

Judgement Details

Judge System

The bottom line is that we have the same computers as yours to run your programs in the judge room. The judge system, however, will run them inside a *sandboxed environment*, i.e. with protections to prevent the system damaged. Specifically:

- Memory usage is limited to 2 GB in the environment. Note it is the total amount, not the amount you can use exclusively in your programs.
- The stack size is set unlimited (in C/C++), only capped by the total memory limit.
- Multi-processing or multi-threading is discouraged and unlikely beneficial, though not prohibited. Remember your programs will run on a single core of processor. The total number of processes is limited to 15, including ones the system may create outside your programs.
- It is *never* recommended to run external commands.¹ It is technically possible but probably does not work as you expect.
- Python module installations may be different from those in your computer (see also: “Note to Python Users”).

If you have no idea about what these mean — no worries. Just remember your programs should use the standard input and output, not files. Everything else should be unrelated to you.

There are a couple more restrictions that apply:

- The total amount of source code must not exceed 256 KB in each submission.
- Your program must compile within 30 seconds.

See the DOMjudge team manual for more details about these restrictions.

¹ e.g. using `execve()` or `system()` in C/C++; `ProcessBuilder` or `Runtime.exec()` in Java.

Compile Options

Your source file(s) will be compiled and run as follows. "\$@" denotes your source file(s); "\$DEST" is the name of binary (which is "./a.out" by default) and is chosen arbitrarily by the system.

C	
Compile	gcc -x c -g -O2 -std=gnu11 -static -o "\$DEST" "\$@" -lm
Run	"\$DEST" < <u>infile</u> > <u>outfile</u>
C++	
Compile	g++ -x cpp -g -O2 -std=gnu++11 -static -o "\$DEST" "\$@"
Run	"\$DEST" < <u>infile</u> > <u>outfile</u>
Java	
Compile	javac -encoding UTF-8 -sourcepath . -d . "\$@"
Run ²	java -XX:+UseSerialGC -Xss64m -Xmx1920m -Xms1920m <u>MainClass</u> \ < <u>infile</u> > <u>outfile</u>
Python 2 (PyPy)	
Compile ³	python2 -m py_compile "\$@"
Run	pypy "\$@" < <u>infile</u> > <u>outfile</u>
Python 3	
Compile ³	python3 -m py_compile "\$@"
Run	python3 "\$@" < <u>infile</u> > <u>outfile</u>

² DOMjudge will detect the main class automatically; you do not have to name it `Main`. See the DOMjudge team manual for details.

³ Python's "Compile" commands are executed only to check the syntax. Generated `*.pyc` files will *not* be used in the real run.

Submission Results

Your submissions will eventually be responded with one of the following results:

Accepted

- **CORRECT** — Your program ran successfully and passed all test cases.

Rejected with 20-minute penalty

- **WRONG-ANSWER** — Your program neither crashed nor exceeded the time limit, but produced incorrect output for some test case(s).
- **NO-OUTPUT** — Your program did not produce any output for some test case(s).
- **TIMELIMIT** — Your program did not finish within the time limit for some test case.
- **RUN-ERROR** — Your program crashed with some test case, or otherwise exited with a non-zero exit status (e.g. because of missing “`return 0;`” in C/C++).

Rejected with no penalty

- **COMPILE-ERROR** — Your program did not compile on the judging environment. You can consult error message(s) on the submission details page.
- **TOO-LATE** — Your program was submitted after the contest was over.⁴

Note to Python Users

The judges have solved all problems in C++ and Java, but not necessarily in Python. They do not guarantee that all problems can be solved in Python.

Only syntax errors will be reported as **COMPILE-ERROR**. Other types of errors, such as `NameError` or `ModuleNotFoundError`, will result in **RUN-ERROR** (incurring 20-minute penalty).

The full list of modules available in the judge system can be found in the following pages. Note it may differ from that you would find on your workstation.

⁴ Note it does not mean your programs need to be *judged* before the end of contest. Your programs will be judged as long as submitted (“*queued*”) within the contest time.

Available Modules in Python 2

BaseHTTPServer	_resource_cffi	formatter	quopri
