

FY 2016 Colgate University Greenhouse Gas Inventory Report

A step-by-step guide to completing the annual greenhouse gas inventory at Colgate University.

Colgate

Office of Sustainability

Edited by: John Pumilio, Director of Sustainability

EXECUTIVE SUMMARY

This year marks Colgate's eighth consecutive greenhouse gas inventory report. Colgate's gross campus carbon emissions in Fiscal Year 2016 was 15,359 metric tons of carbon dioxide equivalent (MTeCO₂). That represents a 1,432 ton reduction from our 2009 baseline, a 9 percent reduction. Likewise, we have reduced our net campus carbon footprint (scope 1, 2, and 3 emissions plus forest sequestration and carbon offsets) by 8,001 MTeCO₂, representing a 48 percent reduction. Since signing the American College and University Presidents' Climate Commitment (ACUPCC) in 2009, rebranded as Second Nature's Carbon Commitment, Colgate has implemented many changes on and off campus to achieve these reductions, moving closer toward our goal of carbon neutrality by 2019.

Colgate's historical greenhouse gas emissions vary from year to year as a result of changing emission factors, improved methodology for tracking and reporting emissions (particularly Scope 3 emissions), and changes in operational practices and campus policies/procedures. In order to normalize Colgate's emissions from year to year, we retroactively update our emission factors from past years. This allows us to make an accurate comparison of our progress between years, as well as eliminate the perception that we are advancing climate action on campus when in fact we might not be.

In 2015, we also switched to new finance and travel management systems, Concur and Christopherson Business Travel, respectively. This significantly improves the way we track and obtain emissions data relating to air and ground travel. However, this switch did and will continue to increase our Scope 3 emissions—not necessarily because our behavior changed, but because our access to data and reporting mechanisms changed.

Our emissions have gone down since our 2009 baseline due to the implementation of dozens of mitigation strategies. Recent projects that have contributed to reduced emissions include the heating plant upgrade that resulted in a switch from fuel oil to natural gas as a backup fuel to our wood boiler. Additionally, we have implemented several energy efficiency measures and lighting upgrades in campus buildings. For example, during the summer of 2015, McGregory Hall completed its multi-year renovation with a substantial upgrade to its interior spaces, including a conversion to LED lighting in the Cooley science library as well as HVAC and air handler upgrades. We also undertook complete LED lighting retrofits in Colgate's Memorial Chapel, Curtis Hall, and Drake Hall. Additionally, several Colgate buildings on Broad Street were upgraded to natural gas from fuel oil, providing additional carbon emissions savings.

In FY 2016, we saw an increase in our campus greenhouse gas emissions. This was due primarily to increased use of natural gas in our heating plant and decreased use of wood chips as we secured a new contract for our supply of wood chips and worked through better management of the facility.

In FY 2016, Colgate continued to benefit from our partnership with Patagonia Sur, LLC providing the institution with 5,000 tons of carbon offsets. This fiscal year, Colgate did not purchase Renewable Energy Certificates (RECs) to offset emissions for our electricity consumption. As a result, the university's net footprint in FY 2016 was 8,781 MTeCO₂ after compensating for offsets and forest sequestration. Colgate's highest sources of emissions continue to be the on-campus use of fossil fuels (7,533 MTeCO₂), followed by air travel (3,746 MTeCO₂).

INTRODUCTION

Colgate's Commitment to Climate Neutrality

The American College and University Presidents' Climate Commitment (ACUPCC), rebranded as Second Nature's Carbon Commitment, was officially announced in October 2006 during the AASHE (Association for the Advancement of Sustainability in Higher Education) conference at Arizona State University. Signatories made a commitment to, "achieve climate neutrality as soon as possible" by eliminating or offsetting 100 percent of the institution's greenhouse gas emissions. One mandatory component of the Carbon Commitment is to complete an annual greenhouse gas emissions inventory. By 2007, 152 presidents and chancellors became charter signatories of the Carbon Commitment. In 2016, there were a total of 593 signatories from all 50 states representing over 6 million students that have committed to carbon neutrality.

In 2009, Colgate University signed the Carbon Commitment (called the ACUPCC at the time) and completed our first greenhouse gas inventory. This is our eighth consecutive year completing the inventory. Colgate's emissions were 16,791, 14,803, 16,495, 15,310, 12,736, 13,551, 14,519, 15,361 metric tons of carbon dioxide equivalent (MTeCO₂) in fiscal years 2009, 2010, 2011, 2012, 2013, 2014, 2015 and 2016, respectively¹.

Throughout this report, we provide the results of Colgate's 2009-2016 inventories; however, our focus here is the 2016 inventory. More specifically, the goals of this report are to: 1) meet a key requirement of the Carbon Commitment by tracking progress compared to our 2009 baseline inventory, 2) highlight the methodology and results of Colgate's 2016 Greenhouse Gas Inventory, and 3) provide step-by-step instructions on how to collect the inventory data and make calculations so this report can serve as a guide for future inventories.

Conservation and efficiency is saving the university approximately \$598,000 (Table 1) annually in avoided operating costs, while enhancing our liberal arts education, as student participation is integral to these results through academic research, governance, and co-curricular student group activities. Our progress towards a more sustainable campus have resulted in numerous awards for the institution. In 2016, Colgate was ranked in Sierra Magazine's "Coolest Schools" issue as the 20th greenest institution in the country, our highest ranking.

Table 1. Annual avoided spending as a result of resource conservation and efficiency, FY 2009 vs. 2016

Colgate Resource	Amount Reduced	Unit Cost	Annual Avoided Cost
Heat Energy (MMBtu)	54,036.66 MMBtu	\$7.90/MMBtu	\$428,587
Electricity (kWh)	2,840,963 kWh	\$0.044/kWh	\$125,002
Paper (lbs)	29,469 lbs	\$1.50/lb	\$44,262
TOTAL			\$597,852

¹ Note: these numbers vary from previously recorded values due to a recalculation of past emissions utilizing most recent emissions factors. Future inventories will modify these numbers as well as emissions factors are updated.

UNDERSTANDING COLGATE'S GREENHOUSE GAS INVENTORY

According to the United States Environmental Protection Agency (U.S. EPA), a greenhouse gas inventory is an accounting of greenhouse gases (GHGs) emitted to or removed from the atmosphere over a period of time. Colgate's comprehensive greenhouse gas inventory is an essential step to track our emissions over time. Understanding the basic concepts and calculations of the inventory is not only important for the individuals carrying out the methodology, but it is also important for anyone interested in what the inventory is telling us and how the results are derived.

Colgate's greenhouse gas inventory quantifies our institution's contribution to global climate change by revealing our net greenhouse gas emissions (total emissions minus the sum of our offsets). Offsets can be any process or activity that avoids emissions or removes greenhouse gases from the atmosphere (e.g., methane capture and recovery, forestry-based carbon sequestration, composting, and others) or any strategy that increases the amount of energy produced from clean, renewable sources (e.g., investing in wind energy or solar photovoltaic arrays or other renewable technologies). Because Colgate is committed to carbon neutrality by 2019, the goal is to balance our greenhouse gas budget at zero, where total emissions equals total offsets. Once equipped with a greenhouse gas budget, the Colgate community can make informed decisions on how to reduce our emissions and increase our offsets. This was the purpose of the Sustainability and Climate Action Plan published in September 2011 and the revised 2016-2019 Sustainability Bicentennial Plan currently undergoing publication.

