

# MT soundings in 2D

In general:

$$Z = \begin{pmatrix} Z_{xx} & Z_{xy} \\ Z_{yx} & Z_{yy} \end{pmatrix}$$

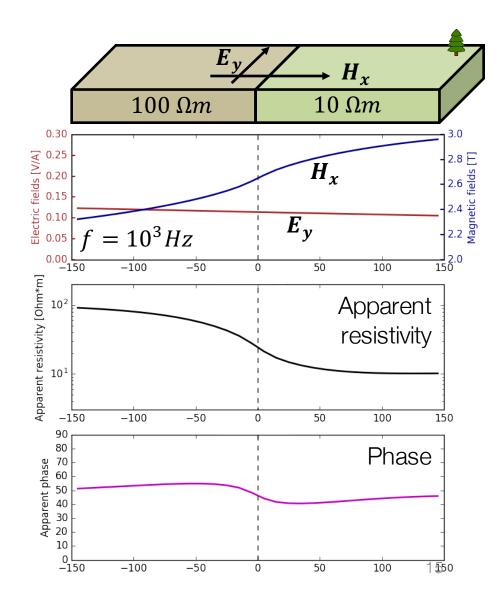

• In 2D:

$$Z = \begin{pmatrix} 0 & Z_{xy} \\ Z_{yx} & 0 \end{pmatrix}$$

$$Z_{xy} \neq Z_{yx}$$

- TE mode
  - E-field parallel to structure

$$Z_{yx} = \frac{E_y}{H_x}$$

# MT soundings in 2D

• In general:

$$Z = \begin{pmatrix} Z_{xx} & Z_{xy} \\ Z_{yx} & Z_{yy} \end{pmatrix}$$

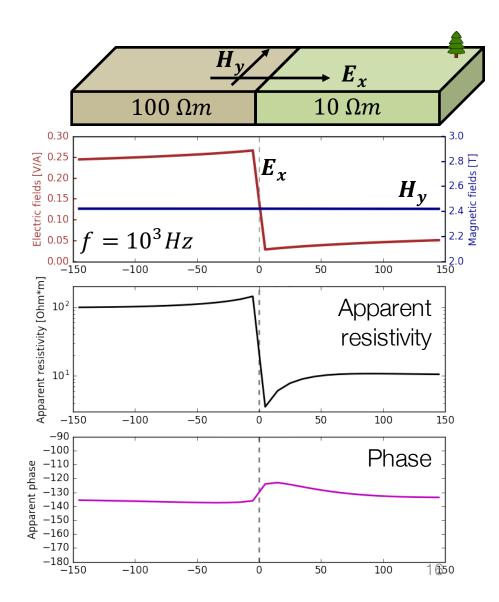

• In 2D:

$$Z = \begin{pmatrix} 0 & Z_{xy} \\ Z_{yx} & 0 \end{pmatrix}$$

$$Z_{xy} \neq Z_{yx}$$

- TM mode
  - H-field parallel to structure
  - E<sub>x</sub> discontinuous

$$Z_{xy} = \frac{E_x}{H_y}$$

# MT soundings in 3D

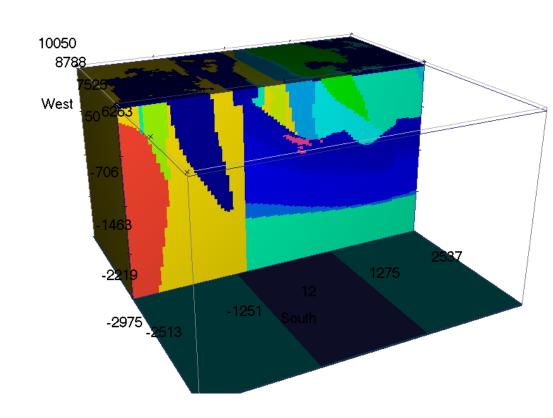

In general:

$$Z = \begin{pmatrix} Z_{xx} & Z_{xy} \\ Z_{yx} & Z_{yy} \end{pmatrix}$$

• In 3D:

