

Common Technical FAQ's

Here is a list of common backup problems that can be resolved or investigated. Please note some errors are windows related not software related.

For further assistance on any errors please email – support@backupeverything.co.uk

- 1) Missed Backups
- 2) Index Error
- 3) VSS
- 4) Access Denied / File doesn't exist
- 5) Find running/stopped files (during a crash)
- 6) How to delete unwanted backed files / folders
- 7) Failed to flush buffer error
- 8) Backup Reminder when shutting down PC
- 9) Data Integrity Check
- 10) Javax.crypto.BadPaddingException
- 11) How to End the bJW.exe Process
- 12) Invalid volume G:\ (Shadow Copy creation is assumed)
- 13) Deleting data in retention to free space
- 14) Unable to backup file, size incorrect (Expected=XXXX Retrieved=XXXXX)
- 15) How to change the temp location
- 16) How to add a filter to your backup set
- 17) Please run integrity check later for destination

1) Missed Backups

If your backup has completed with errors, missed, or just failed to run at all, then checking the debug log on the machine could provide some answers as to what is the cause of the issues. To find this file, you will first need to locate the .obm (PRO) or .acb (LITE) folder on the machine. Before this however please check the machine is on at the time of the scheduled backups and not shutdown or asleep, this could be another reason for missed backups.

First, here is how you find the .obm/.acb folder:

- 1. Open up Windows Explorer, and click into the C drive.
- 2. Next, click in to the users folder
- 3. Now you will need to know which user profile the software was installed with
- 4. Once inside the user profile, you will see the .acb or .obm folders
- 5. You will now need to get to the location of the debug log. Once inside the relevant folder, you will see a folder called log. Open this, and then click a sub-folder called 'Scheduler'
- 6. The debug log file will be inside of this folder. You can then open it and find what the error could be.

2) Index Error

Sometimes there could be an index error with the backups, to resolve carry out the following steps below however please ensure the software is closed first before doing.

- 1. Browse to Program Files
- 2. Click on the Program Folder where it says XXX Cloud Backup
- 3. Right click on cb.opt & select edit
- 4. Please add true at the end of "com.ahsay.cloudbacko.core.bset.file.RemoteBDB.forceRebuild="

```
# Force to rebuild file database (BDB) on server
com.ahsay.cloudbacko.core.bset.file.RemoteBDB.forceRebuild=
```

- 5. Save & close
- 6. Then run a manual backup
- 7. Please remember to remove the "true" within cb.opt after the rebuild has finished
- 8. Save & close
- 9. Then restart the XXX Cloud Backup service again

3) VSS Errors

In any reports if you see VSS errors then these are client side (OS problem), you will need to resolve these before an Exchange backup will work.

From cmd, type vssadmin list writers and it will show the failed writer. Once you fix this, the backups will work.

The backup client uses the MS VSS writers to backup. Same would happen if you try and use Microsoft backup to backup the Exchange, it would fail. A reboot may resolve this, but if the problem comes back, you will need to investigate further.

4) Access Denied / File Doesn't Exist

Some files that are set for backup may not give permissions for the software to back it up, please ensure that this is enabled for the backups to run.

Similarly if a file has changed location and you see "file doesn't exist", this means the file has been moved and the software is still trying to read it from the source, you can either delete this path from the backup set if it is not needed for backup anymore or modify the path.

5) How to Find Running/Stopped Files in the Event of a Crash

If the backup client freezes or crashes, and you are unable to close it, then you may need to delete the running/stopped files created by the backup.

You will need to go to the user folder that the client was installed on. In the picture below, we are using the Admin logon. Once there, you will need to open either the .obm folder or the .acb folder. This all depends on whether you have the PRO (.OBM) or LITE (.ACB) client installed. Once inside this folder, open the ipc folder, then BackupSet folder. In here will be all backup sets currently created. They will not be named, so you will need to find the correct folder. In here will be either the running or stopped files, depending on whether the backup is running or has been forced to stop.

An example of this is below:

6) How to delete unwanted backed files / folders

First you need to modify the backup set so it doesn't backup the file/folder again.