INVENTORY BOUNDARIES

Colgate, like other signatories to Second Nature's Carbon Commitment, follows the international protocol established by the World Business Council for Sustainable Development (WBCSD) and the World Resources Institute (WRI) and the Climate Registry's General Reporting Protocol. Second Nature's *Implementation Guide* outlines these protocols as they relate to higher education institutions. Complying with these protocols, we have established the following boundaries when conducting Colgate's Greenhouse Gas Inventory.

Fiscal Year

Colgate's Greenhouse Gas Inventory tracks emissions over the fiscal year (as opposed to the calendar year or academic year). Colgate's fiscal year runs from July 1 through June 30 of the following year. Throughout this report, whenever a year is mentioned (e.g., 2016), we are referring to the fiscal year unless otherwise noted. Additionally, "fiscal year" is abbreviated to "FY" throughout this report.

Scope of Emissions

Sources of greenhouse gas emissions are organized into three categories called "scopes" as established by the World Resources Institute and followed by the Clean Air-Cool Planet (CA-CP) Campus Carbon Calculator (now maintained by the University of New Hampshire Sustainability Institute). The three-scope format ensures that there is consistency in measurement between institutions. The scopes are essentially levels of how responsible Colgate is for various sources of emissions. For example, travel carried out by Colgate's own fleet of vehicles is categorized as "Scope 1" emissions because Colgate has complete control over what vehicles we decide to purchase and our driving behavior. On the other hand, faculty and staff commuting to and from

campus are considered “Scope 3” because Colgate is not responsible for the decisions employees make in purchasing their vehicles, nor where they choose to live or how they commute to campus. The three scopes of greenhouse gas emissions recorded in Colgate’s Inventory are as follows:

- *Scope 1 Emissions:* Scope 1 refers to direct greenhouse gas emissions occurring from sources that are owned or directly controlled by the institution. At Colgate, this includes on-campus stationary combustion of fossil fuels (such as natural gas, fuel oil #2, kerosene, and propane), vehicle fleet emissions, fugitive refrigerant chemicals, and emissions associated with grounds maintenance.
- *Scope 2 Emissions:* Scope 2 refers to indirect emissions generated in the production of electricity consumed by the institution. To calculate these emissions, we have to determine how our electricity is produced (e.g., hydroelectric, coal, wind, etc.) and calculate the greenhouse gas emissions for each source.
- *Scope 3 Emissions:* Scope 3 refers to all other indirect emissions—those that are a consequence of activities of the institution, but occur from sources not owned or controlled by the institution. Colgate’s Scope 3 emissions include faculty and staff commuting, bus commuting, air travel and business ground travel (paid by or through the university), paper use, and solid waste.

De Minimus Emissions

Colgate is a residential campus with only 250 students (7.5% of population) renting apartments or houses that are not affiliated with the university. The vast majority of students live within walking distance of class. More specifically, all first- and second-year students live in residence halls on campus. Third- and fourth-year students either live in university-owned apartments, townhouses, or special-interest housing with provided shuttle bus transit to and from campus. Those fourth-year students who do not live in university-owned housing tend to rent apartments or homes within a three-mile radius of campus and share rides to campus in their private vehicles. Emissions associated with these activities are minimal, since the distances are so short. Additionally, residential students are not permitted to park their vehicles on campus between the hours of 8:00 AM and 3:30 PM on weekdays, forcing them to take Colgate-provided transportation or shared carpool. As a result, we assumed that greenhouse gas emissions associated with student commuting are de minimus (less than 5% of gross emissions). Moreover, attempting to quantify student commuter emissions would be difficult based on major assumptions and extrapolations. For these reasons, student commuting is not required or included in Colgate’s Greenhouse Gas Inventory.

Operational Boundaries

In compliance with international and Carbon Commitment guidelines, Colgate University tracks each of the six greenhouse gases covered under the Kyoto Protocol: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorinated compounds (PFCs), and sulfur hexafluoride (SF₆). Under Second Nature's Carbon Commitment, Colgate is required to account for and report all Scope 1 and Scope 2 emissions. Additionally, Colgate is required to report Scope 3 emissions from air travel (paid by or through the

university) and employee commutes to and from campus. This inventory accounts for all of these requirements, plus additional Scope 3 emissions highlighted above.

Organizational Boundaries

In order to calculate Colgate’s greenhouse gas emissions, it is necessary to determine the organizational boundaries. Following the Greenhouse Gas Protocol, Colgate defined its organizational boundary by using the operational control approach. As a result, emissions associated with auxiliary services, such as leased buildings incorporated under the for-profit Hamilton Initiative, LLC (e.g., the Colgate Bookstore, the Colgate Inn) are not accounted for in Colgate’s Greenhouse Gas Inventory because the utilities are not directly managed or serviced by Colgate employees.

INVENTORY CALCULATIONS

Global Warming Potentials

Global warming potentials (GWPs) are measures of each greenhouse gas’s influence to warm the Earth’s atmosphere (called radiative forcing). The greater the GWP, the more potent the GHG (Table 1). Carbon dioxide is used as the standard for which the other greenhouse gases are compared, hence the term carbon dioxide equivalent, and therefore, has the GWP of 1. Methane has a GWP of 25, meaning that one kilogram of methane has a radiative forcing that is 25 times greater than one kilogram of carbon dioxide over a 100 year period.

Table 2. Global warming potentials for Colgate’s 2016 greenhouse gas inventory

Greenhouse Gas	100-Year GWP
CO2	1
CH4	25
N2O	298
HFC-134a	1,430
HCFC-22	1,810

Metric Tons of Carbon Dioxide Equivalents (MTeCO2)

Colgate’s greenhouse gas emissions are measured in the international recognized units of metric tons of carbon dioxide equivalents (MTeCO2). International protocol designates carbon dioxide as the standard by which other gases are measured for two specific reasons: 1) in order to provide a standard unit of measurement across the board and 2) carbon dioxide is the most abundant anthropogenic greenhouse gas.

Emissions Factors

Emissions factors are the key to calculating Colgate’s greenhouse gas inventory. They measure the average rate of emission of each greenhouse gas from a particular source converted to metric tons of carbon dioxide equivalents (MTeCO₂). Certain activities, whether it is consuming oil for space heating or using gasoline for transportation, release different greenhouse gases into the atmosphere at different rates. Fuel oil #6, for example, releases three greenhouse gases into the atmosphere: carbon dioxide, methane, and nitrous oxide. The rate of emission for each of these greenhouse gases is 11.24 kg CO₂, 0.0395 kg of CH₄, and 0.02831 kg of N₂O for every gallon of fuel oil #6 combusted. The emission factor of fuel oil #6 is 0.01130 MTeCO₂/gallon, determined by multiplying the GWP for each greenhouse gas by its rate of emission and adding each together (Figure 1).

Note: In previous years, total MTeCO₂ for each emissions source were calculated using that year's emission factors. In the past, we did not retroactively update past calculations as emission factors were updated. This year, however, all previous calculations have been updated with the most recent emission factors provided by the Campus Carbon Calculator v8.0. This allows us to more accurately compare the efficacy of climate mitigation strategies by removing gains or losses attributed to changing emission factors.

