reskilling
35%

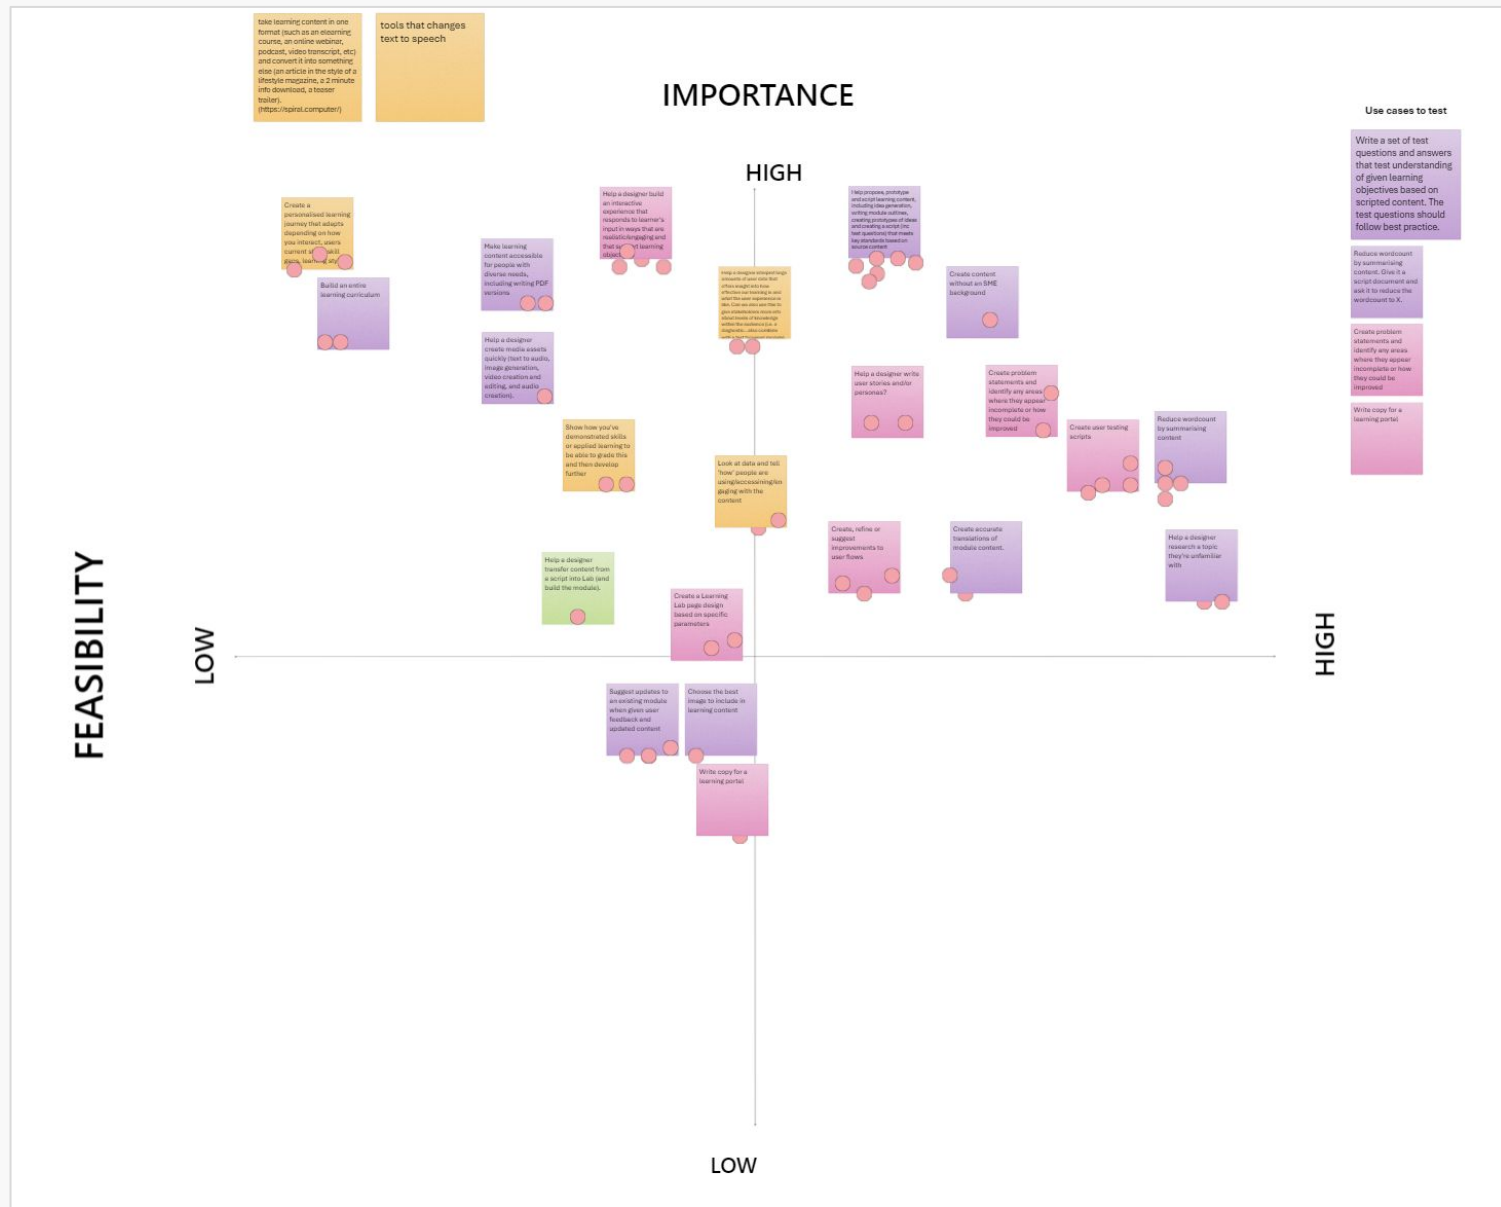

Measurable Gains

Learning Design

AI Use Cases – Near Term

- **Test Question Generation**
- **Summarising Content**
- **Problem Statement Generation**
- **Copy Generation**
- **Improvements to User Flows**
- **Create content without subject-matter expertise**

AI Use Cases

Test Question Generation

"I want AI to write a set of questions and answers to test colleague understanding of given learning objectives. These should be based on scripted content and follow best practice, increasing question quality and reducing time required for designers to produce validation tests."

The Barclays Way
How we do business
July 2024

AI Use Cases

Summarising Content

"I want AI to reduce word count of learning modules by reviewing content provided and creating summaries within a given word Count value."

Digital credentials

Empowering and enabling you to develop and showcase your critical skills.

Add to favourites

Digital credentials is a digitally held certificate which shows that you've demonstrated a certain level of knowledge or skill in a particular area. It's a structured learning pathway for priority technology skills, selected by senior leaders and distinguished engineers, created by subject matter experts, aligned to industry standards and emerging technology.

There are a range of proficiency levels which means there is something for everyone, whether you're just starting out or you're already an expert in your field.

If you'd like to find out more, visit the [digital credentials SharePoint site](#) or get started by selecting the skill group below to see the digital credentials on offer.

Architecture

Our Architects are our thinkers for tomorrow, focusing on strategic priorities and delivering Enterprise capability roadmaps.

