To Whom It May Concern:

The Off-Grid Zero Emissions Building is a one of a kind building that exemplifies the true nature of sustainability and research. It provides a one of a kind platform to test technologies, research human interaction and educate the public of the true cost of sustainable technologies. It is rare to see a building in operation with this level of data acquisition, testing both residential and commercial technologies.

The building was completed just over two years ago through the collaboration of local architects and engineers, university staff and students and industry professionals. The team met every week for a year to design every aspect of the building. The meetings ensured that all members could work through every problem together to develop an optimized solution.

It has been a pleasure to work with the Energy and Sustainability Center on this project and I hope they keep pushing the envelope.

Sincerely,

A handwritten signature in black ink, appearing to read "Justin Kramer", with a long horizontal flourish extending to the right.

Justin Kramer, LEED AP
