ABSTRACT

Recent community assessments identify education as a principal barrier to adopting modern machine learning in astronomy. We present *Deep Learning for Astrophysics*, a freely available textbook at https://deeplearning4astro.com, curated from the NASA Cosmic Origins Artificial Intelligence and Machine Learning Science and Technology Interest Group (AI/ML STIG) lecture series. The book collects 23 chapters by 17 lecturers across six parts, moving from computational foundations and deep-learning architectures through generative modeling, simulation-based inference, reinforcement learning, and large-language-model agents to the practice of AI-laden science. Many include executable notebooks using astronomical data.

The methods exist; accessible training remains the bottleneck between promising demos and trusted science.

The real gap is not access to AI tools, but the understanding needed to use and evaluate them.

THE GAP IS ADOPTION, NOT AVAILABILITY

The scientific case for machine learning in astronomy is established. Data from the Vera C. Rubin Observatory and the Nancy Grace Roman Space Telescope will strain traditional analysis, and learned methods already aid classification and inference. Uptake remains the limiting problem. The U.S. NSF AI+MPS community paper (Ferguson et al. 2026) lists AI education among strategic priorities for the mathematical and physical sciences. It names an undertrained community, distrust of opaque methods, and resources written by and for computer scientists as barriers, and proposes modular, stackable training in response.

A review of deep learning in astrophysics (Ting 2026) makes a complementary point. The value of these methods rests on understanding why they work, on explicit choices that encode physical assumptions and on testability rather than on predictive accuracy alone. Understanding is the prerequisite for trust, and trust for adoption. This matters because AI can produce an appearance of understanding without the substance of it (Messeri & Crockett 2024).

notebook
astronomical example

Accuracy alone cannot tell us whether a model learned physics, shortcuts, or survey artifacts.

Literacy matters even for those who never train a model. Astronomers referee papers, sit on panels, and edit journals, and as AI-generated work enters the literature, understanding the methods is what lets them separate scientific insight from plausible output. Both assessments point to the same response: domain scientists should build AI training tailored to their field, with domain-relevant examples and criteria for when a learned method is the right tool.

TEXTBOOK DESIGN

Short, stackable modules were deliberate: few researchers can pause their science for a full retraining program.

NASA's Cosmic Origins program supports the community studying how galaxies, stars, and cosmic structure form and evolve. The AI/ML STIG is a Science and Technology Interest Group of its Program Analysis Group (COPAG), open to the national and international community.[1] The textbook grew from the premise that training the community can raise the science return of NASA's missions, and that the training must be domain-specific and time-efficient. The book responds to obstacles named in the community paper and the group's founding proposal: resistance to AI among established researchers, the difficulty of assessing interdisciplinary skill, faculty time constraints that make full courses impractical, fragmented resources that lack astronomical context, and a pace of change that outruns standard curricula. The response is a training sequence assembled from stackable short modules, each covering a self-contained concept. The aim is not to turn astronomers into machine-learning engineers but to help researchers connect astronomical questions with machine-learning methods.[2]

THE TEXTBOOK

Over the past academic year the group ran an online lecture series, with recordings and materials collected on the STIG website.[3] We have curated these lectures into a textbook, *Deep Learning for Astrophysics*, available online.[4] The lectures, notebooks, and slides were edited into a consistent chapter format and reviewed by the contributing lecturers. The executable notebooks and their outputs are preserved, so readers can run and modify the methods rather than only read about them (Figure 1). The exercises use real astronomical data, such as galaxy images, radio-galaxy morphologies, transient light curves, and stellar streams, rather than toy examples.

understanding
available methods
trusted adoption

Each notebook chapter pairs the minimum theory a method needs with a worked astronomical example, so that its uses and its failure modes are learned together. Of the 23 chapters, seventeen are executable notebooks and six are concise readings, grouped into six parts. The intended reader is a graduate student or researcher who wants working knowledge rather than a survey. Because the parts are self-contained, the book can be read end to end or used as standalone modules in a course. The broader lecture series also included sessions on the AI funding landscape and on AI-enabled mission concepts; the textbook focuses on the technical and interpretive material most suited to chapter format.