Cyber security

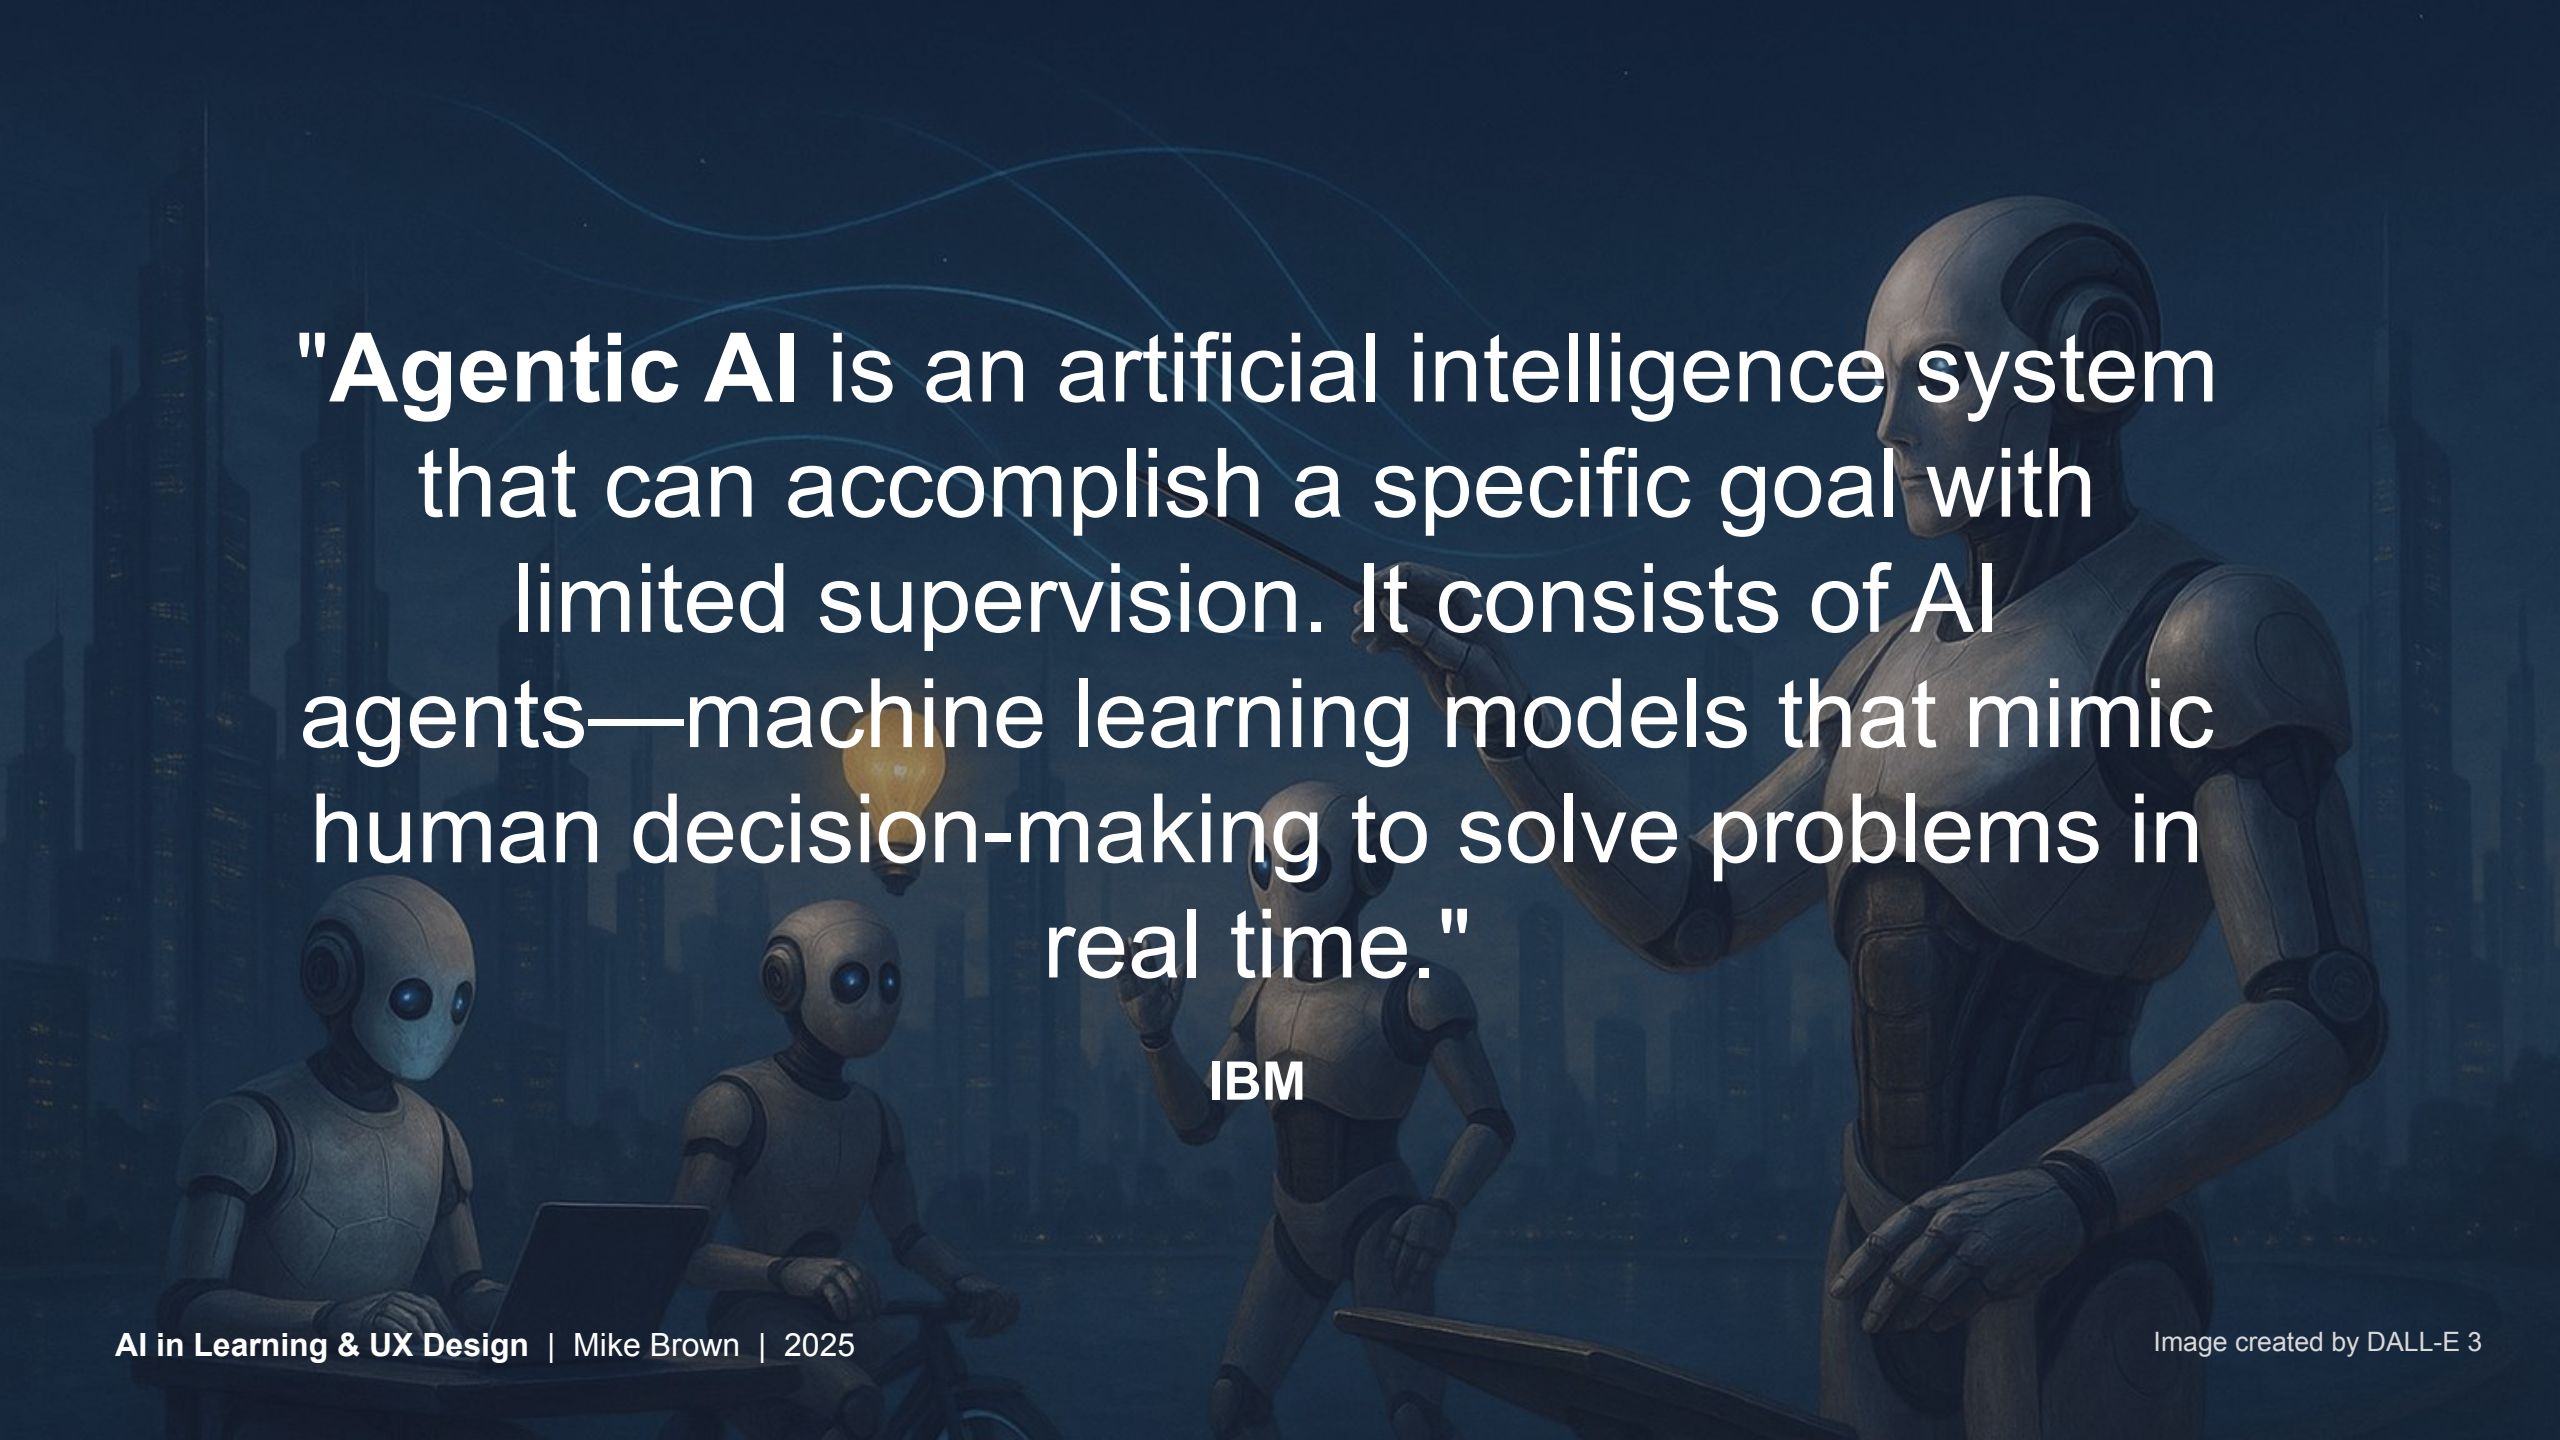

The security of our systems is at the heart of everything we do.

Learning Design

AI Use Cases – Future

- Virtual Coaching / Training
- Media / Asset Creation
- Format Conversion
- Curriculum Design
- Personalised Learning Content
- Generative UI

"Agentic AI is an artificial intelligence system that can accomplish a specific goal with limited supervision. It consists of AI agents—machine learning models that mimic human decision-making to solve problems in real time."

IBM

Agentic AI

Human-Orchestrated Agent Constellations

Agent-Agent Collaboration with Human Governance

Settings

Here is the scenario:

John is a Relationship Manager delivering service through digital channels (removing face-to-face engagement). John is finding it