Providence Journal (published as The Providence Daily Journal) - September 23, 1878 - page 5 ber 23, 1878 | Providence Journal (published as The Providence Daily Journal) | Providence, Rhode Island

IN YEARS 1707-1900-1903-1905-1980.

PREPARED BY E. M. SNOW, M. D.

REPRINTED FROM THE JOURNAL, JUNE, 1337.

1707.

The first appearance of the yellow fover in Providence of which we have any record, was on the 13th of August, 1797. The schooner Betsey, Capt. Bure, from St. Nicholas Mole, in the island of Hayti, arrived on the 10th of August, and anchored on the south side of what is now the forry dock, where she remained for two weeks or more. She had lost two mon on the passage, with the lover, but this fact was kept secret. As she was coming up the river sho was boarded by Nicholas Winsor, of Seekonk, who, with a boat load of yegotables was on his way to Providence market. Ho went on board the schoonor and his boat was taken in tow to the city. On his return home he was taken sick, and died in four or five days. Ills disease was called billous fever, and no suspicions were entertained, at the time, of its origin.

This vessel was loaded with coffee, and was in a fifthy condition. She remained at the whart until the 25th of August, when she was removed to Starve Goat Island, and the cargo was landed there.

The crow of the schooner were discharged on their arrival, and some of their clothing, with the bedding of the vessel, was sent to the "Long House" to be washed. This house was situated at the present junction of Wickendon and South Main streets, reaching weaterly from the present line of Wickenden street to the south end of Carrington's block. On the south side of the house was a lane leading from Wickenden street to the water, a portion of which still exists at the south ond of Carrington's block. The house was about eighty feet long, and was occupied by ton or twelve families of ship carponters, caulkers and washerwomen. The clothing was carried to this house on the 11th or 12th of August, and on the 15th several persons were taken sick with the fever, three of whom, Robert Fuller, Mrs. Mitchell, and Mrs. Goss, died on the 18th. These were the first deaths from this disease, in Providence, and there were no cases of the disease south of this house, during the year 1797.