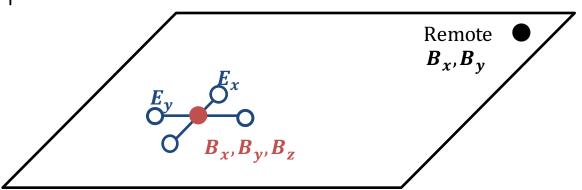

$$Z = \begin{pmatrix} Z_{xx} & Z_{xy} \\ Z_{yx} & Z_{yy} \end{pmatrix}$$

No symmetry or special conditions

# Measuring MT data

Basic acquisition

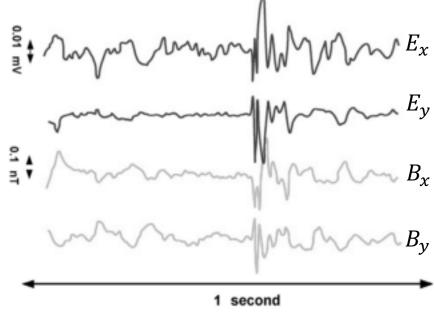

At each station, measure:

$$E_x$$
,  $E_y$ ,  $B_x$ ,  $B_y$ ,  $B_z$ 

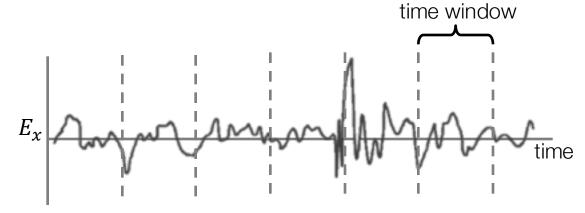

At remote reference, measure:

$$B_x$$
 ,  $B_y$ 

# Processing MT data

 Divide time series into time windows

- Apply Fourier transform
  - For each station:

$$e_{x}(t) \rightarrow E_{x}(\omega)$$
  
 $h_{y}(t) \rightarrow H_{y}(\omega)$ 

– For the remote reference:

$$h_y^R(t) \to H_y^R(\omega)$$

Form the impedance tensor:

$$Z_{xy}(\omega) = \frac{\langle E_x(\omega) H_y^{R*}(\omega) \rangle}{\langle H_y(\omega) H_y^{R*}(\omega) \rangle}$$

(\*) complex conjugate

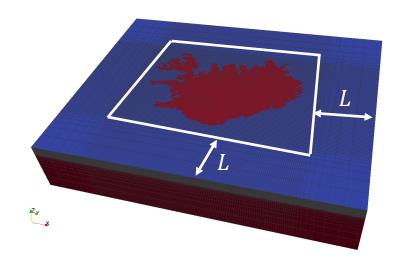

<> average over multiple samples

# Inverting MT data

- Boundary conditions important for modelling
- Mesh size:
  - MT: extended grid

L: a few skin depths from data area

- Challenge: Unknown boundary conditions
  - Possible channeled currents
  - Data can be affected by distant structures
- Otherwise, inversion of MT is essentially same as CSEM data

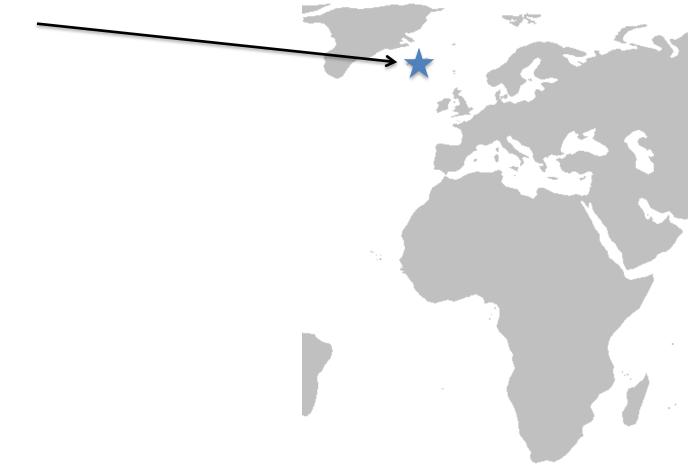

#### Outline

- Background on natural source EM methods
- Magnetotellurics
- Questions?
- MT case histories
- Z-axis tipper electromagnetics
- ZTEM case histories

