

# HEPA's Virus Prevention System

HEPA uses a combination of treatments using two products from manufacturer **mPact Environmental Solutions, LLC**

**mPerial** - traditional virucidal surface sanitizer  
EPA Product #  
10324-59-83129  
to clean and disinfect surfaces,  
formulated for compatibility with:

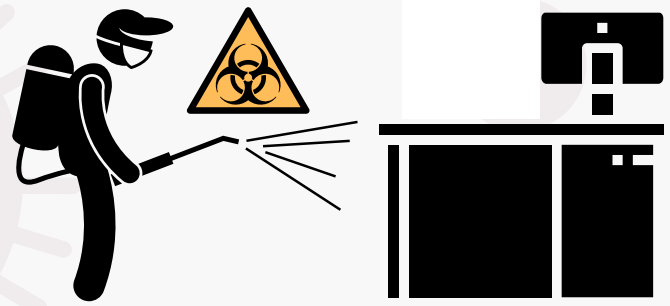

**mPale** - an active anti-microbial barrier which  
EPA Product #  
83129-1  
attracts viruses and utilizes  
nano-spikes to destroy their  
proteins mechanically--  
***no poisons needed!***

Used in combination, the antiviral properties of surfaces treated with these two products has been proven to last at least 30 days.

**No single-chemical spray application can provide this long-term effect.**

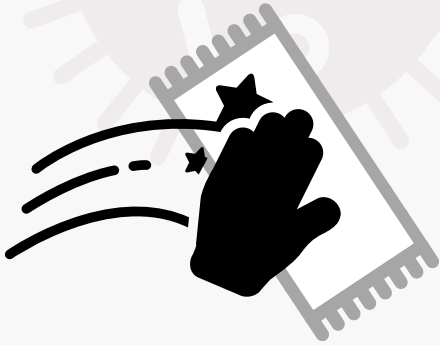

# Step 1: Disinfect

Kill existing pathogens

# Step 2: Clean

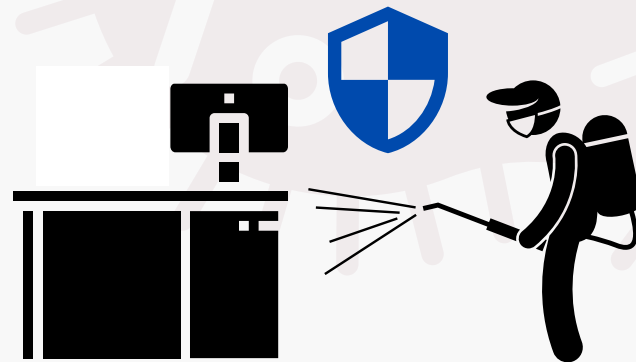

Remove chemicals and prepare surfaces for mPale application

# Step 3: Treat

Apply antimicrobial barrier to cleaned & disinfected surfaces

mPale leaves a film on surfaces which can be removed via standard janitorial procedures, without compromising its antiviral properties.

# *That's it!*