Figure 1. Determining the emission factor for each source of greenhouse gas emissions using fuel oil #6 as an example

	Greenhouse Gas #1		Greenhouse Gas #2		Greenhouse Gas #3
Emission Factor =	(Global Warming Potential) X (Rate of Emissions)	+	(Global Warming Potential) X (Rate of Emissions)	+	(Global Warming Potential) X (Rate of Emissions)
	Carbon Dioxide (CO ₂)		Methane (CH ₄)		Nitrous Oxide (N ₂ O)
Fuel Oil #6 =	1 x 11.24 kg/gallon	+	25 x 0.00158 kg/gallon	+	298 x 0.000095 kg/gallon
	Carbon Dioxide (CO ₂)		Methane (CH ₄)		Nitrous Oxide (N ₂ O)
Fuel Oil #6 =	11.24 kg/gallon	+	0.0395 kg/gallon	+	0.02831 kg/gallon

Table 3. Emission factors in MTeCO₂ per unit consumed to quantify Colgate's 2016 greenhouse gas emissions

Emissions Source	Emission Factor
Scope 1	
Fuel Oil #6 (Gallons)	0.011296106
Fuel Oil #2 (Gallons)	0.01022138
Natural Gas (MMBtu)	0.0531667
Propane (Gallons)	0.0052207
Biomass (Wood Chips)	1.78351514
Gasoline Vehicles (Gallons)	0.008823814
Diesel Vehicles (Gallons)	0.0102563
Refrigerant (HFC-134a)	0.648637089
Refrigerant (HCFC-22)	0.82100219
Organic Fertilizer (lbs of nitrogen)	0.00414123
Scope 2	
Electricity (kWh)	0.0000596931
Scope 3	
Faculty/Staff Commuting (Gallons)	0.008823814
Colgate Cruisers (Gallons)	0.0102563
Outsourced Bus Travel (Gallons)	0.0102563
Air Travel (Miles)	0.000482417
Landfill Waste (w/ CH ₄ recovery and electricity production)	-0.03
Non-recycled Paper (lbs)	0.0.001365993362025
10% recycled paper (lbs)	0.001291490819
30% Recycled Paper (lbs)	0.00121698827505
50% Recycled Paper (lbs)	0.001067983188
100% Recycled Paper (lbs)	0.0007699730141

DATA COLLECTION

Annual Reporting

Data collection is the most time consuming part of Colgate's greenhouse gas inventory. Each year the data collection process commences in September for the previous fiscal year, giving employees the necessary time to finish their end of the fiscal year reporting. Additionally, with proper oversight, we recommend using the Office of Sustainability interns to help in the data collection in order to better facilitate this collection.

The annual data collection process has become routine for most of the stakeholders we contact, and therefore, much easier if we are consistent in the timing and type of data we request. A total history of our contact with stakeholders can be found in the archives of the Sustainability Office email account (sustainability@colgate.edu). Allow a few weeks for employees to provide requested data, anticipating that multiple inquiries might need to be made for the same data.

Once the appropriate data is collected, it should be entered into the "Colgate Carbon Inventory Workbook" created by Sustainability Office Intern, Andrew Pettit '11. The workbook contains data entry fields and performs the necessary calculations through built-in formulas. The workbook can be obtained through Colgate's Office of Sustainability.

Overall, we recommend that the inventory data be collected by the target date of December 15 of each year, with the final inventory report being completed by January 15 of the following year.

Institutional Data

Tracking institutional data is useful because it establishes a frame of historical reference and facilitates the comparison of Colgate's level of emissions in relation to other colleges and universities. Furthermore, significant changes in budget allocations, population, or square-footage of the built-environment can have a great impact on Colgate's activities and energy consumption, and therefore, greenhouse gas emissions. Table 4 provides an overview of Colgate's institutional data for FY 2009-2016.

Table 4. Colgate’s institutional data for FY 2009-2016

Fiscal Year	Budget (dollars)			Population			Physical Size (square-feet)
	Operating Budget	Research Budget	Energy Budget	Full-Time Students	Faculty	Staff	Total Building Space
2009	\$147,320,539	\$614,403	\$4,712,740	2,784	280	688	2,331,239
2010	\$149,220,020	\$300,220	\$3,950,587	2,770	278	678	2,331,239
2011	\$148,433,361	\$592,076	\$4,310,783	2,876	280	659	2,305,648
2012	\$152,207,713	\$630,286	\$4,585,035	2,934	293	663	2,340,773
2013	\$157,766,968	\$686,572	\$4,819,008	2,927	318	648	2,310,726
2014	\$164,695,978	\$735,760	\$5,763,339	2,927	344	648	2,318,703
2015	\$174,437,066	\$736,824	\$4,732,972	2,863	359	672	2,234,931
2016	\$179,846,306	\$739,256	\$4,796,517	2,837	347	672	2,422,000

Budget Information

Data Requested: The operation, research, and energy budgets for FY 2016.

Data Source: Drew Porter, Senior Budget Analyst, Roy Langworthy, Budget Reporting Analyst

Population Information

Data Requested: The headcount of faculty and staff members for FY 2016.

Data Source: Jill Dinski, Human Resources

Physical Size

Data Requested: The university’s total building space in square-feet for FY 2016.

Data Source: Roy Langworthy, Budget Reporting Analyst

Energy and Water Costs

Tracking energy and water costs is valuable because it establishes a frame of historical reference and allows us to perform useful climate action planning analyses. Moreover, relatively small changes in our energy and water costs per unit can have big impacts on our operating budget. For these reasons, it is necessary to track energy and water costs as part of our inventory data collection process (Table 5).

Table 5. Colgate’s energy and water cost per unit, FY 2009-2016

Fiscal Year	Wood Chips	Natural Gas	Fuel Oil #6	Fuel Oil #2	Kerosene	Propane	Electricity	Water
	(\$/ton)	(\$/CCF)	(\$/gallon)	(\$/gallon)	(\$/gallon)	(\$/gallon)	(\$/kWh)	(\$/1,000 gallons)
2009	\$40.00	-	\$2.24	\$3.50	-	\$2.15	\$0.043	\$8.26
2010	\$40.00	-	\$1.39	\$2.30	-	\$1.45	\$0.042	\$9.12
2011	\$42.00	-	\$2.01	\$2.29	\$2.53	\$1.52	\$0.045	\$9.28
2012	\$44.00	-	\$2.18	\$2.91	\$3.87	\$1.95	\$0.041	\$9.68
2013	\$41.88	-	\$2.53	\$2.96	\$2.53	\$1.59	\$0.041	\$9.18
2014	\$42.00	-	-	\$3.40	\$4.15	\$1.48	\$0.051	\$9.58
2015	\$45.00	\$0.88	-	\$3.29	\$3.02	\$1.73	\$0.047	\$9.63
2016	\$65.00	\$0.77	-	\$ 2.86	\$ 2.24	\$ 1.20	\$0.044	\$ 9.49

Wood Chips Cost

Data Requested: Cost per ton of wood chips for FY 2016.

Data Source: Howard Lewis, Mechanical Trades, Heating Plant and Energy Manager.

Natural Gas Costs

Data Requested: Cost per CCF (100 cubic feet) of natural gas for FY 2016.

Data Source: Roy Langworthy, Budget and Reporting Analyst

Calculation: Divide total amount spent on natural gas divided by the amount consumed in CCF. This will provide the cost of gas for the Central Plant. Also need to factor in the amount spent and used for auxiliary services (e.g., buildings on Broad Street).

Fuel Oil #2, Kerosene, and Propane Costs

Data Requested: Cost per gallon of fuel oil #2, kerosene, and propane for FY 2016.

