## Acknowledgements

This project was made possible through the 2013 Memorandum of Understanding between the U.S. Environmental Protection Agency Region 9 and the California State University.

I would like to extend my sincere thanks to all those who enabled me to complete this internship. I am highly indebted to my EPA Learning Project Mentors Laura Bloch and Elyssa Bairstow for their patience, motivation, and immense knowledge. I am thankful to Sally Hanft and Vicky Salazar from EPA Region 10 for their continuous attention, insight and support. I would like to thank all EPA employees for being willing to share their experiences during EPA events and my visits at EPA Region 9 Office.

I would like also to express my special gratitude and thanks to my Faculty Supervisors Professor Burcus Ellis and Professor Kathleen McAfee for their guidance and encouragement in all the while the internship project.

Furthermore, I would also like to acknowledge with much appreciation the crucial role of Water Resources and Policy Initiatives Program Manager Christina Rodriguez and Program Support Assistant Kathleen Firstenberg for giving me such attention and time during the application process and entire internship.

## Executive Summary

The following report draws upon my overall internship experience at the U.S. Environmental Protection Agency Region 9 over the period between June 2015 and May 2016. It reflects on literature review, analysis, listening, observation, conversation, and practice. The original purpose of the project was to aid my EPA Learning Project Mentors in the process of creating a tool for measuring the internal organizational sustainability performance of EPA Region 9. Subsequently, the internship shifted toward helping EPA Region 9 and EPA Region 10 improve their environmental and sustainability education pilot project, EcoLearn. The internship provided me with an invaluable learning experience and helped me build transferable skills.

## BACKGROUND

### *Sustainable Development*

When we hear the word *sustainability* we think about the ability to endure, sustain, maintain, support, or restrain over time.<sup>1</sup> Though, the concept of sustainability can have different interpretations and dimensions. Since the publication of the Brundtland Report in 1987, the concept of sustainable development has gained broad public attention. The United Nations

Image: [thwink.org](http://thwink.org)

World Commission on Environment and Development (the Brundtland Commission) defined *sustainable development* as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs.”<sup>2</sup> The underlying belief of the Commission was that economic growth and industrialization could be achieved without environmental damage and social inequality between and within generations. In 1992, the Rio Declaration on Environment and Development, Agenda 21, outlined the steps

for fighting global poverty and unwise use of natural resources through sustainable consumption, financial assistance, free trade and investment expansion, to name a few. The Agenda urged counters to implement the concept of sustainable development into states’ policies and programs at all levels and to develop indicators of sustainable development that can assist countries in their decision-making.<sup>3</sup> In 2015, the 2030 Agenda for sustainable development updated the goals and targets of the United Nations for transforming the world. It embraced the triple bottom line approach – People, Prosperity and Planet – as a means for eliminating extreme poverty and hunger and creating shared prosperity for all by 2030.<sup>4</sup> While the ambiguity of Brundtland Commission definition of sustainable development allows different interpretations, it clearly recognizes the need for a balance between three dimensions: social, economic and environmental. *Social sustainability* is “the ability of a social system, such as a country, family, or organization, to function at a defined level of social well-being and harmony indefinitely.”<sup>5</sup> *Environmental sustainability* is “the ability of the environment to support a defined level of environmental quality and natural resource extraction rates indefinitely.”<sup>6</sup> *Economic*

<sup>5</sup> <http://www.thwink.org/sustain/glossary/ThreePillarsOfSustainability.htm>

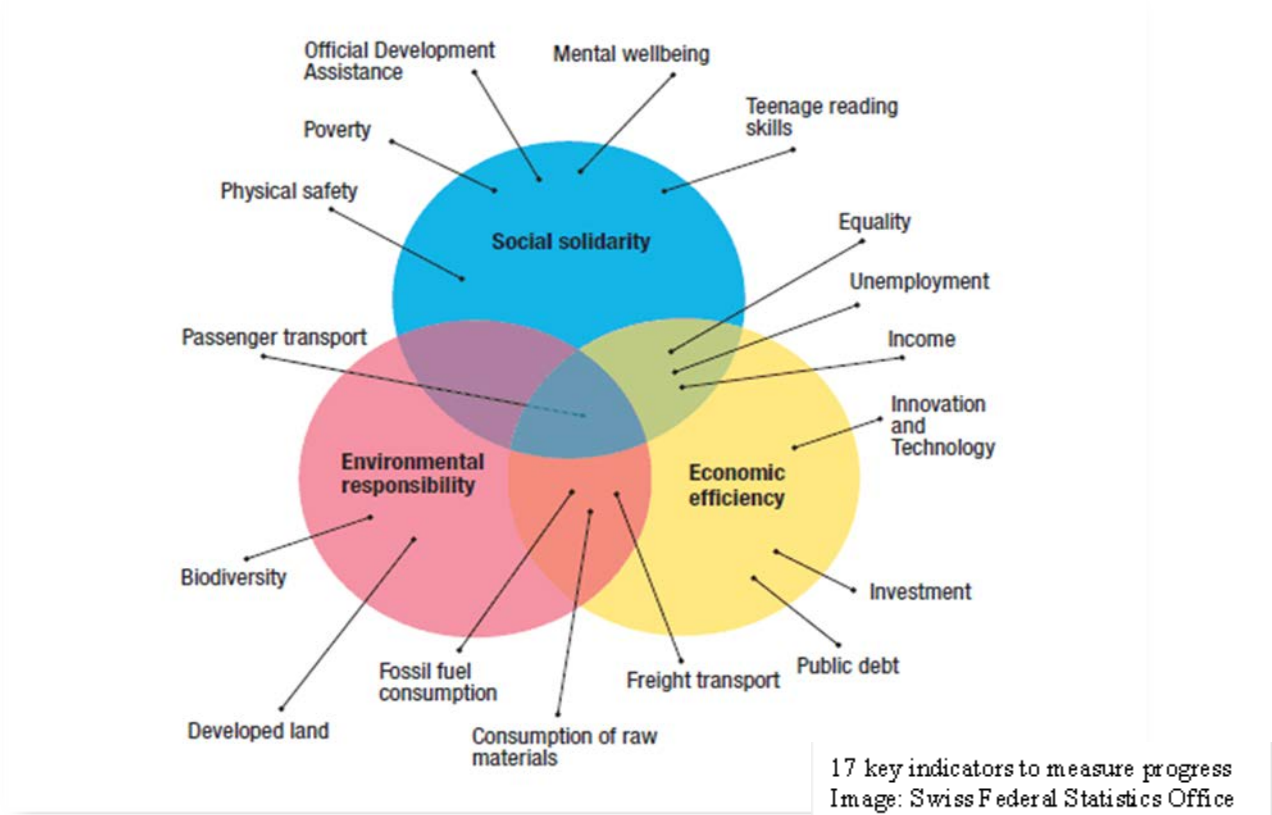

<sup>6</sup> <http://www.thwink.org/sustain/glossary/ThreePillarsOfSustainability.htm>

*sustainability* is “the ability of an economy to support a defined level of economic production indefinitely.”<sup>7</sup>

While these parts of sustainability are interconnected, interwoven and interdependent, organizations, businesses and communities in various fields have different notion of how to balance them. Although they have different understanding of how to measure and monitor progress toward their sustainability goals, both the public and private sectors have been responsive to the call of the United Nations to consider sustainability seriously.<sup>8</sup>

### *Measuring Sustainability*

Measuring sustainability is tracking how each of the three pillars of sustainable development is progressing over time. The aim of this process is to ensure that the resources inherited by future generations allow for the same (or greater) levels of wellbeing as enjoyed by current generations. Measuring sustainability utilizes various metrics, indicators, indexes, benchmarks, and assessments to describe characteristics and quantify performance - how effectively an organization or company is achieving its sustainability objectives.<sup>9</sup> A

*sustainability indicator* is perceived to represent “a measurable aspect of environmental, economic, or social systems that is useful for monitoring changes in system characteristics relevant to the continuation of human and environmental wellbeing.”<sup>10</sup> The effectiveness of scientifically constructed indicators depends on “trade-offs between scientific soundness and rigor, political effectiveness and democratic legitimacy.”<sup>11</sup> Sustainability indicators inform decision-makers, government officials, and the public; they can be a powerful tool to foster sustainability.

The process of assessing the progress toward achieving predetermined goals, including evaluating (i) “information on the efficiency with which resources are transformed into goods and services (outputs)”, (ii) “the quality of those outputs ... and outcomes (the results of a program activity compared to its intended purpose)”, and (iii) “the effectiveness of government operations in terms of their specific contributions to program objectives”<sup>12</sup> refers to *performance measurement*. The performance of an organization in all dimensions of sustainability and for all drivers of organizational sustainability refers to *organizational sustainability performance*.<sup>13</sup> Measuring the internal organizational sustainability performance provides a reliable method to determine the level of integration of sustainability into daily operations and to suggest effective ways for cultural change in the organization.

