

BRICK LAYER MATH

Counting Bricks:

A bricklayer has a pile of 120 bricks. If he uses 30 bricks to build a small wall, how many bricks does he have left?

Building Walls:

A bricklayer needs 75 bricks to build one wall. If he wants to build 4 walls, how many bricks does he need in total?

Brick Shortage:

A bricklayer starts with 200 bricks. After building part of a wall, he has 140 bricks left. How many bricks did he use?

Brick Delivery:

A bricklayer orders 500 bricks for a large project. If the delivery truck brings 5 loads with an equal number of bricks each time, how many bricks are in each load?

Wall Sections:

A wall is divided into 6 sections, each requiring 50 bricks. How many bricks are needed to complete the entire wall?

Daily Work:

A bricklayer can lay 45 bricks in one hour. If he works for 7 hours in a day, how many bricks can he lay in that day?

Brick Layers:

Each layer of a wall requires 25 bricks. If a bricklayer builds a wall with 10 layers, how many bricks does he use?

Leftover Bricks:

A bricklayer starts with 350 bricks and uses 295 to build a patio. How many bricks are left?

Brick Shipment:

A construction site receives a shipment of 750 bricks. If the bricklayer uses 25% of them on the first day, how many bricks did he use?

Brick Distribution:

A bricklayer has 180 bricks and wants to distribute them equally into 9 stacks. How many bricks will be in each stack?