On the 20th of Angust, William Tillinghast and Mrs. James Arnold died. Mr. Till- $\mathbf{\phi} \mathbf{\phi}$ Inghist out his breakfast with his family in the morning, and, though sick, was walking about his room at noon, and died before pight. Ho lived in the house, still standing, and owned at present by his grand-children, at No. 299 (present number) South Main street. Mrs. Arnold lived in the house still in potexistence, at the northeast corner of James and South Main streets. On the 22d of August hor husband, James Arnold, and her son Joseph died in the same house, and on 1 not the 3d of September a domestic in the famiamb ly, Jerusha Townsend, also died. This h by house stood alone, and in the rear extending rary to Benefit street, was a grove of locust trees. The prevailing winds at that season will of the year, from the southwest, would be inco (rom the vessel and docks to this house. abez James Arnold was possessed of a largo illy. property, which, it ho died first, would descend to his only child, Joseph. The son had made his will disposing of the property; ilaga. but the son died five minutes before his father, and the property went to other 0110 heirs. Much excitement prevailed in the town will from fear of contagion. The bodies of thoso who died were ordered to be wrapyed ped in tarred sheets, and by order of the Con. Town Council, tar and brismstone were burned upon the wharves and streets of the and infected district. vant No case of fever originated, during this your, north of Williams street; but it was wholly contined to the small soction between Williams street and the present jurction of Wickonden and South Main streets. Don The fast death occurred on the 6th of linat October, and the whole number of deaths 3 06 from August 18th to October 6th, a period anke of forty-nino days, was thirty-six. The number of cases of the fever cannot now be sleet ascertained. 1.037+ During the same period, the fever pre- \mathbf{a} a vailed in Bristol, and sixteen persons died. poet. It was supposed to originate in Bristol from or of the ship Washington, which areived at that 36 (13) port from Savanuah, via New York, on the opi-15th of August. It was the opinion, how-Mr. ever, of intelligent men, even at that day, **ડર(**ut that the fever could not have prevailed as it. Eage did in Bristol or Providence, had there not with existed local causes calculated to give vise dect. to it. anch. These causes in Providence were un-! tho doubtedly the docks which existed in the and location where the fover prevailed. South Allan Water street was not then in existence, aro and the docks extended, many of them, Y 96 nearly to South Main street. They were vetin. filled with filth, portions of which were exposed at low water; the wharves were most-First ly built of wood much of which was deire," cayed, and their condition was such as has 100 8 been found precisely calculated to give riso ortly to faver in other places. There were no cases of fever on the oppo-**B**9AA site side of the river, and the disease did aly." not spread in any instance from the cases (ugi) which were removed from the infected disхара. tricts to other parts of the town. At that 4/1/16 time, it should be recollected, there were no gned decks existing as at present on the opposite oung shore, and besides, the provailing southwest pean winds had the effect to keep the disease from mpts the west side of the river. spiet I am anable to find any particulars of the at in temperature and weather at that period, exof a cept the general fact that from 1796 to 1800. not the winters were very cold and long, the 0 84 springs very cold and wet, and the sum-0 01 mers excessively hot and dry. One writer Wo says of the winter of 1797-98: "The winter feet. was excessively cold and long, the spring was rainy; nover have I seen so long and severe a rainy season at the breaking up of winter. The summer was ushered in at once, and was as romarkably bot and dry as the preceding winter and spring were cold and rainy. About the middle of June were several days almost insupportable, and universally spoken of by our oldest men as the hottest ever known. Such was the general character of the seasons from 1796 to 1800, during which thus the yellow fever provsiled extensively and soverely in most of the northern citles. It did not provall in Providence again until the year 1300, and afterwards in 1303, 1805. and 1820. I propose to give hereafter an all by account of the disease in those years. It is impossible to obtain any particulars of the . 110 disease from the public papers or from the trom 10.4 T. records of that period. Nothing is given in ey of relation to the number of cases, the sup-0000; posed origin, the location of the disease, or the state of the weather. Indeed, not a robu Rover single particular 14 given which can be of any value in ascortaining the causes or charon of acter of the disease. For many of the par-White ticulars given in this article fam indebted 200M.) Lito to John H. Ormsbee, Esq., who lived at the time in the infected district, and had the trout and diseaso soverely himself. ot his

clans in the town, Drs. A. Throop, Wm. Bowen, Levi Wheaton, Bonjamin Dyer, Henry Faulknor, and Josoph Mason sont a letter to the Town Council recommonding that all the inhabitants be removed from the infected district without doiny, and that all the sick be sent to the hospital, and stating that they considered it dangerous to themsolves and their families to attend the sick In that district.

This does not seem to have been done vory effectually, and not until the 18th of Septembor was a fonce ordered to be placed across South Main street from the south side of Powers lane, and another across South Main street at the foot of Transit street. From the 16th to the 26th of Septombor there were 29 new cases and 21 doaths. The last case and the last death was on the 3d of October, and during the whole time from August 15th to October 3d, a period of 49 days, there were 85 cases and 52 deaths. The duration of the disease was precisely the same as in the year 1797, it having commonced and ended three days earlier than in that year.

The disease was more severe and caused more excitement than in 1797. Vessels from Providence were subjected to quarantine in New York, Philadelphia and Boston. On the 29th of September a letter was received by the Town Connell from Philadelphia, offoring assistance to the sufferers in money or necessaries. The Town Council of Providence replied that owing to the powers of the Council in providing for the poor, there had been very little distress from want of provisions; but that many families having been deprived of employment for some time were in need of assistance. Soon after a check for \$2000 was received from Philadolphin, which was distributed to the needy. The correspondence between Providence and Philadelphia is extremely interesting and creditable to both citles.

The summer of this year (1800) was excessively hot and dry. Under date of August 28th, the "Providence Gazette" says: "The parched earth was last evening refreshed by some fine showers.-Laus Deo."