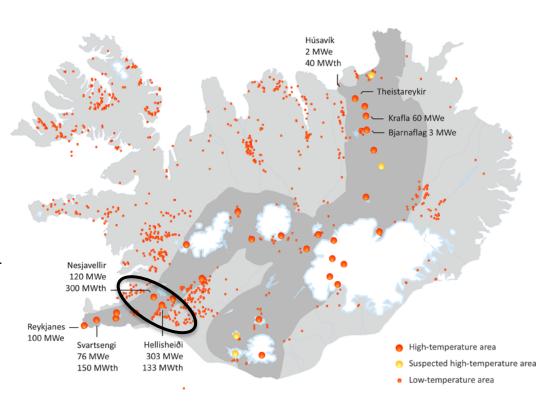

# MT case history

Iceland

# Hengill geothermal region: setup

- Iceland: geothermal hot spot
  - On the mid-Atlantic ridge
  - Hosts multiple high temperature geothermal systems
- Hengill geothermal area
  - Supplies majority of hot water in Reykjavik
  - Contributes ~450 Mwe to National power grid

# Physical properties

# Survey

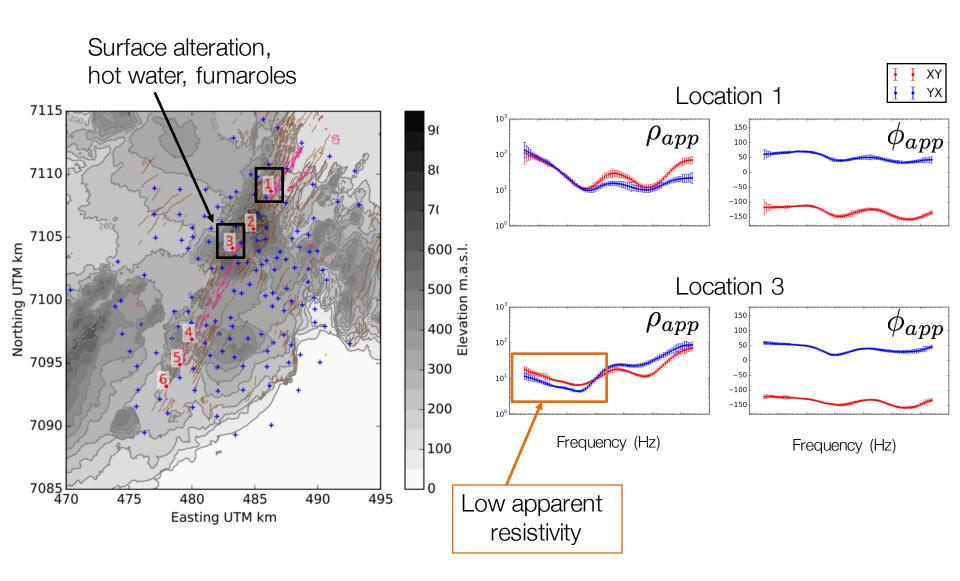

Remote  $B_x, B_y$   $B_x, B_y, B_z$ 

- MT instrumentation
  - Phoenix MTU5's
- Survey
  - 133 stations used
  - Combination of 2E and 2E+3H setup
  - Frequencies: 300 0.001 Hz
- Remote reference
  - About 40 km away
- Raw data processing using Phoenix software

