Ground Penetrating Radar

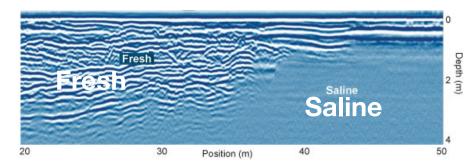

Motivation

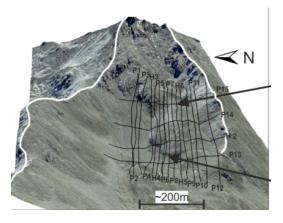

Sink holes

Salt Water Intrusions

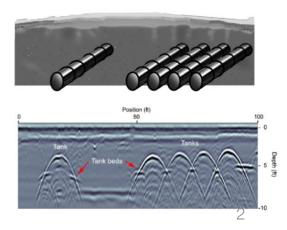

Rock glacier

Archeology

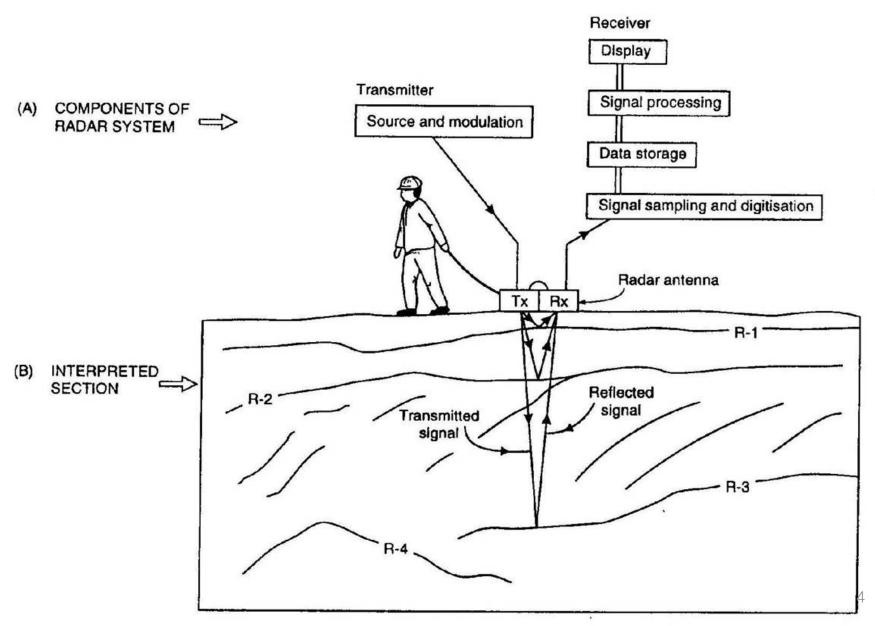

Underground tank

Outline

- Basic experiment

- Data and Processing
- Field examples
- Driverless Vehicles
- Case History: Rock Glacier

Basic Experiment

Basic Equations

	Time	Frequency	
Faraday's Law	$\nabla \times \mathbf{e} = -\frac{\partial \mathbf{b}}{\partial t}$	$ abla imes \mathbf{E} = -i\omega \mathbf{B}$	
Ampere's Law	$\nabla \times \mathbf{h} = \mathbf{j} + \frac{\partial \mathbf{d}}{\partial t}$	$ abla imes \mathbf{H} = \mathbf{J} + i\omega \mathbf{D}$	
No Magnetic Monopoles	$\nabla \cdot \mathbf{b} = 0$	$\nabla \cdot \mathbf{B} = 0$	
Constitutive	$\mathbf{j} = \sigma \mathbf{e}$	$\mathbf{J} = \sigma \mathbf{E}$	
Relationships	$\mathbf{b} = \mu \mathbf{h}$	${f B}=\mu {f H}$	
(non-dispersive)	$\mathbf{d} = \varepsilon \mathbf{e}$	$\mathbf{D} = arepsilon \mathbf{E}$	

