**Re: STARS Innovation Credit – Letter of Affirmation  
The University of Ontario Institute of Technology (UOIT)  
Grey Water Collection and Management**

It is my pleasure to offer this letter of affirmation for UOIT's Grey Water Collection and Management System sustainability innovation. The aquatic toxicology laboratory uses approximately 180,000L of fresh water per day. This water is supplied by the municipality in order to ensure high quality, low contaminant water. This water is further filtered for flow-through single use within the laboratory, following which it is then directed to a 250,000L underground cistern. This Grey water is then used within the university buildings for flushing toilets and urinals. This system, along with other water saving features on campus, help UOIT significantly reduce water use each year. I am proud knowing that the Grey water from my laboratory is reused.

UOIT's Grey water collection and management system is innovative and unique. It showcases UOIT's commitment to sustainable operations. These innovative efforts should be recognized and add to UOIT's sustainability performance.

Sincerely,

---