Data Source: Alan Leonard, Director of Purchasing

Electricity and Water Cost

Data Requested: Cost per kilowatt-hour (kWh) of electricity and cost per 1,000 gallons of water for FY 2016.

Data Source: Manually calculated from monthly utility bill summaries. Spreadsheet provided by Dan Partigianoni

Calculations: To calculate the cost of electricity per kWh and water per 1,000 gallons, we divided the total annual cost by the total annual usage. For electricity, the total cost includes:

- Normal Rate Charge: The Village of Hamilton uses primarily hydropower, which is obtained from Niagara Falls. The Village is allotted a designated amount of hydropower each month to be used by its

customers (including Colgate). The rate is set by the Village and does not fluctuate from month to month unless a rate change is approved by the utilities commission.

- Purchased power adjustment (PPA): When the Village exhausts its hydropower allotment, they are forced to purchase additional electricity from the grid. These purchases are made at a different (and often higher) rate than the normal electricity rate.
- Demand charge: Demand charges intermittently cover start up and equipment costs when electricity is needed, often during peak hours. Demand charges are based on maximum demand, which is the greatest usage of electricity that occurred over a period, usually a month. Once established, the rate remains in effect for eleven months, or until a new maximum is established. To minimize demand charges, electricity usage should be spread out over a period to reduce the peak demand that may occur during any given timeframe.

For water, total cost includes the normal rate charge plus sewer costs. The Village bills Colgate in units of cubic feet. Therefore, cubic feet are converted to gallons (one cubic foot equals 7.48 gallons) and multiplying by 100 to get cost per 1,000 gallons.

Biogenic Emissions (Wood Chips)

In 1981, Colgate University began using wood chips as the primary source of energy for space heating and domestic hot water. Although the wood firing capacity of Colgate's biomass plant is only about 40% of the peak cold day campus steam requirement, that capacity is used year-round so that Colgate can derive 75-85% of our annual heating requirement from wood chips.

In FY 2016, Colgate began to use more natural gas for heating across campus, resulting in a decreased use of biomass. This year, Colgate derived 25-35% of our annual heating requirement from wood chips.

Burning wood chips for energy releases stored carbon into the atmosphere. However, according to international protocol specified in the GHG Protocol guidelines, this carbon does not add to Colgate's greenhouse gas footprint or contribute to anthropogenic climate change. Carbon released from combusting wood chips is on the natural and short carbon cycle and would eventually cycle back into the atmosphere through death and decomposition. In other words, the carbon that is released from Colgate's biomass plant was removed relatively recently from the atmosphere through photosynthesis as the tree grew. Therefore, burning wood for energy may not increase the total amount of carbon in the carbon cycle if the source of biomass comes from sustainable forestry practices. Though recent science and discourse is challenging this, the current protocol suggests that we track emissions associated with Colgate's biomass plant, but report them separately from our emissions (Table 6).

Table 6. Colgate’s emissions associated with wood chip combustion, FY 2009-2016

Fiscal Year	Wood Chips	Emissions Factor	GHG Emissions
	(tons)	(MTeCO2/ton)	(MTeCO2)
2009	22,249	1.78351514	39,681
2010	23,898	1.78351514	42,623

Data Source: Dan McCoach, Associate Director of Facilities and Manager of Engineering Services and Howard Lewis, Mechanical Trades and Energy Manager.

SCOPE 1 EMISSIONS

Scope 1 emissions are direct emissions from sources that are owned and/or directly controlled by Colgate University. This includes combustion of fossil fuels in university-owned facilities or vehicles, fugitive emissions from refrigerant chemicals, and emissions associated with grounds maintenance.

On-campus Stationary Combustion of Fossil Fuels

Colgate University uses four types of fossil fuels to provide heat and hot water to campus buildings: natural gas, fuel oil #2, kerosene, and propane (Table 7).

Colgate’s central steam plant heats 37 main campus buildings and provides the heat source for laundry equipment, domestic water heating, dining hall food preparation, laboratory, library, ice rink humidity control,

and building humidification. While Colgate's primary source of steam comes from the campus 900 boiler horsepower (BoHP) wood chip boiler, we use natural gas as our secondary fuel in the central steam plant, which replaced fuel oil. Fuel oil #2 and natural gas are the primary sources of heat energy used for facilities that do not have access to the steam from the Central Plant. This includes Colgate's buildings on Broad Street (e.g., fraternity and sorority houses, Sanford Field House, Townhouses, and others). Kerosene provides heat energy to a few buildings, including 80 Broad Street and the Seven Oaks Golf Club. Propane is used for fireplaces, heating, cooking, and hot water in a few buildings including those on Broad Street, the Coop, Parker Commons, Frank Dining Hall, and a few academic buildings.

Table 7. Greenhouse gas emissions from on-campus stationary sources, FY 2009-2016

Fiscal Year	Fuel Type	Unit	Consumption	Emissions Factor	GHG Emissions

Fuel Oil #2, Natural Gas

Data Requested: Gallons of fuel oil #6 and CCF of natural gas consumed for FY 2016.

Data Source: Dan McCoach, Associate Director of Facilities and Manager of Engineering Services and Howard Lewis, Mechanical Trades and Energy Manager.

Propane, Kerosene

Data Requested: Gallons of propane and kerosene consumed for FY 2016.

Data Source: Alan Leonard, Director of Purchasing; Howard Lewis, Mechanical Trades, Heating Plant and Energy Manager

Colgate Vehicle Fleet

Colgate University, like most colleges and universities, owns and maintains a fleet of vehicles. The decisions Colgate makes regarding the purchase and operation of this fleet has a direct impact on our institution's greenhouse gas emissions. Therefore, it is important to keep track of Colgate's fleet fuel use, as it is a direct contribution to climate change. The Colgate vehicle fleet consists of about 100 vehicles and was responsible for 515 tons of emissions in 2016 (Table 8).

Table 8. Colgate's greenhouse gas emissions from university vehicle fleet, FY 2016

Facilities Gasoline Pump	Golf Course Gasoline Pump	Total Gasoline	Emissions Factor	GHG Emissions
(gallons)	(gallons)	(gallons)	(MTeCO ₂ /gallon)	(MTeCO ₂)
34,412	4,700	39,112	0.008823814	345

(gallons)	(gallons)	(gallons)	(MTeCO ₂ /gallon)	(MTeCO ₂)
11,821	4,764	16,585	0.0102563	170
Total				515

Capturing fuel consumption for Colgate's vehicle fleet comes from four sources:

1. Facilities gasoline and diesel pumps
2. Seven Oaks golf course gasoline and diesel pumps
3. Facilities vehicles fueled off-campus after hours or during long-term rentals
4. Campus Safety vehicles fueled after hours

Facilities Gasoline and Diesel Pumps

Data Requested: Gallons of gasoline and diesel consumed for FY 2016.

Data Source: Alan Leonard, Director of Purchasing

Seven Oaks Golf Course Gasoline and Diesel Pumps

Data Requested: Gallons of gasoline and diesel consumed for FY 2016.

Data Source: Alan Leonard, Director of Purchasing

Campus Safety Vehicles Fueled Off-Campus (N/A this year, however keep this in mind for the future)

Data Requested: Gallons of gasoline consumed in FY 2016.