* Solve with sources and boundary conditions

Basic Equations: Wave Equation

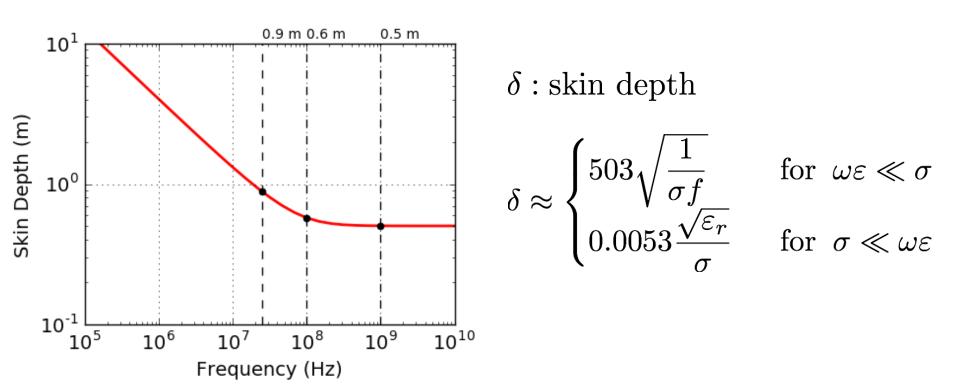

First order equations $\nabla \times \mathbf{e} = -\frac{\partial \mathbf{b}}{\partial t}$ $\mathbf{j} = \sigma \mathbf{e}$ $\mathbf{b} = \mu \mathbf{h}$ $\nabla \times \mathbf{h} = \mathbf{j} + \frac{\partial \mathbf{d}}{\partial t}$ $\mathbf{d} = \varepsilon \mathbf{e}$ Second order equations $\nabla^2 \mathbf{h} - \underbrace{\mu \sigma \frac{\partial \mathbf{h}}{\partial t}}_{} - \underbrace{\mu \epsilon \frac{\partial^2 \mathbf{h}}{\partial t^2}}_{} = 0$ diffusion wave propagation In frequency $\nabla^2 \mathbf{H} + k^2 \mathbf{H} = 0$ $k^2 = \omega^2 \mu \varepsilon - i \omega \mu \sigma$

Physical properties

	Material	ε_r	V_{avg} (m/ns)	σ (ms/m)	Penetration Depth (m)
	Air	1	3	0	∞
•	Fresh Water	80	0.033	0.5	285
	Sea Water	80	0.01	3000	< 0.1
	Ice	3 - 4	0.16	0.01	3000
	Dry Sand	3 - 5	0.15	0.01	3200
	Saturated Sand	20 - 30	0.06	0.1 - 1	145
	Limestone	4 - 8	0.12	0.5 - 2	30
	Shales	5 - 15	0.09	1 - 100	1
	Silts	5 - 30	0.07	1 - 100	1.3
	Clays	5 - 40	0.06	2 - 1000	0.2
	Granite	4 - 6	0.13	0.01 - 1	65
	Anhydrites	3 - 4	0.13	0.01 - 1	55

GPR systems

Common offset

Outline

- Basic experiment
- Physical property
- Physics
- Data and Processing
- Questions?
- Field examples
- Driverless Vehicles
- Case History: Rock Glacier

Environmental Test Survey

Problem

Characterize soil and identify
 potential aquifers

Why use GPR?

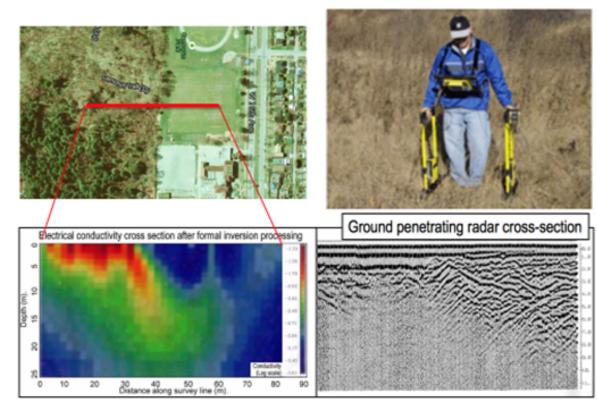

- Dielectric permittivity varies with
 - Water content
 - Lithologies

Survey and Data

 Zero offset data colocated with DC resistivity

Processing and Interpretation

- Attenuation of GPR signals on western side: higher conductivity
- Near surface structure from reflecting events

Locating Underground Storage Tanks

Problem

Locate buried storage tanks and tank beds

Why use GPR?