The origin of the fever this year was not so clearly known as in 1797. No direct connection could be traced between any vessel, and the first cases. The Town Council in a letter to the authorities of Newport, state as follows:

"With respect to the origin of the disease, whother imported from abroad, or dorlved from causes of a local naturo, is not yot satisfactorily ascertained, and about which a great diversity of sentiment provails. It is represented by some as coming from the United States ship General Groone lately arrived in your harbor, which it is said had the contagion on board, and that it originated here from some of the crew of that ship who put up in the quarter where the disorder made the first appearance, and in the neigh-

papers constantly assured the public that the town was healthy.

The Gazette of August 28, 1820, says--"no unusual or nlarming sloknoss provalls." The same paper of September 8th, says that unfounded reports are in circulation, and to correct them "we would state for the infortion of our country friends that no unusual sickness provails here." The Patriot of Sopt. 9th, says that two suddon doaths had occurred, but that they were not yellow 10ver, and that there was no case of malignant fover in town. The Gazette of Sept. 11th, says-"We rejolee in the fact that no malignant nor contagious sloknoss provails in this town;" but unfortunately for the truth of the statement, the same paper, "since the above was in type" publishes a cortificate from Drs. W. Bowon, L. Wheaton and P. Bowon, dated Sept. 10th, and stating that they were then in attendance upon eleven cases of the fover

The Board of Health seem to have been equally desirons of concealing the facts, and they issued no information to the public until the 72th of September, when they published the fact that there were several eases of suspicious lever in the south part of the town. In the meantime, the greater portion of the inhabitants removed from the infected district, and on the 15th of September a fence was ordered to be placed across. South Main street on the south side of Power street, and another on the north side of Transit street. These fonces were removed six days after, the disease having apparently ceased. The inhabitants began to return to the infected district, and the same results followed as in 1805; new cases of the fever occurred, and several died.

The temperature of the month of Septembor, in Providence, was as follows:

7 A. M., 62°5; 2 P. M., 74°; 9 P. M., 63°5. The last case of fover was on the 9th of October, the whole period of the existence of the disease being fifty-four days,

The town records and newspapers of that poriod give no information from which the exact number of cases can be stated. As nearly as I can ascortain, thoro wore twentytwo deaths from the fover during the whole season.

The efforts to conceal the existence of the disease only served, as such offerts always do, to aggravato the ovils destruct to be avolded. The most absurd rumors were circulated in the country towns. Farmers coming to Providence wore informed in Olnoyvillo that the mortality was so great that the inhabitants were obliged to spend the nights in burying the dead. Other rumors equally falso were provalent.

The origin of the disease in 1820 was not accurately ascertained. Some persons artic traced it to one vessel, others to an-Tues other vessel. All that can be stated with cortainty is, that vossols arrived from the West Indies having had eases of the fovor on board, the fever broke out in Providence. South Water street at this time was not extended below where the Fall River Building now stands, and the docks below there were In much the same condition as twenty years provious. This year (1820) was the last in which the yellow fover has been opldomic or ordenito in Providence. Fears were entertained for soveral years that it would provail again, and in one year, I am informed, there were two or three cases which caused considerable excitement for a short time. The Board of Health, however, immediately published all the facts in the case, and this wise course at once secured the confidence and allayed the fears of the public here and in other cities. For more than thirty years there was not, so far as I can ascortain, a caso of the disease in Providence. During the last three years there have been cases of yellow fover in this city; but they were all of persons who came directly from places whore the fever was provniling, and were generally very slight. Late in the summer of 1856 there were two mild cases in the city, one of which was brought in a vessel from Charloston, S. C., and the other came from Staten Island. This completes the facts in relation to the yellow fever in Providence so far as they have come to my knowledge. Different persons will probably draw different conclusions from them; but some conclusions soom to be so obvious and so important, that I may take occasion to present them hereafter.

Α his

0791

borhood of which it is still contined."

Whatever was the origin there was no doubt then, and there is nono now, that the fifthy docks in that neighborhood wore the local causes which are always necessary for the existence of an opidemic of this character.