### *Education for Sustainability*

Education for sustainability “seeks a transformative role for education, in which people are engaged in a new way of seeing, thinking, learning and working. People are not only able to explore the relationships between their lives, the environment, social systems and institutions, but also to become active participants and decision-makers in the change process.”<sup>14</sup> Education for sustainability helps students develop skills such as envisioning, critical thinking and reflection, dialogue and negotiation, collaboration and building of partnerships.<sup>15</sup> The urgent need for individuals and communities to understand the concepts of sustainability has motivated government and non-government organizations to spread sustainability education worldwide. The United Nations Educational, Scientific and Cultural Organization (UNESCO) is serving as the lead agency for education for sustainability project, and nations are being encouraged to establish their own sustainability education initiatives.<sup>16</sup> In the United States, the U.S. Partnership for Education for Sustainable Development is serving as a community-building “convener,

catalyst and communicator for sustainability education.<sup>17</sup> The role of the U.S. Environmental Protection Agency has been central for encouraging industry and the public to integrate sustainability thinking and sustainable practices into everyday life.

### *The United States Environmental Protection Agency*

#### Responsibilities and Goals

On December 2, 1970, the United States Environmental Protection Agency (EPA) was born with the mission "To protect human health and the environment."<sup>18</sup> Concerns over human and environmental health pushed the Nixon Administration (1969–1974) to merge key antipollution programs into a new, independent agency. Environmental duties from the Department of the Interior; Department of Agriculture; Department of Health, Education and Welfare; Atomic Energy Commission; Federal Radiation Council; and Council on Environmental Quality were transferred to the newly formed EPA.<sup>19</sup> Although the President's Advisory Council on Executive Organization "recommended organizing EPA according to functional categories (e.g., monitoring, research, standard-setting, enforcement, assistance) rather than along media lines (e.g., air, water, land)" to better address the interrelated nature of pollution problems, fears of "frictions and chaos" left intact each of the current media programs.<sup>20</sup> The current organizational structure of EPA is a hybrid structure that incorporates twelve headquarters media and functional-based offices and ten regional offices. Each EPA regional office is responsible for the implementation of the EPA's programs within the states it operates. ([Appendix: Figure I](#) summarizes the U.S. EPA offices.) The Agency occupies 175 offices and laboratories and employs over 18,000 scientists, lawyers, policy analysts, and engineers nationwide<sup>21,22</sup>

Key responsibilities of U.S. EPA include (i) developing and enforcing regulations that implement environmental laws enacted by Congress; (ii) financially supporting environmental projects through grants; (iii) studying and solving current and future environmental issues; (iv) sponsoring voluntary partnerships and programs with businesses and organizations; (v) further environmental education and consciousness; and (vi) publishing information to inform the public about the activities of the agency.<sup>23</sup> EPA supports international partners in promoting sustainable development, protecting vulnerable populations, building democracy, and facilitating commerce globally.<sup>24</sup> EPA's international priorities include (i) strong environmental institutions, (ii) climate

change, (iii) air quality, (iv) clean water, (v) toxic chemicals, and (vi) electronic waste. EPA operations have helped dramatically improve the air, water and land quality of the United States.  
Sustainability Framework

The United States had a sustainable development vision several years before the 1987 Brundtland Report. In 1969, the National Environmental Policy Act (NEPA) declared that the “continuing policy of the Federal Government” is to “create and maintain conditions, under which humans and nature can exist in productive harmony, that permit fulfilling the social, economic, and other requirements of present and future generations.”<sup>25</sup> That principle is what currently is described as sustainable development.

Economy, Society, Environment: A Nested Relationship

Image: EPA

Over the years, sustainability has experienced ups-and-downs under different Presidents, yet it remained an integrated part of the conceptual framework of U.S. EPA. In March 2015, President Barack Obama signed Executive Order (E.O.) 13693, titled "Planning for Federal Sustainability in the Next Decade," which revoked E.O. 13423 of 2007, E.O. 13514 of 2009 and several memoranda. The new Executive Order raises expectation of federal leadership and provides guidance for federal agencies to follow in implementing sustainability practices in the area of energy, climate change, water use, vehicle fleets, construction, and acquisition.<sup>26</sup>

The national 2014-2018 Strategic Plan of U.S. EPA sets forth five major goals<sup>27</sup> and four cross-cutting fundamental strategies.<sup>28</sup> It specifies the sustainability practices that U.S. EPA will incorporate across its facilities, purchases, and operations, including: (i) greenhouse gas emissions reductions; (ii) sustainable buildings; (iii) renewable energy; (iv) water conservation; (v) fleet management; (vi) sustainable acquisition; (vii) pollution prevention and waste reduction; (viii) energy performance contracts; (ix) electronics stewardship; (x) climate change resilience.<sup>29</sup> U.S. EPA's Report on the Environment (ROE) monitors how the condition of the environment and human health in the United States is changing over time by utilizing eighty-five indicators in five theme areas – Air, Water, Land, Human Exposure and Health, and Ecological Condition.<sup>30</sup> U.S. EPA has incorporated sustainable principles into sustainable products and purchasing, green infrastructure, sustainable materials, management, and energy efficiency,

<sup>25</sup> EPA, “Learn About Sustainability” <http://www.epa.gov/sustainability/learn-about-sustainability#what>

<sup>26</sup> "EO 13693." *FedCenter* <https://www.fedcenter.gov/programs/eo13693/>

<sup>27</sup> *Goal 1: Addressing Climate Change and Improving Air Quality; Goal 2: Protecting America’s Waters; Goal 3: Cleaning Up Communities and Advancing Sustainable Development; Goal 4: Ensuring the Safety of Chemicals and Preventing Pollution; and Goal 5: Protecting Human Health and the Environment by Enforcing Laws and Assuring Compliance* <http://www.epa.gov/planandbudget/strategicplan>

<sup>28</sup> (i) Working Toward a Sustainable Future; (ii) Working to Make a Visible Difference in Communities; (iii) Launching a New Era of State, Tribal, Local, and (iv) International Partnerships; Embracing EPA as a High-Performing Organization to guide the Agency’s work. <http://www.epa.gov/planandbudget/strategicplan>

<sup>29</sup> EPA Strategic Sustainability Plans, <https://www.epa.gov/greeningepa/epa-strategic-sustainability-plans>

<sup>30</sup> EPA's Report on the Environment (ROE) <https://cfpub.epa.gov/roe/>

sustainable principles and is yet to incorporate sustainability principles into various decisions, operations, facilities, partnership and sustainability measurement tools.<sup>31</sup>

## Environmental and Sustainability Education

The National Environmental Education Act of 1990 “requires EPA to provide national leadership to increase environmental literacy.” The U.S. EPA has established an Environmental Education and Training Program with the goal to “train educational professionals in the development and delivery of environmental education and training programs and studies.”<sup>32</sup> The Environmental Education program of the Agency increases public awareness and knowledge about environmental issues and engage the public in problem solving, and action to improve the environment.<sup>33</sup> The U.S. EPA recognizes that the “key to resolving current challenges and preventing future ones lies in supporting an educated population that understands the interconnectedness of human and natural systems. In order to engineer solutions to these challenges, [EPA’s] workforce needs to augment its capacity to think critically about environmental challenges, analyze potential actions, and work to create sustainable systems.”<sup>34</sup>

In sum, the U.S. EPA has a variety of methods, tools, guidance and programs to promote sustainability. The Agency recognizes that incorporation of sustainability principles into its inter- and intra-agency coordination, collaboration and decision making can help increase the environmental, economic, and social benefits.

## [INTERNSHIP PROJECT OBJECTIVES](#)

### *Sustainability Indicators*

The Sustainability Indicators Project was meant to assist EPA Region 9 in designing a sustainability performance measurement tool that would help enhance the internal organizational sustainability performance via measuring progress toward established goals, informing the management in decision making, and raising understanding, awareness and involvement among EPA personnel.