Conductive tanks, tank beds are strong reflectors

Survey and Data

• Zero offset data (250 MHz)

Processing and Interpretation

- Hyperbolic signatures from tanks
- Flat tank-bed reflectors
- 3D image constructed from radargrams

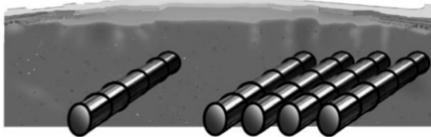

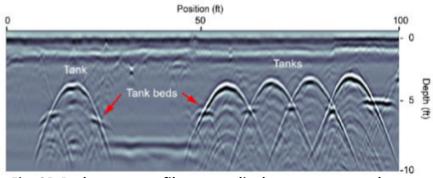

Fig. Geophysical problem

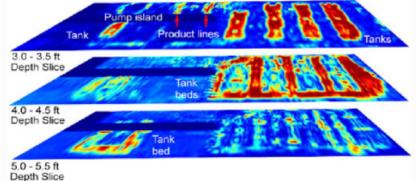

Fig. 129 3D interpolation from several GPR survey lines.

Mapping Peat Thickness

Problem

Estimate peat thickness

Why use GPR?

 Strong reflector at base of the peat

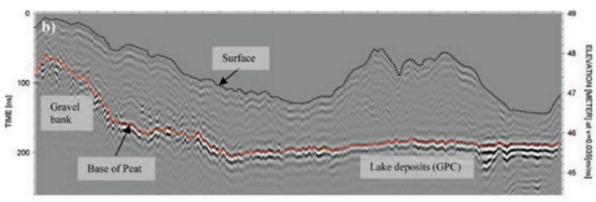

Survey and Data

- Zero offset data (100 MHz)
- Profiles every 60m
- LIDAR collected for local topography

Processing and Interpretation

- Arrival time to depth conversion
- Topography correction with LIDAR
- Peat layers up to 2m thick
- Additional reflectors indicate internal structure of peat

Subsurface Utility Mapping

Problem

 Locate iron-cased water pipes and PVCcased gas lines at an intersection

Why use GPR?

- Iron pipes very conductive → strong GPR reflector
- PVC v. low dielectric permittivity → GPR reflector

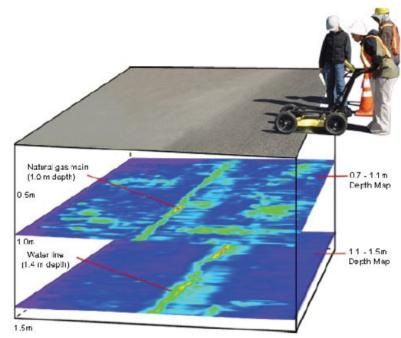

Survey and Data

- Zero offset data (250 MHz)
- 0.5m line spacing, 8m x 23m grid

Processing and Interpretation

- Arrival time to depth conversion
- Natural gas main at 1m depth
- Water line at 1.4m depth

https://www.sensoft.ca/case-studies/locating-pipes-cables_subsurface-utility-mapping/

Underground Potash mines

Problem

Locate water/brine leaking into potash mine

Why use GPR?

- Potash has low relative permittivity (~5).
- Water/brine has high dielectric permittivity (~80).

Survey and Data

• Zero offset data along mine shaft

Processing and Interpretation

• Arrival time to depth conversion using velocity of 0.13 m/ns for anhydrites

Case History: Furggwanghorn

Merz et al, 2015

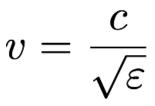

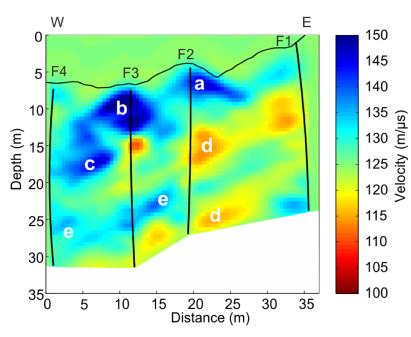

Setup

- Downslope movement shown to increase from 1.5 m/yr to 4.0 m/yr.
- Aim: characterize rock units and evolution of glacier
- Surface GPR: unsuccessful (too close to scatterers)
- Helicopter GPR used

