

Introducing Enfamil[®] Reguline[™]

A new infant formula specifically designed to help support digestive health and promote comfortable stooling

COMPLETE NUTRITION you expect from a routine infant formula; DHA and choline to help support brain development

BLEND OF TWO PREBIOTICS

CLINICALLY PROVEN* to promote beneficial bacteria in the digestive tract and to soften stools

Designed for **FEEDING THROUGH 12 MONTHS OF AGE** to help support digestive health throughout the first year

Easy-to-digest **GENTLE PROTEIN**

- Easy-to-digest gentle protein
- Clinically proven blend of two prebiotics to soften stools
- Clinically proven blend of

Reguline

Reguline

WHAT ARE PREBIOTICS? Prebiotics are a type of carbohydrate found in breast milk that support digestive health

Prebiotic 1 – less complex carbohydrate designed to feed the good bacteria at the beginning of the large intestine

Prebiotic 2 – more complex carbohydrate designed to feed the good bacteria throughout the large intestine

Our blend of 2 prebiotics is designed to help support the growth of good bacteria throughout the large intestine

* Proven in Enfamil[®] Infant formula

Parents Guide to Stool

The color and texture of your baby's stool can change dramatically over the first few months. Here are some things you may notice:

GREEN/BLACK, TAR-LIKE: A newborn's first stool usually consists of a thick, black or dark green substance called *meconium*. It's good that he's passing this and getting it out of his system.

BREASTFED

YELLOW/GREEN, SEEDY: After the meconium is passed, the stools of breastfed infants look mustard-yellow with seed-like particles, although they can also appear green. There is a lot of variation between babies on the number of times they have a bowel movement. A very soft, sometimes even watery, stool is normal for breastfed infants too.

FORMULA-FED

YELLOWISH-BROWN/BROWN-GREEN/LIGHT BROWN: Formula-fed stool is soft but better formed than the stools of breastfed babies. The color may range from yellowish-brown to light brown.

DARK GREEN: More than likely, your baby's iron supplement or iron-fortified formula is making his stool dark green, dark brown or black. There's no medical significance in this change and no need to be concerned.

EATING SOLIDS

DARK BROWN WITH VARIOUS COLORS: When your baby begins eating solid food, his bowel movements might become dark brown—although seemingly odd colors are possible as well. For example, his stool might look red after he eats beets or might contain streaks of dark blue after he eats blueberries. Or you might also find chunks of undigested food in your baby's bowel movements.

CALL YOUR PEDIATRICIAN

BLACK: If the harmless causes have been eliminated (meconium, iron supplements), then black, tarry stool could indicate that there may be blood in your baby's upper GI tract.

RED: If the harmless causes (beets, food coloring) are not present, red streaks in the diaper may indicate blood in the stool. It's better to check with your pediatrician than to worry about it.

WHITE: If stool is white, then bile is not reaching the stool, either because it is not being made by the liver or because something is blocking it from getting to the small intestine.

- If your baby's stool is consistently watery, it might be diarrhea. Call your pediatrician if it lasts more than 24 hours.
- If your baby is consistently producing dark, hard stools, this could be a result of several causes. Contact your pediatrician.
