Service Tech Tip
Preventing Exhaust seepage

We have seen some of the RR two strokes seep a burnt looking oil from the exhaust connector that goes between the pipe and silencer. To prevent this, you can simply install a ziptie in each groove as shown in the photo below. You can use most any high quality ties, our race team uses the same ones that we use in production which are the highest quality known as T&B or Thomas & Betts. (look them up)

This is a great tip to do also before you sell a two stroke or when it is in your shop for service.