Properties

Velocity from cross well GPR

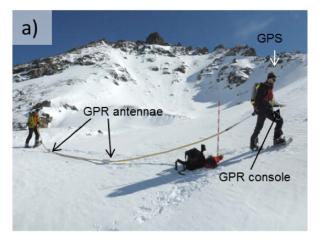

Material	Velocity (m/µs)	
(a & b) Unconsolidated sediments	> 140	
(c) Ice	> 140	
(d) Ice + partial melt	110 - 130	
(e) Compact debris	130 – 140	
Saturated sediments	80 -100	
Bedrock	110 -130	

Survey

- Initial Ground-Based Survey
 - 2 systems
 - Frequencies: 25 MHz and 50 MHz

- Heli-GPR
 - Frequency: 60 MHz
 - Flight height: 15-20 m
 - Line separation ~15 m

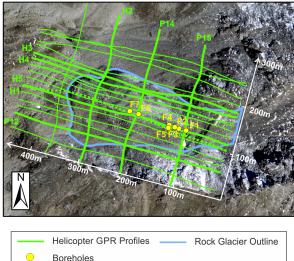

Ground-GPR

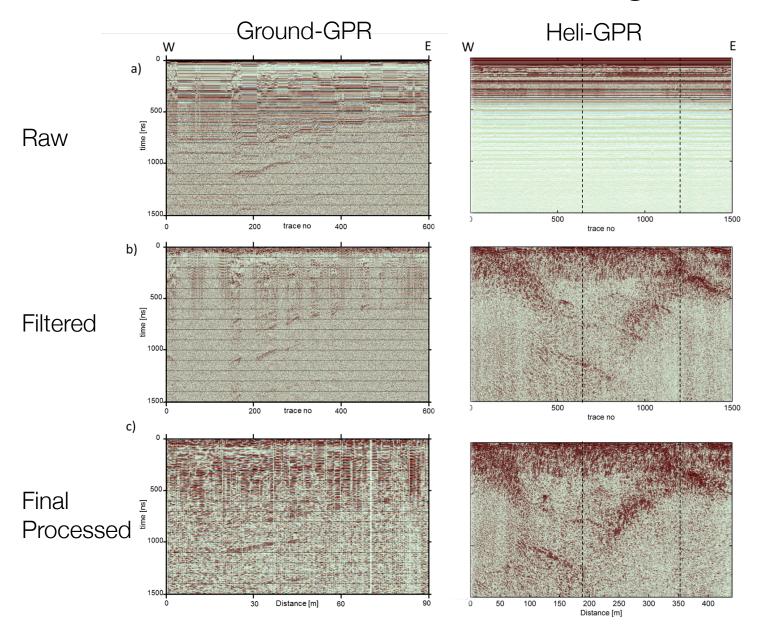

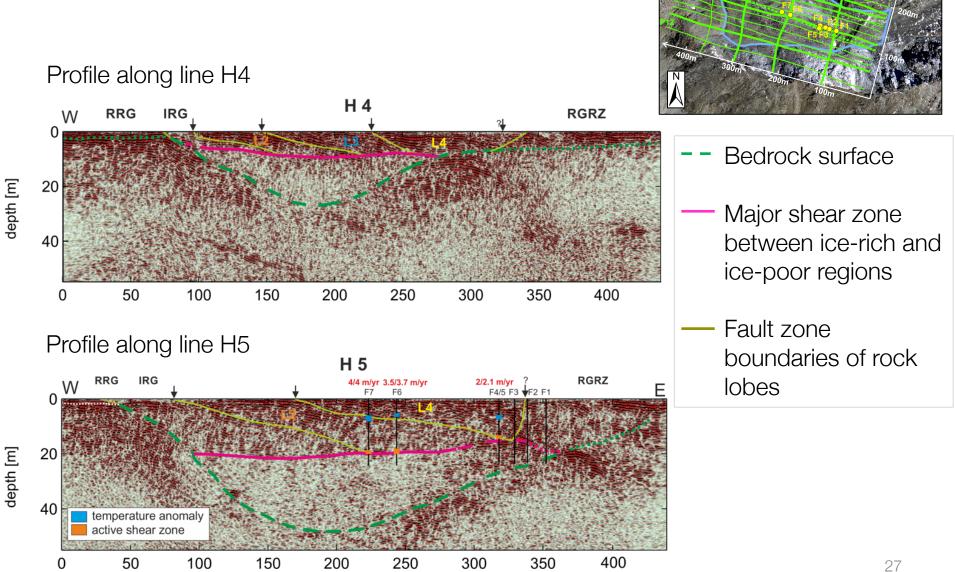

Heli-GPR

Survey lines

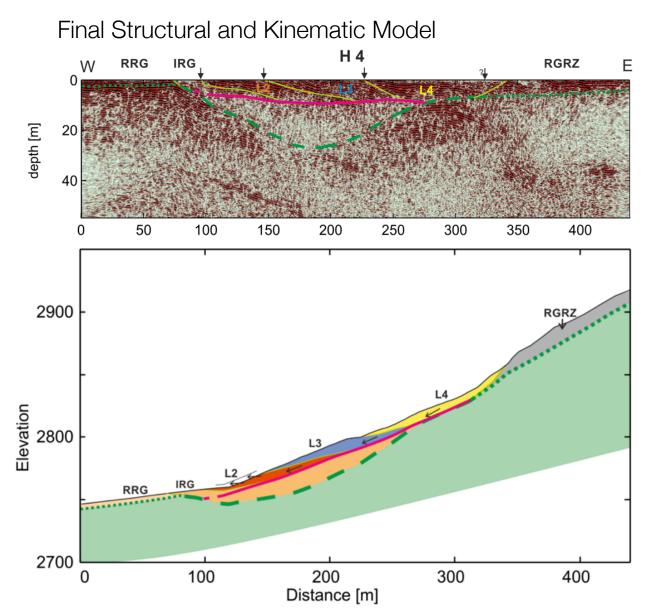

Data and Processing

