

## (Pellet Mill Ring Dies & Rollers)

- **Reconditioning, & NICOMO Metal Treatment Enhancement Process**
- **Increase longer die life by has much as (5) - (8) times longer versus new**

Paradyne's metallurgical alloy impregnation process resolves and prevents fatigue on die surface areas to eliminate wearing, chipping, and hole-expenditures on worn-out dies & rollers.

Our NICOMO metal treatment will strengthen the existing die steel without causing any brittleness, or distortion to die/roller.

Our method is basically penetrating the substrate of the steel improving the composition elements of the die to last longer in production and producing maximum tonnage of materials without change outs and maintenance benefiting you with less down-time and saving you from reconditioning cost periodically.

We can apply this process to new/refurbished dies and maintain the same dimensions.

We provide free shipping cost and a 5-day turnaround from date received.