## EPA Region 9 Background

The U.S. Environmental Protection Agency - Pacific Southwest (Region 9) covers Arizona, California, Hawaii, Nevada, Hawaii, Samoa, Guam and 147 federally recognized tribes in the Pacific Southwest.<sup>35</sup> Its 1,088 personnel are divided in several offices and divisions to support the mission of EPA and serve the American environment and people. ([Appendix: Figure II](#))

---

<sup>31</sup> Sustainability and the ROE <https://cfpub.epa.gov/roe/sustainability.cfm>

<sup>32</sup> EPA, “National Environmental Education Act” <https://www.epa.gov/education/national-environmental-education-act>

<sup>33</sup> Environmental Education <https://www.epa.gov/education>

<sup>35</sup> Region 9 Office <https://www.epa.gov/greeningepa/region-9-office>

sketches the organizational structure of EPA Region 9.) The programs of EPA Region 9 are grouped into 21 main themes focusing on environmental issues, vulnerable populations or geographic areas. ([Appendix: Figure III](#) lists main EPA Region 9's programs.) The Strategic Plan of EPA Region 9 adopts the national strategic goals of U.S. EPA and applies them to the specific for the Pacific Southwest environmental issues and solutions. EPA Region 9 strives to enforce effectively the new federal standards while employing “a multi-disciplinary approach to specific geographic sub-regions and populations.”<sup>36</sup> Over the last several decades, EPA Region 9 has helped reduce smog, improve water quality, clean up hazardous waste and create sustainable, healthy communities. The 267,435 rentable square feet of the EPA Region 9 office in San Francisco (located in the Hawthorne Plaza) has received numerous distinctions for its limited environmental impacts, including the U.S. Green Building Council's LEED® Gold for Existing Buildings (version 2.0) certification in May 2009, LEED Platinum for Existing Buildings (version 2009) in August 2014, and the ENERGY STAR® annually since 2008.<sup>37</sup> EPA Region 9 is “committed to demonstrating the environmental, economic and social equity principles of sustainability in [its] internal operations and regulatory programs.”<sup>38</sup> EPA Region 9 has quality indicators to evaluate progress of tackling environmental issues and now it is in the process of implementing a tool that will help the region measure and advance its internal organizational sustainability performance.

### *EcoLearn*

The EcoLearn Project was meant to support EPA Region 9 and EPA Region 10 with improving forty-eight environmental and sustainability education lesson plans for students from kindergarten to fifth grade.

### EcoLearn Background

Recognizing “the need and the overwhelming process of identifying effective curriculum to teach the concepts of environmental education in the classroom” and that “current standards focus environmental education on scientific discovery, not environmental protection and action,” in addition to that “environmental education at the elementary level is an effective way of educating both the students and the parents about the opportunities and impacts of human action on the environment,” the U.S. Environmental Protection Agency Region 9 and Region 10 offices have assembled a series of lesson plans, named EcoLearn.<sup>39</sup> EcoLearn entails three-year development process: the first year focuses on developing a curriculum, the second year – presenting lesson plans and collecting feedback, and the third year – improving further the curriculum. EcoLearn lesson plans include empirical modules that can be implemented by an external facilitator or classroom teacher; they can be used individually or as a set that build within the school year or between school years. EcoLearn comprises forty-eight lessons divided

<sup>36</sup> Region 9 Strategic Plan <https://www3.epa.gov/region9/strategicplan/>

<sup>37</sup> EPA, "Region 9 Office" <https://www.epa.gov/greeningepa/region-9-office>

<sup>38</sup> Sustainable Region 9 Policy [https://www.epa.gov/sites/production/files/2015-07/documents/r9-ems-policy-statement\\_2010.pdf](https://www.epa.gov/sites/production/files/2015-07/documents/r9-ems-policy-statement_2010.pdf)

<sup>39</sup> U.S. EPA Region 9 and 10, Letter to Schools & EcoLearn K-5 Curriculum Pilot, 2015, by Viccy Salazar

into eight themes per grade: Air, Animals, Climate change, Ecosystems, Energy, Food, Waste, and Water. *Air* included subthemes such as atmosphere structure, carbon cycle, greenhouse effects, acid rain, sources and impacts of air pollution, and reducing air pollution; *Animals* – animal diversity, food chain and food web, extinct, endangered and threatened animals, human impacts on animal diversity, fishing exploitation, reducing human impacts, and animal protection; *Climate change* – weather, climate, fossil fuels, causes and impacts of climate change, carbon footprint, and carbon footprint reduction; *Ecosystems* – levels of organization in an ecosystem, types of ecosystems, photosynthesis, energy flows through an ecosystem, and the role of top predators; *Energy* – forms of energy, sources of energy, non-renewable and renewable energy, electricity, energy units, energy consumption, energy efficiency, energy conservation, and pollution reduction; *Food* – food variety, food production, processing, distribution and consumption, food waste composting and recycling, sustainable food, healthy diet, consumer food choice, bee protection, hanger, and community gardens; *Waste* – natural resources, waste production, types of waste, waste disposal and pollution, and waste reduction; and *Water* – water sources, water scarcity, water cycle, water pollution, water consumption, water conservation, and water protection. EcoLearn lesson plans are STEM<sup>40</sup>-tied and designed for students from kindergarten to fifth grade. They are aligned to national and state education standards. Resources for the pilot project were developed with contributions from the U.S. Environmental Protection Agency, the Public Broadcasting Service, National Geographic, the National Aeronautics and Space Administration, and other educational institutions.<sup>41</sup> EcoLearn is developed to supports the mandate of EPA to make a visible difference in communities.

## [INTERNSHIP PROJECT APPROACH AND ACTIVITIES](#)

Since I knew nothing about sustainability indicators and environmental and sustainability education before starting this internship, my first step was to obtain some understanding about those aspects of sustainability and then to think how to apply those knowledge.

### *Sustainability Indicators*

The activities involved in the Sustainability Indicators Project included literature review, documentary analysis, observation, listening, reflection, and practice. Before being able to explore EPA’s operations from sustainability perspectives, I needed to arm myself with a sustainability lens. I reviewed literature on (i) the history of sustainability and core sustainability concepts; (ii) national strategies for sustainable development and performance measurement,

---

<sup>40</sup> Science, Technology, Engineering and Mathematics are subjects collectively known as STEM

<sup>41</sup> U.S. EPA Region 9 and 10, Letter to Schools & EcoLearn K-5 Curriculum Pilot, 2015, by Viccy Salazar

particularly those of the United States, Germany, New Zealand and Canada; (iii) the sustainability frameworks of the U.S. Environmental Protection Agency, German Federal Environment Agency, New Zealand Environmental Protection Authority and Environment Canada; (iv) the sustainability indicator development processes; (v) organizational sustainability principles and performance reporting structures; (vi) the organizational structure of U.S. EPA; (vii) organizational challenges of implementing sustainability; and (viii) the Action Plan of U.S. EPA. Further, I analyzed EPA’s documents, comprising (i) the Region 9 Sustainability Café Notes<sup>42</sup> and the Evaluation of Input from the Region 9 Sustainability Café and Proposed Next Steps<sup>43</sup>; (ii) EPA Region 10 Sustainability/Organizing principles and EPA Region 10 Section Supplement from the General S-CORE™<sup>44</sup> Assessment; and (iii) U.S. EPA Principles for Greener Cleanups and the ASTM International Standard Guide for a Greener Clean-ups. Further, I gathered firsthand experience on sustainability operations during two EPA events. On July 23<sup>rd</sup>, I attended the U.S. Environmental Protection Agency sponsored workshop on Campus-Community Partnerships for Advancing Sustainability at San Francisco State University, and on August 6<sup>th</sup>, 2015, I attended the presentation of Vicky Salazar, U.S. EPA Region 10 Senior Sustainability Policy Advisor, on S-CORE™ at the EPA Office in San Francisco. I furthered my learning through drafting a sustainability indicator development process roadmap and creating a PowerPoint presentation on World Climate Exercise.<sup>45</sup> During our weekly meetings via conference calls, I shared information on accomplished tasks and asked questions that came over the course of the week. I emailed my notes on findings before each weekly meeting. I worked remotely and visited the office on several occasions.

### *EcoLearn*

My EcoLearn work involved four major tasks: aligning forty eight lesson plans to four national and state educational standards; revising lesson plans; creating eight cross-grade level theme summary charts; updating and unifying forty eight theme background sections of lesson plans.

#### Standards Alignment

Although EcoLearn lessons were created within the framework of sustainability learning standards, experiences, and instructional strategies, national and state corresponding learning standards were not specifically identified.

<sup>42</sup> Notes on Sustainability Café of April 9, 2014, systemized by Laura Bloch

<sup>43</sup> December 17, 2014 by Laura Bloch

<sup>44</sup> S-CORE™ (Sustainability--Competency, Opportunity, Reporting & Evaluation) is a multi-purpose sustainability assessment tool that was originally created in 2005 by Darcy Hitchcock and Marsha Willard of AXIS Performance Advisors in collaboration with the International Sustainable Development Foundation and the Zero Waste Alliance. <https://www.sustainabilityprofessionals.org/resources/s-core-sustainability-assessment>

<sup>45</sup> World Climate Exercise is a computer-simulation-based role-playing exercise, mimicking international climate change negotiations.

The process of aligning EcoLearn lesson plans to the national and state standards entailed several steps. First, I explored the websites of the learning standards: the Washington State K-12 Integrated Environmental and Sustainability Learning Standards, the California Education and the Environment Initiative, the Next Generation Science Standards, and the Common Core State Standards. I closely examined how they are grouped by discipline core, ideas and themes. Then, I read thoroughly each of the forty-eight EcoLearn lesson plans to determine what concepts were involved and what standards would be appropriate. After I selected standards for each lesson, I generated tables and organized the information into those tables.