Data Source: Sue Marks, Campus Safety Administrative Assistant

Refrigerants (HFC-314a and HCFC-22)

Colgate University has an on-campus chiller for space cooling, water fountains, and refrigerators across campus that use HFC-134a refrigerant. Additionally, Starr Hockey Rink and the Dana Arts Center use HCFC-22. We can anticipate that in coming years, the Class of '65 Arena will also contribute to our refrigerant use. These refrigerant hydrocarbons meet all the required standards specified by the U.S. EPA in order to reduce the rate of ozone depletion. Unfortunately, hydrocarbons are powerful GHGs. HFC-134a, for example, has a GWP of 1,430 (meaning that it is 1,430 times more potent as a greenhouse gas than carbon dioxide). Therefore, it is important to calculate the amount of refrigerant chemicals Colgate uses on an annual basis. In 2011, refrigerants accounting for more than 632 tons of GHG emissions, but that number has fallen dramatically in recent years (Table 9).

Table 9. Greenhouse gas emissions from HFC-134a and HCFC-22 refrigerant chemical use, FY 2011-2016

Fiscal Year	HFC-134a Refrigerant Loss	Emission Factor	GHG Emissions	HCFC-22 Refrigerant Loss	Emission Factor	GHG Emissions	Total GHG Emissions
	(lbs)	(MTeCO2/lb)	(MTeCO2)	(lbs)	(MTeCO2/lb)	(MTeCO2)	(MTeCO2)
2011	108	0.648637089	70	685	0.82100219	562	632
2012	46	0.648637089	30	543	0.82100219	446	476
2013	1	0.648637089	1	281	0.82100219	231	231

2015	20	0.648637089	13	120	0.82100219	99	111
2016	17	0.648637089	11	109	0.82100219	89	100

HFC-134a, HCFC-22

Data Requested: The total usage (in pounds) of the refrigerants type HFC-134a and HCFC-22 for FY 2016.

Data Source: Brian Belden, Physical Plant Foreperson

Organic Fertilizer Application

Fertilizer is used for campus landscaping and on the golf course release nitrous oxides into the atmosphere due to its nitrogen content. Even though nitrous oxide is 298 times more powerful as a global warming agent

than carbon dioxide, Colgate’s emissions from fertilizer use is relatively small (Table 10). Nevertheless, they do contribute to climate change and our annual use of fertilizer is relatively easy to track.

Table 10. Greenhouse gas emissions from fertilizer application, FY 2009-2016

Fiscal Year	Landscaping	Golf Course	Total Fertilizers	Emission Factor	GHG Emissions
	(lbs of nitrogen)	(lbs of nitrogen)	(lbs of nitrogen)	(MTeCO2/lb)	(MTeCO2)
2009	10,080	1,059	11,139	0.00414123	46
2010	4,800	297	5,097	0.00414123	21
2011	5,600	275	5,875	0.00414123	24

2014	3,360	1,535	4,895	0.00414123	20
2015	2,000	875	2,875	0.00414123	12
2016	5,513	2,337	7,849	0.00414123	33

Organic Fertilizer

Data Requested: The type and total amount (in pounds) and percent nitrogen of fertilizer used on campus grounds and on the golf course for FY 2016.

Data Source: Emmett A. House III, Supervisor of Grounds, Jon McConville, Golf Course Superintendent.

Calculations: The total pounds of fertilizer is multiplied by the percentage of nitrogen content to get the total pounds of nitrogen used.

SCOPE 2 EMISSIONS

Scope 2 emissions are the indirect emissions from sources that are neither owned nor operated by Colgate University, but whose products are directly linked to on-campus energy consumption. Scope 2 emissions include all emissions generated in the production of electricity consumed by the institution.

Purchased Electricity

In order to calculate Colgate’s emissions associated with the purchase and usage of electricity, we have to determine how our electricity is produced and calculate the rate of greenhouse gas emissions associated with each source. Colgate purchases electricity from the Village of Hamilton, which operates as a municipal electric, water, natural gas, and sewer utility. The vast majority (84 percent) of the Village’s electricity is purchased directly from large-scale hydroelectric power mainly from Niagara Falls. The remaining electricity (16 percent) is purchased from the New York State grid and comes from a mix of sources, including nuclear, wind, coal, and other fossil fuels. Colgate’s emissions factor of 0.0000596931 MTeCO2/kWh is significantly

lower than the Upstate New York average of 0.000373082 MTeCO₂/kWh. The lower factor is based on the large amount of hydroelectric, nuclear, and wind power that makes up the Village’s electricity mix. The result of this low emissions factor is that Colgate’s overall emissions associated with electricity use is also relatively low making up about 10 percent of the university’s total emissions (Table 11).

Table 11. Greenhouse gas emissions from purchased electricity, FY 2008-2016

Fiscal Year	Total	Emissions Factor	GHG Emissions
	(kWh)	(MTeCO ₂ /kWh)	(MTeCO ₂)
2008	30,783,478	0.0000596931	1,838
2009	31,571,030	0.0000596931	1,885
2010	30,264,128	0.0000596931	1,807
2011	30,883,211	0.0000596931	1,844
2012	30,390,822	0.0000596931	1,814
2013	30,252,750	0.0000596931	1,806
2014	29,983,490	0.0000596931	1,790
2015	30,199,884	0.0000596931	1,803
2016	28,730,067	0.0000596931	1,715

Total Purchased Electricity

Data Requested: Total purchased electricity in FY 2016, in kWh.

Data Source: Dan Partigianoni, Associate Controller and Director of Financial Reporting

SCOPE 3 EMISSIONS

Scope 3 emissions are all other indirect emissions attributed to our institution—those that are a consequence of the activities of the institution, but occur from sources not owned or controlled by the institution. Colgate’s Scope 3 emissions include faculty and staff commuting, bus commuting, employee business ground travel, air travel paid by or through the university, solid waste, and paper use. As explained earlier, emissions from student commuting are considered de minimus emissions and are not included in Colgate’s GHG inventory.

Faculty and Staff Commuting

Most Colgate faculty and staff commute to work by driving. In order to calculate the emissions associated with this behavior, we need to determine the amount of gasoline consumed by each employee over the course of the year for commuting. We estimate this by conducting an annual survey (established in FY 2010) using Qualtrics survey software and distributing the survey to the campus community via campus distribution

email (See Appendix A). The survey captures how many days per week and weeks per year each individual drive themselves to campus, the distance traveled, and the average miles per gallon of their vehicle.

Table 12. Greenhouse gas emissions from faculty and staff commuting, FY 2010-2016

Fiscal Year	Total Gasoline	Emission Factor	GHG Emissions
	(gallons)	(MTeCO ₂ /gallon)	(MTeCO ₂)
2010	157,740	0.008648022	1,364
2011	153,057	0.008648022	1,324
2012	154,872	0.008648022	1,339
2013	145,866	0.008648022	1,261
2014	81,904	0.008648022	708
2015	93,202	0.008648022	806
2016	150,027	0.008648022	1,324

Faculty and Staff Commuting

Data Source: The survey is created by the Environmental Studies and Sustainability Program Coordinator and administrate the analysis. Distribution of the survey via campus distributions is done by Penny Mintel, Administrative Coordinator for the Dean of the Faculty.

Calculations: Based on the responses, the average employee utilized 90.4 gallons of gasoline to get to and from campus in FY 2016. Multiply 90.4 gallons by 1,031 employees to get 93,202 gallons consumed.

Comments: The survey is distributed to the campus community via campus distributions during the first week of October and is live for three weeks to collect responses. This year, the Green Raider interns were utilized to complete the analysis.