After the year 1800, a strict quarantino was enforced in Providence overy summer, and every summer vessels arrived which had cases of the fover on board. There were, however, no cases of the disease among the inhabitants of the town, except a very few in 1803, and more in 1805.

The history of the yellow fever in Providence in 1805, is remarkable as exhibiting the effect of prompt, efficient, and energetic sanitary measures. This will be given hereafter.

The yellow fever appeared in Providence for the third time in 1800. The town records mention the frequent arrival of vessels with the fever on board, but say nothing about any eases in town. There were only five deaths from the disease this year, the last of which, Mr. and Mrs. John Viath, died on the 2d and 4th of October. No allusion is made to the disease in Providence in the Garette of that year, though full accounts are given of the fever in New York, where it prevailed with great severity.

1805.

The fourth appearance of the fever in Providence was in July, 1805. On the 3d of this month the brig Planter arrived from St. Croix, having lost some men with fover on the passage. On the 12th, the brig June arrived from Matanzas under similar circumstances. They were permitted to come to the wharves after a brief dotontion at quarantine. The weather was excessively hot and dry. The fever broke out about the the 20th of July, in the same locality as in previous years. The first cases were at the foot of James street, foot of Williams street, feet of Power street, &c., some of them being in the same houses in which persons had died in 1797 and in 1800.

On the 25th of July the Town Connell mot and adopted vigorous measures. A committee was appointed to examine the vessels in that locality, to ascertain the cause of the malignant lever which provailed. An order was passed requiring all the inhabitants "south of Power's Lane, and north of the south still-house," which stood whore the present building of the Providence Tool Company stands, to remove from their houses within three days. This order was faithfully obeyed, and on the 29th of July a watch was appointed to protect the property in the deserted houses. As in provious years, the only cases were in the infected district, or among those who had frequented that locality, and in consequence of the prompt action of the Town Council in removing the inhabitants, the fever ceased immediately, no new cases occurring after the 2d of August. A change of the weather, from oxcessivo heat and drought to cooling showers, perhaps aided in the result. Very great alarm existed at the commencement, it being some weeks earlier than the fover had begun in provious years. The rejoicing at this cessation of the disease was very great. In all, there were twolve cases and six deaths. On the 9th of August the Town Council announced that there had been no now cases, and that the town was never more healthy at that season than at that time. This healthy condition continued until the last of September. Encouraged by the absence of disease, the inhabitants of the infected district had all roturned to their homes by the 20th of September. The consequence of their imprudence was, that seven cases of the fovor occurred during the last ten days of September, of which four were fatal. These were mostly on Wickenden street, between South Main and Benefit streets. The cold weather at this time put a stop to the disease. We have, in the history of the fover this year, a most striking illustration of the efficioncy of prompt and energetic action at the beginning of the disease, in checking its progress; and also a no less marked illustration of the fact, now so well established, that when a district becomes infected nothing but cold weather and frost can remove the intection and make it safe for the inhabitants to return. After the cessation of the fever, about the first of August, the Town Council, in a lotter to the authorities of New York, stated that the fover was supposed to have originated from the brig Planter, from St. Crolx; the packet Friendship, from Charleston, and the brig Juno, from Matanzas. No particular circumstances are given which led to this belief. On its second appearance in Septem. ber it was clearly of local origin. At this time, the last of September, the weather was again dry and hot, and the papers speak of a pestilential fever as provailing in some parts of the country almost as fatal as the yollow fover in the citios. The condition of the infected district at this time was very much the same as in 1797 and 1800, except that a fire in January, 1801, had destroyed the buildings on both sides of South Main street, from Planet street nearly to Williams street. This fire destroyed thirty-six buildings and about \$300,000 worth of property. Some of the houses destroyed were those in which there had been cases of the fever. We are indebted to this fire for the widening of South Main street, in that locality. The docks, however remained unchanged, and after the appearance of the fover, in 1805, their condition began to excite the serious attention of the people. An "Address to the Inhabitants of the southerly part of this town on the opldemic fover," written by Col. H. Sabin, in March, 1806, thus describes the condition of the infected district: "It is notorious to overy person who is conversant about the docks at the south end, that the obb tide sets towards these docks, and lodges the floating substances which it brings down along the wharves from the upper part of the bay. The slips between the wharves by this means are so far filled up, that they are left bare for many hours every tide, and as the docks are made the receptacles of every kind of filth, the mud in the heat of summer is put into a state of fermentation, and millions of blubbers arise, heaving up their noxious air from this mass of vegetable and animal putrofaction." "Many of the cellars under the stores in this quarter being found unsafe depositories for property are suffered to decay, and are filled with mud and filth, which in the heat of summer form hot beds of impurity, gonerating much impure and unwholosome air." "There are a number of large wells in this quarter, originally designed for filling water for vessels, and not being used for many years they have become stagnant and putrid and are receptacles of dead toads and rats, and in the heat of summer send forth their pestilential vapors." The writer also mentions as nulsances the foul ballast and offensive bilge water from vessels, the vats of the unoccupied distilleries, offensive privies, and the practice of throwing dead animals, damaged fish and other fifth into the docks. It does not appear from the town records that any special action was taken in the matter. The epidomic condition of the atmosphero seems to have coased about this time, and the fever did not provall in Providence again until the year 1820.

