*"We choose the dark
to better understand the
value of light!"*

Welcome to the DARK side

Our mission is guided by a single aspiration, give light the room to shine & life is instantly made better.

At DARK we believe lighting is an essential aspect of interior design. It has the ability to turn a space into a story, an experience, a language.

With this in mind, our range of lighting solutions has been curated & dedicated for you, the architect, interior designer, lighting designer, engineer or homemaker, DARK is here to make your story a reality. Whatever your wants or needs we've got something for each & every one of you. Whether you're at the starting line of the biggest project of your career, or just looking to refresh that neglected dining space, by using DARK, you are already one step closer to your vision.

With a wide arrangement of lighting options, each with its own creative potential & dozens of possible solutions, no space is too big, too small or too complex. Illuminate any space with world-class light features created specifically to meet any project requirement or budget.

Our dedicated team is available to assist with every aspect of your production timeline. Together we would define & curate your vision in pursuit of your desired aesthetic while continually delivering on the highest-quality products that not only have long lasting function, but proves the value of lighting design.

Welcome to the DARK side.

PENDANTS

It might look perfectly round when it's full, but the moon is actually asymmetrical. Its crust is thicker on one side than the other, and there are large masses beneath the surface of many lunar basins potentially caused by accumulations of lava. Scientists believe the unevenness and asymmetry could be a result of Earth's gravitational pull.

TABLE

Studies also suggest that rocks from Earth travel to the moon, and computer simulations have led scientists to believe that the moon may have asteroid debris from Earth, Venus, and Mars.

The moon's gravity pulls at the Earth, causing predictable rises and falls in sea levels known as tides.

floor dark

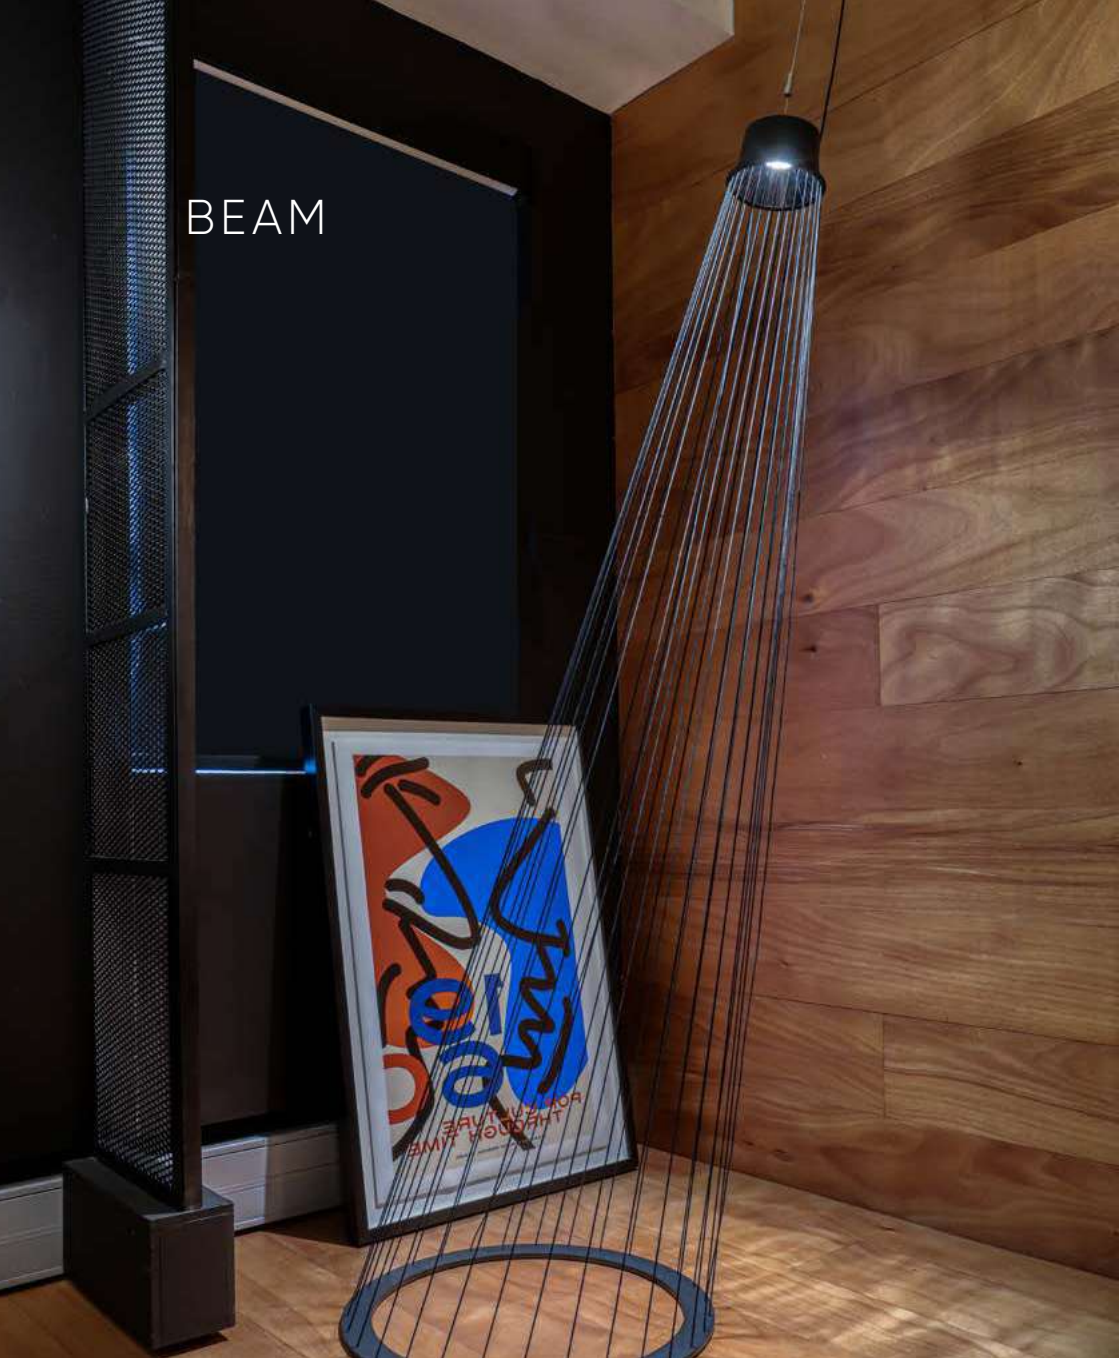

FLOOR

Between approximately 4.4 and 4.6 billion years ago, a magma ocean tens of kilometers deep covered the moon. An early crust on that ocean formed what became the lunar highlands, and meteorite impact reduced that crust more, creating mountain ranges that built up between the impact basins.