### Revision

During the first year of the EcoLearn project, student-interns, under the supervision of EPA Mentors, assembled environmental and sustainability lessons to support learning about the environment and sustainability. My task was to review these lessons and see whether they could be enhanced in terms of clarity, simplicity, source provision and effective key words. Some lesson plans had been already revised by an EPA employee and I made the proposed changes. There were a number of lessons that had not been revised and I needed to determine what improvements the lesson plans needed and then, to do them.

### Cross-Grade Level Theme Summary

My next goal was to create summaries of EcoLearn lessons that would provide teachers and volunteers with an easy and quick access to the components and concepts of each lesson. I decided that charts containing key words would serve that purpose. I created charts, re-read lessons to extract strategic information, and organized that information under several categories.

### Theme Backgrounds

Assuming that EcoLearn lessons will be used by volunteers with some basic subject matter background and minimal preparation time, I tried to amass such material that would make presenters confident when delivering the lessons. I identified the points that all six lessons under one theme differ and share, searched and selected pertinent information, and then I organized the information.

Our EcoLearn team communicated through weekly emails, conference calls and webinars. I saved my work in a shared Dropbox folder. Every week, I emailed to my Project Supervisors to provide them with an update on the progress of my work. During our conference calls, I learned about the work of the EcoLearn Members who were presenting EcoLearn lessons in class, including what obstacles or successes they had experienced, and how teachers and children reacted to the lessons. Further, I reflected on my work, received clarification on unclear aspects or new tasks.

## INTERNSHIP PROJECT OUTCOMES AND FINDINGS

### *Sustainability Indicators*

Prior to my Sustainability Indicators internship, I knew little about sustainability. I was unaware of sustainability frameworks, sustainability indicators, internal<sup>46</sup> and external<sup>47</sup> sustainability performance measurements. Although the U.S. EPA Region 9 office discontinued the Sustainability Indicators project in advance<sup>48</sup>, meaning I was not able to finalize any potential set of sustainability indicators that could help EPA Region 9 office measure its organizational sustainability performance, I obtained immense valuable experience and knowledge.

#### A few important points

There is a need for a shared definition of sustainability. Based on perceptions of the importance of a particular sustainability aspect, definitions of sustainability can vary across frameworks and focus on social, economic, or ecological dimension. Though, establishing a clear definition of what sustainability means will help unify the framework of sustainability across sectors and regions. The unifying framework (tools, concepts and standards) will encourage leaders and organizations to look at sustainability through an integrated lens and set forth “holist, equitable and far-sighted” strategies for achieving it and assessing its progress collaboratively.<sup>49</sup>

Indicators represent desirable values and leverage points. As Donella Meadows puts it, “Indicators arise from values (we measure what we care about), and they create values (we care about what we measure). . . . Their presence or absence, accuracy or inaccuracy, use or non-use, can change the behavior of a system, for better or worse. In fact, changing indicators can be one of the most powerful and at the same time one of the easiest ways of making system changes — it does not require firing people, ripping up physical structures, inventing new technologies, or enforcing new regulations. It only requires delivering new information to new places.”<sup>50</sup> There are hundreds of economic, social and environmental indicators that could demonstrate the state of sustainability for a particular place, activity, process or organization. The selection of indicators shows what is important.

Focus is a key element for success. Before undergoing sustainability performance measurements, it should be clarified first what is to be measured and how; what are the main

---

<sup>46</sup> An *internal* sustainability performance measurement can include indicators that aim to measure internal conditions and performance, such as the extent of sustainability integrated into daily procedures and operations, employee behavior, and the impacts of these sustainability practices and behavior on organizational culture and operations.

<sup>47</sup> An *external* sustainability organizational performance measurement can include indicators that aim to measure the external impacts of organizational operations. In the case of EPA, this can be the ways EPA’s regulatory and enforcement operations, trainings and partnership programs affect the regional, national, international, and global (social, economic, and environmental) sustainability.

<sup>48</sup> The U.S. EPA Region 10 office had developed an effective sustainability organizational performance system and EPA Region 9 decided to adopt it.

<sup>49</sup> Proposing a Unifying Framework for Sustainable Development, The Natural Step Network Contributions For Draft Zero United Nations Conference On Sustainable Development - Rio+20 page 1

[http://www.uncsd2012.org/content/documents/319TNS\\_InputsforDraft%20Zero\\_Rio20\\_1Nov2011.pdf](http://www.uncsd2012.org/content/documents/319TNS_InputsforDraft%20Zero_Rio20_1Nov2011.pdf)

<sup>50</sup> Donella Meadows, “Indicators and Information Systems for Sustainable Development: A Report to the Balatan Group. The Sustainability Institute, Hartland, VT. 1998, viii, 5

sustainability issues and goals of an organization; what activities should be integrated to forge a sustainability culture.<sup>51</sup> There is an old saw that says, “What gets measured gets important and gone.” Regular measurement and monitoring keeps a focus on what is important in the long term. The aspects of organizational operations, activities, and resources that are measured tend to get improved while the aspects that are not measured tend to get ignored and often they can get even worse. Focusing on measuring and monitoring only one aspect of sustainability negatively reflects on the remaining aspects. As an agency that has the mission to protect the environment, the U.S. EPA has focused more on the state of the environment than on economic and social concerns.<sup>52</sup> Caution selection of multidimensional indicators could assist U.S. EPA foster improvement in all spheres of sustainability.

### Integrating sustainability

The incorporation of sustainable development (the UN Agenda 21) is ongoing process, which varies across national development policies. A comparative analysis of the National Sustainable Development Strategy (NSDS), which is “essentially a *coordinated, participatory and iterative process* to achieve economic, environmental and social objectives in a balanced and integrated manner,”<sup>53</sup> of several countries demonstrates those differences. [Appendix: Figure IV](#) briefly summarizes aspects of NSDSs of the United States, Germany, New Zealand and Canada. It appears that the United States has inconsistent NSDS, influenced by political factors. Germany has a strong commitment to sustainable development and the institutional mechanisms of the United Nations. New Zealand has relatively good sustainable development policy integration, but incoherent NSDS; and Canada has coherence between NSDS and provincial and municipal activities, with a focus on environmental sustainability, and good practice in monitoring and evaluation.

### Negotiating sustainability

The integration of sustainability within national strategies and practices depends also on international pressure and cooperation. For instance, climate change is a global challenge that jeopardizes sustainability. It requires a global solution, particularly greenhouse gas emissions reductions that will stabilize carbon dioxide levels at or below 450 parts per million and temperature increases at or below 2 °C above pre-industrial levels. However, it is not that easy a country to overcome national interests for global interests. I experienced it first hand during my one-day training of World Climate facilitators at Climate Interactive<sup>54</sup>, a not-for-profit organization based in Washington DC. I then created a Power Point presentation (see [Appendix: Power Point Presentation I](#)) about World Climate in order to introduce the negotiation-simulation exercise to my EPA Mentors. The role-play is highly simplified version of actual UN meetings, where each participant plays the role of delegates from a particular country or group of countries and C-Learn -- a climate simulator tool – assessed the cumulative impact of the pledges of

<sup>54</sup> Climate Interactive <https://www.climateinteractive.org/about/>

players into the future. Negotiating a viable solution to climate change has the potential to foster deep learning about climate change, sustainability, and the dynamics of international relations.<sup>55</sup> International climate change negotiations impact sustainability at local and global scales.

### Measuring sustainability

For the reason that a universal set of sustainability performance measurement upon which most agrees has not been established, governments, businesses and communities have developed a number of diverse indicator sets to measure their sustainability performance. Currently, the Compendium of Sustainable Development Indicator Initiatives inclines 895 sustainability indicator sets.<sup>56</sup> [Appendix: Figure V](#) outlines 37 of the most popular sustainability measurement tools. The five most prized sustainability reporting frameworks are the Carbon Disclosure Project (CDP), the Dow Jones Sustainability Index (DJSI), the Global reporting Initiative (GRI), the Global Real Estate Sustainability Benchmark (GRESB) and the Sustainability Accounting Standards Board (SASB).<sup>57,58</sup> Yet putting sustainability into practice remains a challenge and measuring sustainability remains confusing.<sup>59</sup> Largely, U.S. companies lag behind E.U. companies in terms of sustainability disclosure. Principally, there is minimal emphasis on social and institutional dimensions of sustainability<sup>60</sup>

### Developing a system of sustainability indicators

An effective sustainable indicator set results from a sustainable developing process. It requires time, effort and active participation. Based on literature review and reflection, I designed a roadmap for crafting an organizational sustainability indicators system, consisting of the following steps: (i) preliminary study; (ii) issue selection; (iii) objectives; (iv) conceptual framework; (v) indicator framework; (vi) initial pool of indicators; (vii) specialist advice; (viii) stakeholder and public consultation; (ix) data collection and processing; (x) indicators analysis; (xi) final selection; (xii) transparency and public information; (xiii) follow up. (Steps are listed and explained in [Appendix: Figure VI](#)) A sustainability indicators set can detect to what extent is taken into account the linkages between the social, environmental, and economic dimensions of sustainability, to what extent the measured dimensions are sensitive to stakeholder and managerial participation in the process; and to what extent collaboration, transparency, and accountability across place, activities, and time are demanded.<sup>61</sup>