- 1. Login to the backup client
- 2. Click On Backup Sets
- 3. Select the backup set you wish to modify

4. Click Source, then either modify the selected tick boxes for Desktop, Documents Favourites etc, or click on "I would like to choose the files to backup"

5. Here you can modify your backup selection. Simply navigate to the files / folders you wish to select or deselect, then once finished, click OK

6. Then click Save.

All done, you have now modified your backup selection.

Then to remove the data:

- 1. Log into the backup client
- 2. Click on utilities
- 3. Select Delete Backup Data

4. Now select the backup set you want to delete files from, the destination and select Choose from ALL files

5. Navigate to the files / folders you want to remove from your backup location and when ready click delete.

NOTE:-This will immediately delete files from our cloud

6. Once deleted, you will see a message stating files deleted successfully. Click close to take you back to the home screen

7) Failed to flush buffer error

Open file explorer and navigate to the following location - C:\ProgramFiles\XXXBusinessCloudBackup

This location will have a afc.opt file, open this in notepad and add the following to the end of the document:

com.ahsay.afc.bfs.cloud.ChunkedOutputStream.retry=20 com.ahsay.afc.io.ReadAheadInputStream.timeout=300 com.ahsay.afc.bfs.cloud.ChunkedOutputStream.upperSleepLimit=5

Ensure you then save this document. Once saved please login to the client and run the backup again.

8) Backup reminder when shutting down PC

To enable or disable this, please follow the below instructions.

- 1. Login to your backup client
- 2. Click on backup sets
- 3. Select the backup set to make changes to (you may have more than one).
- 4. Click on "Show advanced settings"
- 5. Now click on Reminder
- 6. Slide the ruler on or off to enable or disable this option.
- 7. Click save.

9) Data Integrity Check

Goto the dashboard of the software client, then Utilities (bottom right box) and run the data integrity check, make sure the boxes are unticked. Just click **Yes** if a pop up comes saying the statistics are incorrect. This does not mean the data backed up is incorrect, this is just aligning the backend data figure with the front end portal.

10) Javax.crypto.BadPaddingException

If when opening the backup client you receive the below message, try deleting the config folder called.obm for the PRO Client or .acb for the LITE Client.

🛓 Error	USE Rectain Research on the second	
X	Javax.crypto.BadPaddingException: pad block corrupted	
		ОК

The folder can be found in c:\users\userprofile\

The folder contains user information and the encrypted encryption key. After deleting the folder, when you reopen the backup client, you will be prompted for your username and password then once logged in, you may also be prompted for your encryption key(s).

11) How to End the bJW.exe Process

If a backup is stuck running, or even the backup client itself has crashed, you may need to end the executable that will be running in the background so that you can stop both running. This executable is called bJW.exe. By ending this, it will stop the back up/force the client closed, which in turn will allow you to reopen the software and perform the original task.

Here is how to perform this fix:

1. Either right-click the taskbar and press Task Manager, or press Ctrl+Alt+Del and open Task Manager from here.

2. Find the running bJW.exe process, highlight it, and press end task. Below is an idea of what it should look like.

Processes Performance	App histo	ory Start-up	Users	Details	Services		
Name	PID	Status	U	sername	CPU	Memory (p	Description
AppleMobileDeviceS	. 3932	Running	S	YSTEM	00	1.740 K	MobileDeviceService

🐻 infyTray eye	12604	Running	Δ	dmin	00	2 468 K	iofyTray exe

Once it has ended, you should then be able to reopen the client without issue and perform any tasks needed.

12) Invalid volume G:\ (Shadow Copy creation is assumed)

If you get this warning within your backup set: "Invalid volume G:\ (Shadow Copy creation is assumed)" (could be a different drive letter) please follow these steps to fix.

First make sure you are on our most current client so post 7.15.4.41

Go to this location C":\Program Files\XXXX*\cb.opt and open the file in notepad. ("could be a different drive letter)

XXX would be your branded name of the client or BackupEverythingPRO, but look for the cb.opt file

Cb.opt - Notepad	_ 🗆 X
File Edit Format View Help	
<pre># Print out default values of new backup set to a XML file # Location: [WORKING_DIR]\DefaultBkupsetProfile.xml com.ahsay.obc.core.action.GetUserPolicyCmd.debug=</pre>	^

<pre># Set option to YES for confirm consoles com.ahsay.cloudbacko.ui.ConfirmConsole.DEBUG_ENFORCE_2_YES_TO_ALL=</pre>	
# Set option to true for disabling adding all volumes to shadow copy set com.ahsay.obx.core.backup.file.ShadowCopy.disableAddAllVolumes=	~

Then modify the last line..."com.ahsay.obx.core.backup.file.ShadowCopy.disableAddAllVolumes=" & put "true" after the equals.