Directly Financed Outsourced Bus Travel

Up until August of 2016, Colgate University contracted with Birnie Bus Services, Inc. to provide free transportation service around campus and to select locations off-campus with shuttle buses known the Colgate Cruisers. Birnie Bus also provided service to Colgate’s athletic teams for competition away from campus.

Table 13. Greenhouse gas emissions from outsourced bus travel, FY 2009-2016

Fiscal Year	Cruiser	Emissions Factor	GHG Emissions	Athletics Travel	Emissions Factor	GHG Emissions	Total Emissions
	(gallons)	(MTeCO ₂ /gallon)	(MTeCO ₂)	(gallons)	(MTeCO ₂ /gallon)	(MTeCO ₂)	(MTeCO ₂)
2009	7,230	0.010347846	75	18,335	0.010347846	190	265
2010	7,144	0.010347846	74	18,683	0.010347846	193	267
2011	11,985	0.010347846	124	17,352	0.010347846	180	304
2012	10,931	0.010347846	113	19,804	0.010347846	205	318
2013	10,234	0.010347846	106	16,512	0.010347846	171	277
2014	9,128	0.010347846	94	14,873	0.010347846	154	248
2015	10,649	0.010347846	110	12,725	0.010347846	132	242
2016	13,089	0.010347846	134	17,847	0.010347846	183	317

Bus Commuting (Colgate Cruiser)

Data Requested: Gallons of diesel consumed for the buses that make up the Colgate Cruiser fleet in FY 2016.

Data Source: Birnie Bus sends the total gasoline consumption in monthly statements to the Director of Purchasing, Alan Leonard. Alan provides the total amount of gasoline for the purposes of this report.

Athletics Travel

Data Requested: Gallons of diesel consumed in FY 2016 for bus service for varsity athletic travel.

Data Source: Lori Godshalk, Athletics Administrative Assistant

Comments: Club sports outings use the passenger vans owned by Colgate, and are therefore included within the “Colgate Vehicle Fleet” data as Scope 1 emissions.

Employee Business Ground Travel

Colgate faculty and staff sometimes drive their personal vehicles to conduct Colgate business. The emissions associated with this practice are Scope 3 emissions since they are shared with the university and the

individual who partakes in the travel and the university does not have control over which vehicle the employee drives and does not own the vehicles.

Utilizing the accounting code -387 and the Concur expense management system, we determine the amount of money spent on mileage reimbursements for business-related travel. This amount was then added to the total for mileage reimbursement found in -387. The federal reimbursement rate of \$0.56 per mile. However, \$0.24 per mile is awarded for the depreciation of the vehicle. Therefore, we multiplied the total reimbursement cost for accounting code -387 by 60 percent to determine the amount of money spent on gasoline only (and not on vehicle depreciation). We then divided the total reimbursement cost for gasoline only by \$2.32 (the national average cost per gallon of gasoline) in order to determine the total gallons of gasoline consumed.

Table 14. Greenhouse gas emissions from employee business ground travel, FY 2011-2016

Fiscal Year	Reimb. Cost	Percent of reimb. for gasoline	Total Reimb. for Gasoline	Total Gas Station Purchases	Average Cost per Gallon of Gasoline	Total Gasoline	Emission Factor	GHG Emissions
	(\$)	(%)	(\$)	(\$)	(\$)	(gallons)	(MTeCO ₂ /gallon)	(MTeCO ₂)
2011	\$286,687	57%	\$163,412	-	\$3.05	53,578	0.008648022	463
2012	\$339,941	60%	\$203,965	-	\$3.54	57,617	0.008648022	498
2013	\$292,829	60%	\$175,697	-	\$3.49	50,343	0.008648022	435
2014	\$254,722	60%	\$152,833	-	\$3.65	41,872	0.008648022	362
2015	\$246,374	60%	\$147,824	\$67,756.58	\$3.22	66,951	0.008648022	579
2016	\$232,483	60%	\$139,490	-	\$2.32	56,959	0.008648022	503

Accounting Code -387 (Mileage Reimbursement)

Data Requested: Total expenditures on mileage reimbursement in FY 2016 via concur.

Data Source: Tina Pudney, Accounting Assistant

² This information was retrieved from the IRS website in "Standard Mileage Rates." The weblink is <https://www.irs.gov/tax-professionals/standard-mileage-rates>. Averaged 2015 and 2016 rates to get an accurate rate for the FY.

³ To find the national average cost per gallon, we used the U.S. Energy Information Administration (U.S. EIA) website: <http://www.eia.gov/petroleum/gasdiesel/>. Download the "Full History" spreadsheet for U.S. regular gasoline prices. Then, we averaged the weekly data for the FY 2011.

Air Travel

Air travel plays a vital role in many university functions, a role that is arguably exacerbated by Colgate's rural location and our commitment to certain institutional priorities. Faculty travel by air to support research and facilitate conference participation and professional staff throughout the university require air travel to pursue their work. Colgate's commitment to off-campus study opportunities, as well as to Division I athletics, also underscores the centrality of air travel to the university's mission.

All air travel paid by the university is tracked through the Concur expense management system. However, Concur was not formally adopted by the entire institution until the end of a few months into FY 2016. As a result, we had to use expenses from consur and from the legacy system to calculate spending on air travel. Tina Pudny, Accounting Assistant, supplied all airline charges from Colgate corporate cards paid directly to airlines as well as the information gathered via Concur.

Table 15. Colgate's greenhouse gas emissions from air travel, FY 2009-2016

Fiscal Year	Business	Athletics	COVE	Total	Emission Factor	GHG Emissions
	(miles)	(miles)	(miles)	(miles)	(MTeCO ₂ /mile)	(MTeCO ₂)
2009	5,960,140	19,461	5,966	5,985,567	0.000482417	2,888
2010	5,838,481	525,790	63,746	6,428,017	0.000482417	3,101

2016	7,765,444	-	-	7,765,444	0.000482417	3,746

Air Travel Expenditures

Data Requested: Total expenses for air travel spent on corporate cards during FY 2016.

Data Source: Tina Pudney, Accounting Assistant Gift audits, Concur travel and expense administrator

Calculations: According to accounting code -386 and data from Concur, the total money spent on faculty and staff air travel in FY 2016 was \$1,422,940.20. From the total cost, we calculated mileage using the method recommended by the Association for the Advancement of Sustainability in Higher Education (AASHE). This method requires taking the average cost per mile for air travel as provided by the Air Transport Association of

America⁴, increasing that average by 20 percent to account for taxes and fees, and then dividing the total cost of air travel by the resulting amount. This equation is:

- Average cost per mile FY 2016 = 15.27 cents per mile. Plus taxes equals $(15.27 + (15.27 \times .20)) = 18.324$ cents per mile = 7,765,444
- 7,765,444 miles X 0.000482417 MTeCO₂/mile = 3746 metric tons of greenhouse gas emissions (MTeCO₂).

Landfill Waste

Colgate university owns two vehicles that transfer our solid waste to the Madison County Landfill and Recycling Center in the Town of Lincoln, approximately 20 miles from campus. One truck transports recyclables (paper products, metals, plastics, and glass) and the other transports landfill waste. For the purposes of Colgate's GHG inventory, we are only concerned with the amount of landfill waste (and not recycled waste) because landfill waste emits potent methane as it decomposes. However, different landfills utilize different techniques for how they handle methane and these techniques result in very different levels of GHG emissions.