“Education is the most powerful weapon which you can use to change the world.”  
– Nelson Mandela<sup>62</sup>

### Standards Alignment

Learning standards describe what students should know and be able to do at each grade level. EcoLearn has eight themes – Air, Animals, Climate, Ecosystems, Energy, Food, Waste, and Water – for each of the six grade-levels. I aligned each of the forty eight lessons to relevant standards from the following four learning standards frameworks:

- (i) The *Washington State K-12 Integrated Environmental and Sustainability Learning Standards* and their three areas: Standard 1: Ecological, Social, and Economic Systems; Standard 2: The Natural and Built Environment; and Standard 3: Sustainability and Civic Responsibility.<sup>63</sup>
- (ii) The *California Education and the Environment Initiative* and their five principles: Principle I: People Depend on Natural Systems; Principle II: People Influence Natural Systems; Principle III: Natural Systems Change in Ways that People Benefit from and can Influence; Principle IV: There are no Permanent or Impermeable Boundaries that Prevent Matter from Flowing Between Systems; and Principle V: Decisions Affecting Resources and Natural Systems are Complex and Involve Many Factors.<sup>64</sup>
- (iii) The *Next Generation Science Standards* and their three distinct and equally important dimensions to learning science: Dimension 1: Crosscutting Concepts – connections Physical Science, Life Science, Earth and Space Science, and Engineering Design; Dimension 2: Science and Engineering Practices – investigation of the natural world, design and building systems; and Dimension 3: Disciplinary Core Ideas – exploration of the key ideas in science.<sup>65</sup>
- (iv) The *Common Core State Standards* and their academic standards in mathematics and English language arts/literacy.<sup>66</sup>

An example of standards alignment for one grade-level, particularly Third Grade: “Water,” is represented in Appendix Figure VII: [Appendix: Figure VII-a](#) - the K-12 Integrated Environmental and Sustainability Learning Standards, [Appendix: Figure VII-b](#) - the California Education and the Environment Initiative, [Appendix: Figure VII-c](#) - the Next Generation Science Standards, and [Appendix: Figure VII-d](#) – the Common Core State Standards.

<sup>65</sup> <http://www.nextgenscience.org/>

<sup>66</sup> <http://www.corestandards.org/about-the-standards/>

## Revision

My part in the modification of EcoLearn lesson plans entailed: (i) making the suggested by an EPA staff member changes; (ii) ensuring the lessons are clear and organized; (iii) ensuring the credibility of cited sources; (iv) ensuring the provided/cited links work; (v) searching the original sources of activities and materials when citations and/or links were missing; (vi) ensuring each suggested set of key words was suitable for the particular lesson; adding or removing key words; (vii) searching for better images when present images were not clear; (viii) searching information and suitable images and creating PowerPoint slides and presentations to improve understanding of concepts; (ix) searching for and replacing activities when they appeared overly complex or unexciting; (x) searching for and replacing or adding video clips when it deemed to be helpful; and (xi) estimating the approximate duration of each activity and of the total duration of each lesson plan. [Appendix: Power Point Presentation II](#) provides an example of my revision work, particularly the Power Point Presentation for fifth grade Water Pollution through Images.

## Cross-Grade Level Theme Summaries

The theme summaries are to enable potential EcoLearn presenters to experience EcoLearn lessons quickly. I created eight cross-grade level summary charts that both hint the content of each lesson and show how the particular theme gradually evolves from kindergarten to fifth grade levels. I divided the summary information into seven categories: learning objectives, key concepts, visuals, activities, homework, duration, and aligned to learning standards. In my perspective, that organization could allow the content of each lesson plan to be more visible in terms of strong and weak points, gaps and needs for potential improvements. [Appendix: Figure VIII](#) demonstrates a cross-grade level theme summary, specifically for K- Grade 5 “Food and Food Waste” lesson plans.

## Theme Backgrounds

The background section is to arm the potential EcoLearn presenters with helpful information about a particular EcoLearn theme (assuming that EcoLearn volunteers/presenters may not be very familiar with the subject). I created new background sections by undergoing the following steps: (i) selecting key concepts that are unique for each lesson plan; (ii) identifying what all six lessons within each theme have in common; (iii) searching for, skimming over and selecting articles in order to gather all the information required; (iv) organizing the information in question-answer form; and (v) citing sources, and suggesting articles for further reading. [Appendix: Figure IX](#) is an example of a background section, particularly for fifth grade: “Animals.”

Artist: Yana Ilieva

## CONCLUSION

Sustainability is a dynamic, multidimensional, complex, interdisciplinary, holistic and cooperative human approach to protect human and planetary health. The concept of sustainability is built on the assumption that social, economic, and environmental systems are in constant interaction and must be kept in harmony in order economies and cultures to continue to function and benefit from natural systems now and in the future. Implementing sustainability in all public and private aspects of activities is crucial for tackling current and future economic crisis, environmental degradation, poverty, and social inequality. Well-educated and sustainability literate individuals can help solve such issues. Education for sustainability can build lasting change towards a sustainable planet because the idea for sustainability grows and develops in the hearts and minds of learners. The U.S. Environmental Protection Agency strives to improve environmental and community health through the ways it operates and through the ways it makes people think and imagine.

The Sustainability Indicators Project and EcoLearn Project broaden my perspective and contribute to my personal development. Particularly they enhanced my in-depth understanding of: (i) the concept of sustainability; (ii) the characteristics of effective sustainability indicators; (iii) frameworks for measuring the internal organizational sustainability performance; (iv) the process of crafting lesson plans; (v) the process of connecting learning standards and lesson plans; (vi) the organizational structure and operations of the U.S. Environmental Protection Agency; and (vii) specific career paths. Further, the internship tasks enriched my research, analytical, critical thinking, editing, and creativity skills as well as solidified my team working, communication, time management, organizational, and self-reliance skills. While working remotely, from home, allowed me to enjoy maximal time flexibility, I wish I had asked my Mentors to attend more EPA sustainability events. That would have given me a broader perspective of the ways the Agency collaborates with other government agencies to solve sustainability issues as well as would have allowed me to investigate better my career interests. In short, my EPA internship was a rewarding, memorable life experience.

<sup>153</sup> Fiksel, Joseph, Tarsha Eason and Herbert Frederickson. "A Framework for Sustainability Indicators at EPA." U.S. Environmental Protection Agency, October 2012. <http://www.epa.gov/sustainability/docs/framework-for-sustainability-indicators-at-epa.pdf>

<sup>154</sup> Sustainability and the U.S. EPA (2011) page 149 [http://www.nap.edu/openbook.php?record\\_id=13152&page=149](http://www.nap.edu/openbook.php?record_id=13152&page=149)

Figure V: Sustainability Measurement Tools [table is unfinished]

1.	Ecological Footprint Analysis (EFA) --1992, William Rees	measures human demand on nature -- amount of land and water area a human population would hypothetically need in order to provide the resources required to support itself and to absorb its wastes, given prevailing technology
2.	Carbon Footprint	measures the total carbon dioxide (and sometimes methane) emissions of an individual, industry, activity, or political unit
3.	Life-Cycle Analysis or Assessment (LCA)	is a cradle-to-grave analysis that measures all aspects of an item's history
4.	Energy Return on Investment (EROI)	is the ratio of the amount of usable energy acquired from a particular energy source versus the amount of energy expended to obtain that energy source
5.	I=PAT	Impact (I) on the environment is produced by the combination of population (P), affluence (A), and technology (T) of a given society I=PAT later replaced by STIRPAT (an acronym that refers to a statistical model for assessing environmental impacts at virtually any scale and to a research program in structural human ecology )
6.	UN Human Development Index (HDI)  UN Human Poverty Index (HPI)	measures the social wellbeing of a country, including life expectancy, education, and per capita income levels to rate the relative development of a country  measures life expectancy, literacy, and basic standard of living around the world; supplements the HDI
7.	UN Millennium Development Goals (MDGs)	Goal 1: Eradicate Extreme Hunger and Poverty Goal 2: Achieve Universal Primary Education Goal 3: Promote Gender Equality and Empower Women Goal 4: Reduce Child Mortality Goal 5: Improve Maternal Health Goal 6: Combat HIV/AIDS, Malaria and other diseases Goal 7: Ensure Environmental Sustainability Goal 8: Develop a Global Partnership for Development
8.	The Index of Social Health	measures the social wellbeing of society (mainly applied to the U.S.)
9.	The Genuine Progress Indicator (GPI)	an alternative to GDP; measures in monetary term, but does not simply measure the "busyness" of an economy – takes GDP information and adjust for factors such as income distribution, crime, pollution, long-term environmental damage, and dependence on foreign assets
10.	The Genuine Wealth	an alternative to GDP; measures the physical and qualitative conditions of well-being
11.	The Happy Planet Index (HPI) and Gross Domestic Happiness (GDH)	alternatives to GDP; rate the average human happiness in countries

