

Monterey ETL Model

The Monterey ETL model has gone through a lengthy and expensive testing process. The testing was performed by Intertek Laboratories according to UL standards for safety and NSF standards for sanitation. The main differences, which add greatly to the cost of the ETL unit, between the standard Monterey and the Monterey ETL are as follows:

- The ETL cabinet structure is made of solid 3/16" aluminum, then clad with either plastic laminate, aluminum sheeting in various colors, or stainless steel.
- The door frame and sliding glass doors are heavy duty commercial grade and NSF rated.
- Low voltage LED lighting system.
- Back cover panel with bug screens.
- Labels certifying UL and NSF standards are met.
- Registered and listed with Intertek.

The Monterey ETL cabinet is available mainly for customers who must purchase a UL and or NSF compliant dispensing system based on building lease or corporate requirements.

The standard Monterey, as well as all other WineKeeper models, with the exception of the Magnum, incorporates the same refrigeration units and dispensing parts as the Monterey ETL model.

All models include cleaning instructions that comply with the approved NSF cleaning protocol.