Nammary and Conclusions.

A brief summary of the facts presented in relation to the yellow fever in Providence, and a few of the conclusions to which they lead, may not be unprofitable.

The whole number of deaths from the fover in this town during the five periods in which it has provalled has been as follows: In 1797, 36; in 1800, 52; In 1803, 5; in 1805, 10; in 1820, 22; total, 125. When we consider that this is the whole number of deaths from the disease during sixty years, it lessensits importance as a destroyer of human life in this city. I think it would be difficult for any one to give any sufficient reason why a disease, to which we are so little liablo here, should excite so much attention and atarm, while diseases which destroy more lives in Providence every year than the yellow fever does in lifty years, are very little noticed.

The time at which yellow fever commences in Providence depends upon the character of the season. At one period it began about the 20th of July; at the other periods it commenced between the 10th and 20th of August. Whenever a locality becomes infected, the infection is never removed, and the disease does not coase, if there are any inhabitants romaining, until the appearance of frost. This has generally been, in this town, between the 1st and 10th of October.

The origin of the fever in Providence is a question which might oxcito some discussion. At its first appearance, in 1797, the disease was directly and unequivocally traced to the foul bedding and clothing of an infected vessel. At the other periods and no such direct connoction could be Stre At all times, vessels were traced. named which it was said brought aro odit the fever; but the blame was put upon different vessels by different persons. It was, teer case and is still, the opinion of some persons that drot the vessels themselves were the only feel of lt h infection, and that there was nothing in the town itself which could sustain the disease. past the f cannot agree with this opinion. We know that all infected vessels were immediately W0 removed from the infected district, and yet mol the fever continued to provail, and now cases pasi tho aroso after they were removed. In 1805, dest when it reappeared the last of September, after an interval of six wooks, there were no infected vessels at the wharves. In 1820 whi a lady died with the fever near the corner dist of Transit street, who had not been into the thei street, nor had been exposed to infected vessels, from its common comont. It is ovident that the vessels were not the sole points of Infection. Though the fever might have -spir originated from thom, it found local causes ago in the town itself, procisoly calculated to re-Carl coive, sustain and spread the infection after rest the vessels had been removed. These local causes, I have no doubt, were the rotten The wharves and filthy docks in that locality, a tion description of which has already been given. dea At the time the yellow lover first appeared In Providence, a considerable portion of the whe alm community, including many mon of great intelligenco, bolloved in an intimate coneve The nection between opldemics and comets, earthquakes, storms, whirlwinds, &c. Noah Webster, in his History of Postilontial Diseases, published in 1798, gives a list of lifty severe opidemies between the commencement of the Christian Era and the year 1789, all of which, he says, were accompanied by "great olomental convulsions," such as quo earthquakes, comots, storms, &c. 110 also states that sovere winters always coincide with the approach of comets. The locality of the infected district in the Providence was always remarkably restricted, and its limits accuratoly dofined. In September, 1806, the portion of Wiekondon (then South Main) street between Transit and Bonofit streets was infected; at every other period the infection was contined to a small section of a single street (South Main), never extending above Pewer nor below Translt streets. Is yellow fever contagious? This question is still disputed with groat earnostness, spre though the majority of medical mon, and particularly of those who are interested in sanitary measures, have doolded it in the negative. It might be supposed, at first thought, that the question could be decided In Now Orleans, where they have the disease overy year. But there is less harmony of opinion on the question among the profession in that city than in other parts of the country. It seems to mo that Now Orleans is just the place where the question can never be decided, for this reason, that there are local causes which render every part of the city and surrounding country an infected district. Of course, where every person is exposed to infection, it will be impossible to decido that any particular case arises solely from contagion.