12.	The Triple Bottom Line (TBL) <sup>158</sup>	rates three aspects of sustainability: financial, social, and environmental; the three Ps: people, planet and profits
13.	The Leadership in Energy and Environmental Design (LEED Certification)	is used to measure, rate, and promote green building
14.	The Sustainability Tracking, Assessment, and Rating System (STARS)	is a transparent, self-reporting framework for colleges and universities to gauge relative progress toward sustainability
15.	The Ecosystem-Based Fishery Management (EBFM)	Holistic approach that seeks a scientific rather than a maximized yield (maximum sustained yield method)
16.	Eco-label: Certified Organic	is administrated by departments of agriculture or other bodies legally entitled to certify organic
17.	Eco-label: Fair Trade	Ensures that products were produces in a socially and environmentally responsible ways
18.	Eco-label: Food Miles	refers to the distance that a food item travels, beginning with where it is grown or processed and ending with where it is purchased or consumed
19.	Eco-label: Forest Stewardship Council	promotes sustainable use of forests and helps consumers make informed decisions
20.	Eco-label: Marine Stewardship Council and Ocean Wise <sup>159</sup>	recognizes and rewards sustainable fishing
21.	The Environmental Sustainability Index (ESI) and the Environmental Performance Index (EPI) <sup>160</sup>	measure overall progress towards environmental sustainability
22.	Framework for Strategic Sustainable Development (FSSD) <sup>161</sup> , also known as The Natural Step Framework	Is a process of incorporating various sustainability methods, tools, and concepts
23.	International Organization for Standardization <sup>162</sup>	ISO 26000 provides guidance for social responsibility ISO 14031 framework for Environmental Performance Evaluation
24.	The United Nations Global Compact <sup>163</sup>	works with businesses, agencies, labor, civil society and governments to advance collaboration and ten universal principles in the areas of human rights, labor, environment and anti-corruption
25.	Organisation for Economic Co-operation and Development (OECD) <sup>164</sup>	promotes policies that will improve the economic and social well-being of people around the world
26.	The European Management and Adult Scheme Regulation (EMAS) <sup>165</sup>	is developed by the European Commission for companies and other organizations to evaluate, report, and improve their environmental performance.

 <p>Relationship between</p> <ul style="list-style-type: none"> <li>global temperature increase</li> <li>global sea level rise and cumulative global carbon dioxide (CO<sub>2</sub>) emissions</li> </ul>	<h2>Projections of Surface Temperatures</h2> 	<h2>Greenhouse gas emission impacts</h2> 	<h2>The Carbon Bath-tub</h2> 

**Country Data**

Values of Global Country Groups

Country	2005				2007	
	Population (billions)	Fossil Fuel Emissions (GtCO <sub>2</sub> /yr)	CO <sub>2</sub> Emissions per capita (metric tons)	FDI Emissions (GtCO <sub>2</sub> /yr)	GDP per capita (USD)	FDI Emissions per capita (metric tons)
US	0.31	6.15	20.00	0.50	30,000	0.50
EU27	0.50	4.22	8.40	0.30	20,000	0.30
China	1.30	7.38	5.60	0.50	5,000	0.50
India	1.10	1.80	1.60	0.10	1,000	0.10
Other Developing	3.80	5.00	1.30	0.40	1,000	0.40
SDGAs	0.01	0.10	1.00	0.00	0.00	0.00

Source: C40/GEI © 2008 based on BP's Statistical Review 2008.

**Head of State Meeting, Copenhagen, December 2009**

"If there is no sense of finality in the process, it's going to be difficult for us to move forward in a significant way."  
 —President Barack Obama

"I've got to be with all the respect and all the flexibility... I think it has respect to China. The developed countries have pledged to reduce greenhouse gas emissions by 10 percent. And in return, China, which will receive the largest economic power in the world, says to the world, 'Commitments apply to you, but not to me.' This is utterly unacceptable! This is about the essential, and one has to react to this hypocrisy!"  
 —President Vladimir Putin

"People tend to forget when it's done. In the past 200 years of industrialization, developed countries contributed more than 90 percent of emissions. Who are we blaming the problem responsible for the catastrophe we are facing?"  
 —Chinese Deputy Foreign Minister Fu Ying

**United Nations Framework Convention on Climate Change**

Twenty climate change negotiations sessions, but no effective agreement over reduction in greenhouse gas emissions

**World Climate Players**

**Meeting Leads**

UN Secretary-General Ban Ki-moon  
 UNFCCC Executive Secretary Christiana Figueres

**Negotiating Blocs**

- EU
- China
- USA
- Other Developing Countries
- Other Developing Countries
- Arabia
- Others

**Advisors**  
 C-Team or C-ROADS

**Welcome Delegates UN Climate Summit**

**Goals of Negotiators**

- Achieve emissions reduction commitments to stabilize GHG levels by 2100 at a level that limits global warming to no more than 2 °C above preindustrial levels
- Make decisions to address three tasks:
  - Set its own fossil fuel emission targets
  - In what year GHG emissions will stop growing
  - In what year GHG emissions will begin to decline
  - at what rate GHG emissions will decline

**Goals of Negotiators (cont.)**

- Determine its own decarbonization and land use policies
  - Deforestation (1 = BAU, 0 = zero emissions)
  - Afforestation (0 = no new areas for afforestation, 1 = max feasible)
- Decide how much will contribute to the Green Climate Fund, which will be used for disaster relief, food and water, immigration and refugees, mitigation and adaptation. Total cost is \$100 billion per year
  - How much will you contribute?
  - How much should others contribute?
  - What do you need?
  - Terms?

**Round 1**

**Proposal Form**

- Region: \_\_\_\_\_
- CO<sub>2</sub> Emissions growth stop year: \_\_\_\_\_
- CO<sub>2</sub> Emissions decline start year: \_\_\_\_\_
- Fractional rate of decline (%/year): \_\_\_\_\_
- REDD+ (Reduction in Emissions from Deforestation and land Degradation)
  - In: no. Developed, Other Developing only (1 = no reduction from AUCD = zero activity)
  - Out: no. Developed, Other Developing only (1 = no reduction from AUCD = zero activity)
- Afforestation (net new forest area)
  - All regions only (0 = no afforestation, 1 = new forest/ha/yr)
- Your region's contribution to fund for mitigation and adaptation (\$B/year): \_\_\_\_\_

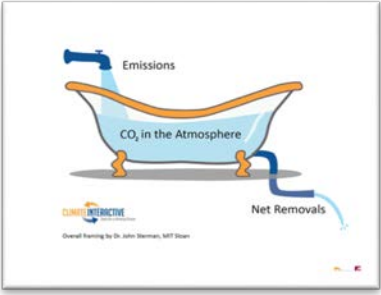

**Intended Nationally-Determined Commitment (INDC)**

	GHG emissions growth stop year	GHG emissions decline start year	Rate of decline (%/year)	REDD+ Afforestation	Afforestation	Contribution or request (\$B/year)
Inland states						
European Union						
Other Developed countries						
China and India						
Developing Countries						

**What does C-Learn say?**

<http://www.climateinteractive.org/tools/cllearn/simulation/>

**Climate Change Impacts**

- Temperature increase
- Warmer oceans
- Shrinking sea ice
- Shrinking snowpack
- Melting glaciers
- Thawing permafrost
- Sea level rise
- Changing rain and snow patterns
- Rising risk of extreme weather
- Habitat destruction
- Disturbance of migration, spatial distribution, interaction and reproductive patterns of species
- Invasion of non-native species
- Loss of biodiversity (including genetic diversity)
- Rising public health risk (including heat-related illnesses and food, water, and vector-borne diseases)

**Round 2**

**Round 3**

**Debriefing**

**Reflections**

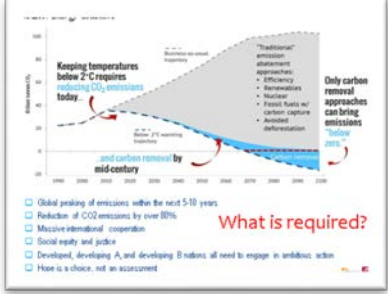

- Were there any surprises?
- Can developed countries solve the problem by their own?
- Can cutting deforestation fight climate change?
- What does it take to limit warming to two degrees above pre-industrial levels?

**Emotions**

- How did this exercise make you feel?

**Insights**

- What do you think were the most important insights from this exercise?
- How can we catalyze change?

