

Hydrovex® IHV Euro Vortex Flow Regulator

The Hydrovex® IHV Euro Vortex Flow Regulator controls discharge with an air-filled vortex which forms as the flow enters the unit tangentially. The IHV/HHV provides all of the same debris and clogging tolerance of other vortex flow regulators, and exhibits an extended flow throttling range where flow can be maintained near a target discharge.

Each Hydrovex® IHV Euro is custom fabricated to meet your specific project flow rate requirements and can be configured for a variety of installation conditions. The Euro is intended for wet-pit installations.

Sample rating curve not to be used for design purposes. Contact 2gH Solutions LLC for a custom configured rating curve tailored to meet your specific project needs.