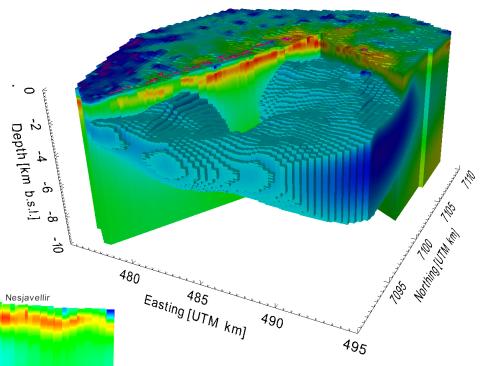

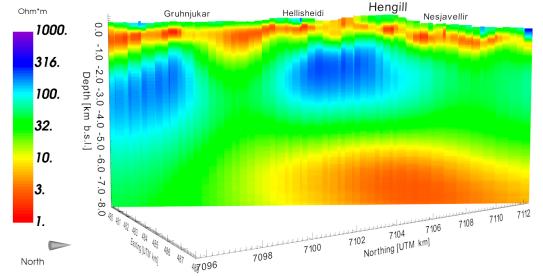

#### Data

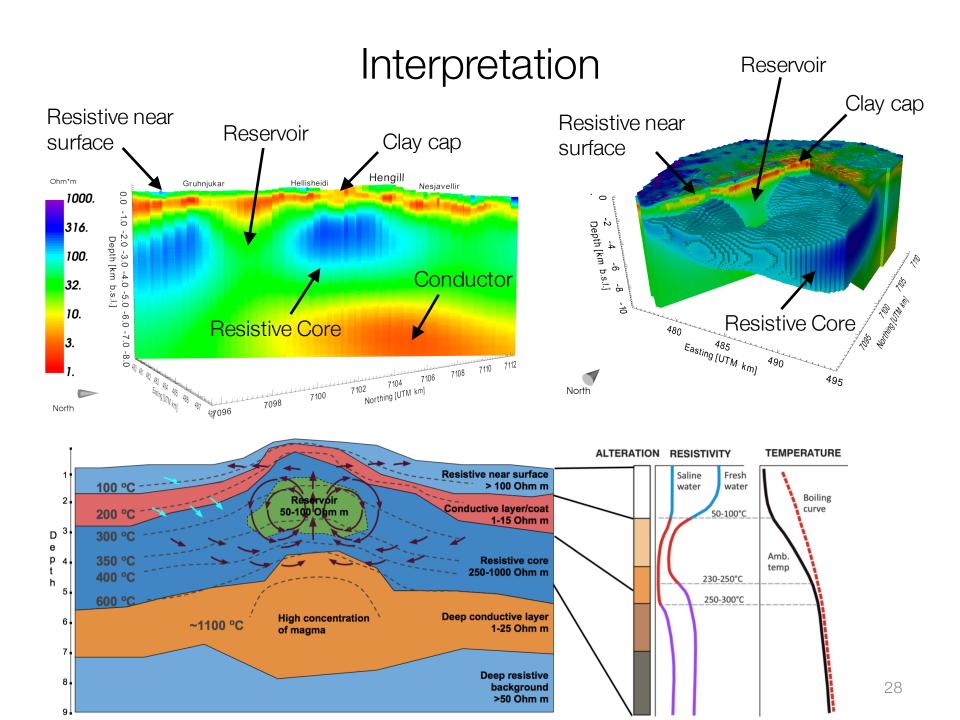

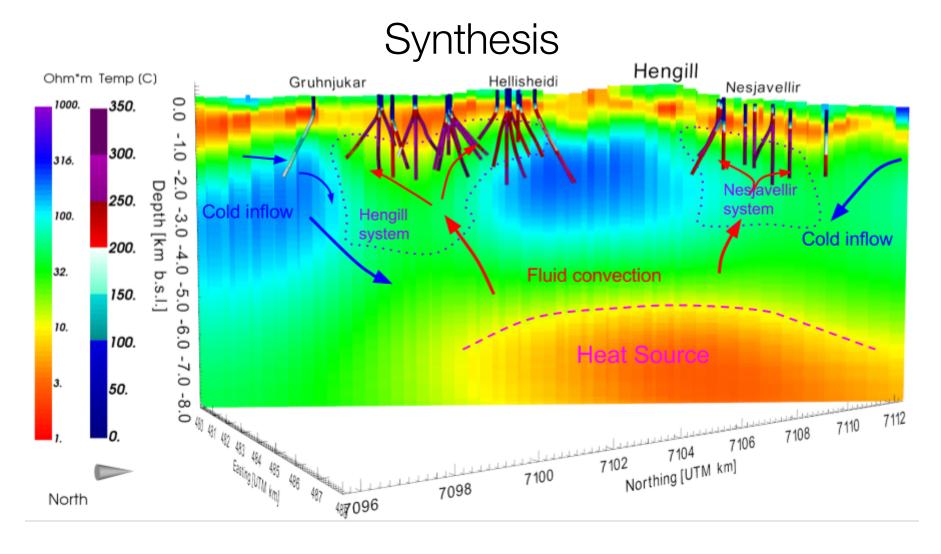

#### 3D inversion

- Off-diagonal impedance  $(Z_{xy} \text{ and } Z_{yx})$  used
- Combined multi-frequency inversion (300 Hz – 0.001 Hz)