Interpretation

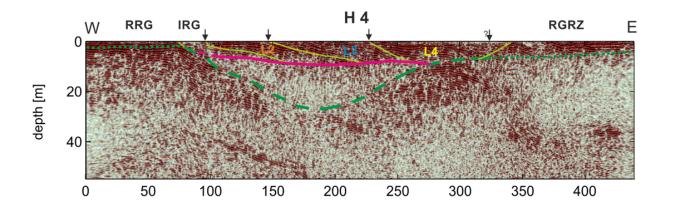

Synthesis

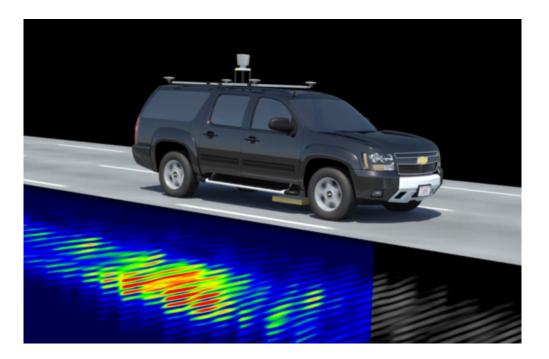

- Interpreted with thinskinned tectonic model
- Major shear zone acts as a décollment
- Rock glacier lobes act as nappes
- Lobes appear to move down-slope
- Tectonic model applicable to other glaciers

Summary

- Basic experiment
- Physical property
- Physics
- Data and Processing
- Case history: rock glacier

LGPR Localizing GPR for driverless vehicles MIT Lincoln Labs with GSSI

Journal of Field Robotics <u>Volume 33, Issue 1, pages 82-102, 27 MAY 2015 DOI: 10.1002/rob.21605</u> <u>http://onlinelibrary.wiley.com/doi/10.1002/rob.21605/full#rob21605-fig-0003</u>