Real data exposes awkward failure modes that polished toy examples conveniently hide.

The curriculum moves from computational foundations to modern architectures, inference, reinforcement learning, and agents.

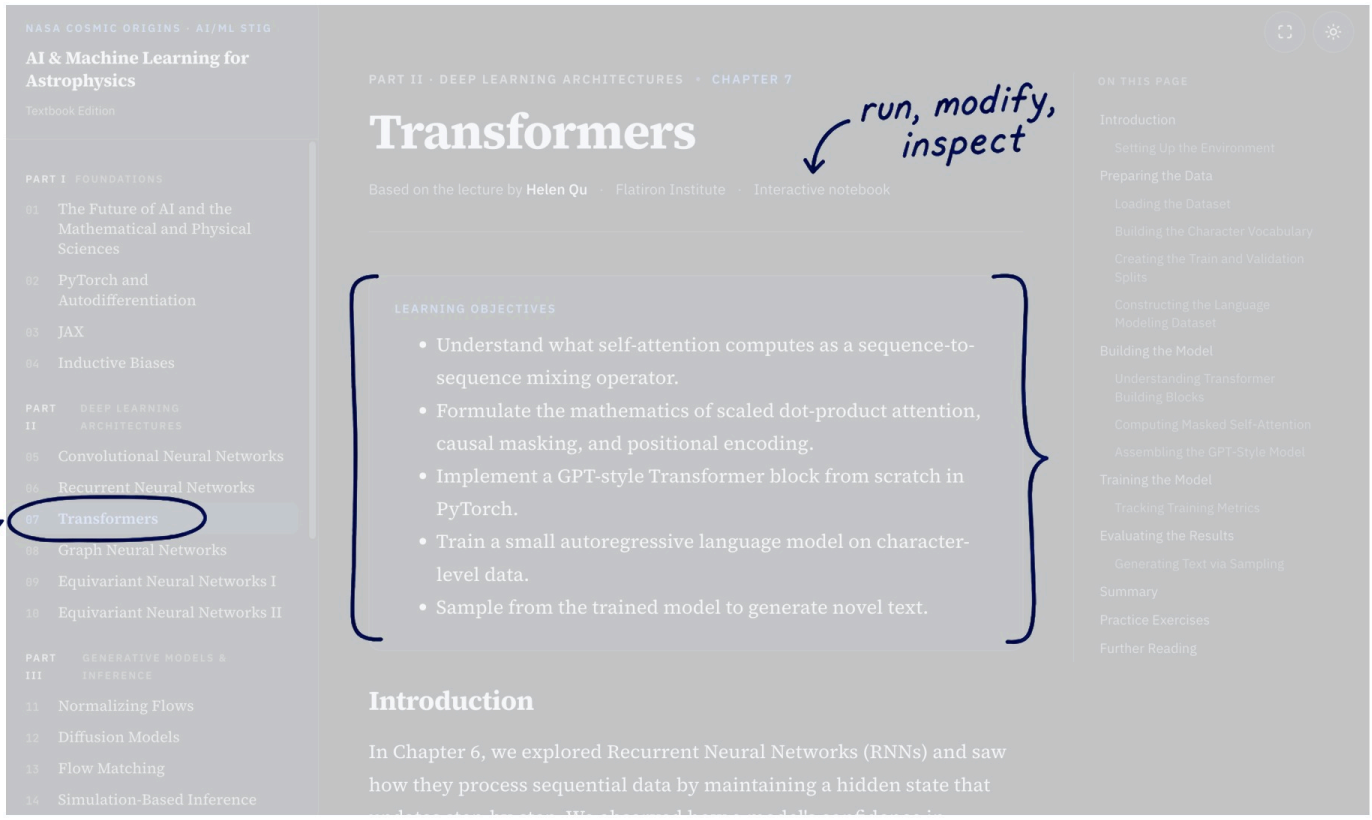

Figure 1. The web version of *Deep Learning for Astrophysics*. The textbook turns the AI/ML STIG lecture series into modular, domain-specific chapters for astronomers learning modern machine-learning methods.