In FY 2010, the Madison County Landfill installed a methane capture and then in FY 2012 an electric generation system that has much lower GHG emissions per ton:

- Prior to FY 2010 (no methane recovery): emissions factor = 1.0842857 MTeCO₂/short ton
- FY 2010-2011 (methane recovery with flaring): emissions factor = 0.1606349 MTeCO₂/short ton
- FY 2012 and beyond (methane recovery and electricity generation): emissions factor = -0.03 MTeCO₂/short ton

As a result, Colgate's overall emissions associated with our landfill waste were significantly reduced (Table 15).

Further emission reductions occurred because Colgate reduced its landfill waste per full-time equivalent student (FTE) through:

- improved recycling of paper, bottles, and cans;
- a new electronic waste recycling program;
- a new composting program;
- decreased overall paper consumption by over four million sheets of paper; and
- increased use of reusable containers (instead of one-time use disposable containers).

Table 16. *Colgate's greenhouse gas emissions associated with landfill waste, FY 2008-2016*

⁴ This information was accessed online in December 2014 from the Air Transport Association of America website at: <http://airlines.org/data/a4a-monthly-passenger-and-cargo-yield-fares-per-mile/> (Also accessed through a Google search for "price per passenger air mile").

Fiscal Year	Landfill Waste	Emission Factor	GHG Emissions	Full-time Equivalent Students	GHG Emissions per FTE
	(short tons)	(MTeCO ₂ /mile)	(MTeCO ₂)	(FTEs)	(MTeCO ₂)

Data Requested: Total annual waste in short tons for FY 2016.

Data Source: Monthly billing statements from Madison County Landfill, accessed by John Pumilio, Director of Sustainability.

Paper Consumption

Colgate University's paper consumption is tracked through two main sources: 1) departmental purchasing and 2) the Print Shop. We track the amount of paper consumed by its recycled content because the greater the recycled content, the lower the rate of emissions (Table 17) and the more environmentally benign.

Table 17. Colgate's greenhouse gas emissions associated with paper consumption, FY 2010-2016

Fiscal Year	Paper Type	Departmental Consumption	Print Shop Consumption	Total Consumption	Emission Factor	GHG Emissions

Departmental Purchasing

The various departments and office throughout campus individually order their paper through W.B. Mason in an exclusive contract. In previous years, some departments purchased tree-free paper from a student-owned LLC, but this company has stopped providing paper to departments. Since 2009, the amount of GHG emissions and overall purchase of paper from vendors and the amount of paper used per student has been significantly reduced (Tables 18 and 19). This was accomplished by adding print-release stations in public printing areas, by setting double-sided printing as the default on campus machines in common areas, by widening margins, and through increased awareness and more conscious printing. Unfortunately, despite past successes with preventing departments from purchasing virgin (0% recycled content) paper, this seems to have resumed in FY 2015 and 2016.

Table 18. Colgate's departmental purchasing (sheets of paper consumed), FY 2009-2016

Fiscal Year	Tree-free	0% recycled	30% recycled	50% recycled	100% recycled	TOTAL	Full-time equivalent students	TOTAL

2016	-	1,447,722	975,644	490,099	3,773,267	6,686,733	2,837	2,357

Departmental Purchasing

Data Requested: The total amount of paper purchased in pound through departmental purchasing by recycled content for FY 2016.

Data Source: Kip Manwarren, Manager of Document and Mail Services

Calculations: To convert pounds of paper to sheets, divide poundage by 5.05 (average weight of one package) and multiply by 500 (sheets per package).

Print Shop

The amount of greenhouse gas emissions and overall paper consumed through Colgate's print shop has also been reduced since we started tracking this data in FY 2010 (Table 19).

Table 19. *Colgate print shop (sheets of paper consumed), FY 2010-2016*

Fiscal Year	0% recycled	10% recycled	30% recycled	50% recycled	100% recycled	TOTAL	Full-time equivalent students	TOTAL
	(sheets)	(sheets)	(sheets)	(sheets)	(sheets)	(sheets)	(FTEs)	(sheets/FT E)
2010	1,969,109	229,703	917,822	1,451,881	94,059	4,662,574	2,770	1,683

Data Requested: The total amount of paper purchased (in pounds) through the print shop by recycled content for FY 2016.

Data Source: Kip Manwarren, Manager of Document and Mail Services

Calculations: To convert pounds of paper to sheets, divide poundage by 5.05 (average weight of one package) and multiply by 500 (sheets per package).

COLGATE'S GROSS GREENHOUSE GAS EMISSIONS

Colgate's gross GHG footprint in FY 2016 was 14,562 MTeCO₂ (5.09 tons/FTE). This includes all Scope 1 emissions (on-site stationary combustion of fossil fuels, vehicle fleet emissions, fugitive refrigerant chemicals, and emissions associated with grounds maintenance) and Scope 2 emissions (purchased electricity). Colgate calculated sources of Scope 3 emissions consistent with the ACUPCC guidelines. Scope 3 emissions include faculty and staff commuting, bus travel, employee ground travel, air travel, landfill waste, and paper consumption. Since 2009, Colgate has reduced its overall emissions by about 13 percent and emissions per student (FTE) by about 17 percent. This reduction is the result of a number of new practices, policies, and resource conservation and efficacy measures that have been put into place since 2009 that are further detailed in Colgate's 2011 Sustainability and Climate Action Plan.

Table 20. Colgate's gross greenhouse gas emissions by source and scope, FY 2009-2016

Fiscal Year	2009	2010	2011	2012	2013	2014	2015	2016

Gross Emissions	16,815	14,807	16,520	15,333	12,759	13,631	14,562	15,361

For each of the years we have completed Colgate's GHG footprint, the stationary combustion of fossil fuels for space heating and domestic hot water remains the largest single source of emissions (Figure 2). Colgate consumes natural gas, as the existing wood boiler does not have enough capacity to provide heat to all buildings connected on the steam line during the winter months. Colgate also burns fuel #2 in buildings not connected to the steam line. Air travel emissions are a close second. Combined, stationary combustion of fossil fuels on campus and air travel comprise three-quarters of Colgate's total greenhouse gas emissions (Figure 3). The drop in landfill waste emissions since 2009 can be attributed to both a reduction in overall landfill waste due to better recycling and composting and a switch to a methane capture and electricity generation system at the Madison County Landfill. This switch significantly reduced the rate of emissions associated with Colgate's waste production. Additionally, it should be noted that in some categories of the baseline year, some sources of emissions were not counted or utilized on campus (e.g., kerosene and propane).