*Back to Table of Contents*

## Figure VI: External Organizational Sustainability Indicator System Development Process

### Step 1: Preliminary study

- A small working group explores (i) the broad conceptual framework of sustainability, (ii) the sustainability performance measurement and monitoring frameworks, *including* the characteristic of sustainability indicator systems, criteria for *effective sustainability indicators*, and *methods for organizing sustainability indicators*; and (iii) whether a standard set of sustainability indicators could be utilized or adapted

### Step 2: Issue selection

- The working group (i) creates a list of EPA Region 9 priority issues; (ii) reviews and condenses the list; and (iii) defines each issue/field of action clearly

### Step 3: Objectives

- The working group identifies and clarifies the overall EPA Region 9 sustainability goals and objectives and their scope and scale

### Step 4: Conceptual framework

- The working group (i) adopts a definition of sustainability; and (ii) identifies EPA Region 9 sustainability themes (and subthemes), including elements necessary for sustainability

### Step 5: Indicator framework

- The working group (i) adopts a definition of *sustainability*; and (ii) identifies EPA Region 9 sustainability themes (and subthemes), including elements necessary for sustainability

### Step 6: Initial pool of indicators

- The working group (i) generates an initial set of sustainability indicators that relates to elements necessary for EPA Region 9 sustainability goals/objectives; (ii) reevaluates/removes duplication and refines the list; (iii) divides indicators in several dominant sustainability themes (and subthemes); and (iv) provides a basic definition, applicable unit of measurement and period covered for each indicator

### Step 7: Specialist advice

- The working group (i) discusses EPA Region 9 issues/goals/objectives, key principles and criteria for selecting indicators and the initial set of indicators with EPA regional/departmental specialists (via e-mail/phone, in person, or group meeting/Sustainability Indicators Café); (ii) compiles experts' comments and suggestions; and (iii) updates the set of indicators

### Step 8: Stakeholder and public consultation

- The working group (i) organizes and conducts a participatory session with key stakeholders and members of civil society/community to discuss EPA Region 9 sustainability goals/objectives and sustainability performance measurement framework, including principles and criteria for selecting indicators, and the set of candidate indicators; and (ii) updates the list of indicators

### Step 9: Data collection and processing

- The working group (i) pares down the list of indicators based on its knowledge of available data sources (the group could identify and contact certain primary or alternative data holders); and (ii) refines the list of indicators, if needed

### Step 10: Indicators analysis

- The working group applies EPA Region 9 indicator criteria to test the relevance-strength of each indicator; and (ii) narrows down the indicator list

### Step 11: Final selection

- The working group (i) identifies the final set of sustainability indicators; and (ii) checks again whether each indicator is clearly defined, covers strategic goals and has a proper unit of measurement and period covered

### Step 12: Transparency and public information

- The working group ensures that (i) EPA Region 9 indicator system is publicized and easily accessible to the public; (ii) information is easily understandable; (iii) and a channel for public input on indicators is available

### Step 13: Follow up

- The indicator set is periodically evaluated, reviewed, optimized and updated

**Figure VII-a: the K-12 Integrated Environmental and Sustainability Learning Standards<sup>180</sup>**

**Standard 1: Ecological, Social, and Economic Systems**

- Students develop knowledge of the interconnections and interdependency of ecological, social and economic systems. They demonstrate understanding of how the health of these systems determines the sustainability of natural and human communities at local, regional, national, and global levels.

**Standard 2: The Natural and Built Environment**

- Students engage in inquiry and systems thinking and use information gained through learning experiences in, about, and for the environment to understand the structure, components, and processes of natural and human-built environments.

**Standard 3: Sustainability and Civic Responsibility**

- Students develop and apply the knowledge, perspective, vision, skills, and habits of mind necessary to make personal and collective decisions and take actions that promote sustainability.

**Figure VII-b: the California Education and the Environment Initiative<sup>181</sup>**

**Principle I: People Depend on Natural Systems**

- The continuation and health of individual human lives and of human communities and societies depend on the health of the natural systems that provide essential goods and ecosystem services.

*Concept B:* Students need to know that the ecosystem services provided by natural systems are essential to human life and to the functioning of our economies and cultures.

**Principle III: Natural Systems Change in Ways that People Benefit from and can Influence**

- Natural systems proceed through cycles that humans depend upon, benefit from, and can alter.

*Concept A:* Students need to know that natural systems proceed through cycles and processes that are required for their functioning.

*Concept B:* Students need to know that human practices depend upon and benefit from the cycles and processes that operate within natural systems.

*Concept C:* Students need to know that human practices can alter the cycles and processes that operate within natural systems.

## Power Point Presentation II: Fifth Grade: “Water Pollution through Images”

### Slide 1:

Water pollution comes from both natural and human-made sources. Water pollution refers to “any change or modification in the physical, chemical and biological properties of water that will have a detrimental consequence on living things.”<sup>184</sup>

### Slide 2:

In ancient times, humans would drink fresh water from streams, lakes, ponds and rain. As human populations took on agriculture and formed permanent settlements the risk of water contamination and disease increased as human and animal waste were often dumped into the closest river or stream.

### Slide 3:

The Romans constructed aqueducts to bring a constant flow of water from distant sources into cities and towns, supplying public baths, latrines, fountains and private households. Waste water, primarily rainwater from roofs and pavements, was removed by the sewage systems and released into nearby bodies of water.<sup>185</sup>

### Slide 4:

During the Middle Ages in Europe, water borne diseases such as Typhoid Fever and Cholera broke out with regularity because people often disposed of their wastes in the street or in bodies of water that were also used as a drinking source.<sup>186</sup>

### Slide 5:

By the 1800s, people began to understand that unsanitary living conditions and water contamination contributed to disease epidemics.<sup>187</sup> Toilets were installed in houses in the early 19th century, but they were usually connected to cesspools, not to sewers. In densely populated areas, local conditions soon became intolerable because the cesspools were seldom emptied and frequently overflowed.<sup>188</sup>

<sup>184</sup> <http://eschooltoday.com/pollution/water-pollution/what-is-water-pollution.html>

<sup>189</sup> <http://oceanservice.noaa.gov/education/kits/pollution/02history.html>

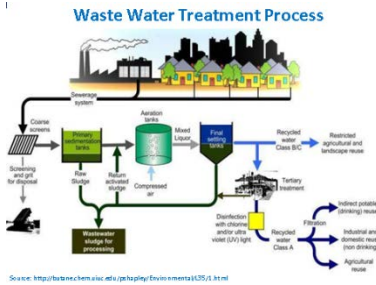

<sup>190</sup> <http://oceanservice.noaa.gov/education/kits/pollution/02history.html>

<sup>191</sup> <http://www.earthday.org/about/the-history-of-earth-day/>

<sup>192</sup> <http://www.epa.gov/regulatory-information-topic/regulatory-information-topic-water>

Slide 11:  
Drinking water treatment process removes contaminants and ensures water quality.

Slide 12:  
Wastewater treatment process ensures that the sewage generated from domestic, commercial, and industrial waste is properly treated and disinfected before it is discharged to a water body.

Slide 13:  
While water pollution has been reduced with the enactment of the Clean Water Act and the Safe Drinking Water Act, there is still much work to be done. Water pollution can result from several sources, including "waste water that runs through city sewers, waste water produced by industrial processes, water runoff from farmers, urban areas, mining, forestry, and construction, and the dredging and filling of waterways which churns up bottom sediment and other pollutants."<sup>193</sup>

Slide 14:  
The causes of water pollution can be divided into two different groups based on their origin. *Point Source*: Point source of pollution is generated from a definite identifiable source like the discharge pipe of domestic or industrial sewage to a water body. *Nonpoint Source*: Nonpoint source of pollution does not have one specific source that is easily identifiable. Example of nonpoint source pollutants are fertilizer, pesticide, oils spilled from cars etc.<sup>194</sup>

Slide 15:  
Here are some examples of non-point source pollution. Water pollution from mines is a major concern.

[Back to EcoLearn Outcomes and Findings: Revision](#)  
[Back to Table of Contents](#)

<sup>193</sup> <http://www1.american.edu/ted/projects/tedcross/xseap17.htm>

<sup>194</sup> <http://www.theecoambassador.com/Causesofwaterpollution.html#sthash.2aQoTjF2.dpuf>

Slide 16:  
Oil spill pose a huge concern as large amount of oil enters into the sea and does not dissolve with water; there by opens problem for local marine wildlife such as fish, birds and sea otters.<sup>195</sup>

Slide 17:  
Water pollution associated with fertilizers usually occurs because of adding more nutrients to the soil than can be taken up by the crop. These materials travel from fields to ground water or surface water.<sup>196</sup>

Slide 18:  
A small leakage from the sewer lines can contaminate the underground water and make it unfit for the people to drink.<sup>197</sup>

Slide 19:  
Fossil fuels like coal and oil when burnt produce substantial amount of ash in the atmosphere. The particles which contain toxic chemicals when mixed with water vapor result in acid rain.<sup>198</sup>

<sup>197</sup> <http://www.conserve-energy-future.com/sources-and-causes-of-water-pollution.php>

<sup>198</sup> <http://www.conserve-energy-future.com/sources-and-causes-of-water-pollution.php>

Slide 20:  
Garbage dumping

Slide 21:  
Water pollution adds enormously to existing problems of water scarcity by contaminating large volumes of available water, thus making it unsuitable for use.