one stackable module

theory becomes testable tasks

Part I. Foundations

- The Future of AI and the Mathematical and Physical Sciences *(Jesse Thaler)*
- PyTorch and Autodifferentiation *(Phillip Cargile)*
- JAX *(Phillip Cargile)*
- Inductive Biases *(John F. Wu)*

Part II. Deep Learning Architectures

- Convolutional Neural Networks *(John F. Wu)*
- Recurrent Neural Networks *(Daniel Muthukrishna)*
- Transformers *(Helen Qu)*
- Graph Neural Networks *(Tri Nguyen)*
- Equivariant Neural Networks *(Anna Scaife)*

Part III. Generative Models & Inference

- Normalizing Flows *(Gregory Green)*
- Diffusion Models *(Duo Xu)*
- Flow Matching *(Tomasz Rozanski)*
- Simulation-Based Inference *(Tomasz Rozanski)*

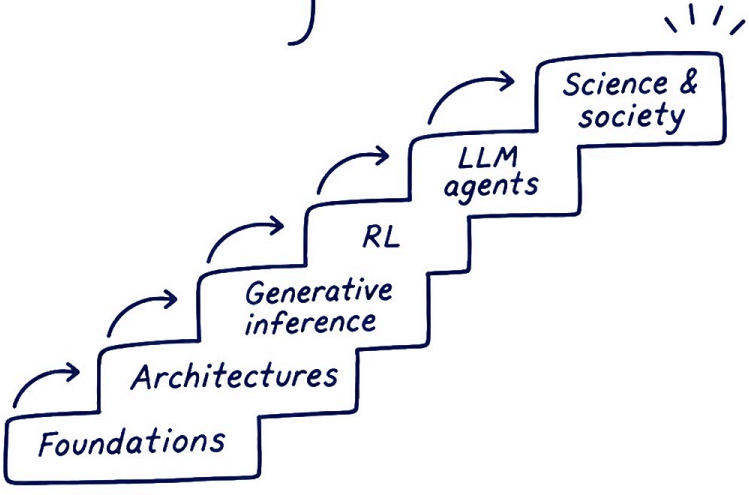

Part IV. Reinforcement Learning

- Reinforcement Learning *(Carol Cuesta-Lazaro)*

Part V. Large Language Models & Agents

- LLM API Basics *(Yuan-Sen Ting)*
- RAG and Function Tools *(Yuan-Sen Ting)*
- Model Context Protocol *(Yuan-Sen Ting)*
- LLM as Agent *(Francisco Villaescusa-Navarro)*

The ordering builds vocabulary first, then increasingly specialized ways to encode structure and uncertainty.

Readers can follow the whole route or enter at the module their current problem demands.

A useful AI textbook must remain editable — and model assistance must remain accountable to human verification.

Part VI. AI, Science & Society

- From Text to Spaceship *(Ryan McClelland)*
- AI and Scientific Publishing *(Licia Verde)*
- Understanding in AI-Laden Science *(Siyu Yao & André Curtis-Trudel)*

A static AI curriculum ages quickly, so community corrections are part of the design, not an afterthought.

The textbook will continue to incorporate corrections and contributions from the community. It remains a living series as a coherent path through AI in astronomy and a practical entry point for researchers.

The textbook was produced by editing the original lecture materials into a consistent chapter format with substantial assistance from large language models (Anthropic's Claude Opus 4.8 and OpenAI's GPT-5.5), which were also used to copy-edit this note. In both cases the text was checked and verified by the authors. We thank the Cosmic Origins Program Office and the COPAG Executive Committee for their support, and the community members whose questions shaped the lectures.
