# Regulatory RNA structures

Ищи свичи

M.Colomer, A.Minochkina, R.Raevskiy, Z. Chervontseva\*

## Introduction

Recently several types of non-coding RNAs have been discovered which perform a variety of functions. One of the main common features shared by these RNAs is a stable secondary structure.

The wealth of genomic data produced by state-of-the-art sequencing technologies empower computational approaches to prediction of non-coding RNAs, the latter being an actual problem.

The aim of our project was to investigate the distribution of known non-coding RNA structures and find new cases using a phylogenetical approach. The well-studied phylum Firmicutes was considered (Figure 1).

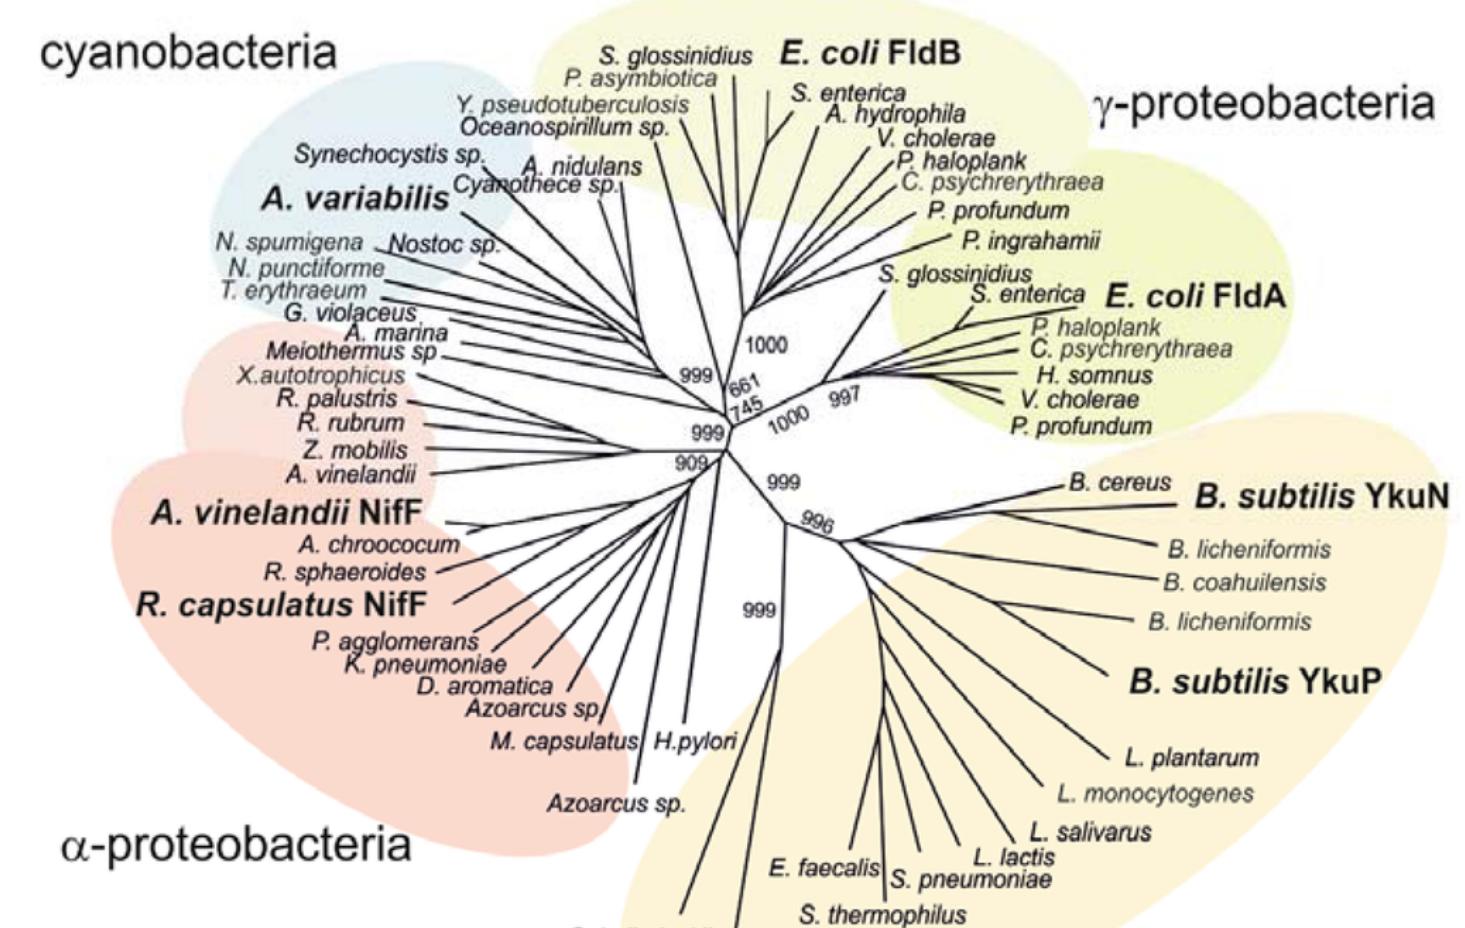

Figure 1. Firmicutes in the phylogenetic tree

## Abstract

En les últimes dècades nous tipus de ARN no codificant i les seves funcions han estat descoberts. Una de les característiques principals que els ARN no codificants comparteixen és que presenten una estructura secundària estable. Avui en dia es produeixen moltes dades genòmiques gràcies a les noves tecnologies de seqüenciació. A causa d'aquest fet, els mètodes computacionals per predir ARN no codificant són molt necessaris actualment. En el nostre projecte vam investigar estructures d'ARN no codificant ja conegeudes analitzant la seva funció. A més, mitjançant una aproximació filogenètica vam trobar noves estructures de ARN i vam predir potencials elements reguladors en bacteris del filum Firmicutes.