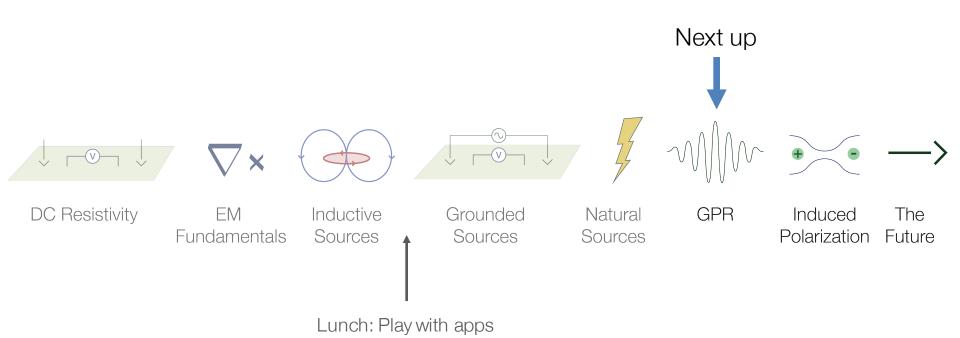

- Conductive layer corresponds with formation temperature
- Two main production fields: Hengill and Nesjavellir
- Deep conductive heat source

# Summary

- Background on natural source EM methods
- Magnetotellurics
- MT case history
- Z-axis tipper electromagnetics
- ZTEM case history