Typical Sensors

Sensors

- GPS
- Lidar
- Camera
- Work fine in good weather

What happens when

- Bad weather
 - rain, snow, sleet, fog, ...
- Changes

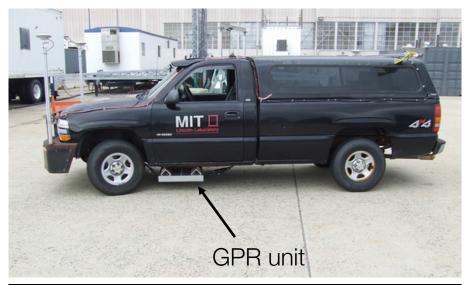

. . .

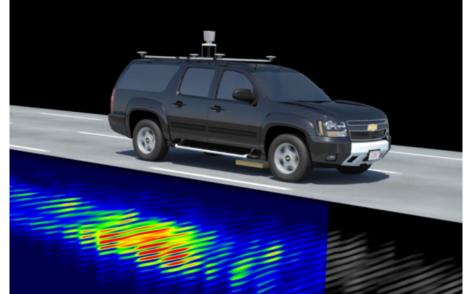

signs, road stripes, vegetation,

Need additional sensor data

Localizing Ground Penetrating Radar

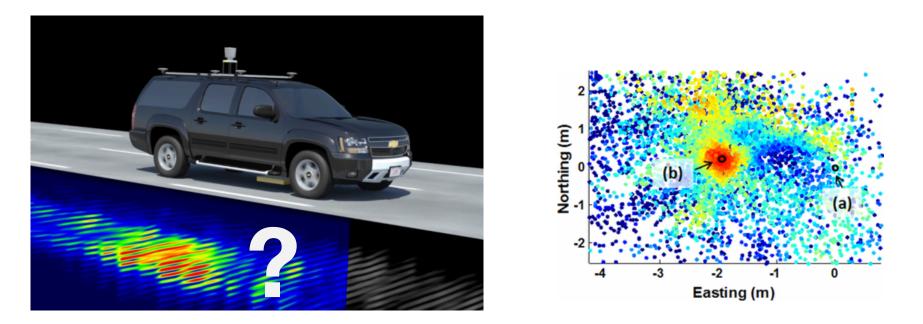

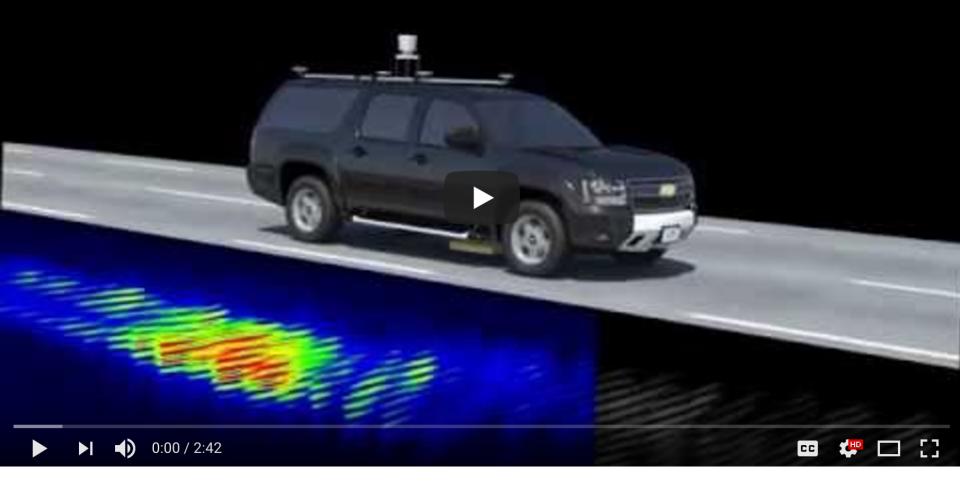

- Collect reference GPR data on clear day
- Store reference data set

Localizing Ground Penetrating Radar

Cross correlate real-time data with reference data to find location

LGPR complements existing technology to achieve the vision of safe autonomous vehicles.