Slide 22:  
Currently more than one-third of the world's population experiences serious water problems and polluted water sickens more than 1 billion people each year. Water pollution is worst in developing countries, where human health is gravely damaged by accelerating contamination of water supplies.<sup>199</sup>

Slide 23:  
Our water is our responsibility.

[Back to Table of Contents](#)

## Figure IX: Background for Third Grade “Animals” lesson

### Background<sup>200</sup> - What does the teacher need to know before teaching this lesson?

#### What is an animal?<sup>201,202</sup>

All life is divided into six kingdoms:

- Bacteria, Archaea, Protista, Plantae, Fungi, and Animalia.

Animals are a group of organisms in the family Animalia. There are over 8 million animal species on our planet! Animals can be

- *Arthropods*: any animals that have more than four, jointed legs, such as insects, spiders and crustaceans, scorpions, etc.
- *Amphibians*: born in water and breathe with gills like a fish, but when grow up, they develop lungs and can live on land.
- *Fish*: Live in water and have gills, scales, fins, and most importantly, a spine.
- *Reptiles*: animals with scaly skin. They are born on land and are cold blooded. Snakes, lizards, crocodiles, alligators, turtles, etc.
- *Birds*: lay and hatch out of eggs. Rather than hair they have feathers, and are the only animals that do so. Not all animals can fly, but all do use their feathers for some sort of navigation (flying, running).
- *Mammals*: drink milk as babies and have hair on their bodies, such as dogs, cats, horses, duckbill platypuses, kangaroos, dolphins and whales, etc.

In agriculture, animals are raised for food, fiber, and fuel. These animals are known as livestock. Companion animals are what we call dogs, cats and other animals that provide companionship to humans.

#### What do animals need to survive?<sup>203</sup>

All animals need air, food, water, shelter, and space to survive.

#### What is a food chain?<sup>204,205,206</sup>

All living things need to feed to get energy to grow, move and reproduce. But what do these living things feed on? Smaller insects feed on green plants, and bigger animals feed on smaller ones and so on. This feeding relationship in an ecosystem is called a food chain.

- Green plants make their own food. They use the energy from the sun to make their own food. Some of this food is used, and some is stored in the roots, stems, and leaves. Plants are producers – they make/produce their own food by photosynthesis.
- Animals cannot make their own food. Animals get their energy and biomass by consuming/eating other organisms. All animals are consumers – they consume/eat. Animals that eat only plants are called herbivores (or primary consumers). Animals that eat other animals are called carnivores. Carnivores that eat herbivores are called secondary consumers, and carnivores that eat other carnivores are called tertiary consumers. Animals that eat both plants and animal are called omnivores.
- Predators are organisms that eat another organism. Preys are the organism which the predators eat.

A food chain always starts with a green plant (a producer), which is eaten by an animal (a consumer). A food chain ends with a predator – the predator is at the top of the food chain. The sun is very important for all living things – without the sun the plants would not grow, without plants there would be no animals.

<sup>200</sup> Answers contain excerpts from cited articles. For more information, follow the links.

<sup>201</sup> <https://articles.extension.org/pages/64594/what-is-an-animal>

<sup>202</sup> [http://www.kidzone.ws/animals/animal\\_classes.htm](http://www.kidzone.ws/animals/animal_classes.htm)

<sup>203</sup> <http://ecosystems.psu.edu/youth/sftrc/lesson-plan-pdfs/habitat>

<sup>206</sup> <http://mpalalive.org/classroom/lesson/food-chains-kenya#sthash.poHFPaN1.dpuf>

**What is a food web?**

A food web consists of many food chains.

**What is the difference between a food web and a food chain?<sup>207</sup>**

A food chain only follows just one path as animals find food.

- A hawk eats a snake, which has eaten a frog, which has eaten a grasshopper, which has eaten grass.

A food web shows the many different paths plants and animals are connected.

- A hawk might also eat a mouse, a squirrel, a frog or some other animal. The snake may eat a beetle, a caterpillar, or some other animal. And so on for all the other animals in the food chain.

A food web is several food chains connected together.

**What is extinction?<sup>208</sup>**

Extinction of a particular animal or plant species occurs when there are no more individuals of that species alive anywhere in the world - the species has died out. This is a natural part of evolution. But sometimes extinctions happen at a much faster rate than usual. For example, at the end of the Cretaceous period 65 million years ago, a mass extinction caused the death of many different types of animals and plants, including the dinosaurs. Today human intervention is also causing rapid extinction. Hunting, habitat destruction and the over exploitation of wildlife means that many different types of plants and animals are being pushed to the edge of extinction.

**What are endangered and threatened species?<sup>209</sup>**

Endangered species are those plants and animals that have become so rare they are in danger of becoming extinct. Threatened species are plants and animals that are likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

**Why do species become endangered?<sup>210</sup>**

Every day between 50 and 150 plant and animal species become extinct for a variety of reasons:

- Habitat loss. Habitat refers to the place where an animal or plant species lives. This habitat consists of five elements: food, water, shelter, space and an appropriate mixture of these elements. All species must have adequate habitat in order to survive.
- Introduced species. When non-native plants or animals are introduced into an area, they may disturb the natural balance of the ecosystem. Introduced species may over populate an area, compete for food, carry diseases for which native species may have no immunity, drive out other species and cause numerous other problems. They may prey on native species that have no defenses against the invader.
- Pollution. Pollution from pesticides, burning coal, oil and gas, industrial plants and automobile emissions all impact wildlife populations.
- Population. It took the entire history of humankind for the population to reach 1 billion around 1810. By 1930, this doubled to 2 billion people. Today there are over 7 billion people.
- Over-consumption. Because of over-consumption of the earth's resources, the world is losing wild places and species as the demand for food, minerals, lumber, and other resources increase.

**Why protect endangered and threatened species?<sup>211, 212</sup>**

The Endangered Species Act of 1973 recognizes that endangered and threatened species of wildlife and plants "are of esthetic, ecological, educational, historical, recreational, and scientific value to the Nation and its people."

We all depend upon plants and wildlife. From studying them, we have learned new ways of growing food, making clothing, and building houses. Scientists have discovered how to use certain plants and animals as

<sup>207</sup> <http://resources.woodlands-junior.kent.sch.uk/homework/foodchains.htm>

<sup>208</sup> <http://www.oum.ox.ac.uk/thezone/animals/extinct/define.htm>

<sup>209</sup> <https://www.epa.gov/endangered-species/learn-more-about-threatened-and-endangered-species>

<sup>210</sup> [http://www.rollinghillswildlife.com/get\\_involved/conserv\\_endang.html#habitat](http://www.rollinghillswildlife.com/get_involved/conserv_endang.html#habitat)

<sup>211</sup> <https://www.fws.gov/nativeamerican/pdf/why-save-endangered-species.pdf>

<sup>212</sup> <https://www.epa.gov/endangered-species/learn-more-about-threatened-and-endangered-species>

medicine. If we fail to protect threatened or endangered species, we will never know how they might have improved our lives.

#### **What can we do to help save endangered species?<sup>213</sup>**

- Learn about endangered species in your area. Teach your friends and family about the wonderful wildlife, birds, fish and plants that live near you.
- Get involved by volunteering at your local nature center or wildlife refuge. The best way to protect endangered species is to protect the places where they live, such as national wildlife refuges, parks or other open spaces.
- Make your home wildlife friendly. Feed pets indoors and lock pet doors at night to avoid attracting wild animals into your home. Reduce your use of water in your home and garden so that animals that live in or near water can have a better chance of survival. Place decals on windows to deter bird collisions.
- Plant native plants. Native plants provide food and shelter for native wildlife. Attracting native insects like bees and butterflies can help pollinate your plants.
- Avoid using herbicides and pesticides. Many herbicides and pesticides take a long time to degrade and build up in the soils or throughout the food chain. Predators such as hawks, owls and coyotes can be harmed if they eat poisoned animals.
- Slow down when driving. Many animals live in developed areas and this means they must navigate a landscape full of human hazards.. Roads divide habitat and present a constant hazard to any animal attempting to cross from one side to the other.
- Recycle and buy sustainable products. Buy recycled paper, sustainable products like bamboo and Forest Stewardship Council wood products to protect forest species. Recycle your cell phones, because a mineral used in cell phones and other electronics is mined in gorilla habitat.
- Never purchase products made from threatened or endangered species. Avoid supporting the market in illegal wildlife including: tortoise-shell, ivory, coral.
- Do not participate in shooting, trapping, or forcing a threatened or endangered animal into captivity, and report it as soon as you see it to your local state or federal wildlife enforcement office.
- Protect wildlife habitat so that wildlife have places to find food, shelter and raise their young. Support the minimization of logging, oil and gas drilling, over-grazing and development all result habitat destruction.