#### **End of Natural Sources**

# Tipper data (ZTEM)

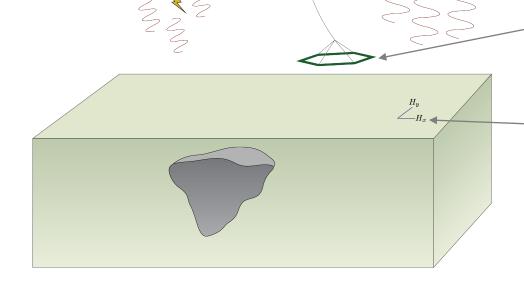

Magnetic transfer function

$$H_z = \mathbf{TH}$$

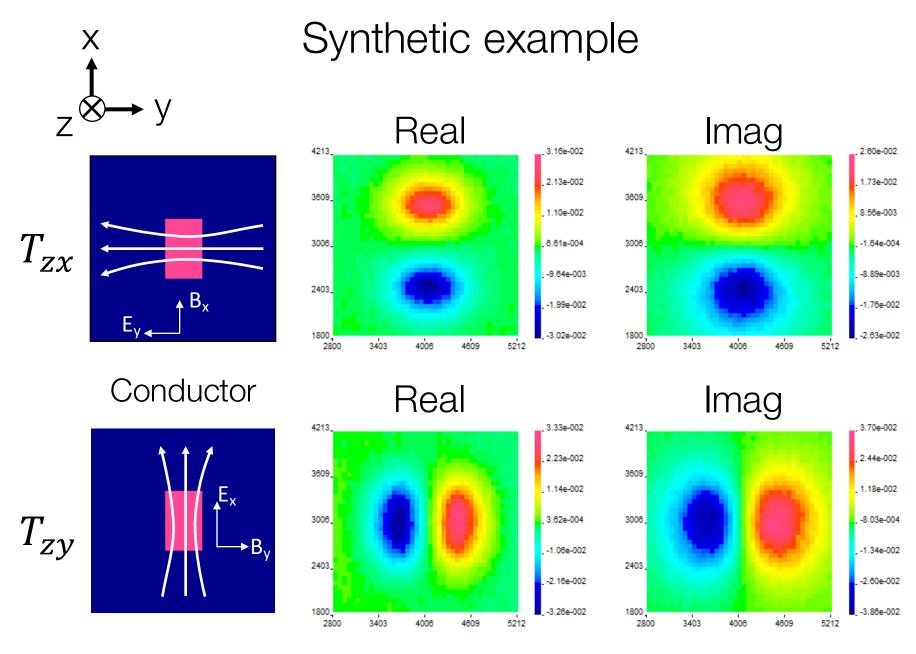

$$H_z(r) = T_{zx}H_x(r_0) + T_{zy}H_y(r_0)$$

• Frequencies 30Hz – 720 Hz

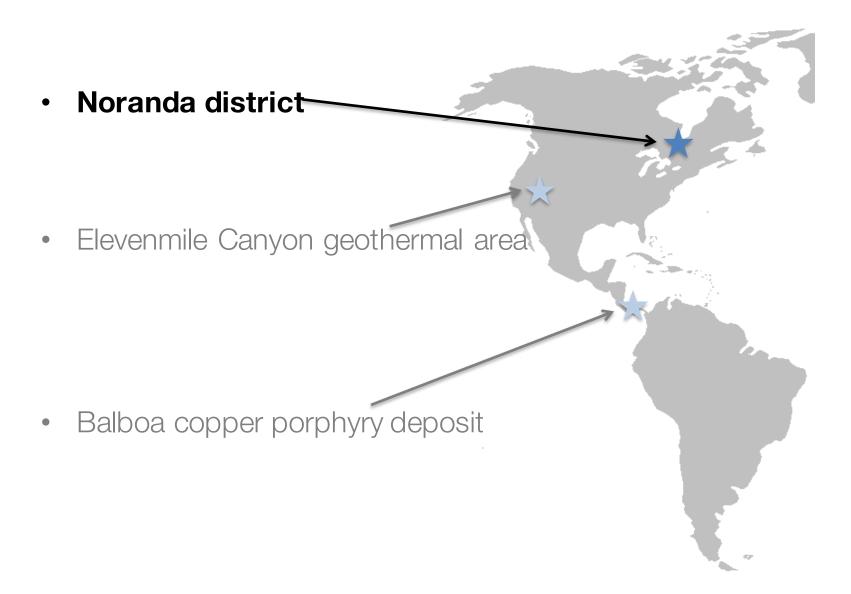

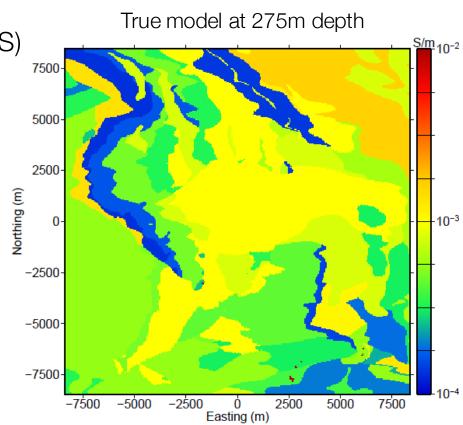

#### ZTEM case histories

## Noranda district, Canada

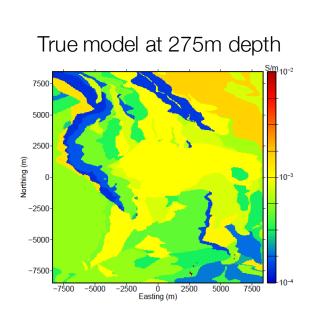

- Hosts many deposits:
  - 20 economic volcanogenic massive sulphide deposits (VMS)
  - 19 orogenic gold deposits
  - Several intrusion-hosted
     Cu-Mo deposits
- Physical properties
  - Synthetic example from geologic model
  - 38 geologic units converted into expected conductivities