Save the file.

Run a backup & it will be successful.

13) Deleting data in retention to free space

If you dont need retention data then please go to "Utilities" on the software dashboard. You will then see delete the backed up data option. If you click on the backup set & select all files you will see everything. The greyed out files will be in retention.

14) Unable to backup file, size incorrect (Expected=XXXX Retrieved=XXXXX)

If you receive the following error:

"XXXXX" size incorrect (Expected=XXXX Retrieved=XXXXX), Unable to backup file

This is due to a VSS error within Windows. The file size has changed during the backup process, therefore the software cant upload the file. Check to see whether the backup runs at the next schedule or during a manual backup if it is run before the schedule. Checking the Windows Event logs may also offer some more insight into this.

15) How to change the temp location

Sometimes you may need to change the temp location used for the cloud backup service, usually because of lack of space, or not enough rights to the current location.

To do this, please follow these instructions.

- 1. Login to your backup account
- 2. Click on Backup Sets
- 3. Select the required backup set
- 4. Click on Show Advanced Options

General

Source

Backup Schedule

Continuous Backup

Destination

Show advanced settings

5. Click Others and then on the top right click Change on the temporary directory and browse to a location that the logged in account has full access to. Alternatively you may want to create a new folder.

🔗 Backup Everything Pro		- 🗆 ×
Desktop	Temporary Directory	î
	Temporary directory for storing backup files	
General	C:\Users\HP-Spectre\temp	Change
Source	310.46GB free out of total 461.77GB space in C: Remove temporary files after backup	
Backup Schedule	Follow Link	
Continuous Backup	Follow link of the backup files	
Destination	On Con	
In-File Delta	Volume Shadow Copy

Delete this backup set		Save Cancel

6. Click Save, the temp location used for backups have now been changed.

16) How to add a filter to your backup set

Adding filters will allow you to deselect certain items from your backup, first Login to the client and select "backup sets".

Select the backup set you want to add a filter to and navigate to "source"

General
Source
Backup Schedule
Continuous Backup
Destination

Turn "filter" to on and press "+ add new filter". From here you will be able to name your filter and edit the filter to do what you wish.

The blank filter form looks like this

New Backup Filter	
Name	
Filter-1	
For each of the matched files/folders under top directory Include them Exclude them	
Exclude all unmatched files/folders	
Match file/folder names by Simple comparison ends with Regular expression (UNIX-style) 	
Existing patterns to match	X
Apply this filter to all files/folders in	
	Change
Apply to	

Here is a filter we have created so that .mp3 files are excluded from the backup, If your backup is for certain files it is best to put the location in the "Apply this filter to all files/folders in" and select "this folder only" - else the software will scan all the folders. Press "ok" and "cancel" - If you don't want to add anything else to the filter.

New Backup Filter

Name	
.mp3 filter	
For each of the matched files/folders under top directory O Include them O Exclude them	
Include all unmatched files/folders	
Match file/folder names by

C:\Users\rosey\Documents\Misc Chan	ge
Apply to	

✓ File ✓ Folder

Press "save" and exit.

17) Please run integrity check later for destination

If you see the following 3 lines of text below in your backup reports, then please run a manual integrity check as follows:

Goto the dashboard of the software client, then Utilities (bottom right box) and run the data integrity check, make sure the boxes are unticked. Just click Yes if a pop up comes saying the statistics are incorrect. This does not mean the data backed up is incorrect, this is just aligning the backend data figure with the front end portal.

Please run integrity check later for destination "-1505849135223". Error: "[d] Failed to initialize RemoteBDB.Cloud. Error=[BlockDBConfig.readConfig] unknown default path for creating new journal file config: 0, caused by [RuntimeException] [BlockDBConfig.readConfig] unknown default path for creating new journal file config: 0"

Data integrity check on backup set= "Data Backup" destination= "UK Cloud Storage" is completed

Finished data integrity check with error on backup set "Data Backup(1515502435075)", "UK Cloud Storage(-1505849135223)", crc disabled, rebuild index disabled