quite difficult to work through this change. He feels stuck, unsettled, and uncertain. John tends to withdraw when exposed to periods of change and has a long-standing client base with whom he has developed strong relationships.

Are you ready to start the simulation?

Start the simulation

Alright, let's begin the simulation.

AI Assistant (John): "Hi, I know you wanted to talk about the changes happening in our service delivery. I'm feeling a bit overwhelmed by all of this."

Please go ahead and respond as the people leader.

AUTOMATION

A futuristic industrial setting with a humanoid robot and workers. The robot, which has a white and grey body with blue glowing eyes and a small screen on its chest, stands in the center. To its right, a woman in a light blue shirt holds a clipboard and looks at the robot. In the background, two men in light blue shirts are working; one is holding a cardboard box. The scene is dimly lit with blue tones, suggesting a high-tech environment.

AUGMENTATION

Key Takeaways

MEASURABLE GAINS

- AI Opportunities are vast, but must be relevant
- Smaller process improvements are often more feasible and can be measured and proven

TOO BIG, TOO FAST ... OR TOO SLOW?

- It's easy to fall into the trap of too big, too early
- Progress will inevitably be slower than expected
- But just waiting for wider AI progress has its own significant risks

AI AND RISK

- AI offers huge opportunity, but can't be integrated without introducing risk
- Augmentation, rather than Automation is key
- Humans can be the control, to mitigate risk and harness AI's potential

Thanks