Figure 2. Total Emissions by source, FY 2009-2016

Figure 3. FY 2016 percentage of gross emissions by source

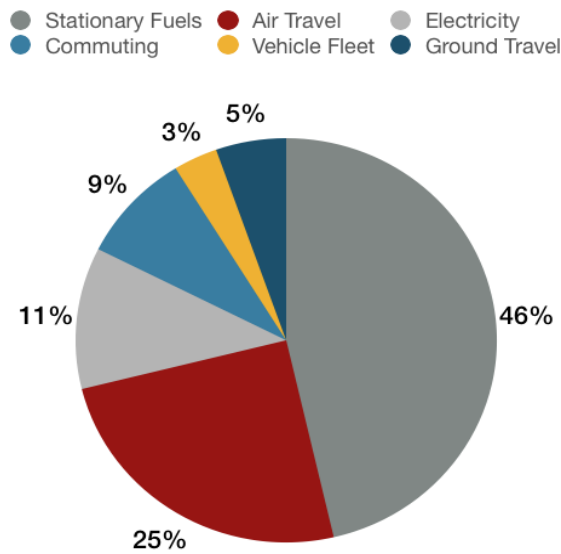

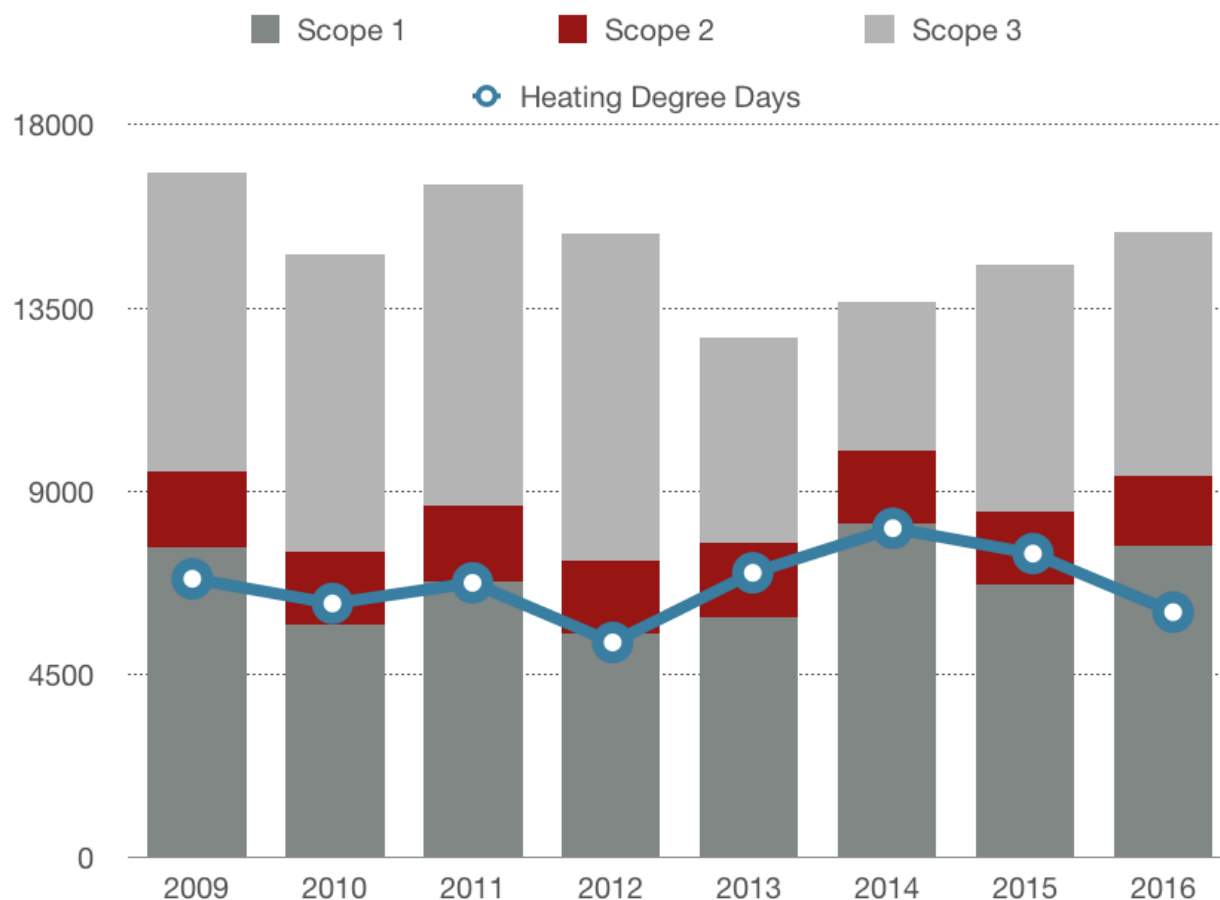

Figure 4. Gross Emissions vs. Heating Degree Days, FY 2009-2015

CARBON OFFSETS AND NET GREENHOUSE GAS EMISSIONS

Thus far we have examined Colgate’s activities that add greenhouse gases into the atmosphere. However, we also need to consider activities that sequester and/or avoid emitting greenhouse gases in order to determine our net carbon budget. In FY 2016, Colgate’s source of offsets included the annual rate of carbon sequestration of our purchased offsets in Patagonia Sur, as well as other purchased offsets described below. As a result, Colgate’s net greenhouse gas emissions in FY 2016 are 7,984 (Table 21).

Forest Preservation

In FY 2013, Colgate completed a detailed survey of its forested lands. As a result of the survey, we determined that 1,578 tons of carbon are sequestered each year and Colgate’s 1,069 acres of forest land contains 165,491 tons of stored carbon. Given this information, Colgate has begun to count the amount of

carbon sequestered by its forests in our GHG Inventory. The detailed methodology for this survey can be found on Colgate's sustainability website.

Purchased Offsets

In the past, Colgate has purchased enough renewable energy credits (RECs) to offset its electricity consumption. However, this year the Office of Sustainability elected to not purchase offsets to offset our electricity consumption.

Patagonia Sur

FY 2012 was the first year that Colgate purchased offsets from Patagonia Sur. Patagonia Sur is a Verified Carbon Standard (VCS) credited carbon offset vendor in Patagonia, Chile. Patagonia Sur is a for-profit conservation venture, which reforests and educates people about the Chilean environment. Patagonia Sur will plant the equivalent number of trees to absorb 5,000 tons of carbon from the atmosphere annually. The contract is set to last for 15 years.

Table 21. Colgate’s offsets and net greenhouse gas emissions, FY 2009-2016

Fiscal Year	Total Emissions (MTeCO2)	Total Carbon Offsets (MTeCO2)					Total Net Carbon Emissions (MTeCO2)
		Forest Sequestration	Renewable Energy Credits	Carbon Offset Purchases	Patagonia Sur Offsets	Total Carbon Offsets

APPENDIX A: 2016 COMMUTER SURVEY

Employee commuting is responsible for roughly 10% of Colgate’s emissions. This annual survey is designed to provide a reliable estimate of these emissions and to evaluate progress in reducing them.

Commuter Information

Please describe your driving commute for the 12 month period from September 1, 2015-August 31, 2016. For each of the time periods below, please state the number of days per week you drove.

Note: do not include days in which you are riding in someone else’s car (including spouse or partner).

A note to new employees: If you started at Colgate within the last 12 months, but you replaced another employee, please complete the form *as if* you had been here all year. If your position was newly created, insert zero (0) for the time periods you were not here.

FALL 2015: ____

SPRING 2016: ____

SUMMER 2016: ____

On the days that you drove, how far did you drive *ONE WAY* to Colgate? Enter a whole number; round up to 1 if it’s less than a 1 mile drive. If your driving is being compensated by Colgate, it should not be included in this mileage total. ____

Please enter the number of days per week for each alternative commute method. Enter zero (0) if you did not use these methods during the specified time period. Note: carpooling with a spouse or partner is considered riding in someone else’s car.

	Walked or Biked	Carpooled	Worked from home	Other
Fall 2015				
Spring 2016				
Summer 2016				

Car Information

Please estimate your primary car’s fuel economy. If you do not drive a car, you can skip the question. The fuel economy of your car can be found at fuelconomy.gov by clicking on “Find and Compare Cars.” ____

Is there a secondary vehicle you use to commute to work? ____

If your commute was too complicated to be described on this survey, you can explain it below. ____
