Vitiligo on the side of the neck

Case history

- The 11-year-old boy has a hyperpigmented linear patch on the left side of his neck that has been present for more than a year.
- He has not experienced itching or any other associated symptoms.

Physical examination

- There is a linear hyperpigmented patch extending from the left ear down to the clavicle, measuring 10mm x 4.5mm.
- The left ear lobule is also affected.

Past and family medical history

- The patient's maternal uncle has vitiligo on the dorsal side of both hands and feet.
- The patient has no other relevant medical history and is fully vaccinated.

Laboratory analysis

- All blood tests, including the typhoid profile were within normal limits.

Diagnosis

- Vitiligo

Recommended treatment

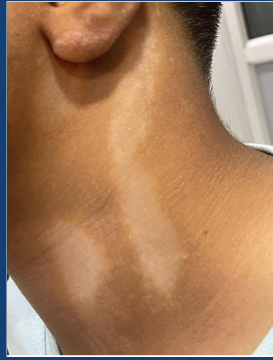

- Topical Pacroma for 7 months

Follow-up

- The patient showed 50% improvement in 3 months and achieved comparable remission in 7 months
- No side effects were reported, and the treatment was well-tolerated by the child

50% improvement in 3 months and comparable remission in 7 months

Before Treatment

After Treatment

Discussion

Pimecrolimus can be a preferred treatment choice, especially for children^{1,2}

As effective as clobetasol propionate to restore skin color in lesions of vitiligo in children

Onset of repigmentation within the first to third months

Low systemic immunosuppressive potential (lacks epidermal atrophy and telangiectasia)

Good tolerability profile