1900.

The last ten years of the last contury, and first five or six years of the present contury, seem to have been marked by a general opldende lafluoneo in tho Northern States, They comprise what may be called an opideade cycle or term. During this time the yellow fovor provailed more or less extensively overy year in some of our cities, and there was a general expectation among the people every year that the disease would provail. Numerous circumstances of a ppcultar naturo, which were supposed to indicate an unusual condition of the atmosphere, are noticed by the writers of that day. One writer mentions that soap suds were decomposed in three hours "and the separation of the ingredients was so effectual as to require belling water to detach the fallow from the "Beef in barrols became putrid much basin." more frequently than usual, and when putrid the smell was thought to be much more offensive than usual. Meat of all kinds spould more quickly than in ordinary times, and the odor from sowers, and all sources of tilth is described as much worse than usual. These peculiarities were ascribed to the presence of "septic" acid in the atmosphere. During the same period, epidemics were common to the animal kingdom, and one writer, in 1798, speaks of epidomics among other animals as being as rite as among men. The cats were affected and thousands dled, in 1796, in Philadelphia, New York, Boston, Albany and other cities. In Conpectical a distamper destroyed great numbers of neat cattle. In New York State, borses and dogs were affected with a distemper in the head and throat which destroyed many. In Massachusotts and Now Hampshiro, "foxes were affected with a disorder which rendered them an easy proy to hunters," and, in the same States, the geose had a disease which can led thom "to seize some object with their bills, and keep hold of it until they died." Hydrophobia is mendoned as being remarkably provalent, and small pox prevailed extensively. I find no mention of any disease among hogs at that timø. Yellow fever did not provail as an opldomic in Providence from 1797 to 1890, though Dr. Wheaton states, in a medical journal, that there were four or five cases in the town in 4598. He also mentions during the same year, thirty or forty cases of low, typhoid fover in the north part of the town, "ovidently caused by draining a mill-poad at the common common of the hot and dry weather." In 1798, the yellow fever was particularly fatal in many of our citles, and in August a strict quaranthic was enforced in Providence against all yessels from Philadelphia, New York, New London, Boston and Portsmouth. In Philadelphia, 3345 persons alod; in Now York, 2086; In Boston, 140, and In New London there were 246 cases. Philadelphia was nearly depopulated, and on the 15th of September, 1798, a subscription was forwarded from Providence for the sufferers in that city. The summers were extremely hot. Under date of October 13, 1798, Noah Webster speaks of the "great and all-subduing heat of the last two months." In the summer of the year 1800, the yellow fover seems to have been confidently expected in Providence, and an order was 13sned by the Yown Council respecting the removal of unisances, on the 12th of May. As early as the 22d of June a vessel arrived from Jamaica with cases of yellow lever on board which were sout to the hospital. Other Intected vescols arrived in June and July, but no caso occurred among the inhabitants of the town until the 15th of August. The first case was a Mrs. Taylor, who lived on the west side of Wickendon street, a little north of the present location of the Providence Tool Company. Mrs. Taylor died on the 20th of August. Botween the 13th and 20d of August there were ulnoteen cases and six doaths. The present site of the buildjugs of the Providence Tool Company was occupied at that thus by three distillaries. One man who worked in the distilleries died, and several deaths occurred opposite these buildings on the oast side of Wiekenden street. The greatest portion of the cases were between Transit and Power streets, and this was considered the infected district this year, being in the same locality; but a little more extensive than in 1797. Cases occurred, howover, in all parts of the city on both sides of the river; but every case could be traced to exposure in the infected district, and in no instance did the fever spread from those who were sick out of this district. On the second of Soptembor, the physi-

1820.