## Results

Numerous terminators were identified. Some of them are bidirectional and some are parts of riboswitches (not shown).

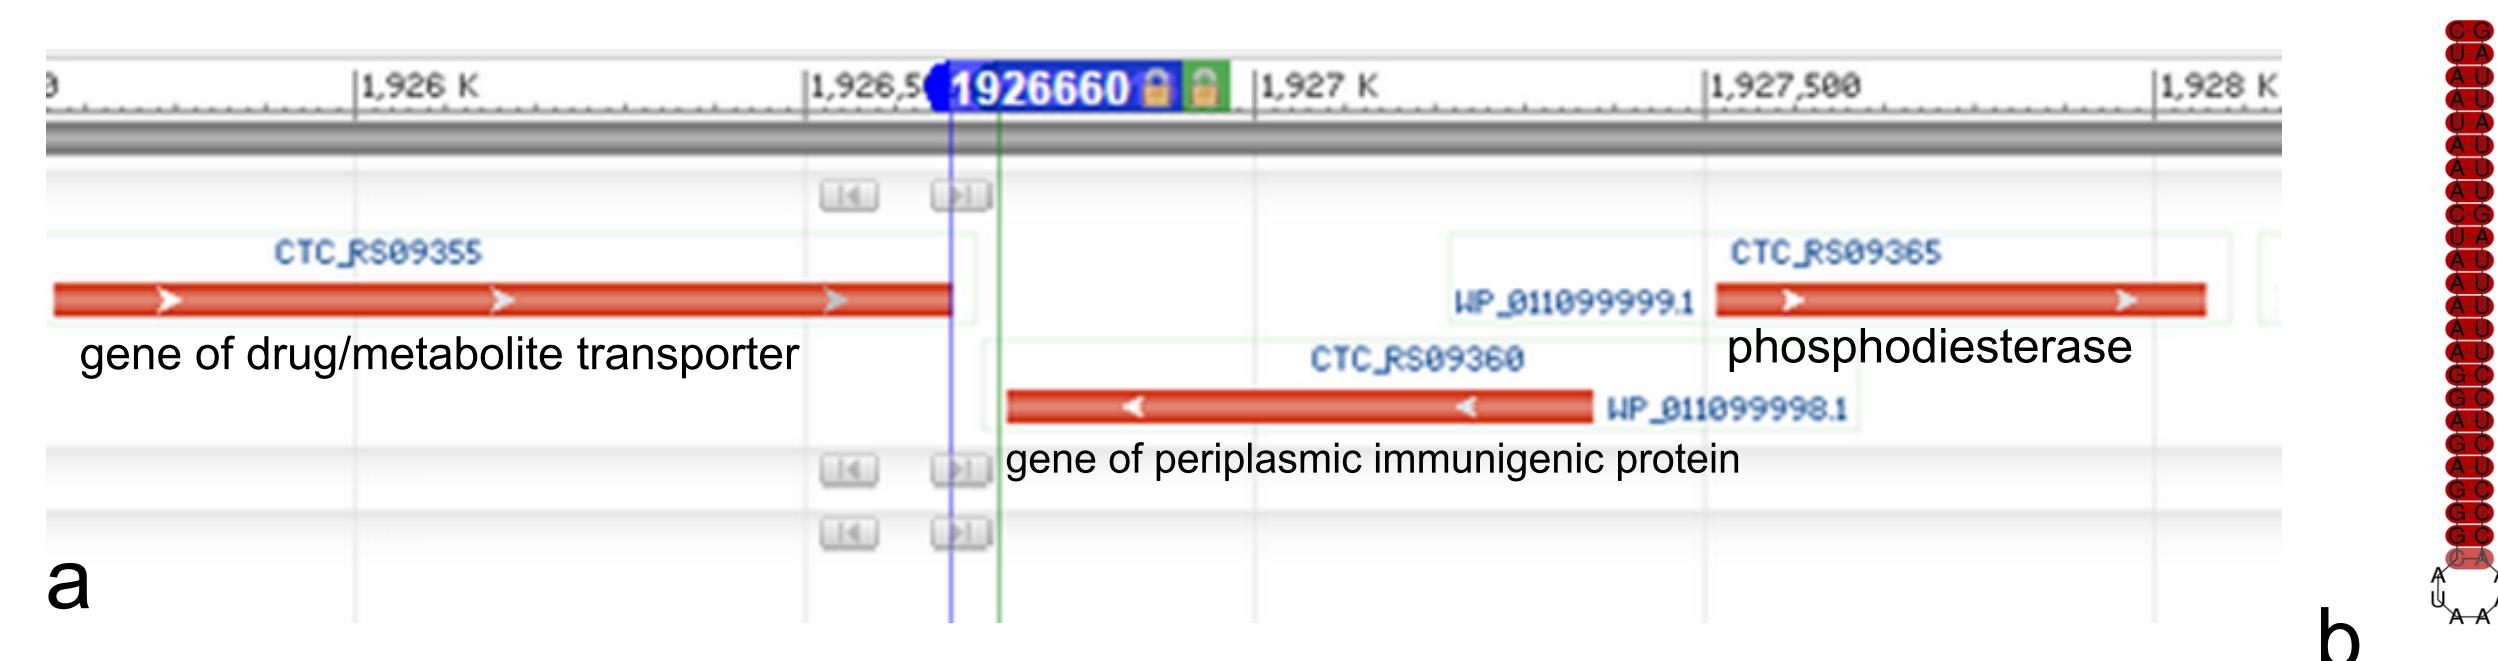

Figure 2. Bidirectional terminator: a) genome context b) structure

RNA regulation may switch between different types in related species (Figure 3).
