Deliverable D6.1 Project management online Platform

Microsoft Teams (MSTeams) as Project Management Tool

For modern project management - especially for interdisciplinary and globally distributed partners - a modern infrastructure is needed that provides various suitable forms of communication and options for sharing and storing data, while ensuring appropriate technical and legal framework conditions, e.g. GDPR.

Microsoft Teams is a tool for communication and collaboration within organisations. The software enables collaborative work on documents, video and telephone conferences, group chats and other forms of collaboration.

Information is open, transparent, easily retrievable and secure. Meetings can be recorded and automatically transcribed. Teams is available on all devices, in almost all countries and in 44 languages.

Project management encompasses all the efforts required to plan, coordinate and realize a specific project in a structured manner. Project management is responsible for ensuring that the defined goals are achieved on time and within budget.

Due to its diverse functions, **Microsoft Teams** is also ideal as a project management tool.

Microsoft Teams offers organisations a platform for communication and data exchange. Due to the networking, the application can be best used in agile project management.