After an interval of fifteon years, the yellow fever appeared in Providence for the lifth time in 1820. There were two or three cases of slekness in town in 1819, which were brought from vessels; and were probably yellow fever, though it was denied by some persons at the time. The month of August, 1820, was excessively hot and dry, particularly from the 1st to the 19th. The average temperature in Providence for the whole month, was as follows:

7 A. M. 0591; 2 P. M. 7991; 9 P. M. 6794.

Rain fell on only four days during the month and then in small quantity. One writer says of the weather that year: "The winter of 1818-20 was unusually severe, and the spring was late and wot. The summer set in suddenly with great heat and little ruin.

Among the vessels which arrived from the West Indies in July and August, one or two had cases of the fever on board. It should be observed with reference to this period, as well as provious years, that nearly all the vessels which arrived in Providence from the West Indies discharged their cargoes from the docks between Power street and Transit street.

On the 8th of August, 1820, the town rocords state that the inhabitants of the south part of the town were much annoyed by the offluria from soveral vessel loads of soawoed collected for manuro. On the 16th of August, Mrs. Jamos Brown was taken sick with the fovor. This was the first case that year, and she died on the 20th of August. Sho lived in the house, still standing, next south of the southeast corner of James and South Main stroots. Other cases occurred immediately after in that vicinity, but the facts were carofully concealed, and the

conclusivo against its contagiousness here. the The following reasons may be montioned: mn_1

1. During the five periods in which the the yellow fever provailed in this town, no case over occurred out of the infected district Hot which could not be directly traced to exposure and in that locality.

2. Many porsons with the fever were moved from the infected district to other places in town, and persons died with the disease in overy part of the town; yet, never in any instance, did any other portion of the town become infected, nor did a single person take the disease from those who were sick out of the infected district.

Meteorology -Thoro is a romarkable similarity in the character of the seasons of em those years in which the fover appeared in tho Providence. The preceding whiter was alsho ways very sovere, the spring was late, cold No and wet, and the summer was very hot and whi dry. This may have been ontirely an accidental colucidonco. It is cortain that we have had many seasons precisely similar when we have had no yellow fover.

The class of persons who have had the fever in Providence has always been good. They have nearly all fived in comfortable houses, not crowded, surrounded with the necessaries of life, and giving the usual attention of such persons to cleanliness and order in and about their houses. There could be no reason why they should have had the fever, except the fact that their residence was in an infected locality. I should judge that the majority of the victims were in the prime of life.

"CINCUMSTANCES NEVER LIE."-Day boforo yesterday, in the Lowis will case, at Hoboken, experts seem to have conclusively proven that a marriage cortificate proviously offered in evidence, dated the nuptials which it described three or four years before there existed the unmistakable steel plate from which the original blank of the cortificate was taken. "If regues must steal dates, lot them beware of the soods," says an old Arab provorb, of the truth of which this is only one example. An important sult in this State was decided by a discovery that the water-mark of the paper on which a deed was written was not brought into uso until some years after the date of the instrument. And the English story is familiar of the wanton and superfluous perjurer who protonded to have been the witness of a will, and declared that the testator had put his seal over a sixpence. The seal being removed, the sixpence was found, but it was of more recent date than the will .- New York World.

Hon. Alexander II. Stephens has had two hemorrhages from the lungs, and is very ill. This is the first time he has been affected In this way.

Upon Invitation of a number of prominent citizens, Hon. Carl Schurz will visit Oinoinnati on September 27, and deliver an address upon pending finanoial issues.