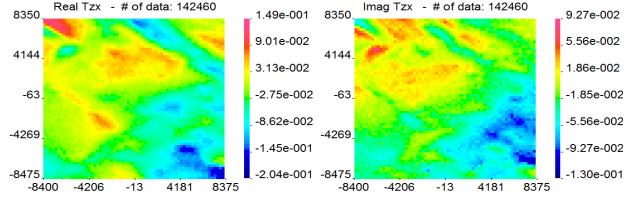

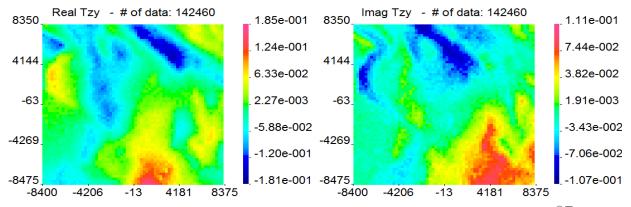

#### Data

- Forward model data at 6 frequencies
  - 30, 45, 90, 180, 360, and 720 Hz
- Need to invert data

#### Observed (90 Hz)

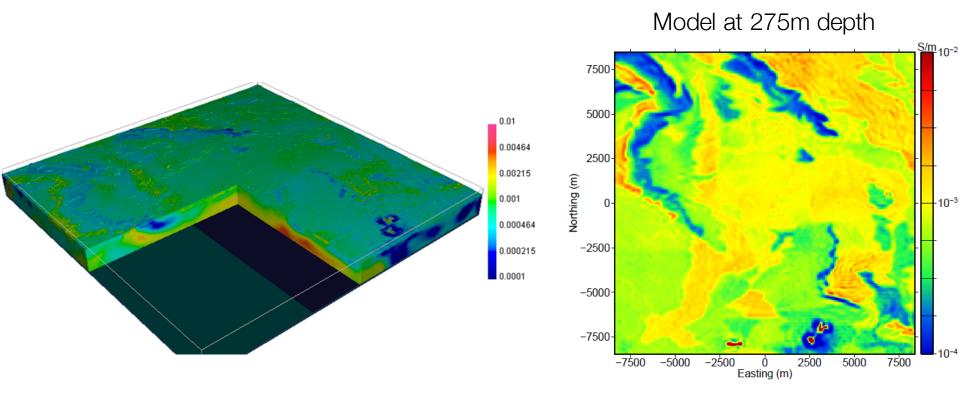

## Interpretation

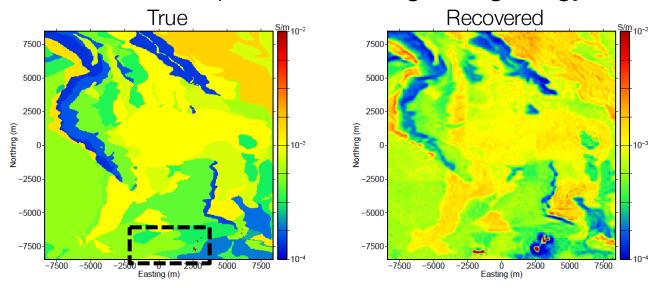

#### Recovered Model

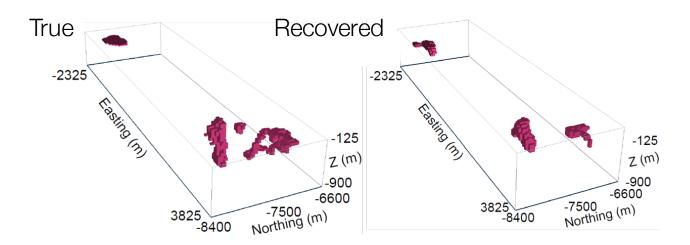

- Geologic units are well mapped
- Some mineralized bodies are located

# Synthesis

Recovered model represents the regional geology

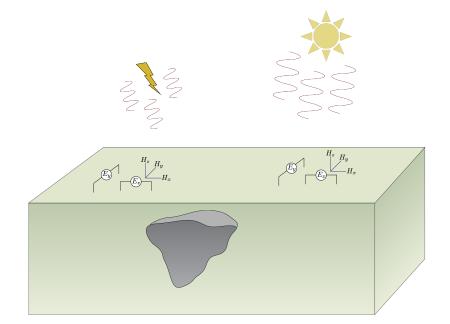

Mineralized zones are recovered

# Summary

- Background on natural source EM methods
- Magnetotellurics
- MT case history
- Z-axis tipper electromagnetics
- ZTEM case history

#### **End of Natural Sources**
